KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate.
ȧ " " senate, chaotic.
â " " glare, care, and as *e* in there.
ă " " am, at.
ä " " arm, father.
á " " ant, and final *a* in America, armada, etc.
a " " final, regal, pleasant.
a̱ " " all, fall.
ē " " eve.
ė̄ " " elate, evade.
ĕ " " end, pet.
ẽ " " fern, her, and as *i* in sir, etc.
e " " agency, judgment.
ī " " ice, quiet.
i̇ " " quiescent.
ĭ " " ill, fit.
ō " " old, sober.
ȯ " " obey, sobriety.
ô " " orb, nor.
ŏ " " odd, forest, not.
o " " atom, carol.
oi " " oil, boil.
o͞o " " food, fool, and as *u* in rude, rule.
ou " " house, mouse
ū " " use, mule.
u̇ " " unite.
ŭ " " cut, but.
u " " full, put, or as *oo* in foot, book.
û " " urn, burn.
y " " yet, yield.
B " " Spanish Habana, Córdoba, where it is like English *v* but made with the lips alone.

ch as in chair, cheese.
D " " Spanish Almodovar, pulgada, where it is nearly like *th* in English then.
g " " go, get.
G " " German Landtag = *ch* in Ger. ach, etc.
H " *j* in Spanish Jijona, *g* in Spanish gila; like English *h* in hue, but stronger.
hw " *wh* in which.
K " *ch* in German ich, Albrecht = *g* in German Arensberg, Mecklenburg, etc.
n̲ " in sinker, longer.
ng " " sing, long.
N " " French bon, Bourbon, and *m* in the French Étampes; here it indicates nasalizing of the preceding vowel.
sh " " shine, shut.
th " " thrust, thin.
TH " " then, this.
zh " *z* in azure, and *s* in pleasure.

An apostrophe ['] is sometimes used as in tā'b'l (table), kăz"m (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as G, H, K, N, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME V

CHAIN.
Mr. Frederick Remsen Hutton.

CHALDIANS.
Professor Nathaniel Schmidt.

CHANCERY.
Professor George W. Kirchwey.

CHARITABLE TRUSTS, OR CHARITIES.
Professor George W. Kirchwey.

CHARITIES.
Professor Alvin Saunders Johnson.

CHARITY ORGANIZATION SOCIETY.
Dr. Samuel McCune Lindsay.
Professor Alvin Saunders Johnson.

CHARLES THE GREAT, OR CHARLEMAGNE.
Professor Dana Carleton Munro.

CHARLES V (ROMAN).
Professor Dana Carleton Munro.

CHARLESTON, S. C.
Mr. A. S. Salley, Jr.

CHART.
Captain Lewis Sayre Van Duzer.

CHATEAUBRIAND, FRANÇOIS A. R.
Dr. Horatio S. Krans.

CHAUTAUQUA INSTITUTION.
Professor Paul Monroe.
Professor Isaac Leon Kandel.

CHEESE.
Dr. Edwin West Allen.

CHEESE MAKING.
Dr. Edwin West Allen.

CHEMISTRY.
Professor Martin A. Rosanoff.

CHEMISTRY, AGRICULTURAL.
Dr. Edwin West Allen.

CHEMISTRY, PHYSIOLOGICAL.
Dr. David Gilbert Yates.

CHICAGO.
Mr. Albert Robbins Sabin.
Mr. Josiah Seymour Currey.

CHICAGO, UNIVERSITY OF.
Mr. James Spencer Dickerson.
Mr. Allen Leon Churchill.

CHILD, DEVELOPMENT AND GROWTH OF.
Dr. William Leland Stowell.

CHILD LABOR.
Professor Alvin Saunders Johnson.

CHILD PSYCHOLOGY.
Professor Edward Bradford Titchener.

CHILDREN, DISEASES OF.
Dr. William Leland Stowell.

CHILD STUDY.
Professor Edward Bradford Titchener.

CHILE, OR CHILI.
Professor Walter Phelps Hall.
Mr. William Churchill.

CHIMNEY.
Mr. Herbert Treadwell Wade.

CHINA.
Professor Friedrich Hirth; Dr. Paul H. Clements; Mr. William Everett Hooper.

CHINESE ART.
Dr. George Kriehn.

CHINESE LANGUAGE.
Professor Friedrich Hirth.

CHOLERA.
Dr. Albert Warren Ferris.
Dr. David Gilbert Yates.

CHOPIN, FREDERIC FRANÇOIS.
Mr. Gustav Kobbe.
Professor Alfred Remy.

CHORAL SOCIETIES.
Professor Alfred Remy.

CHRISTIAN ART.
Professor A. D. F. Hamlin.

CHRISTIANITY.
Dr. Frank Hugh Foster.
Professor Irving F. Wood.

CHRISTIAN SCIENCE.
Judge Clifford P. Smith.

CHRISTOLOGY.
Professor Irving F. Wood.

CHRONICLES.
Professor Morris Jastrow.
Professor Nathaniel Schmidt.

CHRONOGRAPH.
Professor T. W. Edmondson.

CHRONOLOGY.
Professor Harold Jacoby.
Professor T. W. Edmondson.

CHU-HI.
Dr. William Elliot Griffis.
Professor Friedrich Hirth.

CHURCH.
Professor A. D. F. Hamlin.

CICERO.
Dr. George N. Olcott.*
Professor Charles Knapp.

CID.
Professor John Driscoll Fitz-Gerald

CINCINNATI.
Mr. Charles Theodore Greve.

CIRCLE.
Professor F. N. Cole.

CIRCULATION.
Dr. David Gilbert Yates.

CIRCUMCISION.
Professor Nathaniel Schmidt.

CITY PLANNING.
Mr. Moses Nelson Baker.

CIVIL ADMINISTRATION.
Professor George W. Kirchwey.

CIVIL CHURCH LAW.
Dr. George James Bayles.*

CIVIL LAW.
Professor George W. Kirchwey.

CIVIL SERVICE.
Professor George W. Kirchwey.

CIVIL SERVICE REFORM.
Professor George W. Kirchwey.

CIVIL WAR IN AMERICA.
Dr. H. A. Cushing.
Professor James Edward Winston.

CLAY.
Professor Heinrich Ries.

* Deceased.

CLAY, HENRY.
Professor William Peterfield Trent.
Professor Benjamin B. Kendrick.

CLEMENT.
Professor Irving F. Wood.

CLEVELAND.
Mr. Thomas L. Sidlo.

CLEVELAND, GROVER.
Dr. Talcott Williams.

CLIMATE.
Professor Cleveland Abbe.
Professor Charles F. Marvin.

CLOCK.
Mr. Herbert Treadwell Wade.

CLOUD.
Professor Charles F. Marvin.

CLOVER.
Dr. Edwin West Allen.

CLUB.
Mr. E. S. Nadal; Professor Francis M. Burdick; Mr. A. E. Coleman.

COACH.
Mr. Herbert Treadwell Wade.

COACHING.
Mr. George Gladden.

COAL.
Professor Heinrich Ries, and others.

COAL TAR COLORS.
Professor Morris Loeb.*
Professor Herman T. Vulte.

COAST AND GEODETIC SURVEY.
Mr. Herbert Treadwell Wade.

COAST DEFENSE.
Lieut.-Col. Cornélis DeWitt Willcox.

COBDEN, RICHARD.
Professor Alvin Saunders Johnson.

COEDUCATION.
Professor Isaac Leon Kandel

CŒLENTERATA.
Mr. C. William Beebe.

COFFEE.
Dr. Alfred Charles True.
Dr. Edwin West Allen.

COINAGE.
Professor Alvin Saunders Johnson.

COKE.
Dr. Arthur H. Elliott.

COLERIDGE.
Dr. Horatio S. Krans.

COLLEGES, AMERICAN.
Professor Paul Monroe.
Professor Isaac Leon Kandel.

COLLEGIATE EDUCATION FOR WOMEN.
Professor Isaac Leon Kandel.

COLOGNE.
Mr. Edward Lathrop Engle; Professor George Kriehn; Professor Dana Carleton Munro.

COLOMBIA.
Mr. Leon Dominian; Mr. Edward Lathrop Engle; Professor Walter Phelps Hall.

COLORADO.
Professor Junius Henderson.
Mr. Allen Leon Churchill.

COLORADO RIVER OF THE WEST.
Mr. Frederick S. Dellenbaugh.

COLOR IN PLANTS.
Professor John Merle Coulter.

COLOR PHOTOGRAPHY.
Professor Joseph Sweetman Ames.

COLOSSIANS, EPISTLE TO THE.
Professor Melanchthon W. Jacobus.
Professor Edward E. Nourse.

COLUMBIA UNIVERSITY.
Mr. Allen Leon Churchill.

COLUMBUS, OHIO.
Mr. Osman C. Hooper.

COLUMBUS, CHRISTOPHER.
Mr. George Parker Winship.
Professor John Driscoll Fitz-Gerald.

COLUMN.
Professor Arthur L. Frothingham.
Professor A. D. F. Hamlin.

COMBUSTION.
Professor Martin A. Rosanoff.

COMET.
Professor Harold Jacoby.
Professor T. W. Edmondson.

COMMERCE.
Dr. Roland P. Falkner.
Professor Alvin Saunders Johnson.

COMMUNISM.
Dr. Samuel McCune Lindsay.
Professor Alvin Saunders Johnson.

COMPASS.
Captain Lewis Sayre Van Duzer.

COMPETITION.
Professor Alvin Saunders Johnson.

CONCRETE.
Mr. Frank C. Wight.

CONFEDERATE STATES OF AMERICA.
Professor James Edward Winston.

CONFUCIUS.
Dr. Paul H. Clements.

CONGO.
Mr. Edward Lathrop Engle; Professor Clark Wissler; Professor Walter Phelps Hall; Mr. Leon Dominian.

CONGREGATIONALISM.
Dr. Williston Walker.

CONGRESS.
Professor George W. Kirchwey.

CONIFERÆ.
Professor John Merle Coulter.

CONJUNCTIVITIS.
Dr. David Gilbert Yates.

CONNECTICUT.
Professor William North Rice.

CONSCIOUSNESS.
Professor Edward Bradford Titchener.

CONSCRIPTION.
Major LeRoy S. Lyon.

CONSERVATION.
Mr. Overton W. Price.*

CONSERVATORY.
Professor Alfred Remy.

CONSTANTINOPLE.
Mr. Leon Dominian.

CONSTANTS OF NATURE.
Professor W. J. A. Bliss.
Professor Joseph Sweetman Ames.

CONSTITUTION.
Professor George W. Kirchwey.

CONSTITUTIONAL LAW.
Professor George W. Kirchwey.

CONSTITUTION OF THE UNITED STATES.
Professor George W. Kirchwey.

* Deceased.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

CHÆRONEA, kĕr'ô-nē'ȧ (Lat., from Gk. *Χαιρώνεια, Chairōneia*). An ancient town of Bœotia, near the Cephissus, on the borders of Phocis, at the head of the last defile where a stand could be made against an invader of central Greece (Map: Greece, Ancient, C 2). Here, in 338 B.C., Philip of Macedon signally defeated the united forces of the Athenians and Bœotians, and so crushed the liberties of Greece. A mound of earth, about a mile from the modern village of Kapræna, which occupies the site of the old city, still marks the place where the Thebans who fell in the battle were buried; the grave was also marked by a magnificent colossal lion (quite recently restored). At Chæronea also, 86 B.C., Sulla defeated Archelaus, the general of Mithridates. Plutarch was a native of this town.

CHÆTODONTIDÆ, kē'tô-dŏn'tĭ-dē (Neo-Lat. nom. pl., from Gk. *χαίτη, chaitē*, mane + *ὀδούς, odous*, tooth). A family of tropical spiny-rayed fishes. See BUTTERFLY FISH.

CHÆTOGNATHA, kê-tŏg'nȧ-thȧ (Neo-Lat. nom. pl., from Gk. *χαίτη, chaitē*, mane + *γνάθος gnathos*, jaw). An aberrant marine worm, cylindrical or fish-shaped, belonging to a division of the Nemathelminthes. It includes the arrow worms (*Sagitta*) and the related genus *Spadella*.

CHÆTOPODA, kê-tŏp'ô-dȧ (Neo-Lat. nom. pl., from Gk. *χαίτη, chaitē*, mane + *πούς, pous*, foot). Marine worms. See ANNULATA.

CHAFARINAS, chȧ-fȧ-rē'nȧs, or ZAFFARINES. A group of three small islands belonging to Spain, situated off the coast of Morocco, opposite the mouth of the Muluya River, in long. 2° 26′ W. The Chafarinas, the *Tres Insulæ* of the ancients, have long been known for the natural harbor or refuge they afford. There are fortifications on the middle island. Spain took possession of the group in 1848 and is building a breakwater to unite the middle island, Isabella II, with the near-by islet El Rey, for the purpose of inclosing a deep and sheltered anchorage for large ships. Pop., 1900, 426; 1910, 736.

CHAFER, or **COCKCHAFER** (AS. *ceafor*, Ger. *Käfer*, OHG. *kevar, chevaro;* probably connected with Ger. *Keifer*, MHG. *kiver*, AS. *ceáfl*, OS. *kāfl*, jawbone), ETC. A beetle of the family Scarabæidæ. In England all scarabs (dung beetles) are so called, the name being found frequently as the last part of such compounds as cockchafer, leaf chafer, rose chafer, etc. The cockchafer, May beetle, or dor bug (*Melolontha vulgaris*) is substantially the same as the Junebug (q.v.) of the United States. See SCARABÆIDÆ.

CHAFFEE, ADNA ROMANZA (1842–1914). An American soldier. He was born at Orwell, Ohio, and in 1861 entered the Sixth United States Cavalry. He was promoted to be first lieutenant in 1865, and in the same year received the brevet of captain for gallant conduct at Dinwiddie Court House. In 1897 he was made lieutenant colonel, and in 1898 saw service in Cuba during the Spanish-American War, distinguishing himself at El Caney, and was brevetted major general of volunteers. In 1900 he was sent to take command of the United States forces in China, being promoted to be major general of volunteers, and took an important part in the expedition against Peking. Subsequently he was put in command of the United States army in the Philippine Islands. In 1901 he was appointed major general in the regular army. He succeeded Gen. S. B. M. Young as lieutenant general and chief of staff in 1904 and was retired on Feb. 1, 1906.

CHAFFINCH (so called because the *finch* is fond of *chaff*, or grain). A handsome and familiar European finch (*Fringilla cœlebs*) and one of the foremost cage birds, especially in Germany. It is common in England and known there by many provincial names. The male, in summer, has the top of the head and nape of the neck bluish gray; the back chestnut; the wings almost black, with two conspicuous white bars; the tail nearly black. The colors of the female (and of the male in winter) are much duller than those of the summer male. In the colder northern countries it is migratory, but spends the winter in flocks in England and all around the Mediterranean, where it is shot in great numbers for market, especially in Italy. It builds a very soft and beautiful nest, garnished with lichens and placed in a bush, and lays spotted eggs. Its food is highly varied, and its habits generally are typically fringilline.

The chaffinch is one of the birds most sought by bird catchers, as well as reared from the nest, to be a cage songster. Its naturally loud, clear, and thrilling voice is susceptible of being trained almost to articulate human words; and so docile is it that the German bird trainers teach these finches several distinct tunes and trills besides

cultivating their own powers of melody and imitation. Bechstein, in *Naturgeschichte der Stubenvögel* (Gotha, 1792), gives an extended account of these vocal accomplishments, the proper acquirement of which renders chaffinches among the most valuable of cage birds. See CAGE BIRD, and Plate of CAGE BIRDS.

CHA'FIN, EUGENE WILDER (1852–1920). An American temperance advocate and Prohibition party candidate for President of the United States, born at East Troy, Wis. Admitted to the bar in 1875, he was in practice at Waukesha, Wis., from 1876 to 1900, and from 1901 to 1904 was superintendent of the Washingtonian Home, Chicago. He was the Prohibition candidate for Congress (Wisconsin) in 1882 and (Chicago) in 1902, for Attorney-General of Wisconsin in 1886 and 1900, for Governor of Wisconsin in 1898, for Attorney-General of Illinois in 1904, and for President of the United States in 1908 and 1912. In 1908 he was admitted to the bar of the Supreme Court of the United States, and in the following year moved to Arizona. He is author of *Voters' Handbook* (1876); *Lives of the Presidents* (1896); *Lincoln, the Man of Sorrow* (1908); *Washington as a Statesman* (1909). Chafin became known as one of the most active speakers and organizers in the temperance and prohibition movements.

CHAGA, chä'gà, or **WA CHAGA,** wä chä'gà. A Bantu people on the southern slopes of Mount Kilimanjaro, German East Africa. They are an interesting people, friendly, exceedingly superstitious, much harassed by the Masai, and in turn raiding the Wa Gweno and other tribes. The Chaga possess considerable skill in ironworking, their assegais being the largest and finest in Africa. Their hide shields are large, oval, decorated with colored symbols; the present form, borrowed from the Masai, has superseded the old type of shield, which was of buffalo hide, long, narrow, and decorated only with incised lines. They employ poisoned arrows. They brew beer in large wooden vessels and have partially domesticated the wild bee. They hunt also the abundant fauna on the slopes of Kilimanjaro, but do not ascend very high up the mountains. Consult Bruno Gutmann, *Dichten und Denken der Dschagganeger* (Leipzig, 1909).

CHAGOS (chä'gôs) **ISLANDS.** A small archipelago in the Indian Ocean, situated between lat. 4° 44′ to 7° 39′ S. and long. 70° 55′ to 72° 52′ E. (Map: World, Eastern Hemisphere, K 28). They are mostly of coral formation. The chief island of the group, Diego Garcia, is over 12 miles long and over 6 miles wide; pop. 1911, 517. The chief product is coconut oil. The group belongs to Great Britain and is an administrative dependency of Mauritius. It has an aggregate land area of 76 square miles.

CHAGRES, chä'grâs. A river of Panama rising in the Cordillera de San Blas, flowing southwest, west, and northwest into the Caribbean Sea (Map: Panama Canal). The mouth of the old river bed is about 7 miles west of Colon. The river supplies the water required to operate the locks of the Panama Canal, which follows the bed of the stream from Mindi to Gamboa. The tremendous rise of this river during freshets, as much as 32 feet in 24 hours, presented one of the most formidable engineering problems in connection with the construction of the canal. The building of the Gatun Dam, thereby forming Gatun Lake, successfully solved the problem.

CHAHA, chä'hà, or **CHAJA.** See SCREAMER.

CHAILLÉ-LONG, shà'yâ'lôn', CHARLES (1842–1917). An American diplomat and explorer. He was born in Maryland, of French descent, and served in the Union army during the Civil War. In 1869 he was appointed lieutenant colonel in the Egyptian army, and four years later became chief of staff to General Gordon, then engaged in suppressing the slave trade on the White Nile. Soon afterward he was sent by the Khedive to the court of the King of Uganda, who acknowledged himself the vassal of Egypt. He published an account of this expedition in *Central Africa: Naked Truths of Naked People* (1876). Returning to New York, he studied law at Columbia and in 1882 went to Alexandria to practice international law. There he rendered important services during the Alexandria massacre and the subsequent bombardment by the English squadron. In the absence of the United States Consul General and consular agents, he reëstablished the consulate and protected many Europeans and Americans. Later in the same year he practiced international law in Paris, and in 1887 was appointed United States Consul General and Secretary of Legation in Korea. He was secretary of the Universal Postal Congress at Washington in 1897, and special representative of the United States to the Paris Exposition in 1900. In 1884 he published *The Three Prophets: Chinese Gordon, the Mahdi, and Arabi Pasha.* Other publications: *L'Afrique Centrale* (1877); *Les Sources du Nil* (1891); *L'Egypte et ses provinces perdues* (1892); *La Corée ou Chosen* (1894).

CHAIN (OF. *chaine,* Fr. *chaine,* Dutch *keten, ketting,* MLG. *kedene, kede,* Ger. *Kette,* OHG. *chettina,* from Lat. *catena,* chain). A series of flexibly connected links of metal or other material designed for ornament or to serve the purpose of cord, rope, or cables. Chains are evidently of very ancient origin. Nearly all old writers speak of their use, and they are repeatedly referred to in the Bible. Remnants of chains of Roman manufacture are preserved in museums, and they show a variety of link formations and excellent workmanship. The uses made of chains by the ancients were few and unimportant compared with the multitude of uses to which they are applied at present. They served for ornament, as emblems of investiture and badges of office, and as fetters for captors, but cordage was employed for all other purposes to which chains are now extensively applied. Chains are now employed as ornaments and for the various purposes of a band, cord, rope, or cable in hoisting and hauling operations, in transmitting power, and in connecting, confining, and restraining objects. The modern chain of commerce, therefore, embraces chains varying in size and material, from the threadlike article of pure gold to the ship's cable of iron, each link of which weighs from 100 to 200 pounds, and will withstand a breaking strain of many tons.

Structurally chains may be somewhat roughly divided into those whose separate links are each composed of a single piece of metal and those whose links are each made up of several separate pieces of metal. The ordinary oval-link hoisting chain is an example of the first class, while the bicycle chain exemplifies quite well the second class. Chains may be also loosely divided into handmade and machine-made chains. It is also common practice to define

chains by special names based upon the form of the link, as stud chains, open-link chains, and twisted-link chains; or upon the use to which the chain is put, as crane chain, chain cable, and bicycle chain; or upon the name of the inventor or some other real or apparent peculiarity.

Chains are made in a variety of ways, depending upon the material used, the size, the link formation, the purpose to which the article is to be put, etc. Chains for cranes, ship's cables, dredges, etc., are always handmade, i.e., each link is welded by hand and often is both formed and welded by hand from rolled bar iron. The various stages of operation are substantially as follows: The workman, taking a round bar or rod of iron of the proper diameter, heats it in a forge and then by means of a chisel cuts off a piece long enough to form a single link. This piece is again heated and then bent by hammer blows around a suitably shaped nose until it has a U-shape. The U-shaped piece is then hooked into the last completed link of the chain and the unconnected ends thrust again into the forge to receive a welding heat. The final process is to weld together the unconnected ends around a nose of suitable shape and to bring the link to perfect form and dimensions. In chains made as just described, the weld is usually at the end of the link. When making large ship's cables, the chain maker often uses presses for bending the bars into link form, and the bending is so done as to bring the weld at the side of the link. The welding in large cables may also be done by power hammers.

In making stud chains or twisted-link chains the only change in the mode of procedure described above is the introduction of the necessary additional operation of inserting the brace or stud or of twisting the link, just previous to closing up the ends of the U-piece for the final welding operation. A stud chain is an open-link chain, in each link of which a transverse stud or brace is placed to prevent the sides of the links from closing up or drawing together when the chain is subjected to a heavy pull or load. Twisted links are of great advantage when a chain has to be wound on a drum, since they lie flat and smooth on the drum.

Generally speaking, all chains over one inch in size are made by hand. Machine-made iron chains are of two kinds, known as welded chains and weldless chains. In making welded chains by machine the rod of iron is first run through a machine called a winder, which winds it round a mandrel and turns it out in the form of a long spiral spring. This rod is then cut by a machine so that each twist or spiral is severed from the next and the stock is in the form of rings whose open ends only need to be welded together to form complete closed links. The welding is done by heating the ring and placing it in dies, which, under the blows of a trip hammer operated by the workman's foot, form it into shape and weld together the open ends.

These small sizes of machine-welded chains are often made with twisted links, but are never made in the form of stud chains. Weldless machine-made chains are manufactured by automatic machinery which takes the rolled iron, cuts it into lengths, forms these lengths into links, and connects or couples the links into completed chains. In weldless chains the links are formed by twisting or locking the unconnected ends of the short lengths of rod. There are numerous forms of such connections, and certain advantages are claimed for each form. Chains of this construction are made only in the small sizes which are used for horse halters, cow ties, dog chains, fence chains, and similar purposes. For many of these brass, bronze, and composition metals are used instead of iron, but the process of manufacturing the chain is otherwise unchanged. With the exception of the stud chain, the chains so far described have each link composed of a single piece of metal bent to form and welded, twisted into a closed ring.

Chains for transmitting power are of an entirely different construction. In certain of these each link is made of several pieces of metal connected by rivets, bolts, or stud screws, and is so formed as to engage with the teeth of a sprocket wheel. The bicycle chain is an excellent example of this variety. Chains of this kind are made by assembling by hand the several parts composing each link and connecting them; the separate parts are themselves cut, stamped, turned, threaded, or otherwise formed by machinery designed especially for the purpose. Drive chains may be made of malleableized cast iron, each link a separate unit, and so formed that one link can be slid sidewise to lock with the next one, but cannot unlock except in a position which the links will never occupy relatively to each other in service.

Silent chains are those in which each link is made up of several plates set edgewise and side by side, and with profiles on the inner or driving side which fit the epicycloidal or involute profiles of the ordinary spur-gear wheel. Such chains are much used in driving the pump and valve-gear shafts in motor vehicles, and in transmitting motion and power to the driving or rear axle of such vehicles. The drive chain has a flexibility against the twisting action by road shocks far greater than any other means of transmitting power at the low speeds required. See BELT; LINK.

A chain used almost exclusively in plumbing for securing washbowl stoppers, etc., is called safety chain. Each link is stamped from a sheet of metal and has an eye at each end. The first link is bent around so that the eyes lie together; the next link is then threaded through the two eyes and bent to bring its eyes together.

Watch chains, neck chains, and other chains made of precious metal for ornament form a class by themselves. Some of the larger and heavier chains of this class, which are made in the simple forms common to the chains of brass and iron which have been described, are made by methods closely corresponding to those used in making iron and brass chains. The smaller sizes of wire chains are made by machinery with twisted and locked links, others are formed by methods analogous to that adopted in producing machine-made welded chains of iron, the links being closed by brazing instead of by welding. In still other forms the links are stamped and cut from metal plate and are assembled and brazed together by hand.

The strength of chains is a very important matter in certain uses to which chains are put. For example, the safety of an anchored ship and the lives of its crew may often depend upon the strength of its chain cable. For this reason the British Admiralty and corresponding organizations in other countries require all chain cable to undergo severe tests before it is used on shipboard. Similar tests are required by rail-

ways, builders of cranes and dredges, and other large users of chain. The size of chains is defined by the diameter of the bar of which the links are made; thus, a 1-inch chain is one whose links are made by bars one inch in diameter. According to tests made by the United States Testing Board, "with proper material and construction the ultimate resistance of chains may be expected to vary from 155 per cent to 170 per cent of that of the bar used in making the links and to show an average of about 163 per cent." This conclusion refers only to hand-welded chain cable. The Pennsylvania Railroad requires its 1½-crane chain to stand without giving way a pull of 70,000 pounds, and not to break under a load of 116,000 pounds. The British Admiralty requires a 2-inch stud-chain cable to withstand a proof load of 72 tons before it is used. These figures are selected at random for the purpose of illustration. For a statement of the test requirements of the Pennsylvania Railroad, the British Admiralty, and the United States Testing Board, see Kent, *Mechanical Engineer's Pocket Book* (8th ed., New York, 1913). Special literature on the manufacture of chains is very scarce, and such as there is will be found scattered through the engineering papers and the proceedings of the various engineering societies.

CHAIN, Anchor. See Cable; Anchor.

CHAIN, Engineer's, or Surveyor's. See Engineering Instruments.

CHAIN BRIDGE. See Bridge.

CHAIN CABLE. See Cable.

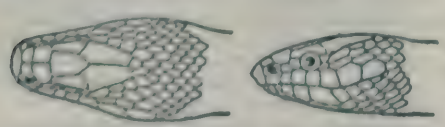
CHAIN CORAL. See Halysites.

CHAIN CREEPER. See Bauhinia.

CHAIN MAIL, or **CHAIN ARMOR.** A coat of hammered iron links, interwoven into the form of a garment. It was much more flexible and convenient than either the byrnie or plate armor, but was not so good a protection as the latter. It was much used from the twelfth to the fourteenth century. See Armor; Coat of Mail.

CHAIN SHOT. A projectile composed of two shots fastened together by a short chain, and used chiefly at sea to cut or destroy the enemy's rigging. It has long been obsolete.

CHAIN SNAKE. A North American harmless snake (*Ophibolus getulus*), found from the Hudson River and Great Lakes to Mexico, and subject to great variation in color and markings. The typical form of the East and South is lustrous black, crossed by about 30 yellow lines which unite along the sides, forming a chain-like pattern; the belly is yellowish, blotched with black; headplates black, with yellow spots. The lighter and larger variety west of the Mississippi is *sayi*, and that of the Pacific coast *boylii*. In the last the markings are ivory-



CHAIN SNAKE — TOP AND PROFILE VIEWS.

white, and in the form of bands encircling the body and broadening, but not coalescing, along the sides, so that it has been described as "cream colored, sharply marked by rings of black," instead of the reverse. Everywhere these snakes are large (4 to 5 feet), strong, active, and mainly nocturnal. They do not take to water nor climb trees, and feed mainly upon small mammals, amphibians, and reptiles, including other snakes; and they are protected by the country people of the South and West, as one of the "king" snakes (q.v.), because they constantly destroy venomous reptiles. The chain snake kills these serpents by constricting tightly, disregarding their repeated bites, as it is quite immune to their poison. See Plate of Snakes, American Harmless.

CHAIX D'EST ANGE, shā'dâ'tänzh', Gustave Louis Adolphe Victor Charles (1800–76). A French advocate. He was a brilliant pleader. In 1857 Napoleon III appointed him *procureur général* and soon after Councilor of State. In 1862 he was made senator; in 1863 Vice President of the Council of State; and in 1864 President of the Department of Public Works and Fine Arts. He retired in 1870. Consult Rousse, *Chaix d'Est Ange* (3 vols., Paris, 1862–77).

CHAJ'JUG. See Hayyuj.

CHAKA, chä'kà, or **TCHAKA.** A chief of the Zulus. See Zululand.

CHALAZA, kà-lā'zà (Neo-Lat., from Gk. χάλαζα, *chalaza*, hailstone, pimple). The basal region of an ovule, in which there is no differentiation of integument. See Ovule.

CHALAZOGAMY, kāl'â-zŏg'â-mĭ (from Gk. χάλαζα, *chalaza*, hailstone, pimple + γάμος, *gamos*, marriage, from γαμεῖν, *gamein*, to marry).

Casuarina showing chalazogamy: *p*, pollen tube descending to the chalazal region of the ovule and entering the bundle region (*b*), turning upward into the nucellus (*n*), entering the embryo sac (*e*) from below, and thus approaching the egg.

The passage of the pollen tube through the chalaza of the ovule. In seed plants the pollen tube ordinarily reaches the egg by passing through the micropyle, which is a small passageway left by the integument of the ovule. In certain cases, however, it has been discovered that the pollen tube does not enter in this way, but pierces the ovule in the general region of the chalaza, which is the base of the ovule, where the integument and body of the ovule are indistinguishable. In this way the tube approaches the egg from beneath and burrows its way through the intervening tissue. This phenomenon

is known as "chalazogamy," as distinguished from the ordinary method, which has been called "porogamy." Chalazogamy has been discovered as yet only in connection with the amentaceous trees, those in which it has been recorded being birch, alder, hornbeam, walnut, hazel, casuarina, and elm. While in most of these cases the pollen tube enters through the chalazal region, in the elm it passes into the ovule above the chalaza. However, the term "chalazogamy" has been extended to include all cases in which the pollen tube does not enter by way of the micropyle. When chalazogamy was first discovered in *Casuarina*, it was thought to indicate that this genus was the most primitive of the flowering plants. This view has continued to be held by certain botanists with the multiplication of cases of chalazogamy. These cases are so well scattered, however, that the general opinion is that chalazogamy is not a primitive feature, but may occur in any group of plants when the conditions are appropriate.

CHALCAN'THITE. A natural hydrous sulphate of copper, having the same composition, appearance, and properties as the artificial product known as blue vitriol.

CHALCE'DON, or **CALCHE'DON** (Lat., from Χαλκηδών, *Chalkēdōn*, or Καλχηδών, *Kalchēdōn*). A city of ancient Bithynia, at the entrance of the Bosporus, opposite Byzantium. It was founded about 677 B.C. by a colony from Megara and soon became a place of considerable trade and importance. It contained several temples, one of which, dedicated to Apollo, had an oracle. After the liberation of the Greek cities from Persian rule, Chalcedon joined the Athenian League, but at the end of the Peloponnesian War came into possession of the Spartans. With the rest of Bithynia, it was bequeathed to the Romans by King Nicomedes III. (See BITHYNIA.) During the Mithridatic War it was the scene of a bold exploit of the Pontic sovereign. Bithynia having been invaded by Mithridates, all the wealthy Romans in the district fled for refuge to Chalcedon, whereupon he broke the chains that protected the port, burned four ships, and towed away the remaining 60. Under the Empire Chalcedon was made a free city, and it was the scene of a general council, held 451 A.D. Chosroës II, King of Persia, captured it 616 A.D., after which it declined, until it was finally demolished by the Turks, who used its ruins to build mosques and other edifices in Constantinople. Chalcedon was the birthplace of the philosopher Xenocrates.

The Council of Chalcedon, to which allusion has been made, was the fourth general council, and was assembled by the Emperor Marcian for the purpose of drawing up a form of doctrine in regard to the nature of Christ, which should equally avoid the errors of the Nestorians (q.v.) and those of the Monophysites (q.v.). Six hundred bishops, almost all of the Eastern or Greek church, were present. The doctrine declared to be orthodox was that in Christ there were two natures, which could not be intermixed (this clause was directed against the Monophysites), and which also were not in entire separation (this was directed against the Nestorians), but which were so conjoined that their union destroyed neither the peculiarity of each nature nor the oneness of Christ's person.

CHALCEDONY, kăl-sĕd'ō-nĭ (Lat. *chalcedonius*, a gem named after Gk. Χαλκηδών, *Chalkēdōn*, a city in Asia Minor, where it abounded, Gk. χαλκηδών, *chalkēdōn*, chalcedony). A crystalline variety of quartz of various shades of white, yellow, brown, green, and blue. It is transparent or translucent, and some of the milk-white varieties are opaque. It occurs in mammillary, botryoidal, and stalactitic shapes, and as a lining or filling of cavities in rocks. The principal varieties of chalcedony are *agate*, which is banded and striped; *carnelian*, which is clear and of various shades of red; *chrysoprase*, an apple-green variety, in which the color is due to nickel oxide; *heliotrope* or *bloodstone*, of a dark-green color, with small spots of jasper; *onyx*, consisting of bands of different colors, usually black and white; *plasma*, of a deep-green color; and *sardonyx*, a red-banded variety of onyx, all of which are described in special articles under their names. The variety of its colors and the high lustre that it takes by polishing render chalcedony valuable for brooches, necklaces, and other ornaments, and some varieties of it are cut as seal stones. Chalcedony is found in Great Britain, in Brazil, and in a number of localities in Colorado and California. The formation of the famous agatized wood of Chalcedony Park, Ariz., is caused by a natural replacement of the woody fibre by chalcedony from siliceous waters.

CHALCEDONYX, kăl-sĕd'ō-nĭks (from Gk. χαλκηδών, *chalkēdōn*, chalcedony + ὄνυξ, *onyx*, finger nail, onyx, Lat. *onyx*. See CHALCEDONY). A variety of agate consisting of alternate layers of a white opaque and a grayish translucent chalcedony.

CHALCHIHUITL, chăl'chē-wē't'l (Mexican). A green mineral referred to by Spanish writers contemporary with Cortés. It was held in high repute by the ancient Mexicans, who valued it more than gold. The Mexicans believed that the art of cutting and polishing chalchihuitl had been taught them by the god Quetzalcoatl. The best authorities believe the mineral to have been the bluish-green variety of turquoise from Los Cerillos mines, New Mexico, although some still think it is a variety of jadeite. A blue calamine from Chihuahua, Mexico, has recently been claimed to be chalchihuitl.

CHALCIDICE, kăl-sĭd'ĭ-sē (Lat., from Gk. Χαλκιδική, sc. χώρα, *chōra*, district, *Chalkidikē*, of Chalcis). The ancient name of three districts in Grecian or partly Grecian lands. 1. In Eubœa, the land belonging to the inhabitants of the town of Chalcis, on the southwestern side of the island, near the Strait of Euripus. (See CHALCIS.) 2. A district of Macedonia, between the Thermaic and the Strymonic gulfs (Map: Greece, Ancient, C 1). The lower part of this district forms three peninsulas, called, from west to east, Pallene (or, more anciently, Phlegra), Sithonia, and Acte or Athos. This district received its name from Chalcis, in Eubœa, having been settled in the eighth century B.C. by colonists from that place. Among the flourishing towns of Chalcidice were Olynthus and Potidæa. 3. A district in Syria, extending eastward from the Orontes River to the desert, and called Chalcidice from the town of Chalcis, lying therein.

CHALCIDIDÆ. See CHALCIS FLIES.

CHALCIS, kăl'sĭs (Lat., from Gk. Χαλκίς, *Chalkis*). The capital of the island and the Nomarchy of Eubœa, Greece, situated on the Euripus, the strait which separates the island from Bœotia (Map: Greece, E 3, and Ancient Greece, C 2). The Euripus is divided into two channels, of unequal breadth and depth, by a rock which is

surmounted by a castle, partly of Venetian and partly of Turkish construction. A shallow channel, 85 feet wide, separates the rock from Bœotia and is crossed by a stone bridge. The main channel, about 120 feet wide, through which a strong current flows, was at one time crossed by a drawbridge, which has been removed in modern times in connection with operations for widening and deepening the channel. The site seems to have been occupied in very early times, and during the ninth and eighth centuries B.C. the inhabitants were active colonizers, especially towards the north, where they gave their name to the Chalcidian Peninsula on the Macedonian coast. (See CHALCIDICE, 2.) They also appear early as allies of the Corinthians in the Greek colonization of Italy and Sicily, where they settled Cumæ and Naxos, and gave their alphabet to the Italians, via Cumæ (q.v.). After a long war with its rival, Eretria, Chalcis acquired the undisputed headship of Eubœa and rapidly rose to wealth and importance. Its government was strongly aristocratic, but after a crushing defeat at the hands of the Athenians (506 B.C.) the nobles were driven out and a democracy established. It subsequently fell under the power of the Macedonians and the Romans and was at this time a place of great military importance, nearly 9 miles in circumference, and had many fine temples, theatres, and other public buildings. The orator Isæus and the poet Lycophron were born at Chalcis; Aristotle died there. In the Middle Ages it was prosperous under the Venetians, who held it for nearly three centuries, until its conquest by the Turks in 1470. Not many ancient remains now exist. The streets are narrow, but the houses, many of which owe their origin to the Venetians, are substantial and spacious. It suffered from an earthquake in 1894. Pop., 1896, 8661; (commune), 15,989; 1907, 19,950.

CHALCIS (kăl'sĭs) **FLIES,** or **CHALCIDIDÆ,** kăl-sĭd'ĭ-dē (Neo-Lat. nom. pl., from Gk. *χαλκίς, chalkis,* lizard, either from Χαλκίς, *Chalkis,* a city of Eubœa, or, more probably, like the name of the town itself, from *χαλκός, chalkos,* copper). A group of very small Hymenoptera, characterized by elbowed feelers. They number thousands of species and are truly parasitic, except a few gall-making and seed-feeding genera. One large section glues its eggs upon the backs of caterpillars of moths. These eggs hatch in about two days, when the grubs quickly bury their heads in the skin of their host and begin to feed, growing more rapidly than any other known insect larvæ, and reaching full growth within three or four days. The first to mature then withdraws its head, preparatory to pupating—an act which at once causes the death of the exhausted caterpillar and consequently of many belated grubs. The more advanced survivors spin and attach their cocoon to the underside of the empty skin of the dead host, which thus furnishes a roof, and within about eight days complete their transformation and emerge as adult chalcids. The fact that they attack many fly maggots, caterpillars, etc., greatly injurious to cultivated plants, and destroy them with much speed and certainty, places them among the most valuable aids mankind has in its warfare against insect pests. It is due to these insects, principally, that the cotton worm of the South is kept down, and millions of dollars' worth of cotton saved each year. "Nowhere in Nature," remarks L. O. Howard, "is there a more marked example of the correlation between structure and habits than occurs in this family. . . . So that it is possible for an experienced person, on seeing a new species of chalcis fly, to tell precisely what kind of insect it will be found parasitic upon." See Howard, *The Insect Book* (New York, 1901); also papers, often illustrated, by Howard and Ashmead, in the publications of the United States National Museum and Department of Agriculture.

CHALCIS FLY.

CHAL'COCITE. A copper sulphide occurring in crystals of the orthorhombic system, but more frequently met with in granular or compact masses. The lustre is metallic, and the color lead gray, which tarnishes to dull black on exposure. Chalcocite occurs commonly associated with other copper minerals, as in the Cornwall mines, where beautiful specimens are found. It also occurs in Bohemia, Saxony, Mexico, South America, and at Bristol, Conn. See COPPER.

CHALCOGRAPHY, kăl-kŏg'rȧ-fĭ (from Gk. *χαλκός, chalkos,* copper + *γράφειν, graphein,* to write). A modern term used to signify engraving on copper and steel plates. It is more properly called "line engraving" (q.v.).

CHALCONDYLAS, kăl-kŏn'dĭ-lȧs, or **CHALCON'DYLES,** DEMETRIUS (c.1424–c.1511). A Greek scholar. He was born in Athens, and after teaching Greek in various cities of Italy, from 1447 onward, was called by Lorenzo de' Medici to the chair of Greek in Florence (1471), where Pope Leo X was one of his pupils. After the death of the Prince (1492), he was professor of Greek in Milan, where he died. Chalcondylas wrote a Greek grammar, entitled *Erotemata* (c.1493), worked out in the form of questions and answers, and published editions of Homer (1488), of Isocrates (1493), and of the *Lexicon* of Suidas (1499). Consult Hody, *De Græcis Illustribus* (London, 1742).

CHALCOPYRITE, kăl'kō-pī'rīt (from Gk. *χαλκός, chalkos,* copper + *πυρίτης, pyritēs,* flint, from *πῦρ, pyr,* fire), commonly called COPPER PYRITES. A copper-iron sulphide that crystallizes in the tetragonal system. It has a metallic lustre, is of a brass-yellow color, and is often tarnished or iridescent. It occurs widely disseminated in metallic veins and in the older rocks, frequently with pyrite or iron sulphide, and sometimes with nickel and cobalt sulphide. This mineral occurs in large deposits in Sweden, in the Harz Mountains, in Bohemia, Hungary, New South Wales, and in South Africa. In the United States it is found quite largely in Colorado, Montana, Arizona, Utah, and California, where it frequently carries gold and silver. It is also found in Vermont, Tennessee, and North Carolina, and is here mined as a copper ore. When tarnished, it is sometimes called *peacock ore,* owing to the iridescent film of brilliant colors with which it becomes coated.

CHALDÆA, kăl-dē'ȧ. See BABYLONIA.

CHALDÆAN (kăl-dē'an) **RITE,** CHRISTIANS OF THE, also called SYRO-CHALDÆANS, or SYRO-ORIENTALS. A branch of the Nestorians who

acknowledge the Pope of Rome. They use the Eastern rite and are under the Patriarch of Babylon, usually residing at Mosul. Their number is estimated at about 66,000. See NESTORIANS.

CHALDÆANS (from Lat. *Chaldæi*, Gk. Χαλδαῖοι, *Chaldaioi*, Heb. *Kasdīm*, Assyr. *Kaldi*). Properly a designation of a Semitic people, whose original home was southeast of Babylonia, on the Persian Gulf, in the Sea Land (Mat Tamti). There was a considerable number of Kaldu states, such as Bit Ammukani, Bit Dakan, Bit Shilani, Bit Shaali, and Bit Yakin. Of these the most important seems to have been Bit Yakin. Hommel's theory that Ur (Mukḳayar) belonged to the realm of the Kaldu as early as the third millennium B.C. is not convincing. It is possible that already the Pashe dynasty (1185–1051) was Chaldæan. In the case of Mat Tamti (1051–1030) and Bit Bazi (1030–1010), this is quite probable. Adadnirari III, in 803, received tribute from Kaldu princes. In 723 Ukinzir, of Bit Ammukani, consequently a Chaldæan, ascended the throne of Babylon. Marduk-apaliddin (Merodach Baladan), ruler of Bit Yakin, made himself King of Babylon in 721 and maintained himself with the aid of Elamites and Aramæans until 709. In 702 he returned for nine months, but was driven back to Bit Yakin by Sennacherib. In 693–689 another Chaldæan, Mushezib Marduk, occupied the throne of Babylon. But it was with Nabuapaluzur (Nabopolassar) (625–604) and Nabukuduruzur (Nebuchadnezzar), his son (604–562), that Chaldæan princes seated themselves upon this throne who were able to make Babylonia a world power. Nabukuduruzur's son, Amil Marduk (Evil Merodach), who reigned 562–560, was overthrown by Nergalsharuzur (560–556), and the son of this usurper, Labashi Marduk (556), was the last Chaldæan King. He was supplanted by a Babylonian, Nabunaid (Nabonidos), who reigned 556–549. The period of foreign conquests and a powerful inner administration had made the terms "Chaldæan" and "Babylonian" practically synonymous with foreigners. Hebrew writers of the postexilic period speak of the Babylonians as Chaldæans (Kasdim). In the second century B.C. the term "Chaldæan" was used by the author of the Book of Daniel as a designation of a class of magicians. Concerning the Chaldæan language we have no other information than that which may be gleaned from proper names. These suggest a closer kinship to the Babylonian than to either Arabic or Aramaic. After the conquest of Babylon the native Chaldæan dialect was no doubt crowded out by Babylonian and Aramaic. The latter was regarded by the author of Dan. ii. 4a not altogether erroneously as the "language of the Chaldæans," though the language of the following chapters is not the East Aramaic spoken in Babylonia to some extent, but the Judæan dialect. (See DANIEL, BOOK OF.) Hence Aramaic was called "Chaldee" by Jerome, and the confusing term has remained in use until recent times. The failure to distinguish between Babylonians and Chaldæans has added to this confusion. It is probable that the Chaldæan system of astronomy and astrology was developed by this people in Babylonia, on the basis of earlier observations in the beginning of the first millennium B.C. The Chaldi, a people related to the modern Georgians of the Caucasus, were called by the old geographers "Pontic Chaldæans," but they were Chaldæans in name only and non-Semitic. (See CHALDIANS.) Consult: Delattre, "Les Chaldéens," in *Revue des questions historiques* (Paris, 1896); Winckler, *Untersuchungen zur altorientalischen Geschichte* (Leipzig, 1889); Brinton, *Protohistoric Ethnography of Western Asia* (Philadelphia, 1895); Ed. Meyer, *Geschichte des Altertums*, i, 2, pp. 434, 592 ff. (3d ed., 1913).

CHALDEE PARAPHRASE. See TARGUM.

CHALDIANS, kăl'dĭ-anz (Gk. Χαλδαῖοι, *Chaldaioi*, Χάλδοι, *Chaldoi*, Lat. *Chaldi*). A people inhabiting Armenia before the arrival of the Haik. The early Assyrian kings called this country Nairi. It was then inhabited by petty nomadic tribes of uncertain ethnic relation. About 900 B.C. the Chaldians seem to have entered the country from the northeast and founded a powerful kingdom. The name by which they designated themselves, and the land which they conquered, was that of their chief god, Chaldis. It is impossible as yet to determine to what family of nations they belonged. But a connection may be suspected with such people as the Mushki, Kashki, Tabal, Kummuch, and Chatti. The Assyrians, from the time of Asurnazirpal III (885–860), called them Urartu, which may have been the name of the first tribe or district with which they became acquainted. It is possible that Arame, against whom Shalmaneser III (860–825) fought in 857 and 845 B.C., was the first Chaldian King who succeeded in uniting under his sceptre the territory around Lake Van. In 833 Shalmaneser III warred with a Sarduris, who is possibly to be identified with the Sarduris, son of Lutipris, of whom three inscriptions in Assyrian have been found. These agree most closely with the Assyrian inscriptions of the time in form and character. Ispuinis, who is called Ushpina by Samsi Adad V (825–812), associated with himself his son, Menuas. It is possible that Ispuinis was the conqueror and organizer of the territory of Biaina and that he made Tuspas the capital. Menuas is known to us chiefly through his building enterprises. The canals he constructed reveal the great architectural skill of the builders and their remarkable knowledge of hydraulics. They also show the great extent of territory and large resources of the King. In 802, 792, and 785 Adad Nirari V (812–783) made campaigns against Menuas. About 80 inscriptions in the Chaldian language of this King have been found. Argistis (785–760), a great conqueror, further extended the boundaries of Chaldia. He left a long inscription on the rock of Van and many others. In vain Shalmaneser IV (783–773) repeatedly invaded his territory. He was defeated, and the power of the Chaldian King grew apace. Sarduris II (760–730) appears to have a right to call himself "King of Kings," as he was the actual liege lord over Melitene, Commagene, Arpad, Cilicia, and some adjoining districts. Owing to the weakness of Assyria during the generation from Shalmaneser IV to Tiglath-pileser IV, Chaldia became quite the most important power in western Asia. In the struggle for empire between Chaldia and Assyria Tiglath-pileser III (745–728) was able in 735, by an expedition into the very heart of Chaldia, to establish the Assyrian power in Asia by greatly weakening the rival state, yet was obliged to retire without being able to capture the impregnable capital. The final struggle between Rusas I (730–712) and Sargon II (722–705) ended in the loss of

Chaldian supremacy. The Assyrian reports are indeed wrong in stating that Rusas committed suicide. He was even able to extend his power somewhat after the alleged defeat, north and east. But in the west and the south Assyria had effectually checked the growth of Chaldia. And towards the end of Sargon's reign the Kimmerians fell upon Chaldia from the north. This invasion Argistis III, mentioned by Sargon in 709, or his successor, Rusas II, seems to have still been in a position to repulse. But their territory unquestionably suffered much. Internally these reigns are marked by great advance in architecture, sculpture, and other arts. Rusas II built an important residence city at Toprakkaleh, near Van, called Rusachina, the ruins of which have been excavated. Erimenas is known only as the father of Rusas III, who appears to have been the father of Sarduris III, mentioned in an inscription of Asurbanipal (668–625) as having finally submitted to Assyrian suzerainty. If this is more than a vain boast, it may mean that the Scythians (Ashkuza), having established themselves in the territory of the Mannai and become allies of the Assyrians about 630, forced their western neighbors to seek safety from repeated raids in acknowledging Assyrian authority. It is possible that, with the fall of the Scythian power through the Medes, the Chaldians also were incorporated in the Median Empire immediately before or soon after the destruction of Nineveh, in 606. The invasion of the Haik, the modern Armenians, in the sixth century B.C., drove the Chaldians into exile. While the Assyrian form of the name survived in the biblical Ararat (Gen. viii. 4; Jer. li. 27; 2 Kings xix. 37; Isa. xxxvii. 38) and in the Alarodioi, who, according to Herodotus, served in the army of Xerxes, the name "Chaldian" has been preserved in the Chaldaioi of Sophocles, Xenophon, Strabo, and Plutarch, in the Chaldoi and the theme Chaldia of Byzantine times, in numerous place names, and in the Armenian Chaltiq. The Chaldians are also identical with the Χάλυβες, *Chalybes*, of the Greeks, as Lehmann-Haupt has shown. Possibly there is even a remnant of the old Chaldians in Chalt, near Baiburt.

The Chaldians worshiped as their highest god Chaldis, by the side of him Ardinis, a sun god, and Teisbas, a storm god, as well as a host of minor deities conceived as the sons of Chaldis. Their civilization was no doubt borrowed from Assyria, but in some respects advanced beyond the point reached by the Assyrians themselves. They were probably the discoverers of the methods of ironworking, for which the region became famous among the Greeks. Unlike the Assyrians, they erected their buildings of massive walls of stone. The country was intersected with fine roads and canals, showing great technical knowledge. Their sculptures are more lifelike than the Assyrian. They excelled in mosaics, filigree work, and ceramics.

The Chaldian language was written in cuneiform characters, borrowed from the Assyrian, but simplified by giving only one value to each sign, avoiding signs representing closed syllables, and using as a rule separate signs for the vowels, thus made to approach to a purely alphabetical system. The family to which it belongs has not been determined. It has some affinity with the Georgian and may belong to the same group as Mitannian, Hittite, and some early Asianic languages. Nearly 200 native inscriptions have been discovered in all parts of modern Armenia, presenting some dialectical differences. They were first studied by Schultz and Hincks, who worked out the general idea with the aid of Assyrian ideographs. Guyard first noticed the identity of the imprecations at the end of the inscription with those found on Assyrian documents. Sayce established the main outlines of the grammar. D. H. Müller cleared up many difficulties. Belck and Lehmann discovered most of the inscriptions, and Sandalgian has brought them together in a corpus.

Bibliography. A good account of the Chaldians is found in Maspero, *The Passing of the Empires* (London, 1899). Consult: Sayce, in *Journal of the Royal Asiatic Society*, xiv–xx (London, 1882–94); Belck and Lehmann, *Zeitschrift für Ethnologie* (Berlin, 1892 et seq.); id., in *Zeitschrift für Assyriologie* (Leipzig, 1892 et seq.) and in *Verhandlungen der Berliner anthropologischen Gesellschaft* (Berlin, 1892 et seq.); Müller, *Die Keilinschrift von Aschrut Daga* (Vienna, 1890); Nikolsky, *Les inscriptions cunéiformes de Koelani Girlan* (1893); Olmstead, in *American Journal of Semitic Languages* (Chicago, 1901); Lehmann-Haupt, "Materialien zur alten Geschichte Armeniens und Mesopotamiens," in *Abhandlungen der Gött. Ges.* 1907); id., *Armenien einst und jetzt* (1910); Bagel, "Vorarmenische Keilinschriften," in *Der Zeitgeist* (1912); Ed. Meyer, *Geschichte des Altertums*, i, 2, pp. 698 f. (3d ed., 1913).

CHÂLET, shȧ'lȧ' (from ML. *castelletum*, dim. of *castellum*, fort, castle, from *castrum*, fort). The French-Swiss name for the wooden summer hut of the Swiss herdsmen on the mountains; but the term is also extended to include Swiss houses generally as well as picturesque and ornate villas built in imitation of them.

CHALEURS BAY, or **BAIE DES CHALEURS**, bȧ dȧ shȧ'lėr' (Fr., bay of heat). An inlet on the west side of the Gulf of St. Lawrence, which partly separates New Brunswick from Quebec (Map: Newfoundland, D 5). It is about 85 miles in length from east to west and has a maximum width of over 20 miles. While its depth is only about 250 feet in the channel, yet a depth of 100 feet is found quite near the shore, thus affording commodious anchorage and easy access to the land. Chaleurs Bay receives numerous small streams, chief of which are the Nepisiguit River from the south and the Patapedia River from the west. Fishing is the chief industry. A number of towns skirt the shore. Chaleurs Bay receives its name from Jacques Cartier, who entered it in the hottest month of 1535.

CHALICE, chăl'ĭs (Fr. *calice*, It. *calice*, AS. *calic*, Ger. *Kelch*, OHG. *chelih*, from Lat. *calix*, Skt. *kalaśa*, cup). This ancient name for a drinking cup has been retained for the vessels used for the wine in the holy sacrament. Some of the earliest were made of wood or horn; others, of which there are some superb Byzantine examples, of glass, crystal, or agate. But on account of their fragility, these materials fell into general disuse in favor of precious metals; and most mediæval, Renaissance, and modern chalices are of gold, silver gilt, or silver, often decorated with enamels and set with precious stones. They were among the objects on which the goldsmith lavished the greatest care. Many examples remain in industrial and other muse-

ums and in church treasuries throughout Europe; in some cases small parish or cathedral churches have preserved their old pieces more carefully than have the larger institutions.

There were two classes of chalices: the ordinary chalice, used by the priest at the altar, and the ministering chalice, for the communion of the congregation. (See COMMUNION IN BOTH KINDS.) The latter was larger and frequently had two handles. The chalice always consisted of three parts—a bowl, a long neck, and a foot. It varied very much in shape. The earliest (fourth to eighth century) had a deep, slender bowl, which became broader and more semicircular in the Romanesque age, and then changed radically during the Gothic period, passing first to a broader flat bowl, with enlarged foot, and then to a conical, tunnel-shaped bowl with longer neck, often broken with bulbs. The bowl itself, which was originally the most decorative part, tended to become the simplest with smooth surface. The chalice is the symbol of St. John the Evangelist. Consult Giefers, *Ueber den Altarkelch* (Paderborn, 1856), and Corblet, *Histoire du sacrement de l'Eucharistie* (Paris, 1885).

CHALK (AS. *cealc*, Ger. *Kalk*, Fr. *chaux*, Ir. *cailc*, from Lat. *calx*, lime). A soft, earthy variety of limestone or carbonate of lime, which often forms beds of great thickness and extent. It is usually yellowish or white in color, has an earthy texture, is rough to the touch, and adheres slightly to the tongue. The average chemical composition is about that of English chalk —calcium carbonate, 97.90 per cent; silica, 0.66 per cent; magnesium carbonate, 0.10 per cent; ferric oxide, 0.35 per cent.

Chalk is formed by the accumulation on the ocean bottom of the tiny shells of Foraminifera, fragments of molluscan shells, sea-urchins' spines, and sponge spicules, which can be seen under the microscope. It is very abundant in certain areas and also in certain geological formations, the Cretaceous system being so named on account of the thick and extensive deposits of chalk which it contains. These deposits are especially abundant in England and France, where the great white cliffs of chalk on both sides of the English Channel, notably in the vicinity of Dover, England, and Dieppe, France, are conspicuous objects. In the United States chalk is known to occur in the Cretaceous formation of Iowa, in the Tertiary of Texas and Arkansas, and in other States.

Chalk is not much used as a building stone, chiefly because of its low resistance to the weather. In England some of the harder beds are occasionally employed for structural purposes. It is burned to lime, and the mortar is used generally in the construction of buildings in London. In England chalk has been used for many years as an ingredient of Portland cement, and more recently the Arkansas chalk has been employed for the same purpose. When ground and mixed with water it forms "whitewash." If the ground material is freed from grit by washing, it is known as "whiting," which is used for cleaning silver and making putty. "Gilder's white" and "Paris white" are forms of the same material which have been more carefully washed. On account of its color and softness, it finds general application as a marking material, but when so used has to be mixed with some bonding substance. (See CRAYON.) Like lime and gypsum, chalk is used in farming to ameliorate the texture of the soil. In a purified condition it is administered as medicine to correct acidity of the stomach. The flint concretions so abundant in the chalk of Europe are used for pebbles in ball mills. See CRETACEOUS SYSTEM; SOIL; PORTLAND CEMENT; LIME.

CHALK, BLACK. See CRAYON.

CHALK FORMATION. See CRETACEOUS SYSTEM.

CHALKIS. See CHALCIS.

CHALLEMEL-LACOUR, shàl'mĕl' là'kōōr', PAUL AMAND (1827–96). A French publicist and politician. He became professor of philosophy at the Lyceum of Pau in 1849, and at the time of the coup d'état, while holding a similar position at the Lyceum of Limoges, was arrested because of his pronounced Republican opinions. After a few months of imprisonment he was expelled from France. He went to Belgium, where he lectured on literature, and thence to Germany and Italy. In 1856 he became professor of French literature at the Polytechnic Institute of Zurich, and in 1859, being amnestied, returned to France. He soon became known as one of the ablest contributors to the *Temps*, the *Revue Moderne*, and other influential journals. For a short time he was editor of the *Revue des Deux Mondes*. After the fall of the Second Empire he became Prefect of the Department of the Rhône. He was elected deputy (1872), senator (1876), President of the Senate (1893). He was, from 1880 to 1882, Ambassador to England, and became Minister of Foreign Affairs in 1883. In 1893 he was elected a member of the French Academy. He translated Ritter's *Geschichte der Philosophie* (1861) and *La philosophie individualiste: étude sur Guillaume de Humboldt* (1864), and edited, in 1869, the *Works* of Madame d'Epinay, the friend of Rousseau. In 1897 appeared *Œuvres oratoires de Challemel-Lacour*, edited by Joseph Reinach. His essays were collected as *Etudes et réflections d'un pessimiste* (1901).

CHALLENGE (OF. *chalenge, chalonge*, It. *calogna*, accusation, from Lat. *calumnia*, false accusation, from *calvi*, to deceive). In English and American law, the criminal offense of inciting another to fight with deadly weapons. No set phrase or form of words is necessary to constitute a challenge. Any language which, when connected with the circumstances of a quarrel and the conduct of the parties, shows an intention to invite or solicit a meeting in order to fight with deadly weapons, amounts to a challenge. Giving a challenge, or knowingly bearing one, or even inciting to a challenge, is a criminal offense at common law. The tendency of modern statutes is to subject all persons connected with a challenge to severe criminal punishment and to disqualify them from holding public office thereafter. See DUELING.

In civil and criminal procedure, a formal exception taken to one or more persons summoned to serve as jurors. When exception is taken to the entire panel, it is called a challenge *to the array*, or *to the panel*, or a motion to set aside the panel, or to quash the array. A challenge is said to be *for cause* when it is based upon a state of facts which, if established, renders the juror incompetent, as that he is pecuniarily interested in the case, or disqualified by reason of age, sex, or mental condition. A challenge is said to be *to the favor* when founded on a charge that the juror is biased or subject to some improper influence. A *peremptory* challenge is one for which no reason need be

assigned. The number of peremptory challenges allowable in civil or criminal cases is regulated by statute. Challenges are to be made after the appearance of the jurors and before they are sworn. For further particulars, see JURY.

CHAL'LENGER EXPEDI'TION. A scientific exploration of the open sea sent out by the British government in 1872–76. In 1872 the *Challenger*, a corvette of 2306 tons, was completely fitted out and furnished with every scientific appliance for examining the sea from surface to bottom, e.g., with natural-history workroom, chemical laboratory, and aquarium. The ship was placed in charge of a naval surveying staff under Captain Nares and of a scientific staff, with Prof. Wyville Thomson at their head, for the purpose of sounding the depths, mapping the basins, and determining the physical and biological conditions of the Atlantic, the Southern, and the Pacific oceans. During three and a half years the *Challenger* cruised over 68,900 nautical miles. Investigations were made at 362 stations, at each of which were determined the depth of channel, the bottom, surface, and intermediate temperatures, currents, and fauna, and the atmospheric and meteorological conditions. The route was by Madeira, the Canaries, the West Indies, Nova Scotia, Bermudas, Azores, Cape Verde, Fernando Noronha, Bahía, Tristan d'Acunha, Cape of Good Hope, Kerguelen, Melbourne, the China Sea, Hongkong, Japan, Valparaiso, Straits of Magellan, Montevideo, Vigo, and Portsmouth. Between the Admiralty Islands and Japan the *Challenger* made her deepest sounding, 4575 fathoms. Consult Wyville Thomson and Dr. John Murray, editors of the copious *Reports on the Scientific Results of the Voyage of H. M. S. Challenger* (50 vols., London, 1880–95). They fall into a *Narrative* (2 vols., 1882–85); *Zoölogy* (30 vols., 1880–89); *Physics and Chemistry* (3 vols., 1884–89); *Botany* (1885–86). A popular narrative of the cruise is Moseley's *A Naturalist on the Challenger* (London, 1879).

CHAL'LIS, JAMES (1803–82). An English astronomer. He was born at Braintree, Essex, and was educated at Trinity College, Cambridge. He became a fellow of his college in 1826 and Plumian professor of astronomy and experimental philosophy at Cambridge in 1836 and from then until 1861 was also director of the Cambridge Observatory. His labors were directed principally to the determination of the positions of sun, moon, and planets, with the object of increasing tabular accuracy. Among the valuable improvements devised by him were the collimating eyepiece, the transit reducer, and the meteoroscope. In addition to 225 contributions to scientific publications, he published several independent works on astronomy, mathematics, and physics.

CHAL'LONER, RICHARD (1691–1781). An English Catholic prelate, born at Lewes, Sussex. He was the son of a dissenter, but was brought up among Roman Catholics and sent to an English college at Douai, where he finally became professor of divinity and vice rector. In 1730 he joined the English Mission in London, and on the death of Dr. Benjamin Petre, in 1758, he became vicar apostolic of the London district. During much of his residence he was subjected to persecutions. He was the author of numerous controversial and devotional works, the most popular one being *The Garden of the Soul* (1740), which has been translated into various languages and continues to be the most popular prayer book among English Catholics. As an antidote to Foxe's well-known *Book of Martyrs*, he wrote *Memoirs of Missionary Priests and Other Catholics of Both Sexes that Have Suffered Death in England on Religious Accounts* (1741–42). He published a version of the Douai Bible, which is substantially that used by English-speaking Catholics, and the lives of English, Scottish, and Irish saints under the title of *Britannia Sancta*. For his *Life*, consult Barnard (1784) and Burton (London, 1909).

CHALMERS, chä'mĕrz *or* chą'merz, ALEXANDER (1759–1834). A Scottish biographer and editor. He was educated in Aberdeen and early in life edited several newspapers in London, besides contributing to periodicals, but he devoted himself chiefly to writing prefaces for new editions of English classics. Of the many works edited by him, *The British Essayists*, in 45 volumes, is still regarded as useful. His fame rests more particularly on his *General Biographical Dictionary* (32 vols., 1812–14), in which, however, the various articles are for the most part long and tedious and lacking in research and accuracy.

CHALMERS, GEORGE (1742–1825). A Scottish antiquarian and historian, born at Fochabers in the County of Moray. He was educated in Aberdeen, studied law in Edinburgh, emigrated to America in 1763, and practiced law in Baltimore until the Revolution. Being a Loyalist, he then returned to Great Britain, and from 1786 until his death was chief clerk of the Board of Trade. He wrote a number of works on the Colonies, and biographies of De Foe, Thomas Paine, and Mary, Queen of Scots; but his most important work is *Caledonia: An Account, Historical and Topographical, of North Britain* (1807–24), which displays profound research into the history of Scotland and is not yet entirely superseded.

CHALMERS, GEORGE PAUL (1836–78). A Scottish landscape, genre, and portrait painter. He was born in Montrose and studied at the Trustees School in Edinburgh under Scott Lauder. In 1871 he was elected to the Royal Scottish Academy. His landscapes, such as "The End of the Harvest" (1873) and "Rain in Slichagan" (1878), are fine examples of mood painting. They are rich and beautiful in color and prove Chalmers to be one of the most important precursors of modern Scottish landscape painting. His greatest achievement, "The Legend" (Edinburgh), executed in the manner of Josef Israels, was unfinished at the time of his violent death. Among his genre pictures "The Prayer" is especially popular, and of his portraits that of J. C. Bell (1870) is of exceptional merit. Consult his biography by Pinnington (Glasgow, 1897), and Caw, *Scottish Painting* (Edinburgh, 1908).

CHALMERS, THOMAS (1780–1847). A Scottish theologian. He was born in Anstruther, Fifeshire, Easter Day, March 17, 1780, educated at the University of St. Andrews, and in his nineteenth year licensed to preach the gospel. In 1803 he was ordained minister of the parish of Kilmany, in Fifeshire, near St. Andrews. At this period his attention was entirely absorbed by mathematics, political economy, and natural philosophy, to the neglect of the studies appertaining to his profession. But personal illness, new anxieties, the reading of Wilberforce's *View of Practical Religion*, and thought required

for his article on Christianity for Brewster's *Edinburgh Encyclopædia* (1810) awakened his dormant spiritual nature, and he grew earnest, eloquent, devout, and faithful to his pastoral duties. In July, 1815, he was translated to the Tron church and parish, Glasgow, where his magnificent oratory took the city by storm. His *Astronomical Discourses* (1817) had a prodigious popularity. During the same year he visited London, where his preaching excited as great sensation as at home. But Chalmers's energies could not be exhausted by mere oratory. Discovering that his parish was in a state of great ignorance and immorality, he began to devise a scheme for overtaking and checking the alarming evil. It seemed to him that the only means by which this could be accomplished was by "revivifying, remodeling, and extending the old parochial economy of Scotland," which had proved so fruitful of good in the rural parishes. In order to wrestle more closely with the ignorance and vice of Glasgow, Chalmers, in 1819, became minister of St. John's parish, "the population of which was made up principally of weavers, laborers, factory workers, and other operatives." Of its 2000 families, more than 800 had no connection with any Christian church and the children were growing up in ignorance. He broke up his parish into 25 districts, each of which he placed under separate management, and established two week-day schools and between 40 and 50 local Sabbath schools, for the instruction of the "poorer and neglected classes," more than 1000 of whom attended. In a multitude of other ways he sought to elevate and purify the lives of his parishioners. See Chalmers's *Christian and Civic Economy of Large Towns* (3 vols., 1821–26). His plan of parochial work carried out in Glasgow, although abandoned soon after its inception and not elsewhere imitated, may be called the suggestion of the modern method of dealing with the dependent classes, as seen in the charity organization societies and in settlement work. His parental relation to these movements has received recognition in the condensed edition of his *Christian and Civic Economy*, by Prof. C. R. Henderson (New York, 1900), and in a similar work published in London in the same year, *Chalmers on Charity, a Selection of Passages and Scenes to Illustrate the Social Teaching and Practical Work of Thomas Chalmers*, edited by N. Masterman.

But such herculean toils began to undermine his constitution, and in 1823 he accepted the offer of the moral philosophy chair in St. Andrews, where he wrote his treatise on the *Use and Abuse of Literary and Ecclesiastical Endowments* (1827). In 1828 he was transferred to the chair of theology in Edinburgh, and in 1832 published a work on political economy in connection with the moral state and moral prospects of society. In 1833 appeared his Bridgewater treatise, *On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man*. It was received with great favor, and obtained for the author many literary honors, the Royal Society of Edinburgh electing him a fellow, and the French Institute a corresponding member, while the University of Oxford conferred upon him the degree of D.C.L. In 1834 he was appointed convener of the church-extension committee; and after seven years of enthusiastic labor announced that upward of £300,000 had been collected from the nation and 220 new churches built. Meanwhile, however, troubles were springing up in the bosom of the church itself. The evangelical party had become predominant in the General Assembly, and came forward as the vindicators of popular rights; the struggles in regard to patronage between them and the "moderate" or "Erastian" party became keener and more frequent, until the decision of the civil courts in the famous "Auchterarder" and "Strathbogie" cases brought matters to a crisis; and on May 18, 1843, Chalmers, followed by 470 clergymen, left the church of his fathers, rather than sacrifice those principles which he believed essential to the purity, honor, and independence of the church. (See PRESBYTERIANISM.) The rapid formation and organization of the Free church were greatly owing to his indefatigable exertions, in consequence of which he was elected principal of the Free Church College and spent the close of his life in the zealous performance of his duties and in perfecting his *Institutes of Theology*. He died suddenly at Morningside, Edinburgh, May 30, 1847.

The works of Chalmers contain valuable, and in some cases original, contributions to the sciences of natural theology, Christian apologetics, and political economy; while on minor topics, such as the church-establishment question, they exhibit both novelty and ingenuity of argument. As an orator, Chalmers was unique and unrivaled. His works were collected (23 vols., 1836–42); posthumous works (9 vols., 1847–49); select works (12 vols., 1854–79). For his life, consult: Hanna, *Memoirs of the Life and Writings of Thomas Chalmers* (New York, 1850); Fraser, *Thomas Chalmers* (New York, 1882); Mrs. Oliphant, *Thomas Chalmers, Philosopher and Statesman* (London, 1893); Blaikie, *Thomas Chalmers* (New York, 1897).

CHAL'ON, JOHN JAMES (1778–1854). An English landscape and genre painter. He was born in Geneva, Switzerland, but studied at the Royal Academy, London, of which he became a member in 1841. He painted with great facility in water color and oils, and his pictures include landscapes, marine views, figure and animal subjects. His best-known work is "Napoleon on Board the Bellerophon" (Greenwich Hospital). "A View of Hastings" (South Kensington Museum) and his book of humorous "Sketches of Parisian Manners" also deserve mention.—ALFRED EDWARD (1781–1860), his more celebrated brother, was also born at Geneva and studied at the Royal Academy, later becoming a member. He was the most fashionable miniature and portrait painter of his day and was appointed painter in water color to Queen Victoria, whom he portrayed, as he did also her court ladies. Later critics consider his portraits lacking pictorial qualities and characterization. One of his best oil paintings is "John Knox Reproving Queen Mary's Ladies." He was a clever imitator, especially of Watteau.

CHÂLONS-SUR-MARNE, shä'lôn' sụr märn'. A garrison town of France, capital of the Department of Marne, 107 miles east of Paris by rail, on the right bank of the river Marne, which is here crossed by a handsome stone bridge (Map: France, N., K 4). Châlons-sur-Marne is an old walled town and the seat of a bishopric. The situation is agreeable, and the town contains some fine public buildings, the principal of which is the cathedral of St. Etienne, in which is one of the finest grand altars in France. Also the churches Notre Dame, St. Alpin, St. Jean,

and St. Loup are notable examples of mediæval architecture, as well as a few mansions of the fifteenth and sixteenth centuries. On the east side of the town there is the splendid *Promenade du Jard*, or park, which covers 19 acres. Châlons has a school of industry, a communal college, a seminary, a museum, and a library. It is a centre of the champagne trade, manufactures woolens, cotton, leather, etc., and has a considerable trade in grain, hemp, and rapeseed oil. Pop. (commune), 1901, 26,737; 1911, 31,367. Châlons is of great historical importance. It was known as the Roman Catalaunum, or chief town of the Catalauni, in the third century; witnessed the defeat of Tetricus by Aurelian in 274 A.D.; of the Alemanni by Jovinus in 266; and here or in the district (Catalaunian Fields), in 451, was fought one of the 15 decisive battles of the world (according to Sir Edward Creasy), when the Romans and their allies, the Visigoths, defeated Attila and his Huns. The town successfully resisted the English attacks in 1430–34; in 1589 Henry IV, King of France, held the Parlement of Paris here; it was taken by the Prussians in 1814 and by the Russians in the following year. In 1870 it was occupied by the Germans after the evacuation by MacMahon of the celebrated camp established here in 1856 by Napoleon III. See Barthélemy, *Histoire de la ville de Châlons* (1888).

CHÂLONS-SUR-SAÔNE, shȧ'lôN' sụr sôn. The capital of an arrondissement of the Department Saône-et-Loire, France, about 33 miles north of Mâcon (Map: France, N., K 6). It is situated on the right bank of the Saône, where that river is joined by the Canal du Centre, which unites the Saône with the Loire. Vineyards, woods, meadows, and cultivated fields surround it. It is irregularly built, although along the river the houses are modern, and the quays are excellent. It has two fine churches, a communal college, a library, a school of design, and an archæological museum. Its manufactures include wine, hats, hosiery, vinegar, oil, pottery, jewelry, and imitation pearls; and it has a large trade in the agricultural and other produce of the district. Le Petit-Creusot, a branch of the famous Creusot engineering works, constructs bridges, iron steamboats, and structural steel, and with its glass works, chemical works, and straw-hat manufactories, Châlons ranks as the second industrial city of Burgundy. Steamboats navigate the Saône from Châlons-sur-Saône downward. Pop. (commune), 1901, 29,058; 1911, 31,550. Châlons-sur-Saône occupies the site of the ancient Cabillonum, or Caballinum of the Ædui.

CHALOTAIS, shȧ'lô'tȧ', Louis René de Caradeuc, La. See La Chalotais, Louis René de Caradeuc.

CHALUKYAS, chȧ-lo͞o'kyȧs. The names of several dynasties of Hindu kings. The early and western Chalukyas of Bādāmi and Kalyāna ruled during the sixth and seventh centuries A.D., and another line of the same dynasty reigned over Kalyāna from 973 to 1183 A.D. The other important lines of the Chalukyas were the eastern (615–1127 A.D.) and the Chalukyas of Anhilvād (941–1296 A.D.). Consult V. A. Smith, *Early History of India* (Oxford, 1908).

CHALYBEATE (kȧ-lĭb'ē-ȧt) **WATERS** (from Lat. *chalybs*, Gk. χάλυψ, *chalyps*, from Χάλυβες, *Chalybes*, ironworkers in Asia Minor). Natural mineral waters that contain considerable amounts of iron in solution. The carbonate is generally held in solution by an excess of carbonic acid and is precipitated as soon as the latter has escaped into the air. This accounts for the characteristic deposits of ochre or ferric oxide on the surface of stones near the mouth of chalybeate-water springs. Chalybeate springs may be subdivided into *carbonated chalybeate* (or *carbonated ferruginous*) and *sulphated chalybeate*. Examples of the former are Islington Spa, Oddy's Saline Water, and Tunbridge Wells, England; and Bailey Springs, Ala., and Rawley Springs, Va., in the United States. An excess of carbonic acid communicates to the water a sparkling aspect and a pleasant acidulous taste. Of such a character are the mineral springs at Pyrmont in Germany, and they are called *carbonated chalybeate* or *carbonated ferruginous*. The sulphated chalybeate waters contain ferrous sulphate dissolved in them, and of this character are the Sand Rock Spring on the Isle of Wight, and the springs at Moffat and Vicarsbridge in England, and the Rockbridge Alum Springs, Va., and the Texas Sour Springs in the United States. Chalybeate waters have a more or less astringent or styptic taste, and show a purplish-black tint when mixed with some varieties of wine, owing to the tannin present in the latter. A pale-blue color is produced when a few drops of potassium ferrocyanide are added. Chalybeate waters are frequently prescribed in cases of debility, and as the carbonated varieties are lighter on the stomach, they are generally preferred. The chalybeate waters should be avoided in plethoric, febrile, and inflammatory conditions of the system. See Carbonated or Acidulous Waters; Mineral Waters.

CHAM, shȧN (1819–79). The pseudonym of Count Amédée de Noé, a French caricaturist. He was born in Paris, the son of a peer of France. He was intended for science, but, preferring painting, he studied with Paul Delaroche and afterward with Charlet and developed a talent for the grotesque. Beginning in 1842, he contributed, chiefly to *Charivari* (the *Punch* of Paris), an immense number of caricatures, and some sketches more remarkable for their wit than for artistic merit, under the signature of "Cham." His political cartoons were singularly sharp and effective.

CHAMÆROPS, kȧ-mē'rōps (Lat., from Gk. χαμαίρωψ, *chamairōps*, from χαμαί, *chamai*, on the ground + ῥώψ, *rhōps*, bush). A genus of palms with fan-shaped leaves. It is less exclusively tropical than palms are in general, and one species, *Chamærops humilis*, is the only palm truly indigenous to Europe. It extends as far northward as the neighborhood of Nice. It is sometimes called the palmetto. The flowers are in spathes about 6 to 8 inches long; the fruit is a three-sided, blackish, spongy drupe, which is eaten, as are also the young shoots. This palm is one of the most tolerant of all palms to cold and on that account is commonly grown. In its native regions the leaves are much used for thatching and for making brooms, hats, chair bottoms, etc. They abound in an excellent fibre, which the Arabs mix with camel's hair and make into tent covers; cordage and sometimes sailcloth are made of it in Spain; it is imported into France, and used for making carpets, under the name of African hair. The French in Algeria make paper and paste-

board of it; and it is a valuable commercial commodity, as a material for paper making, cordage, upholstery, etc. Other species, sometimes referred to this genus, abundant in India, China, etc., serve similar purposes and deserve attention in connection with paper. To this genus is referred also the West Indian palm, which yields the material for chip hats. See BRAZILIAN GRASS.

CHAMALHARI, chŭm'â-lä'rê. A peak of the Himalayas (q.v.), in northwestern Bhutan (Map: India, E 3). It has an altitude of 23,929 feet.

CHAMBA, chŭm'bâ. One of the feudatory Punjab states in the Lahore division of north India, between lat. 32° 10′ and 33° 13′ N., and long. 75° 45′ and 77° 3′ E. (Map: India, C 2). The Rajah owns all the land. Area, 3126 square miles. Pop., 1891, 124,032; 1901, 127,834; 1911, 135,873.

CHAMBERED NAUTILUS, THE. A noted poem by Oliver Wendell Holmes, published in 1857, in his *Autocrat of the Breakfast-Table.*

CHAMBERLAIN, chām'bĕr-lĭn. A city and the county seat of Brule Co., S. Dak., 85 miles (direct) southeast of Pierre, on the Missouri River, and on the Chicago, Milwaukee, and St. Paul Railroad (Map: South Dakota, E 4). It is the centre of a productive stock-raising region and there are two flour mills, a cement factory, and bottling works. Chamberlain is the seat of Columbus College and has a public library and a sanitarium. In the river, opposite the city, is an island park of 1000 acres, the gift of the Federal government to the city. Chamberlain has adopted the commission form of government. Pop., 1900, 874; 1910, 1275.

CHAMBERLAIN (OF. *chambrelein, chamberlain*, Fr. *chambellan*, Sp. *camarlengo*, It. *camarlingo*, from ML. *camarlingus*, from OHG. *chamarlino, chamarling*, chamberlain, from *chamara*, Ger. *Kammer*, room, from Lat. *camera*, room, Gk. *καμάρα, kamara*, room with vaulted ceiling; connected with Lat. *camur*, crooked, Gk. *κάμπτειν, kamptein*, to bend, Ir. *cam*, crooked), LORD. In Great Britain an officer of state dating from very early times, formerly an influential member of the government and still of high standing in the royal household. He indorses the king's answer on petitions and often communicates his Majesty's pleasure to Parliament and to the Council. He has control over all the officers and servants of the royal chambers, except those of the bedchamber, as well as of all tradesmen connected with the royal household. Cards of admission to the King's drawing-room and other royal functions must be obtained from him. All theatres in towns in which a royal palace is situated require to be licensed by the Lord Chamberlain, and no new play can be performed anywhere without his license. One of the leading members of his staff is the Examiner of Plays, whose duties are to attend to these matters. In accordance with ancient custom, the Lord Chamberlain is still a member of the Privy Council, but his tenure of office depends on that of the political party to which he belongs.

CHAMBERLAIN, THE LORD GREAT. In Great Britain an hereditary officer of great antiquity and formerly of great importance. He has the government of the palace at Westminster, and during the sitting of Parliament has charge of the House of Lords and issues tickets of admission on the opening or prorogation of Parliament.

CHAMBERLAIN, ALEXANDER FRANCIS (1865–1914). A Canadian-American ethnologist and educator, born at Kenninghall, England. He graduated in 1886 at Toronto University and from 1886 to 1891 was examiner in modern languages successively at Toronto University, Trinity University, and in the educational department of Ontario Province. He was appointed lecturer (1892) and afterward assistant professor of anthropology at Clark University. Under the auspices of the British Association he made a special investigation of the Kootenay (British Columbia) Indians. He was editor of the *Journal of American Folk-Lore* in 1901–08. He was elected a fellow of the American Association for the Advancement of Science and, in addition to contributions to the *Journal of American Folk-Lore* and other periodicals, published *Report on the Kootenay Indians* (1892); *Language of the Mississaga Indians* (1892); *The Mythology of the Columbian Discovery* (1893); *Child and Childhood in Folk-Thought* (1896); *The Child: A Study in the Evolution of Man* (1900); *Poems* (1904). He contributed to the second edition of the NEW INTERNATIONAL ENCYCLOPÆDIA on South American and Asiatic tribes and peoples.

CHAMBERLAIN, RT. HON. (JOSEPH) AUSTEN (1863–). A prominent British statesman, son of Joseph Chamberlain. He was educated at Rugby and Cambridge and elected to Parliament from East Worcestershire in 1892. From 1895 to 1900 he served as Civil Lord of the Admiralty, from 1900 to 1902 as Financial Secretary to the Treasury. He was then made Postmaster-General and in 1903 Chancellor of the Exchequer. The promotion to this latter post was given partly as a recognition of ability, partly as an acknowledgment that the Conservatives, although not yet prepared to adopt in its entirety the fiscal policy of Joseph Chamberlain, still desired to propitiate the latter statesman and his more extreme followers. After the downfall of the Balfour ministry (1905) Austen Chamberlain became the leader of the more rigid tariff-reform element in his party. In 1911 he was a prominent candidate for the Unionist leadership made vacant by the resignation of Mr. Balfour; in 1913 he was made chairman of the important royal commission on Indian finance. Although somewhat eclipsed on the public stage by the more dramatic rôles played by F. E. Smith, Sir Edward Carson, Bonar Law, and other Unionists, Austen Chamberlain displayed a prodigious even if quiet activity in everything pertaining to British fiscal policy.

CHAMBERLAIN, BASIL HALL (1850–). A distinguished English Japanese scholar. He was born in Southsea, England, the grandson of Basil Hall, and was educated in France and by private tutors in England. For many years he was professor of Japanese and philology in the Imperial University of Tokio, Japan. His combination of scholarship with a light and interesting style is perhaps most evident in his *Things Japanese* (1890; 5th ed., 1905). His other works include: *The Classical Poetry of the Japanese* (1880); a version of the *Kojiki* (1883); *Language, Mythology, and Geographical Nomenclature of Japan in the Light of Aino Studies* (1887); *Aino Folk Tales* (1888); *Luchuan Grammar* (1895); *Handbook of Colloquial Japanese* (4th ed., 1907); Murray's *Japan* (1891; 9th ed., 1913, with W. B.

Mason); *Japanese Poetry* (1911); volumes in the "Japanese Fairy Tale Series"; and contributions to the *Transactions* of the Asiatic Society of Japan and of other Oriental societies.

CHAMBERLAIN, CHARLES JOSEPH (1863–). An American botanist, born at Sullivan, Ohio. He was educated at Oberlin College and at the University of Chicago, where he was assistant and associate in botany from 1897 to 1901, instructor in 1901–07, assistant professor of morphology and cytology in 1908–11, and became associate professor in 1911. Besides his contributions to the *Botanical Gazette*, he is author of *Methods in Plant Histology* (1901) and joint author with John M. Coulter (q.v.) of *The Morphology of Gymnosperms* (1901) and *The Morphology of Angiosperms* (1903).

CHAMBERLAIN, DANIEL HENRY (1835–1907). An American politician. He was born at West Brookfield, Mass., and was educated at Yale and at the Harvard Law School. In 1864 he entered the Union army and served until the close of the Civil War, chiefly as a staff officer. At the close of the war he settled in South Carolina, where he became a cotton planter and was a member of the State Constitutional Convention (1867–68), Attorney-General (1868–72), and Governor (1874–76). He was inaugurated a second time, but his election was contested by Wade Hampton, and he relinquished his office (1877) and removed to New York to practice his profession. His publications include *The Campaign in South Carolina* (1876) and *Charles Sumner and the Treaty of Washington* (1902). Consult Allen, *Governor Chamberlain's Administration in South Carolina* (1888).

CHAMBERLAIN, GEORGE EARLE (1854–). An American legislator and public official. He was born near Natchez, Miss., and graduated from the academic and law departments of Washington and Lee University in 1876. Taking up the practice of law in Oregon, he early became prominent politically. He was in succession a member of the State Legislature, district attorney for the third judicial district, Attorney-General of the State, and, having removed to Portland, district attorney for the fourth judicial district. In 1902 he was elected Democratic Governor of Oregon and in 1906 was reëlected. Three years later he was chosen United States Senator for the term ending 1915. In the first session of the Sixty-third Congress he was chairman of the Public Lands Committee, and he was also a member of numerous important committees.

CHAMBERLAIN, HENRY RICHARDSON (1859–1911). An American journalist, born at Peoria, Ill. He took up journalistic work in 1877, was in succession correspondent of the New York *Sun*, managing editor of the New York *Press*, and managing editor of the Boston *Journal*. In 1893 he was made correspondent of the *Sun* in London, with general oversight of the Laffan News Bureau in Europe. He reported the Macedonian disturbances, the details of the Panama Canal scandal, the Russian political crisis of 1906, and the Messina earthquake. He became known for his extensive knowledge of European politics. His publications include *The Farmers' Alliance* (1891) and *Six Thousand Tons of Gold* (1894).

CHAMBERLAIN, HOUSTON STEWART (1855–). A versatile German writer. He was born Sept. 9, 1855, at Portsmouth, England, the son of an admiral in the British navy. His earliest education he received at Versailles, and later attended Cheltenham College, Gloucester. At first he planned to follow a military career, but poor health compelled him to abandon this intention. In 1870 he left England and settled in Germany, at first in Stettin. Here Professor Kuntze aroused his interest in Germanic culture and civilization, the study of which occupied him for many years and resulted in his most original and very remarkable work, *Die Grundlagen des 19 Jahrhunderts*, published in two parts in 1899 and 1901 (reprinted subsequently in several editions, and translated into English by Lord Redesdale in 1910). In 1878 he married a daughter of Richard Wagner. In 1879–81 he studied natural sciences in Geneva, and at the same time music under A. Ruthard. In 1885 he took up his residence in Dresden and began his activity as a contributor to several prominent German, English, and French periodicals, writing with equal facility in all three languages. In 1889 he settled permanently in Vienna. His chief work on music is his comprehensive and excellent biography of Richard Wagner, which he published in German (1896), English (1897), and French (1899). Other works concerning Wagner are: *Das Drama Richard Wagners* (1892); *R. Wagners echte Briefe an F. Präger* (1894); *Die ersten 20 Jahre der Bayreuther Festspiele* (1896); *Parsifalmärchen* (1900). His other works are: *Worte Christi* (1901); *Heinrich von Stein* (1903); *Immanuel Kant* (1905); *Goethe* (1912).

CHAMBERLAIN, JACOB (1835–1908). An American missionary of the Reformed Dutch church, born at Sharon, Conn. He graduated at the Western Reserve College, 1856, and New Brunswick Theological Seminary, 1859, and received the degree of M.D. (College of Physicians and Surgeons, New York City), 1859. In December of 1859 he went as missionary to the Arcot Mission, southern India. He is recognized as one of the leading missionaries of India. His linguistic attainments were remarkable and he played a prominent part in translating the Scriptures into Telugu. In English he published: *A Home, or Christian Giving* (1879); *Break Cocoanuts over the Wheels; or, All Pull for Christ* (1885); *Native Churches and Foreign Missionary Societies* (1879); *Winding Up; In the Tiger Jungle* (1896); *The Cobra's Den and Other Stories of Missionary Work among the Telugus of India* (1900); and other books on mission subjects.

CHAMBERLAIN, RT. HON. JOSEPH (1836–1914). A distinguished British statesman, born in London, July 8, 1836. He was educated at the University College School, entered the screw-manufacturing firm of Nettlefold and Chamberlain, Birmingham, of which his father was a partner, and retired in 1874 with a large fortune. He early distinguished himself in local debating societies by his radical opinions and ready, forceful eloquence. He became very popular in the northern industrial centres, and was three times elected mayor of Birmingham, 1873–76. His mayoralty was marked by extensive municipal improvements looking largely to the amelioration of the condition of the poorer classes and carried out against much opposition. After an unsuccessful contest at Sheffield in 1874 he entered Parliament in 1876 on a Birmingham by-election. He was returned at the general election of 1880 and became President of the Board of Trade under Gladstone with

membership in the cabinet. He achieved wide fame as the advocate of popular reforms, including measures aiming at the restitution of the land to small proprietors, free education, a system of graduated taxation and increased powers of local self-government. In 1885 he was returned to Parliament for Birmingham, West, became President of the Local Government Board under Gladstone in January of the following year, but resigned in March because of his antagonism to Gladstone's Home Rule Bill, and with Lord Hartington organized the Liberal Unionist party which helped to bring about the defeat of the measure and the fall of the Gladstone ministry. In 1888 he was one of the British commissioners sent to Washington to effect a settlement of the Canadian fisheries dispute. In November he married, as his third wife, Miss Endicott, daughter of President Cleveland's Secretary of War. When Lord Hartington became Duke of Devonshire (1891), Mr. Chamberlain succeeded him as leader of the Liberal Unionist party in the House of Commons. In the Salisbury cabinet of 1895, which marked the definite amalgamation of the Conservative and the Liberal Unionist party, he became Secretary for the Colonies. The former Republican and Radical now entered upon a policy of aggressive imperialism. The great event of his administration was the war with the Boer republics, which was hastened, if not caused, by the Jameson Raid and the intrigues of Cecil Rhodes's South African Company, in which Mr. Chamberlain was charged with being implicated. A committee of the House of Commons in 1897 acquitted him of all complicity in the raid, but his name nevertheless remained the one particularly associated with the policy which ended in the extinction of the South African republics. In the general election of 1900, the so-called "Khaki" election, which was brought about largely by Mr. Chamberlain in order to take advantage of the patriotic fervor animating the nation, he was the principal mark for the Liberal attack, but came out triumphant. A noteworthy achievement of the same year was the passage of the act constituting the Australian Commonwealth. The retirement of Lord Salisbury in 1902 and the succession of Mr. Balfour as Premier brought no change in the Colonial Office. In the winter of 1902–03 Mr. Chamberlain visited South Africa, where his speeches left no doubt of his intention to continue a firm imperialistic policy.

In May, 1903, Mr. Chamberlain injected a new and momentous question into the field of political discussion by bringing forward proposals for a system of preferential tariffs with the colonies as the only means for promoting a closer union of the Empire. The question of establishing more intimate relations between the United Kingdom and the colonies had occupied him as early as 1897, when he presided over a conference of colonial premiers assembled in London on the occasion of Queen Victoria's jubilee. A second conference met in 1902. Mr. Chamberlain's proposals, by openly advocating the imposition of a tax on foreign food products in violation of the traditional free-trade policy which had remained unchallenged for 60 years, produced a profound impression, and led ultimately to an unprecedented change in the balance of parties. (For the fiscal controversy, see GREAT BRITAIN.) In September, 1903, he resigned from the cabinet in order to have a free hand in expounding his views to the country, which, he admitted, was not as yet prepared to accept them. In 1904 he succeeded in reorganizing the Liberal Unionist party machinery on a basis which made it a tariff-reform party. His outspoken views, in contrast to the halfway position assumed by Mr. Balfour, made him in 1904 and 1905 the strongest man on the ministerial side. Mr. Balfour saw himself gradually impelled towards a common position with Mr. Chamberlain, and the latter's insistence on an aggressive tariff-reform policy contributed to the resignation of the Balfour cabinet in December, 1905. The general election, fought out principally on the fiscal question and resulting in the overwhelming defeat of the Unionist party, was accepted by most as an unmistakable repudiation of tariff reform. But Mr. Chamberlain chose to interpret his personal triumph in Birmingham, which he carried solidly for the Unionists, as a vindication of his judgment in insisting on a forward policy. Although illness after 1906 largely restricted his activities, he continued to hold his seat in Parliament and to inspire the progress of the tariff-reform movement for several years, not finally retiring from that body till the early part of 1914. Consult: Morris, *The Right Hon. Joseph Chamberlain* (New York, 1901); Jeyes, *Mr. Chamberlain: His Life and Public Career* (London, 1903); Creswicke, *Life of Joseph Chamberlain* (3 vols., London, 1904); Mackintosh, *Joseph Chamberlain* (London, 1906).

CHAMBERLAIN, JOSHUA LAWRENCE (1828–1914). An American soldier and educator. He was born in Brewer, Me., graduated at Bowdoin College in 1852 and at the Bangor Theological Seminary in 1855, and was professor of modern languages at Bowdoin when the Civil War broke out. He then enlisted in the Union army and served with distinction throughout the war, was several times wounded, and left the service (1865) with the brevet rank of major general. From 1866 to 1871 he was Governor of Maine, and in 1871–83 was president of Bowdoin College. When the Democrats and Fusionists under Governor Garcelon got possession of the State Legislature in 1879–80, and the Republicans organized a rival body, peace was preserved by the militia of the State under the command of General Chamberlain until the legality of the Republican Legislature was established by decision of the Supreme Court. (See MAINE, *History.*) He resigned the presidency of Bowdoin in 1883, and removed to New York to practice law. He published *Maine: Her Place in History* (1877); *American Ideals* (1890); *Ethics and Politics of the Spanish War* (1898); *Property: Its Office and Sanction* (1900); *De Monts and Acadia* (1904); *Ruling Powers in History* (1905), and edited an extensive work entitled *Universities and their Sons* (1898).

CHAMBERLAIN, MELLEN (1821–1900). An American librarian and historical writer. He was born in Pembroke, N. H., graduated at Dartmouth in 1844 and at the Harvard Law School in 1848, and in 1849 began the practice of the law in Chelsea, Mass. He subsequently served for some years in the Massachusetts Legislature; was chairman of the Judiciary Committee in the Senate; became a justice of the Boston Municipal Court in 1866; and from 1870 to 1878 was Chief Justice. From 1878 to 1890 he was librarian in chief of the Boston Public Library. He devoted much of his time to the

study of American history and wrote a number of monographs and essays of considerable value, some of which were collected into a volume entitled *John Adams, the Statesman of the Revolution, and Other Essays* (1898). Among his other publications are: *The Journals of Captain Henry Dearborn, 1775–83* (1886–87); several chapters, notably the one entitled "The Revolution Impending," in Winsor's *Narrative and Critical History of America* (1884–89); *The Authentication of the Declaration of Independence* (1885); *The Constitutional Relations of the American Colonies to the English Government at the Commencement of the American Revolution* (1887).

CHAMBERLAIN, MONTAGUE (1844–). A Canadian ornithologist, born at St. John, New Brunswick. In 1890 he became recorder of Harvard University, and from 1893 to 1900 was secretary of the Lawrence Scientific School. He was one of the founders of the American Ornithological Union. Besides a revision of *Nuttall's Handbook of the Birds of Eastern North America* (1872), he published the following important works and lectures: *Canadian Birds* (1870); *Nuttall's Ornithology, Revised and Extended* (1891, 1896); *Birds of Greenland* (1892); *Some Canadian Birds* (1895); *The Church Army* (1897); *The Penobscot Indians* (1899).

CHAMBERLAIN, SIR NEVILLE BOWLES (1820–1902). An English soldier, born in Brazil. He entered the Indian army in 1837 and served throughout the Afghan War of 1839–42, during which he was six times wounded. In 1842 he was attached to the Governor-General's bodyguard, with which he in 1843 participated in the battle of Maharajpur. He was promoted to be lieutenant colonel, commanded the Punjab frontier force from 1854 to 1857, in the latter year became adjutant general of the Indian army, and during the Mutiny (1857–58) distinguished himself, being present at the taking of Delhi. He was commissioned lieutenant general in 1872, full general in 1877, and field marshal in 1900. In 1876–81 he was commander in chief of the Madras army, in 1878 was a member of a special mission to the Ameer of Afghanistan, and for some time was military member of the Council of the Viceroy of India. It was said of him before his retirement from active service that he had been more often wounded than any other officer of the British army.

CHAMBERLIN, AGNES. A Canadian illustrator and author, the daughter of Susannah Moodie, a Canadian author (one of the Strickland sisters). She was born and educated in Belleville, Ontario. She wrote and illustrated *Canadian Wild Flowers*, the first Canadian publication of its kind, the three editions of which necessitated the coloring of 15,000 plates. She also illustrated Mrs. Traill's *Studies of Plant Life*. In 1876 her drawings were exhibited at the Philadelphia Centennial Exhibition. The set of Canadian fungi published by the Geological Survey of Canada was made from her drawings.

CHAMBERLIN, THOMAS CHROWDER (1843–). An American geologist, born at Mattoon, Ill. He graduated in 1866 at Beloit College, studied science at Michigan University, and from 1869 to 1873 was professor of natural science at the State Normal School, Whitewater, Wis. From 1873 to 1882 he was professor of geology at Beloit College, and from 1887 to 1892 was president of the University of Wisconsin. In 1892 he took charge of the geological department of the University of Chicago, and later became editor of the *Journal of Geology*. In 1873–76 he was assistant State geologist for Wisconsin, in 1876–82 was chief geologist, and in 1882 was a United States geologist in charge of the glacial division. While engaged in this active geological work he collected and published a large amount of new material relative to the character of the glacial deposits in the Northern States, upon which he based some interesting theories. He has also made a study of modern glaciers, with valuable scientific results. He was geologist of the Peary Arctic relief expedition in 1894. The planetesimal hypothesis, which he formulated in company with Moulton as an explanation of the origin of the planetary system, has commanded general attention in the scientific world. He was president of the Geological Society of America in 1894 and of the American Association for the Advancement of Science in 1908. His publications include: *Outline of a Course of Oral Instruction* (1872); *Geology of Wisconsin* (1877–83); *Contribution to the Theory of Glacial Motion* (1904); with R. D. Salisbury, *Geology* (3 vols., 1907–09), and many geological papers.

CHAMBER MUSIC. A term used to designate music that is specially adapted for performance in a small auditorium. The name originally designated both vocal and instrumental music, not intended for the church or theatre; but it is now entirely restricted to works written for the combination of instruments employed in trios, quartets, etc., up to nonets or decimets, where each instrument is represented by only one performer. Compositions for piano with some other instrument (violin, 'cello, clarinet), and even for one or more solo voices with piano and some other instrument, are included. There is a distinct chamber-music style, just as we distinguish orchestral style, piano style, vocal style, etc. Chamber music demands nothing less than absolute mastery of all technical details from both composer and performer. During the seventeenth and early part of the eighteenth century the history of chamber music is intimately connected with that of the violin. Consult: J. Wasielewski, *Die Violine und ihre Meister* (Stuttgart, 1904); N. Kilburn, *The Story of Chamber Music* (London, 1904); E. Krause, *Die Entwicklung der Kammermusik* (Hamburg, 1904); A. Schering, *Geschichte des Instrumentalkonzerts* (Leipzig, 1905).

CHAMBER OF COMMERCE. A body of merchants and traders, associated for the purpose of promoting the interests of its own members, of the town or district to which the society belongs, and of the community generally, in so far as these have reference to trade and merchandise. In America and England the chambers of commerce are voluntary associations with no recognized official functions. They exert an influence upon the course of legislation through the adoption of resolutions, through the investigation of conditions affecting trade and publication of findings. Not infrequently the views of important chambers of commerce are sought by legislators engaged in the drafting of regulations affecting industry.

In the countries of continental Europe the chamber of commerce is endowed with official character, and is often vested with administrative functions concerning trade. In some coun-

tries it is made their duty to express their opinion in advance upon proposed legislation, and in the Hanse cities they must by law be consulted before certain kinds of legislation can be considered.

Chambers of commerce originated on the continent of Europe, when, with the gradual disintegration of the old guild system, they were clothed with some of the municipal and administrative functions which had in earlier times been exercised by the craft guilds. The first of these organizations on record is that of Marseilles, which grew out of a commission of merchants established in 1599, and enlarged in 1650 and given practically the form of a chamber of commerce. Similar bodies were created at Dunkirk in 1700, and in the following year at Rouen, Toulouse, Lyons, Bordeaux, and other points. During the Napoleonic period, when the French influence extended to Holland, Germany, Austria, and Italy, similar organizations were established in the principal cities of those countries. Before this time they had spread to Scotland, where the year 1773 witnessed the establishment of the Glasgow Chamber of Commerce, and to the American Colonies, where the New York Chamber of Commerce was organized in 1768. It was not until the early part of the nineteenth century that the institution took root in England. The Chamber of Commerce of Manchester was organized in 1820, but that of London not until 1882. At the present time such organizations, whether under the original name of chamber of commerce or under that of board of trade, are well-nigh universal, and no town of any considerable importance lacks such a corporate representation of its mercantile interests.

CHAMBERS (OF. *chambre, cambre,* It. *camara,* Ger. *Kammer,* OHG. *chamarā,* chamber, from Lat. *camera,* room, Gk. *καμάρα, kamara,* room with vaulted ceiling; connected with Lat. *camur,* crooked, Gk. *κάμπτειν, kamptein,* to bend, Ir. *cam,* crooked). In English and American law, the private room or office of a judge in which he hears motions, signs papers, or does other business pertaining to his office. A judge is said to act at "chambers" when any legal proceeding is carried on before him out of court, either at his office or residence, or other convenient place, including the court room itself, provided he is acting in his individual capacity as judge and not formally as the presiding officer of the court. The practice of making orders and transacting other judicial business in chambers is of considerable antiquity and appears to have grown up insensibly to avoid the serious inconveniences of short and infrequent terms of the courts. The validity of orders made out of court was long disputed, but was conclusively established early in the last century. The practice received its first statutory sanction by Act of Parliament in 1821.

In general, *ex parte* proceedings and proceedings incidental to an action or to the main proceeding may be carried on at chambers. Modern statutes have increased materially the business which may be transacted in this manner; and the codes of civil procedure adopted in several of the United States expressly provide that certain acts may be done by the *court,* and others by a *judge* of the court.

Under the English statutes, 16 Vict., c. 80, and 36 and 37 Vict., c. 66, the office of master in chancery (q.v.) was abolished, and the business formerly transacted by him was directed to be transacted under the direction of a judge at chambers by officers of the court. Consult the authorities referred to under PRACTICE; also Coe, *Practice at the Judges' Chambers, Queen's Bench,* etc. (London, 1876). See MASTER IN CHANCERY.

CHAMBERS, CHARLES EDWARD STUART. See CHAMBERS, WILLIAM.

CHAMBERS, chām'bĕrz, CHARLES HADDON (1860–1921). An English playwright. He was born April 22, 1860, and educated at Sydney, N. S. W., where he entered the civil service in 1875. Two years afterward he turned for a time to a life of more adventurous experiences in the "bush." His first visit to England was in 1880, and in 1882 he went to London to engage in literary work. His first work was in the way of articles and stories for the periodicals, but about 1886 he began dramatic writing. After several minor achievements he made his first great success with *Captain Swift,* which was produced at the Haymarket Theatre, June 20, 1888. Subsequently he wrote *The Idler,* first produced in New York at the Lyceum Theatre, and a few weeks later at the St. James, London (1891); *The Honorable Herbert* (Vaudeville, 1892); *John a' Dreams* (Haymarket, 1894); *The Tyranny of Tears* (1899); *The Awakening* (1901); *The Golden Silence* (1903); *Sir Anthony* (1906); *Passers-By* (1911); *Tante* (1913). Both *The Tyranny of Tears,* with John Drew, and *Tante,* with Ethel Barrymore, were presented in New York in 1913.

CHAMBERS, EDMUND KERCHEVER (1866–). An English scholar and educator. He was born in Berkshire, and was educated at Marlborough and at Corpus Christi College, Oxford, where he was Chancellor's English essayist in 1891. In the next year he entered the Education Department and became Assistant Secretary of the Board of Education. He was created C.B. in 1912. His most important work was on early English poetry, especially the drama. He wrote *The Mediæval Stage* (1903) and *The Tudor Revels* (1906), and the article on "Shakespeare" for the 11th edition of the *Encyclopædia Britannica;* and edited *English Pastorals* (1895), Donne's *Poems* (1896), Vaughan's *Poems* (1896), *The Red-Letter Shakespeare* (1904–08), and *Early English Lyrics* (1907), with F. Sidgwick.

CHAMBERS, EDWARD THOMAS DAVIES (1852–). A Canadian journalist and author. He was born at Saffron Walden, England, and was educated there and in Canada, to which he went in 1870. After two years of school teaching he entered journalism and established *Progress,* the first newspaper printed in Argenteuil Co., Quebec. He became a member of the staff of the *Daily Chronicle* (Quebec City) and in 1897 editor of this paper; later editor of the *Mercury* and of *North American Notes and Queries.* He contributed frequently to British, American, and Canadian magazines on subjects relating to Canadian scenery, resources, and, especially, hunting and fishing. In 1884–94 he was an alderman of Quebec and for a time was promayor. He was prominent in organizing the Champlain celebration in 1906 and the Quebec tercentenary celebration in 1908. His publications include: *The Port of Quebec: Its Facilities and Prospects* (1890); *The Haunts of the Ouananiche* (1891); *Quebec, Lake St. John and the Saguenay* (1895); *The Ouananiche and*

Its Canadian Environment (1895); *The Anglers' Guide to Eastern Canada* (1898); *The Sportsman's Companion* (1899); *The Quebec Tercentenary Commemorative History* (1909).

CHAMBERS, EPHRAIM (c.1680–1740). An English encyclopædist. In early life he was an apprentice to a map and globe maker in London, where he formed the plan of compiling an encyclopædia on a larger scale than that of John Harris's *Lexicon Technicum* (1704), then the only work of the kind in the language. He published by subscription the first edition of his *Cyclopædia, or an Universal Dictionary of Arts and Sciences,* in 1728. Ten years later the second edition appeared, and in the year following the third. The fourth was issued in 1741, a year after the editor's death, and many other editions have since been issued. A French translation of it gave rise to Diderot's and D'Alembert's *Encyclopédie.* It was also expanded into Dr. Rees's once well-known *Encyclopædia.* Chambers was an avowed freethinker, irascible, kind to the poor, and extremely frugal.

CHAMBERS, ERNEST JOHN (1862–). A Canadian journalist and author. He was born at Penkridge, Staffordshire, England, but early went to Canada and was educated at the Montreal high school. He entered journalism in Montreal in 1880, and in 1885 during the second Northwest Rebellion under Louis Riél (q.v.) was correspondent for the Montreal *Star.* In 1893–96 he was joint proprietor and editor of the *Canada Military Gazette,* and in 1894 he established the *Metropolitan,* a weekly journal. In 1904 he removed to Ottawa, having received the government appointment of Gentleman Usher of the Black Rod. In 1908 he became the editor and publisher of *The Parliamentary Guide.* He published: *The Book of Montreal* (1903); *The Book of Canada* (1905); *The Canadian Marine* (1906); *The History of the Royal Northwest Mounted Police* (1906); *Canada's Fertile Northland* (1908). He also wrote many regimental histories of the Canadian militia.

CHAMBERS, GEORGE FREDERICK (1841–1915). An English author. He was educated at Brighton, and at King's College, London, and held several local government posts, becoming a member of the Lewisham Borough Council in 1904. Among his many books on very diverse subjects are: *Handbook of Descriptive and Practical Astronomy* (3 vols., 4th ed., 1889–90), *Pictorial Astronomy* (1891), *The Story of the Sun, Stars, Eclipses, Weather, Comets* (4 vols., 1895–99), and *Astronomy for Amateurs* (1912); digests of laws of public health, etc., and textbooks of law; and guidebooks of Sussex (1877) and Eastbourne, including *Old Memories of Eastbourne* (1910).

CHAMBERS, ROBERT (1802–71). A Scottish publisher and author, born at Peebles, July 10, 1802. He attended the local grammar school, where he learned Latin; and at home read through the fourth edition of the *Encyclopædia Britannica.* The family moved to Edinburgh in 1813, where, five years later, Robert set up as a bookseller, read extensively, and began writing. His *Traditions of Edinburgh* (1823) procured him the friendship of Sir Walter Scott, who contributed various memoranda for the work. It was followed by a large number of books, among which are *Popular Rhymes of Scotland* (1826), *Picture of Scotland* (1826), and *History of the Rebellions in Scotland* (1828–29). He also edited *Scottish Ballads and Songs* (1829), the *Biographical Dictionary of Eminent Scotsmen* (4 vols., 1832–34), and many other collections. The success of *Chambers's Edinburgh Journal,* founded in 1832 by his brother, William Chambers, was materially promoted by his many essays, moral and humorous. His great work, however, is the *Vestiges of the Natural History of Creation,* published anonymously in 1844. It is a brilliant exposition of development in the natural world, and it prepared the public for the theories of Darwin. Among his later works are: *Ancient Sea Margins* (1848), *Life and Works of Robert Burns* (1851), *Domestic Animals of Scotland* (1859–61), and *The Book of Days,* a miscellany (1863). Ever since 1832 he had been a member of the firm of William and Robert Chambers, printers and publishers. He died March 17, 1871. A collection of his miscellaneous papers appeared in 7 vols. (1847).

CHAMBERS, ROBERT. See CHAMBERS, WILLIAM.

CHAMBERS, ROBERT WILLIAM (1865–). An American novelist and writer of short stories, who has scored many a popular success. He began his career as an artist after studying at the Julian Academy, Paris, and became an illustrator for various New York weeklies; but he soon practically abandoned the brush for the pen. The long list of his writings includes: *In the Quarter* (1893); *The Red Republic* (1894); *Lorraine* (1896); *The Cambric Mask* (1899); *The Conspirators* (1900); *The Fighting Chance* (1906); *The Firing Line* (1908); *The Green Mouse* (1910); *Adventures of a Modest Man* (1911); *Streets of Ascalon* (1912); *Gay Rebellion* (1913); *The Business of Life* (1913). Among his early productions was a drama, entitled *The Witch of Ellengowan,* and written for Ada Rehan, which was performed at Daly's Theatre.

CHAMBERS, TALBOT WILSON (1819–96). An American clergyman. He was born at Carlisle, Pa., graduated in 1834 at Rutgers College, studied in 1836–37 at Princeton Theological Seminary, and in 1838 was licensed to preach. From 1839 to 1849 he was pastor of the Second Reformed Dutch Church, Somerville, N. J., and from 1849 to 1871 one of the pastors of the Collegiate Dutch Church of New York City. He was a member of the Old Testament Company of the American Bible Revision Committee. He published: *The Noon Prayer-Meeting in Fulton Street* (1857); *Memoir of Theodore Frelinghuysen* (1863); expositions of Amos and Zechariah (in the Schaff-Lange *Commentary,* 1874); *The Psalter: A Witness to the Divine Origin of the Bible* (1875); a *Companion to the Revised Version of the Old Testament* (1885).

CHAMBERS, W(ASHINGTON) IRVING (1856–). An American naval officer, born in Kingston, N. Y. He graduated from the United States Naval Academy in 1876, served on various vessels, and in 1883 was appointed to service in the office of naval intelligence. During 1884 he was a member of the Greely relief expedition and was engaged in the special survey of the Nicaragua Canal Route. Thereafter in succession he served in the office of naval intelligence, at the Naval War College, as inspector of ordnance at sea, and at the naval torpedo station. In 1907–09 he was chief of the Bureau of Ordnance and in 1909–11 assistant to the aid for material. After that he was in charge of the development of aviation in the Bureau of Navigation.

CHAMBERS, William (1800–83). A Scottish publisher and author, elder brother of Robert Chambers. He was born at Peebles and when 19 years old began business as a bookseller in Edinburgh. Between 1825 and 1830 he wrote the *Book of Scotland* and, jointly with his brother, the *Gazetteer of Scotland.* His venture, *Chambers's Edinburgh Journal,* was a success from the first. The two brothers established in 1832 the firm of W. & R. Chambers, thereafter writing, editing, and printing various popular and notable works, including their 10-volume *Cyclopædia* (1859–68). William Chambers wrote independently, among other books, *Things as they Are in America* (the result of a visit to the United States in 1853). He was Lord Provost of Edinburgh in 1865–69, and in 1872 the University of Edinburgh conferred upon him the degree of LL.D., in recognition, especially, of his services in improving the older part of the city. He died May 20, 1883, and Robert Chambers (1832–88), eldest son of the Robert Chambers named above, became editor of the *Journal* and head of the firm. On his death, in 1888, he was in turn succeeded by his son, Charles Edward Stuart Chambers (1859–), who is also a well-known editor. Consult Chambers, *Memoir of W. and R. Chambers* (Edinburgh, 1872; 13th ed., with additions, 1884).

CHAMBERS, Sir William (1726–96). An English architect. He was born in Stockholm, but was brought to England in his infancy. In his youth, as a supercargo in the service of the Swedish East India Company, he made a voyage to China, and there produced sketches, which were published under the title *Designs for Chinese Buildings.* At the age of 18 he left the sea and studied architecture in Italy and Paris. He returned to England in 1755 and became the foremost living English architect, continuing the propaganda for the Palladian style begun by Inigo Jones. His masterpiece is the remodeling of Somerset House in 1776. He also designed buildings for Kew Gardens, the pagoda among them. He wrote several books, including a *Dissertation on Oriental Gardening,* in which he praised extravagantly the Chinese artificial system of laying out grounds. The book called forth several keen satires, of which the most widely circulated was *An Heroic Epistle to Sir William Chambers,* probably written by William Mason. It is said that Horace Walpole had a hand in it also. Chambers's high reputation as a writer rests upon his standard work for classic architecture, *A Treatise on the Decorative Part of Civil Architecture,* which exercised a potent influence on the architecture of his time. He was created Knight of the Polar Star by the King of Sweden (1771), and George III permitted him to use his title in England.

CHAMBERSBURG. A borough and the county seat of Franklin Co., Pa., 52 miles by rail southwest of Harrisburg, on the Cumberland Valley and the Western Maryland railroads, and on Conococheague Creek (Map: Pennsylvania, F 8). It is finely situated in the broad Cumberland valley and in a populous and well-cultivated region. Chambersburg is the seat of Wilson College (Presbyterian) for women, organized 1870; Penn Hall Preparatory School for girls; and it has a small courthouse, hospital, children's home, old people's home, public library, memorial fountain, and many handsome churches, while in the vicinity are Wolf Lake, Mont Alto, and several parks. There are manufactures of hosiery, flour, furniture, wool, dresses, paper, iron, milling machinery, engines, boilers, soap, steam and hydraulic machinery, iron castings, silk, ice, and condensed milk; and the shops of the Cumberland Valley Railroad are situated here. The city owns and operates its water works and electric light plant. Its government has its source in special acts of the State Legislature, which provide for a chief burgess, elected every three years, and a borough council. Pop., 1890, 7863; 1900, 8864; 1910, 11,800; 1920, 13,171.

Chambersburg was first settled (in 1730) by Benjamin Chambers, an immigrant from Ireland, and was for many years called "Falling Spring." It was incorporated in 1803. On July 30, 1864, the Confederate General McCausland burned the town in default of the payment of a ransom of $100,000. It was entirely rebuilt after the war. Consult *History of Franklin County* (Chicago, 1887).

CHAMBERTIN, shän'bĕr'tăn'. A red wine of Burgundy, which is famous for having been a favorite with both Louis XIV and Napoleon. The grape is grown on the hills near Dijon, and the vineyard (Chambertin) is divided among several proprietors. See Wine.

CHAMBERY, shäm'bâ'rē'. The capital of the Department of Savoie, France, situated in an elevated valley about 6 miles south of Lake Bourget, at an elevation of over 800 feet (Map: France, S., K 3). It is not a modern city, and most of its streets are flanked by old and gloomy buildings. It contains a cathedral dating from the fifteenth century and a number of interesting old churches. The castle of the dukes of Savoie, which was repeatedly demolished by fire, has been restored, and is now used by the administrative authorities of the department. There are also a museum, a fine library of 40,000 volumes, a number of institutions for higher and secondary education, and a theatre. The chief industries are the manufacture of lace, silk fabrics, leather, soap, paper. Pop. (commune), 1901, 22,108; 1911, 22,958.

CHAMBE'ZI. A river of Africa, one of the head streams of the Congo (Map: Congo Free State, F 5). It rises in the plateau between the lakes of Tanganyika and Nyassa and, flowing southwest, enters Lake Bangweolo in the wet season, but during the dry season skirts the southern border of the shrunken lake and flows directly into the Luapula River.

CHAMBIGES, shän'bêzh', Martin (?–1532). A French architect of the late Gothic period. He built parts of three of the finest cathedrals in France—Sens (transept, 1494; portals, 1501–13), Troyes (façade, 1502), and Beauvais (transept, 1500–32)—and was one of the few really great architects of his age. His son, Pierre Chambiges, besides assisting his father, took part in the building of the Hôtel de Ville in Paris (1533–34), with Domenico da Cortona (Bogador), and of the Château de Fontainebleau (1538), but his claim to originality rests on the remarkable Château de Saint-Germain, near Paris, which stands between the Gothic and Classic styles, and between Feudal and Renaissance castles, in a style peculiar to itself.

CHAM'BLISS, Charles Edward (1871–). An American entomologist, born at Petersburg, Va. He was educated at the University of Tennessee, where from 1894 to 1900 he was an instructor in zoölogy and entomology, acting at the same time as entomologist of the Ten-

nessee Agricultural Experiment Station. Subsequently he was State entomologist of Tennessee, associate professor of zoölogy and entomology at Clemson College, and State entomologist of South Carolina. In 1908 he took charge of the rice investigations of the United States Department of Agriculture. He published *A Preliminary Report on Rice-Growing in the Sacramento Valley* (1912), a bulletin of the United States Department of Agriculture.

CHAMBLY (shän'blē') **RIVER.** See RICHELIEU.

CHAMBORD, shän'bôr'. A celebrated castle of the Renaissance in France. It is situated in the Department of Loir-et-Cher, about 12 miles east of Blois, in the midst of a park 21 miles in circumference. It was begun by Francis I in 1526, and was continued by his successors of the houses of Valois and Bourbon. The building marks the transition between the fortified castle and the Italian palace, and is surmounted by a vast number of turrets, minarets, and cones. The most prominent features of the structure are its six round towers, each 60 feet in diameter. The double spiral staircase in the central tower is so contrived that persons ascending and descending may pass each other without meeting. The castle, which contains 440 chambers, was the residence of Francis I, Henri II, and Louis XIV, and the scene of the first presentation of Molière's *Bourgeois gentilhomme.* Among the other occupants of Chambord were Marshal Saxe, Stanislas Leszczynski, King of Poland, and Marshal Berthier, upon whom it was bestowed by Napoleon. In 1821 it was bought from Berthier's widow by a number of Legitimists and presented to the infant Duc de Bordeaux, who was afterward known as the Comte de Chambord. The possession of this celebrated château was passed on by bequest to the Parma family in 1883. Consult Millot, *Les châteaux historiques: Chambord* (Paris, 1875).

CHAMBORD, HENRI CHARLES FERDINAND MARIE DIEUDONNÉ D'ARTOIS, DUC DE BORDEAUX, COMTE DE (1820–83). A Bourbon claimant to the French throne. He was the son of the Duc de Berry, who was murdered by Louvel on Feb. 13, 1820, and the grandson of Charles X. Seven months after the death of the Duc de Berry, who was heir presumptive to the throne of France, his widow gave birth to a prince, who received the title of Duc de Bordeaux—that of count, by which he was subsequently known, being derived from the castle of Chambord (q.v.), presented to him at his christening. He was baptized amid circumstances of great pomp, with water brought by Chateaubriand from the river Jordan, and received the appellation of *l'enfant du miracle.* Chambord was chosen by Charles X to succeed him when, in 1830, he abdicated the French throne; and at the death of Charles the Legitimists proclaimed Chambord King. In 1839 the Prince visited Italy, accompanied by his mother, and was received by the petty courts with great distinction. After the death of the Duc d'Angoulême, in 1844, the heads of the different factions of Legitimists met in London to pay their united homage, and the Duc de Bordeaux made a "pilgrimage to Belgrave Square" to receive it. In 1846 he married a sister of the Duc de Modena, who had never acknowledged the monarchy of July. After the revolution of 1848 many Legitimists were returned to the National Assembly, and in 1850 the Comte de Chambord appeared at Wiesbaden, where a congress of his adherents assembled to consult as to their future policy. As the Comte de Chambord was without heirs, a union of the partisans of the elder Bourbons with the Orleanists was effected, but no attempts were made to carry out the arrangement. After the fall of Napoleon III, in 1870, repeated attempts were again made to effect a coalition between the supporters of the Bourbons and the Orleanist claims; but whatever chance there might have been for a royal restoration during the troubled days of the Third Republic before 1880 was ruined by the Comte de Chambord's obstinate refusal to abandon his extreme Legitimist views, which he aired more than once in "royal" proclamations. He died at Frohsdorf, in Lower Austria, which had been his residence for many years, Aug. 24, 1883.

CHAMBRE ARDENTE, shän'brär'dänt' (fiery room). A tribunal established by Francis I in 1535 for the trial and execution of heretics apprehended by the Inquisition. It derived its name from the manner of execution, which was chiefly by burning. It flourished during the civil wars and the time of the League, but sank into abeyance under the early Bourbons. Louis XIV, however, employed it in the investigation of the numerous reports of poisonings that followed the apprehension of the Marquise de Brinvilliers (q.v.). It was discovered that a certain hag named La Voisin, posing as a sorceress, had been driving a lively trade in poisons—"succession powders," they were called—with such as were afflicted with superfluous husbands, fathers, or rival heirs. Many persons of the highest court circles, the Marshal Luxembourg among them, were summoned before the tribunal, but the affair ended with the execution of the sorceress only, in 1680. With this the Chambre Ardente ceased its activity. Consult Weiss, *La chambre ardente* (Paris, 1889), and Ravaisson, *Archives de la Bastille* (Paris, 1866–84).

CHAMBRE DES DÉPUTÉS, shän'br' dâ dâ'pu'tâ'. The building in Paris in which the sessions of the French Legislature are held. It is called also "Palais du Corps Législatif" and "Palais Bourbon," and was built in 1722 for the Duchess of Bourbon, becoming national property in 1790. It fronts the Seine opposite the Pont de la Concorde. The style is that of a Greek temple, with 12 Corinthian columns. The steps and façade are ornamented with statues and reliefs.

CHAMBRE INTROUVABLE, shän'brän'-trōō'và'bl'. The name given to a packed assembly of deputies in France which sat from October, 1815, to April, 1816. The epithet (meaning "chamber whose like cannot be found") originated with Louis XVIII, by whom, after his restoration, this chamber had been summoned. Louis, no doubt, used the term ironically, for he realized the injury which was sustained by his cause through the fanaticism of these deputies; but they, for the most part, accepted the name seriously as a compliment. The former chamber, which had shown much moderation, had been dissolved under the influence of the court party, and the ministry, led by Talleyrand, had exerted itself to procure the election of a submissive chamber. The ultra-Royalists were for a time in the ascendant. The number of the deputies was arbitrarily raised from 259 to 392, and many of the elections, especially in the south, took place under the supervision of the partisans of reaction or of foreign troops. At the elections in Nîmes more than 100 persons were

killed by the Royalist bands. At last, on October 7, the King opened the chamber, on which he enjoined quiet and moderation; but when, in one of the first sittings, Boyer d'Argenson asked for the intervention of the chamber in behalf of the Protestants, who were being slaughtered in the south by the ultra-Royalist bands, the speaker was called to order, and the chamber from that time ceased to observe any bounds or moderation. The fanatical legislation that followed inspired the ministers, the King, and especially the Emperor Alexander, with so much aversion and fear that the chamber was dissolved on April 5, 1816, an event which was received with universal rejoicing. The electoral law of Feb. 5, 1817, prevented the return of a similar chamber, and it was only by the modified electoral law of 1820 that ultra-royalism regained a predominating influence in the Parliament. See WHITE TERROR.

CHAMBURU, chäm-bo͝o′ro͝o. A species of papaw (q.v.), native of Brazil.

CHAMECK, shä-mĕk′ (Brazil). The coaita. See SPIDER MONKEY.

CHAMELEON, kȧ-mē′lē-ŭn (Lat. *chamæleon*, Gk. *χαμαιλέων*, *chamaileōn*, from *χαμαί*, *chamai*, on the ground + *λέων*, *leōn*, lion). An African lizard of the family Chamæleontidæ, of very peculiar form and structure, and placed at the head of the order Lacertilia. The body is much compressed, the dorsal line sharp, in some of the species rising into an elevated crest; the back of the head is also elevated into a sort of cone. The neck is very short and does not admit of the head being turned, for which, however, compensation is found in the remarkable powers of motion possessed by the large, prominent eyes, which move independently of one another and are covered with a membrane pierced only with a small hole for the pupil to look through. There are no external ears. The skin is not covered with scales, but, like shagreen, is rough with granules. The legs raise the body rather higher than in most of the saurians; the toes, both of the fore and hind feet, are divided into two sets —one directed forward and the other backward —so that each foot has the power of grasping like a hand. The tail is long and prehensile. The lungs are very large and are connected with air cells that lie among the muscles and beneath the skin, so that the animal has a remarkable power of inflating itself with air. The tongue is remarkably extensile and is the organ by which the animal seizes the insects which constitute its food, being darted at them with unerring aim, while a viscous saliva causes them to adhere to it, and they are carried with it into the mouth. For illustration of the chameleon's method of catching insects, see the article LIZARD.

The chameleons are slow in their movements, except those of the eyes and the tongue, and remain long fixed in one spot, awaiting the approach of insects, which they seize on their coming within reach. They all live among the branches of trees, but lay their large eggs (10 or 12) under leaves on the ground. Their power of fasting is great and, along with their gulping of air, gave rise to the fable, current among the ancients and until recent times, of their living on air, and led to other fables and to their ancient use in medicine. Their celebrated power of changing color is not equally fabulous, and may be used to render the animal less easy of observation, by assimilating it to the color of surrounding objects. It may depend in part on the action of light; it is certainly connected with the fear and other passions of the creature. Milne-Edwards has discovered that it depends upon the presence of two differently colored layers of pigment underneath a transparent skin. Both may show simultaneously, or blend, or one may replace the other. This power of changing color is possessed by many lizards and is explained more fully under METACHROSIS. One species (*Chamæleon vulgaris*) is found wild along the European shore of the Mediterranean and is often made captive.

American Chameleons are the small, slender lizards of the iguanid genus *Anolis*, very common throughout tropical America and represented in the southern United States by a single species (*Anolis carolinensis*), often also called "scorpion." It is 3 to 3½ inches long in body, with a tail 5 to 6 inches long. Below it is white, above emerald green, or the color of any natural object upon which it rests. Beneath the capacious mouth is a large dewlap, which "can be vertically expanded like a fan, when it is of a deep-red shade, or may be retracted so as to be scarcely visible." They are extremely active during the warm hours of the day, and extremely amusing as they dart and scramble about bushes, rocks, or buildings in search of insects, of which they destroy a vast number. In Jamaica and the Antilles they are often household pets. A closely allied tropical species is illustrated on the Colored Plate of LIZARDS. Consult Parker and Starratt, "The Effect of Heat on the Color Changes in the Skin of Anolis Carolinensis," *Proceedings, American Academy of Arts and Sciences*, vol. xl, No. 10 (Boston, 1904).

CHAMELEON. A southern constellation within the Antarctic polar circle.

CHAMFER (OF. *chamfrein*, *chamfrain*, of uncertain origin). In architecture, an angle or arris which is obliquely beveled or cut off is said to be chamfered. The chamfer is sometimes a *concave* or *hollow* chamfer; when it does not extend over the entire length of the arris, it is called a *stopped* chamfer. It was most used in mediæval architecture, and in Gothic buildings it is greatly varied and decorated. It is frequently employed in modern architectural woodwork.

CHAMFORT, shäN'fôr′, SÉBASTIEN ROCH NICOLAS (1741–94). A French epigrammatist, the best talker and raconteur of his generation in France. He was born in Auvergne, an illegitimate child, was educated on a scholarship in Paris, and achieved a distinction in classical studies that led him in afteryears to write, "What I learned I have forgotten. The little that I do know I have guessed." He left school to become an abbé, "a costume, not a profession," he said, adding when offered a benefice that he "preferred honor to honors." For the moment, however, he got neither. Booksellers declined his books, and for a year he lived by writing other people's sermons and on chance journalistic crumbs. Then he won an academic prize and became the fashion in the literary salons, where he led a life of gallantry from which he had presently to seek rest and recuperation at Spa and elsewhere. Returning, he wrote a successful drama, *La jeune Indienne* (1764). He made a living—scanty, to be sure—more by his tongue than by his pen, paying for his entertainment by the diversion that he gave to his hosts, especially Madame Helvétius, and

Chabanon, who resigned to him a pension of 1200 livres on the *Mercure de France*. Occasionally he won academic prizes, as by his eulogies on Molière and La Fontaine. But with every epigram his reputation grew. The King added 1200 livres to his pension, and the Prince de Condé made him his secretary, a post that he found uncongenial to his Bohemianism. He withdrew to Autreuil and married a clever woman of 48, who died six months after. Then he went to Holland, but returned to accept a seat in the Academy in 1781. An unfortunate and mysterious love affair soon made him quit the court forever; but he gathered about him at the house of M. de Vaudreuil a congenial circle, which included Mirabeau (q.v.), whom Chamfort helped with his orations. He worked actively for the Revolution with tongue and pen, for a time as secretary of the Jacobin Club and as street orator. He was among the stormers of the Bastille. But, with the fall of the Girondists, his political life ended, and his criticisms of the Terrorists soon made them anxious to silence his bitter tongue with the guillotine. This he escaped by suicide with dagger and pistol. He did not die immediately, however, but lived to bequeath to the world two final epigrams. "I declare," he dictated—and signed the declaration with his blood before the police who came to arrest him—"that I wished to die free rather than be led slave to prison." To the Abbé Sieyès, who owed his political fortune to Chamfort's epigram on the Third Estate, "It is everything and has nothing," he said, as his last word, "I am going at last from a world where the heart must either break or turn to bronze." No writing of Chamfort's is worth recalling save his aphorisms (*Maximes et pensées*), which, after those of La Rochefoucauld, are the keenest, the most incisive, and the most pregnantly cynical in modern literature. They are restrained in utterance, violent in implication, subtle in manner, iconoclastic in effect. Chamfort's *Œuvres complètes* is in 5 vols. (1824–25); a selection from his writings appeared as *Œuvres de Chamfort* (1852), with a critical preface by Houssaye. In 1879 appeared *Œuvres choisis* (2 vols.), with preface and notes by M. de Lescure. Consult Sainte-Beuve, *Causeries du lundi*, vol. iv (Paris, 1857–62), and Pelisson, *Chamfort, Etude sur sa vie, son caractère et ses écrits* (Paris, 1895). See EPIGRAM.

CHAMFRON, chăm'frŏn, or **CHAMFRAIN**, chăm'frĭn (Fr. *chanfrein*, of uncertain origin). A frontlet of metal, forming part of the armor worn by a charger in late mediæval times. It protected the forehead, eyes, and nostrils, and was frequently provided with a projecting spike. It came into use about the beginning of the fourteenth century. In the fifteenth century the chamfron was sometimes adorned with precious metals and became an object of great cost. To prevent shying in tourneys, the chamfron was often made so that the horse could see nothing in front of him. See illustration under CAVALRY.

CHAMIDÆ, kăm'ĭ-dē (Neo-Lat. nom. pl., from Gk. *χαίνειν, chainein*, to gape). A group of curious marine Pelecypoda, allied to the genus *Cardita*, and having shells with unequal valves, that exhibit a tendency to spiral development of the beaks. In the recent forms and many of the fossil representatives, which are far more numerous than those now living, one of the valves is attached to some supporting object by direct cementation of the outer wall of the valve, and there is usually a considerable thickness of the shell wall of this valve. The only living genus, *Chama*, is less different from the normal clam form, as seen in *Cardita*, than are its numerous fossil relatives from the Mesozoic and Tertiary rocks. *Chama* has a shell of which the larger (attached) valve is convex with a somewhat spiral nonelevated beak, and a smaller spiral flattened valve that suggests a lid for the larger one, which latter contains in its cavity the bulk of the animal. This genus, with about 55 living species, is found abundantly in warm seas, especially the Red Sea and the Indian Ocean, where its shells are common on coral reefs, fastened into the cavities of the coral masses. Fossil species of *Chama*, little different from the modern forms, are found first in the Cretaceous rocks, and the genus attained its maximum in the Eocene, when it was quite abundant in the European Mediterranean Sea of that period. The related fossil genera, found in the Mesozoic rocks, present some curious forms, due to extreme inequality or to spiral extension of the beaks of the valves. *Diceras*, of the Upper Jura, has the two valves of slightly unequal size, with their beaks twisted spirally outward, so that they resemble a pair of ram's horns. *Requienia*, of the Cretaceous, resembles a turreted gastropod with the aperture of its spirally rolled larger (left) valve closed by the operculum-like flattened right valve. Other allied genera are *Monopleura*, *Caprina*, etc., all from the Cretaceous rocks. For description of similar and closely allied, though even more aberrant, fossil pelecypods, see the articles on HIPPURITES; and, for illustrations, see RUDISTÆ.

CHAMIER, shà-mēr', FREDERICK (1796–1870). An English novelist. He was born in London, entered the navy in 1809, and distinguished himself in the American War of 1812. He retired in 1833 and was promoted captain in 1856. The success of Marryat in depicting sea life led Chamier to enter the same field, in which he was not without success, though in invention and humor he falls short of his model. His best romances are: *Ben Brace* (1835); *The Arethusa* (1836); *Life of a Sailor* (1837); *Jack Adams* (1838); *Tom Bowling* (1841); *Jack Malcolm's Log* (1846). All of his novels have been translated into German. He also wrote a *Review of the French Revolution of 1848* (1849), in which he gives a prejudiced view of some of the prominent actors.

CHAMINADE, shà'mē'nàd', CÉCILE LOUISE STÉPHANIE (1861–). A French composer, born in Paris. She studied under Le Couppey, Savard, Marsick, and Godard, and made her début as a pianist when 18. Her compositions at one time enjoyed great popularity, because of their melodiousness and piquant rhythm. For a time she was vastly overrated. Although her visit to the United States in 1908 proved very successful for the moment, she failed to regain her hold on the musical public. Among her best-known instrumental pieces are: *La lisonjera* ('The Flatterer'); *Pas des amphores; Pas des écharpes* ('Scarf Dance'); *Au matin* for two pianos; *Callirhoë*, a ballet symphony performed first in 1888 in Marseilles; *Les amazones*, a lyric symphony; two suites for orchestra; a concert-stück for piano and orchestra. Her songs also were formerly in great vogue.

CHAMISO, chà-mē'sō. A plant of the order Rosaceæ. See Colored Plate of CALIFORNIA SHRUBS.

CHAMISSO, shä-mēs'sō, ADELBERT VON (1781–1838). An eminent German poet and naturalist. Although born in Champagne, France, he in childhood shared the exile of his parents, fleeing from the terrors of the French Revolution. In 1796 he became a page of the Queen of Prussia, and though his parents afterward returned to France, education had made Germany more congenial to his poetic nature, and he identified himself wholly with his adopted country. In 1798 he entered the army as ensign and in 1801 became lieutenant. He showed his interest in the military calling by two technical treatises published in 1798 and 1799. Already he had joined a romantic brotherhood, which included several young men destined to fame, Varnhagen, Hitzig, De la Motte-Fouqué, and others. He studied Homer diligently, translated much into German, and in 1803 essayed a *Faust*, the only one of his early poems preserved in his *Works*. He also coöperated as editor of the *Musenalmanach* (1804–07). In 1806 he resigned from the army and went to France, hoping to secure a position as teacher in the gymnasium at Napoléonville; disappointed in this, he spent several years in futile and discontented Bohemian wanderings. He was in France again in 1810, when he undertook to turn into French Schlegel's noted *Lectures on Art and Literature*, staying with him and Madame de Staël at Chaumont, and later following her to Coppet, where her relations with Jean de Rocca brought him to his senses. Here he began to study botany under Aug. de Staël, and in 1812 he matriculated as a student of medicine in Berlin. In the next year, during the War of Liberation, he retired to Kunersdorf, and while there wrote his most noteworthy prose work, *Peter Schlemihl*, a wonderful tale of the loss of a shadow by compact with the devil—an idea familiar to folklore and already developed by Goethe in his *Märchen*, and by Körner in his *Teufel von Salamanca*, but here given its enduring and classic form. He took part in Captain Kotzebue's Russian polar expedition (1815–18), and in 1835 published in a *Journal* an account of it which in style and power of description is among the classics of travel. He returned to Berlin in 1819, and was appointed assistant custodian of the botanical garden. While here he married Antoine Piaste. Having recovered an indemnity of 100,000 francs for his French estates, he visited Paris in 1825. His greatest literary activity dates from his return, when he settled down to domestic life and peaceful production stimulated by the genial companionship of his wife, to whose inspiration we owe especially the charming poetic cycles *Frauen-Liebe und -Leben*, and *Lebens-Lieder und -Bilder*. He also made an admirable translation of the *Song of Thrym*, from the *Edda*, and many versions of poems in other languages. From 1832 till his death he was editor of the *Musenalmanach*, which he made an annual of much literary importance. His poetry is rather small in amount, but widely popular in Germany. Some of his lyrics, ballads, and romances rank among the finest in German literature, especially *Das Schloss Boncourt*, *Die alte Waschfrau*, and *Die Kreuzschau*. His international reputation rests on the many translations of his *Peter Schlemihl*. His collected *Works* fill 6 vols. (Leipzig, 1836–39; 6th ed., Berlin, 1874), containing also his *Biography* by Hitzig and his *Letters*. Consult also: Fulda, *Chamisso und seine Zeit* (Leipzig, 1881); Du Bois-Reymond, *Chamisso als Naturforscher* (Leipzig, 1889); Kossmann, *Der deutsche Musenalmanach, 1833–1839* (The Hague, 1909); and Geiger, *Aus Chamissos Frühlingzeit* (Berlin, 1905).

CHAMOIS, shăm'mĭ, *Fr. pron.* shă-mwȧ' (Fr., It. *camozza;* probably from MHG. *gemeze, gemz*, Ger. *Gemse*, chamois; cf. also Sp., Portug. *gamo*, fallow deer), or GEMSE. A goat antelope (*Rupicapra rupicapra* or *tragus*), inhabiting the high mountains of southern Europe. It occurs in the Pyrenees, where it is called "izard"; in the mountains of the coasts of Spain, Dalmatia, and Greece; in the Alps, Carpathian, Caucasus, and Taurus ranges, and in Georgia. The izard of Spain and the atchi of the Caucasus and beyond differ somewhat from the typical chamois of Tirol, but only as local races. The chamois is about the size of a large goat, but the neck is longer in proportion, and the body shorter. The color is brown, deeper in winter than in summer; the tail is black; the head a pale yellow, with a dark-brown band along each cheek. The horns, seldom more than 6 or 7 inches long, rising nearly straight up from the forehead, are black and so bent back at the tip as to form a hook. (See Plate of GOAT ANTELOPES.) The usual summer resort of the chamois is in the higher regions of the mountains which it inhabits, not far from the snow line, and it is often to be seen lying on the snow. In winter it descends to the higher forests, where, indeed, the females and their young fawns spend most of the time. The aromatic and bitter plants of the mountain pastures are its favorite food. Flocks of 100 are sometimes seen; but in the Swiss Alps, where the numbers have been much reduced by hunting, the flocks are generally very small and often consist only of a few individuals. Old males often live solitarily. The chamois produces one or two young at a birth, in May or June.

It is an animal of extraordinary agility, and flocks may often be observed sporting in a remarkable manner among the rocky heights. It can leap over ravines 16 to 18 feet wide; a wall 14 feet high presents no obstacle to it; and it passes readily up or down precipices which almost no other quadruped could attempt. It is said to descend obliquely almost perpendicular precipices of more than 20 feet, striking its feet once or twice against the rock, as if to stay and guide its descent, and alighting securely, often on a very narrow ridge of rock, with its hind feet first, and bringing the fore feet almost into contact with them. When a flock of chamois are feeding (usually early in the morning), one is always on the watch, and by a sort of whistle announces apprehended danger.

The hunting of the chamois is attended with great hardship and much danger, but calls forth the highest qualities of both sportsmanship and mountaineering, since no great numbers exist, nor is any free hunting to be had except in the remotest and loftiest Carpathians, or else in Persia. This is due to the fact that for many years the Alpine resorts, and much of the region to the eastward, have been most strictly preserved by royal decree or private ownership, and only a very limited number of animals permitted to be killed annually; yet much poaching is done. The finest and proper way is to stalk the quarry alone, or with only a guide, but battue methods are frequently followed in Bavaria and Transylvania. The flesh of the chamois is highly esteemed. Its skin is made into leather, and from it the original "shammoy," or "shammy

leather," so much prized for softness and warmth, was obtained. (See LEATHER.) Its horns and hoofs are mounted as ornaments, alpenstock handles, etc., and form a valuable article of trade at mountain resorts. When taken young, the chamois is easily tamed.

CHAMOMILE, kăm'ō-mīl, or **CAMOMILE** (OF. *camamille*, ML. *camamilla*, Lat. *chamomilla*, from Gk. *χαμαί, chamai*, on the ground + *μῆλον, mēlon*, apple). A genus of plants of the natural order Compositæ, suborder Tubulifloræ, distinguished by imbricated bracts, a scaly conical receptacle, a ray of one row of female florets, those of the disk hermaphrodite, the achænia obscurely four-cornered, and destitute of pappus. The species are annual and perennial herbaceous plants, chiefly natives of Europe and other temperate parts of the world. The common chamomile (*Anthemis nobilis*), the Roman or true chamomile, the most important species of the genus, well known for its medicinal virtues, is a perennial plant with a stem about a foot long, procumbent and much branched, each branch terminated by a flower (head of flowers) more than an inch broad, with yellow disk and white ray, the whole plant intensely bitter and highly aromatic. It contains a bitter principle, tannin, and a volatile oil, *oil of chamomile*, which abounds most of all in the involucre. The dried flowers are used in medicine; the infusion, or "tea," made from them is used to a slight extent as a stomachic tonic, especially in convalescence. The German chamomile, or *Matricaria*, consists of the flowers of *Matricaria chamomilla*. This is called wild chamomile in Great Britain. Its flowers are smaller and the taste and odor stronger and less pleasant. This plant is so abundant in some parts of the south of England as to fill the whole air with its scent. The other British species of chamomile are mere weeds; one of them (*Anthemis cotula*) is so acrid as to blister the fingers if much handled. The flowers of the oxeye or dyer's chamomile (*Anthemis tinctoria*), a native of many parts of the continent of Europe, yield a beautiful yellow dye, on account of which the plant is often cultivated.

CHAMONIX, shà'mô'nê', or **CHAMOUNI,** shà'mōō'nê' (Lat. *Campus munitus*). The name of a wild and romantic valley and village among the Alps in the Department of Haute-Savoie, France. It lies at an elevation of about 3400 feet above sea level, is about 13 miles long and 1 mile broad, and is traversed by the Arve. It begins at the northeast, from the Col-de-Balme, over which there is a mule path to Martigny, in the upper valley of the Rhône. From the other end issues the road to Geneva, which is 53½ miles from Chamonix. On the north side lie Mont le Brévent and the chain of the Aiguilles Rouges, and on the south is the giant group of Mont Blanc, with its enormous glaciers. The chief of these glaciers are the Glacier des Bossons, des Bois, d'Argentière, and du Tour. By ascending to a point called Montanvert, we come upon the upper course of a glacier, where it expands into a great mountain lake of ice called the Mer de Glace, in which there is a solitary rock or oasis called Le Jardin, about 7 acres in extent, and covered with the most beautiful herbage. Until 1741 the valley was almost unknown; the region was considered a wilderness, and known by the name of Les Montagnes Maudites, or 'accursed mountains.' In that year it was visited by two Englishmen, Pococke and Wyndham, who ascended as far as Montanvert. It was only, however, in 1775 that the attention of travelers was effectually called to it by Saussure and Bourrit. The valley is rich in peculiar plants and furnishes an aromatic and perfectly white honey. The village of Chamonix owes its origin to the Benedictine convent founded between 1088 and 1099. The inhabitants depend for a livelihood partly upon the tourists who visit the valley and partly upon the pastures and upon hunting. There are several good hotels, and the best guides are to be found here for the neighboring Alps. It is from Chamonix that Mont Blanc is usually ascended. Consult Whymper, *Chamonix and the Range of Mont Blanc* (London, 1896).

CHAMOUCHOUAN (shä'mōō-chwän') **RIVER,** or ASHUAPMOUCHOUAN. A northwestern affluent of Lake St. John (q.v.), Quebec, Canada, and the outlet of Chamouchouan, Obatogaman, Shabogama, and other lakes of the district.

CHAMPAGNE, shăn'pā'ny' (Fr., flat country, It. *campagna*, Lat. *campania*, plain, from *campus*, field). A former province of France, now included within the departments of Marne, Haute-Marne, Seine-et-Marne, Aube, Ardennes, Aisne, and Yonne. The province was about 180 miles long by 150 broad, its surface presenting extensive plains with ranges of hills, especially in the north and east, from the vineyards of which is produced the famous champagne wine. In ancient times Champagne was subjugated by Cæsar, and afterward was annexed to the kingdom established by the Franks. After the tenth century it had its own counts, who were vassals of the French kings. The capital was Troyes. By the marriage of Philip IV with Joanna, heiress to the Kingdom of Navarre, in 1284, Champagne and Brie came to the French crown and were incorporated in 1361.

CHAMPAGNE, shăn'pā'ny', or **CHAMPAIGNE,** PHILIPPE DE (1602–74). A French religious and portrait painter, of Flemish extraction. He was born in Brussels, studied under Fouquières, Jean Bouillon, Michel de Bordeaux, and at 19 removed to Paris. There he was associated with Nicolas Poussin in decorating the Luxembourg Palace and several convents for Queen Maria de' Medici. Later he was in the service of Louis XIII and Richelieu, whose portraits he painted many times, besides those of the Queen, Turenne, Mazarin, Henrietta Maria of England, and other celebrated personages. A series of family misfortunes deepened his naturally strong religious convictions and led to a close connection with the Jansenists of Port Royal, for whom he painted the magnificent altarpiece of the "Last Supper" (Louvre). One of his best portraits is the touching likeness of his daughter Catherine, who had become a nun. Among other religious pictures dating from this time is the series of the "Life of St. Benedict" (Brussels). In his latter years his nephew, Jean Baptiste, was associated with him in painting the frescoes in the royal apartments at Vincennes and the Dauphin's room in the Tuileries. Philippe de Champagne happily combined the realism of Flemish art with the spiritual qualities of the French. Although somewhat lacking in imagination and cold in color, especially in his later pictures, he is nevertheless a painter of the first rank, and many of his portraits are veritable

masterpieces. The Louvre is richest in his works, which are also in most European collections, in the Boston Museum ("Arnaud d'Andilly"), and in the Museum of the New York Historical Society. For his biography, consult A. Gazier (Paris, 1893) and Stein (ib., 1891).

CHAMPAGNE (shăm-pān') **WINE.** See WINE.

CHAMPAGNY, shăn'pā'nyē', FRANÇOIS JOSEPH NOMPÈRE DE (1804–82). A French publicist, born in Vienna, where his father (see the next title) was French Ambassador. He was a member of the Neo-Catholic party and with Montalembert contended for Catholic schools of instruction independent of the University of France. He contributed to the *Correspondant* and *Ami de la Religion.* In 1869 he was elected to the French Academy for his most pretentious work, a history of the Roman Empire: *Les Césars* (4 vols., 1841–43), *Les Antonins* (3 vols., 1863), and *Les Césars du IIIe siècle* (3 vols., 1870).

CHAMPAGNY, shăn'pā'nyē', JEAN BAPTISTE NOMPÈRE DE, DUC DE CADORE (1756–1834). A French courtier and diplomat, born at Roanne. He served in the American Revolution. In 1789 he was elected to the States-General, and as a supporter of the Third Estate became a prominent member of the General Assembly. During the Reign of Terror he was imprisoned (1793), but was released after Robespierre's fall, and was made a Councilor of State by Napoleon (1799). He became Ambassador to Vienna (1801–04), Minister of the Interior (1804–07), and Minister of Foreign Affairs (1807–11). In 1809 he accompanied the Emperor to Austria, where he negotiated the Treaty of Vienna, and he helped arrange the marriage with Marie Louise. He quarreled with Napoleon in 1811, but joined him during the Hundred Days. After the restoration of the Bourbons (1814) he retired from public life, but in 1819 was restored to the Chamber of Peers.

CHAMPAIGN, shăm-pān'. A city in Champaign Co., Ill., 128 miles south by west of Chicago, on the Illinois Central, the Cleveland, Cincinnati, Chicago, and St. Louis, the Illinois Traction and the Wabash railroads (Map: Illinois, D 3). It is situated in an agricultural region and has an ice and cold-storage plant, railroad shops of the Illinois Central, extensive foundries, and tool and textile factories. It is the twin town of Urbana, which contains the University of Illinois, and it has a fine public library, several parks, and a high school. Settled in 1855, Champaign was incorporated five years later. Its government is administered by a mayor, elected every two years, and a city council. The electric light plant is owned by the city. Pop., 1900, 9098; 1910, 12,421; 1920, 15,873.

CHAMPAIGNE, PHILIPPE DE. See CHAMPAGNE, PHILIPPE DE.

CHAMP DE MAI, shăn de mâ. See CHAMP DE MARS.

CHAMP DE MARS, märs (Fr., Field of Mars, Lat. *Campus Martius*). The name given to the annual meetings held in the month of March by the Franks of Gaul in the fifth century and later. These were either national assemblies called for the purpose of deliberation upon important matters and for the trial of important cases, or else military reviews. The Champs de Mars were not held as frequently under the later Merovingians, but were revived by Pepin, who held his meetings, however, in May (hence the name CHAMP DE MAI). Under Charles the Great similar meetings were held in one of the summer months and had varied functions.

CHAMP DE MARS (Fr., Field of Mars). A great parallelogram in Paris, between the Seine and the Ecole Militaire, formerly used especially for military purposes and drills. It is 1093 yards long and 537 wide, with four rows of trees on each side, and until 1861 it was surrounded by high embankments. It has been the scene of many remarkable political and public celebrations, from the Feasts of the Federation in 1790 and of the Champ de Mai in 1815, to the universal expositions of 1867, 1878, and 1889. For the last the Eiffel Tower was built at one end of the Champ.

CHAMPEAUX, shăn'pō', GUILLAUME DE. See GUILLAUME DE CHAMPEAUX.

CHAMPERICO, chăm'pâ-rē'kō. A port of Guatemala, situated on the Pacific coast, at the mouth of the Salamo, 100 miles southwest of Guatemala (Map: Central America, B 3). The town is connected with Acapulco, Mexico, by steamship and with the interior by railroad and is the residence of a United States consular agent. Its chief article of export is coffee. Pop., 1500.

CHAMPERTY, shăm'pēr-tĭ, or **CHAMPARTY** (OF. *champart*, from ML. *campipars, campars, campartagium*, from Lat. *campi pars*, part of the field, from *campi partitio*, a division of lands). The common-law offense of promoting or maintaining a suit for the purpose of sharing in the proceeds. The practice has been strictly forbidden by statute in England from very early times (3 Edw. I, c. 25; 13 Edw. I, c. 49; etc.) and gave rise to a tort action for damages and subjected the offender also to criminal liability. In Scotland the rule of the civil law by which the *pactum de quotâ litis* was held to be a *pactum illicitum*, and as such void, has all along been part of the common law. Such practices were also forbidden by statute to members of the college of justice (1594, c. 216). There is this difference between the laws of the two countries, however, that whereas in England the offense has always been punished criminally, in Scotland the only penalty which it entails, beyond nullity of the bargain, is deprivation of office. According to Blackstone, the word "signifies the purchasing of a suit, or a right of suing—a practice so much abhorred by our law that it is one main reason why a chose in action, or thing of which one hath the right but not the possession, is not assignable at common law, because no man should purchase any pretense to sue in another's right."

In many of the United States, however, champertous agreements are authorized by statute; and, both in England and in this country, the prevailing tendency is towards freedom of contract between litigant and lawyer, and between the owner of a *chose in action* (q.v.) and any one who is willing to buy it. See MAINTENANCE.

CHAMPFLEURY, shăn'flē'rē'. The pseudonym of Jules Fleury-Husson (1821–89). A French novelist and miscellaneous writer, born at Laon. His early work was an essential, if an apparently accidental, contribution to the naturalistic movement in French fiction, though most of his novels are romantic. In these he appears as a quiet and genial observer of the follies of mankind, not a satirist of its vices.

In *Chien-Caillou* (1847), and especially in his best novel, *Les bourgeois de Molinchart* (1854), he forms a most interesting connecting link between Balzac in his *Scènes de la vie de province* and Flaubert (q.v.) in the epoch-making *Madame Bovary* (1856). Champfleury wrote also three volumes of *Etudes littéraires*, and a *Bibliographie céramique*, based on the collections of the porcelain manufactory at Sèvres, of which, in 1872, he was made custodian. Consult Troubat, *Souvenirs sur Champfleury et le Réalisme* (Paris, 1905). See REALISM AND NATURALISM.

CHAMPION (from ML. *campio*, combatant, from *campus*, [battle]field). In the judicial combats of the Middle Ages women, children, and aged persons were usually allowed to appear by deputy in the lists. Such a deputy was called a champion. Those who followed this profession were frequently of a low class and were regarded as disreputable and in case of defeat were liable to equal punishment with their clients. Sometimes they were obliged to wear a peculiar armor and dress of leather and were not allowed to fight on horseback. Champions are mentioned as early as the time of Charlemagne. A noble was not required to meet a plebeian, nor were the clergy allowed to enter the lists. In the age of chivalry the champion was a knight, who entered the lists in behalf of an injured lady, or child, or any one incapable of self-defense. The term "champion" was also applied to the knight who saw that no injury or insult was offered to ladies at tournaments. In England, formerly, on coronation day a knight fully armed would challenge all who denied the King's right to the throne. The custom, which dates back to William the Conqueror, became, in the time of Richard III, the hereditary right of the Dymoke family and was last observed at the coronation of George IV.

CHAMPION HILLS. A group of hills in Hinds Co., Miss., 20 miles east of Vicksburg, where, May 16, 1863, during the Civil War, a Federal force of about 15,000 (actually engaged), under General Grant, defeated a somewhat larger Confederate force under General Pemberton, the battle lasting about four hours, and the losses in killed, wounded, captured, and missing being about 2450 for the Federals and 5500 for the Confederates (Map: Mississippi, D 6).

CHAMPLAIN, shăm-plān'. A lake lying between Vermont and New York (Map: New York, G 1). It is 110 miles long and increases in width from ¼ of a mile in the south to 13 miles in the north. Its area is about 600 square miles, of which two-thirds is in Vermont. The northern extremity extends 6 miles into Canada. It is about 95 feet above the sea, has a maximum depth of some 300 feet, and is navigable for the largest vessels. It is drained at the north by the Richelieu River (q.v.), which empties into the St. Lawrence. It is connected with the Hudson by a canal from Whitehall. Its principal islands are those composing Grand Isle Co., Vt. Grand Isle, 12 miles long and 1 to 4 miles wide, contains two townships—Grand Isle and South Hero. North Hero, 14 miles long, 2 to 3 miles wide, and Isle La Motte, 6 miles long and 1 to 2 miles wide, are the other main islands of the group. Alburg Peninsula, about 12 miles long and projecting south from Canada into the lake, completes the territory of Grand Isle County. The general shore line is sinuous and offers many fine bays and bold promontories. The scenery in this region is beautiful. The Green Mountain Range (q.v.) lies about 20 miles east of the lake; on the west are the Adirondacks. The chief towns along the water line are Rouse Point, Plattsburg, Port Henry, Crown Point, and Whitehall in New York, and Burlington in Vermont. Lake Champlain receives the discharge of Lake George and of several small rivers. It was discovered by Samuel de Champlain in 1609, who gave it his own name. Its amphitheatre was the scene of much activity during the French and Indian War and also during the American Revolution. The Champlain Society, with headquarters at Toronto, has published important historical writings dealing with the history of New France. In July, 1909, a celebration in Lake Champlain in honor of the tercentenary of its discovery assumed an international character.

The Battle of Lake Champlain. The name given to a decisive naval engagement of the War of 1812, fought off the town of Plattsburg, on Sept. 11, 1814, between a British fleet under Capt. George Downie and an American squadron under Com. Thomas Macdonough. In July, 1814, a British army of about 11,000 men, under Sir George Prevost, undertook the invasion of New York, by the way of the western shore of Lake Champlain. To reënforce this movement it was necessary, however, to dispose of the small American fleet which was then at Plattsburg. In preparation for the coming naval battle, both sides increased their strength by the building of ships. On September 11 the British fleet entered Plattsburg harbor and assailed the American squadron, which was awaiting their attack at anchor. Macdonough had chosen an advantageous position, with his line of battle so disposed as to make it impossible for the enemy to turn either flank. The two fleets were about equally matched in fighting strength, the American squadron numbering 14 vessels of some 2250 tons, with 882 men and 86 guns; while the strength of the British comprised 16 vessels of 2400 tons, with 937 men and 92 guns. The advantage in training and seamanship was probably on the side of the British. The battle lasted about two and one-half hours and ended in a victory for the Americans. Owing to the close range at which the ships engaged, the loss was heavy on both sides, the Americans losing about 200, as against more than 300 for the British. As a result of the battle, the plan of British invasion by land was abandoned, and Prevost retreated in haste to Canada. The victory was also effective in hurrying on the close of hostilities. Consult: Roosevelt, *The Naval War of 1812* (New York, 1882); Johnson, *History of the War of 1812–15* (New York, 1882); Mahan, *Sea Power in its Relations to the War of 1812* (2 vols., Boston, 1905).

CHAMPLAIN, SAMUEL DE (1567–1635). A French explorer and colonizer, the founder of Quebec, and the most prominent figure in the early history of New France. He was born at Brouage, in Saintonge, the son of a ship captain; received a careful training in the principles of navigation and cartography; entered the army, and served in Brittany as quartermaster of cavalry under D'Aumont, Saint-Luc, and Brissac. In 1598 he accompanied his uncle, recently appointed pilot general of Spain, when the latter carried home from Blavet the Spanish soldiers who had served in France as allies of the Leaguers, and in January, 1599, he was placed in command of the *Saint-Julien*, which,

with several other vessels, started at that time for the West Indies. After an absence of more than two years, during which he visited various Spanish settlements in America, including Mexico City and New Granada, Champlain returned to France and made a careful report of his observations to Henry IV. This report, entitled *Bref discours des choses plus remarquables que Samuel Champlain a reconnu aux Indes Occidentales*, remains in manuscript at Dieppe and was not printed in the original until 1870, though an English translation was published by the Hakluyt Society in 1859. In it Champlain suggests the building of a canal across the Isthmus of Panama, "by which," he says, "the voyage to the South Sea would be shortened by more than 1500 leagues." In 1603 he accompanied the expedition sent out by Amyar de Chastes to choose a site for a proposed settlement, explored the St. Lawrence to the Lachine Rapids and the Saguenay for 30 or 40 miles, and soon after his return published a small work entitled *Des sauvages: ou voyage de Samuel Champlain de Brouage fait en la France Nouvelle*, which, together with his other works, has been of the utmost value to historians and gives an especially interesting account of the character and habits of the Indians. In the following year Champlain went to America with De Monts (q.v.), who, on De Chastes's death (1603), had secured the privilege of colonizing Acadia, and during the next three years, in the course of four separate voyages, explored the Bay of Fundy and the New England coast from the mouth of the St. Croix to Vineyard Sound, though he also spent much of his time during this period at the settlement which was established first at St. Croix and afterward at Port Royal, near the present Annapolis, Nova Scotia (q.v.). In 1607 he returned with the discouraged colonists to France, but in 1608 came again to America, this time as Lieutenant Governor (an office which he held until his death), and on July 3 began to lay the foundations of Quebec (q.v.).

In 1609 he accompanied a band of Montagnais, Huron, and Algonquin Indians on an expedition against the Iroquois, discovered the lake which bears his name, and on July 30, near the present Ticonderoga, was instrumental in defeating a band of Mohawks—an event of great historical importance, since it definitely committed France to the policy, probably adopted by Champlain, whereby the French endeavored, by antagonizing the Five Nations, to secure the alliance of the diverse tribes of Canada, while the Iroquois were impelled to unite first with the Dutch and afterward with the English. From 1609 until his death Champlain spent part of almost every year in France, zealously looking after the interests of the colony, and while in Paris in 1610 he married Mademoiselle Hélène Boullé, then only 12 years of age, who, however, did not come to Canada until 1620. In 1610 he again took an active part in a battle with the Iroquois, who had formed a barricade of trees near the Sorel, and in 1611 he established a temporary trading post on the site of the present Montreal. On the reorganization of the government of New France in 1612, he was reappointed Lieutenant Governor under De Soissons, and subsequently held this position under the Prince de Condé, the Duc de Montmorency, the Duc de Ventadour, and Cardinal Richelieu. In 1613, lured by the tales of one Vignau, who claimed to have found a great lake at the sources of the Ottawa and a salt sea not far distant, Champlain proceeded up the Ottawa as far as Allumette Island. Two years later he accompanied a band of Indians, known as "The Great War Party," on an expedition against the Iroquois, and, after a circuitous journey by way of the Ottawa, Lake Nipissing, Georgian Bay, Trent River, and Lake Erie, unsuccessfully attacked the great Seneca fortress, probably near the eastern end of Oneida Lake in New York. This was the last of his expeditions either for war or for exploration, and he passed the rest of his life for the most part in Quebec and in Paris. In 1619 he published a third volume, *Voyages et découvertes faites en la Nouvelle France, depuis l'année 1615 jusques à la fin de l'année 1618;* and in 1632 he issued his last work, *Les voyages de la Nouvelle France occidentale, dicte Canada, faites par le Sieur de Champlain Xainctongeois . . . et toutes les découvertes qu'il a faites en ce pais depuis l'an 1603 jusques en l'an 1629*, which is in part an abridgment of his three previous works relating to Canada. In July, 1629, he was forced to surrender Quebec to an English fleet under Gervaise Kirke, and, after being detained for some time as a prisoner in England, he went to France, whence, in 1633, he again came to Quebec (New France having been restored by England in the previous year), and there on Christmas Day, 1635, he died.

Bold and intrepid, farseeing and resourceful, tactful in his dealings with his white subordinates and his red allies, born to command, and thoroughly imbued with the spirit of adventure and discovery, he was the real founder of French power in America, and richly earned his title, "The Father of New France." "Of the pioneers of the North American forests," says Parkman, "his name stands foremost on the list. It was he who struck the deepest and boldest strokes into the heart of their pristine barbarism. . . . His character belonged partly to the past, partly to the present. The *preux chevalier*, the crusader, the romance-loving explorer, the curious knowledge-seeking traveler, the practical navigator, all found their share in him. . . . His books mark the man—all for his theme and purpose, nothing for himself. Crude in style, full of the superficial errors of carelessness and haste, rarely diffuse, often brief to a fault, they bear on every page the palpable impress of truth." In 1870 a complete edition of Champlain's works was issued under the editorship of Laverdière and Casgrain, as *Œuvres de Champlain, publiées sous le patronage de l'Université Laval* (6 vols., Quebec, 1870), and an English translation of the *Voyages* was published by the Prince Society, under the title, *Voyages of Samuel de Champlain, Translated from the French by Charles P. Otis, with Historical Illustrations and Memoir by Rev. E. F. Slafter* (3 vols., Boston, 1878–82), Grant (ed.). Consult also *Voyages of Samuel de Champlain, 1604–1618* (New York, 1907). For sketches of Champlain, consult: Dionne, *Champlain* (Toronto, 1905); Parkman, *Pioneers of France in the New World* (Boston, 1865); Winsor, *Narrative and Critical History of America*, vol. iv (8 vols., Boston, 1886–89); G. Gravier, *Vie de Samuel Champlain* (Paris, 1900); and an excellent, though brief, biography by Sedgwick in the "Riverside Biographical Series" (Boston, 1902); Dix, *Champlain, the Founder of New France* (New York, 1903); Colby, *Canadian Types of*

the Old Régime (New York, 1908); Gosselin, "Champlain et Hudson," *Proceedings, Royal Society of Canada*, 3d series, vol. iii (Ottawa, 1910); *Report, New York Lake Champlain Tercentenary Commission* (Albany, 1911); Hanotaux, *La France vivante en Amérique du Nord* (Paris, 1913). See CHAMPLAIN (lake).

CHAMPLAIN STAGE. A series of marine clays with interbedded sands and gravels found in the St. Lawrence and Champlain valleys that was deposited during Glacial time, when those valleys were occupied by arms of the sea. The beds were formed probably after the ice sheet had retreated northward into Canada. They mark a very considerable depression of the land surface in that section, since raised beaches of the clays are now observed at altitudes up to 500 feet or more above sea level. The Hudson valley was also lower at that time than it is now. Within the clays are found shells of marine organisms and bones of the whale and walrus. A very complete skeleton of a whale was unearthed at Burlington, Vt., and is now on exhibit in the State Capitol at Montpelier. The Champlain strata extend as far southwest as the eastern end of Lake Ontario.

CHAMP LEVÉ, shän' le-vā'. See ENAMEL.

CHAMPLIN, chămp'lĭn, JAMES TIFT (1811–82). An American educator. He was born in Colchester, Conn., graduated at Brown University in 1834, and entered the Baptist ministry. He was professor of ancient languages in Waterville College (now Colby College) from 1841 to 1857, and was president from 1857 to 1872. He published a number of college textbooks, including a *Text-Book of Intellectual Philosophy* (1860), *First Principles of Ethics* (1861), *Text-Book of Political Economy* (1868), *and Scripture Reading Lessons* (1876).

CHAMPLIN, JOHN DENISON (1834–1915). An American writer. He was born in Stonington, Conn., graduated at Yale in 1856, studied law in Litchfield, Conn., and was admitted to the bar in 1859. In 1862 he began newspaper work, and from 1865 to 1869 was editor of the Litchfield *Sentinel*. He edited *Fox's Mission to Russia* (1873), was one of the corps of editors of Appleton's *American Cyclopædia* (1873–77), and was one of the editors of the *Standard Dictionary* (1892–94). He also edited *Young Folks' Cyclopædia of Common Things* (1879); *Young Folks' Cyclopædia of Persons and Places* (1880); *Young Folks' Cyclopædia of Literature and Art* (1901); *Young Folks' Cyclopædia of Games and Sports*, with Arthur E. Bostwick (New York, 1890); *Young Folks' Cyclopædia of Natural History* (1905); *Cyclopædia of Painters and Paintings*, in collaboration with Perkins (4 vols., 1886–88); *Cyclopædia of Music and Musicians*, in collaboration with Apthorp (3 vols., 1888–90); and *Orations, Addresses, and Speeches of Chauncey M. Depew* (8 vols., 1910). In 1911 appeared his *The Tragedy of Anne Hutchinson* and *The Tragedy of Canonchet*.

CHAMPMESLÉ, shän'mā'lā', MARIE DESMARES (1642–98). A celebrated French actress, born in Rouen, and married in 1666 to Charles Chevillet de Champmeslé, who was an important comedian and playwright of his day. She had already begun her career in the provinces when she came with her husband in 1669 to the Théâtre du Marais in Paris. Her great reputation seems to have started with her acting of Hermione in *Andromaque* at the Hôtel de Bourgogne the following year. Racine was notoriously captivated by her charms, and the public appreciation of her acting was almost as enthusiastic. She and her husband went over in a few years to the Théâtre Grénégaud, and in 1680 at the union of the companies they became members of the new Comédie Française. During her brilliant career "La Champmeslé" created a large number of the famous rôles, among them Bérénice, Ariane, Phèdre, Vénus in *Les amours de Vénus et d'Adonis*, Atalide in *Bajazet*, Monime in *Mithridate*, Iphigénie in *Iphigénie en Aulide*, and the same character in *Oreste et Pylade*. She left the stage, in the vain attempt to restore her health at Auteuil, where she died.

CHAMPNEY, chămp'nĭ, BENJAMIN (1817–1907). An American landscape painter. He was born at New Ipswich, N. H., and studied in Boston and Paris. His best works are paintings of White Mountain scenery and flower pieces. He also painted a panorama of the Rhine, exhibited in Boston and other places, and wrote *Sixty Years' Memories of Art and Artists* (1900). His studio at North Conway was a noted resort, visited by people from all parts of the country.

CHAMPNEY, JAMES WELLS (1843–1903). An American genre and portrait painter. He was born in Boston and first studied wood engraving there, then went to Europe and studied at the Antwerp Academy and under Edouard Frère in Paris. His paintings include landscape and genre subjects, but he is best known for his excellent pastel portraits, among which are those of William Winter, Henry M. Stanley, and Mary Mannering as "Daphne." His etchings and illustrations were also very popular. His wife, ELIZABETH WILLIAMS CHAMPNEY (1850–), is the author of the "Witch Winnie Books," the series of "Vassar Girls Abroad," *Romance of the Feudal Châteaux* (1900), and many other works.

CHAMPNEYS, chămp'nĭz, BASIL (1842–). An English architect and author. He graduated at Trinity College, Cambridge, and studied architecture as a pupil of John Prichard of Llandaff, built the divinity and literary schools at Newnham, the Archæological Museum at Cambridge, Indian Institute (New College), Mansfield College (Oxford), Butler Museum (Harrow), the Quincentenary Buildings (Winchester College), Rylands Library (Manchester), Bedford College, and many churches and schools. The royal medal for 1912 was presented to him by the Institute of British Architects. His publications include *A Quiet Corner of England* (1875) and *Coventry Patmore, Memoirs and Correspondence* (1900).

CHAMPOLLION, shän'pô'lyôN', JEAN FRANÇOIS (1790–1832). A French Egyptologist. He was born Dec. 23, 1790, at Figeac, Department of Lot. He is often called Champollion le Jeune, in distinction from his brother Champollion Figeac, a professor at Grenoble, who educated him. In 1807 he went to Paris to pursue his various Oriental studies, and in 1809 was appointed professor of history at the lyceum of Grenoble. In 1814 he published *L'Egypte sous les Pharaons*, a study of the geography of ancient Egypt. Afterward he essayed the decipherment of the Egyptian hieroglyphics to which the discovery of the Rosetta stone had attracted widespread interest. His brilliant results were first communicated in his *Lettre à Monsieur Dacier* to the public (1822), and were more fully stated in his *Précis du système hiéroglyphique* (1824).

It is now generally recognized that the attempts to ascribe priority in the decipherment of hieroglyphics to Dr. Thomas Young, and even to charge Champollion with plagiarizing Young's discoveries, were entirely unjust. Champollion worked independently, and in any case Young's results published in 1819 were of slight importance as compared with those obtained by Champollion. Champollion was sent by the French government to study the museums of Italy in 1824, and in 1828 to Egypt, where he joined a Tuscan expedition, headed by Rosellini. After his return he became a member of the French Académie des Inscriptions (1830), and in 1832 professor of Egyptology at the Collège de France. His premature death was doubtless due to constant overwork. His genius and his untiring industry are most clearly shown in his posthumous works. His *Grammaire égyptienne* (1836) and his *Dictionnaire hiéroglyphique* (1841) were both unfinished at his death. His *Notices manuscripts* (1844 et seq.), at first in incomplete form, gives a more adequate idea of the results of his Egyptian journey than the more extensive *Monuments de l'Egypte*, published 1835 et seq. Of the numerous books and essays published during his lifetime, the most noteworthy are: *Panthéon égyptien* (1824); *Sur l'écriture hiératique* (1821); *Sur l'écriture démotique* (1824). After Champollion's death Egyptology retrograded temporarily, and much time was wasted in fruitless disputes on the merits of Champollion's system. At present no one doubts the enormous debt of gratitude owed by science to the great decipherer, whose system has been brilliantly confirmed by modern discoveries, although it has been greatly developed and improved in matters of detail. Consult Aimé Champollion, *Les deux Champollion, leur vie et leurs œuvres* (Grenoble, 1888).

CHAMPOLLION, Jean Jacques (1778–1867), usually called Champollion Figeac. A distinguished French archæologist, elder brother of J. F. Champollion, the founder of Egyptology. He was born at Figeac, in the Department of Lot, Oct. 5, 1778. After completing his collegiate studies, he was for a time librarian and afterward professor of Greek at Grenoble. In 1828 he was appointed keeper of manuscripts in the Royal Library in Paris, and 20 years later became librarian at Fontainebleau. He was at the same time professor in the Ecole des Chartes. He died May 9, 1867, in his eighty-ninth year. Champollion first published a number of works on French history and philology. Among them were: *Antiquités de Grenoble* (1807); *Recherches sur les patois ou idiomes de France* (1809); *Nouveaux éclaircissements sur la ville de Cularo, aujourd'hui Grenoble* (1814). Then, at his brother's suggestion, he turned his attention to Egyptian archæology, limiting his studies, however, to the Greek documents bearing upon the subject. His *Annales des Lagides* (1819, with *Supplément*, 1821) was crowned by the Institute, and he published later, utilizing his brother's manuscript collections, *L'Egypte ancienne et moderne* (1840) and *L'écriture démotique égyptienne* (1843). Among his other works are: *Traité élémentaire d'archéologie* (2d ed., 1843); *Histoire des peuples anciens et modernes, l'Asie centrale, l'Inde, et la Chine* (1857); *Monographie du palais de Fontainebleau* (1859–64); *Documents paléographiques relatifs à l'histoire des beaux-arts et des belles-lettres pendant le moyen âge* (1868). Champollion also collaborated actively in editing the manuscripts left by his brother. Consult Aimé Champollion, *Les deux Champollion, leur vie et leurs œuvres* (Grenoble, 1888).

CHAMPS ELYSÉES, shän'zā'lē'zā'. The fashionable promenade of Paris—a magnificent avenue, extending from the Place de la Concorde to the Arc de Triomphe de l'Etoile, about 1⅓ miles. It was laid out in 1616 by Marie de' Medicis. The lower end forms a park, on either side of which are placed the Palais de l'Elysée, built in 1718 for Count d'Evreux, and the two Palais des Beaux-Arts, occupying the site of the old Palais de l'Industrie. The afternoon concourse of carriages is one of the sights of Paris. The lower end of the avenue abounds in cafés chantants and restaurants. Though a pleasure promenade, the shifting of the commercial centre of Paris to the west is slowly driving the residential section away from this avenue.

CHANAK KALESSI, chā-näk' kä'lĕs-sē', or Kale Sultanie (sometimes called Dardanelles) (Turkish, Pot Castle). The chief town of the Sanjak of Bigha in Asiatic Turkey, situated on the Dardanelles (Map: Turkey in Asia, B 2). It is of considerable strategical importance, and is the seat of the Turkish defenses of the straits and islands of the Mediterranean. It has a well-developed pottery industry and a population of about 10,000. The Trojan War is supposed to have been waged in the surrounding country.

CHANAR, chā-när', or **ESPINAL,** ā'spē-näl'. Names applied to the thorny xerophytic (dry region) thickets of Argentina. See Thicket.

CHANCE (OF. *cheance*, from ML. *cadentia*, fall, from Lat. *cadere*, to fall). A word which in its original and strict meaning may be defined as the causelessness of an event. (See Causality.) But with the growing insight into the universal prevalence of causality, chance in this sense of the term is in most scientific and philosophical circles no longer regarded as possible. The word continues to be used in a different sense, viz., the unknown cause of an event. The cause may be entirely unknown, or unknown only in detail. In either case there is a lack of predictability, and in so far as an event is unpredictable it is said to be due to chance. The only case where chance is still believed in as the absence of causality is the case of volition. (See Determinism; Free Will.) The unpredictable event is itself called an accident, sometimes also itself a chance. See Probability.

CHANCE, Julie Grinnell (Julien Gordon). An American novelist, born in Paris, France. She was married to Col. S. Van Rensselaer Cruger, and after his death to Wade Chance (in 1908). Under the pen name of "Julien Gordon" she wrote many novels displaying much insight into social conditions in the United States and European countries: *A Wedding and Other Stories; A Diplomat's Diary; Poppœa; A Successful Man; Eat not thy Heart; Mademoiselle Reseda; A Puritan Pagan; Mrs. Clyde* (1901); *The Wage of Character* (1901); *World's People* (1902); and a volume of *Poems* (1905).

CHAN'CEL (OF., from ML. *cancellus*, screen, Lat. *cancelli*, grating, dim. of *cancer*, lattice). The end of the church opposite the entrance, so called from the *cancellus* which in the Roman basilica screened the judicial tribune from the rest of the edifice. Usually in fact, and always in ritual, the east end, the choir end, was called

the chancel because it was divided from the body of the church by a screen or rail which marked the beginning of the part reserved for the clergy. In Roman Catholic churches the screen was usually not high except in monastic churches and Gothic cathedrals, but in Greek and Russian churches it completely shuts off the spectator (see ICONOSTASIS), as it did also in many mediæval English churches. The division was made sometimes so as to include the place for singers in the nave, sometimes it divided off only the altar and what was behind it to the end of the apse. In fact, it was used in England as practically synonymous with choir. A chancel aisle is the aisle or ambulatory of the choir. See APSE; BASILICA; CHOIR; CHURCH; REREDOS.

CHAN'CELLOR (OF. *chanceler*, Fr. *chancelier*, Lat. *cancellarius*, porter, doorkeeper, from *cancelli*, lattice). Under the later Roman emperors the chancellor was an usher or officer whose duty it was to stand at the railing or latticework (*cancelli*) to protect the judicial officer from the crowding of the people and to act as intermediary between him and those having business with the court. Upon the breaking up of the Roman Empire the officer of the crown in both the Eastern Empire and the Roman-German Empire and the kingdoms of the West, whose duty it was as notary or scribe to prepare and seal all important documents, was known as a chancellor. His position was one of great influence, and he became the chief officer of the crown. The office was also adopted by the ecclesiastical court at Rome as an inheritance from the Roman Empire, and the office was in turn created in the several bishoprics, each diocese having its chancellor. In France the chancellor was an officer of state of great power and dignity. He was charged with the care of the great seal; he presided over the King's councils, and under him several other officers bearing the name of chancellor were employed in the administration of justice and the preservation of public order. During the Revolution the office was abolished (1790). It was revived by Napoleon I, though deprived of many of its functions. It was continued by the Bourbons, but finally, in 1848, merged with the Ministry of Justice. The chief functionary of the Austrian Empire and of other European states has often been termed "chancellor," and on the establishment of the German Empire Bismarck, as the Prime Minister and chief administrative officer, was made Chancellor of the Empire (Reichskanzler), an office which has been continued in his successors.

In England the chancellor, known as the Lord Chancellor or Lord High Chancellor, is the highest judicial officer of the crown, the law adviser of the government and the Keeper of the Great Seal. The existence of the office in England, as in the other states of Europe, is to be ascribed to the influence of the constitution of the Roman Empire, this influence being exercised chiefly through the medium of the Church. In the early history of the office the chancellor was always an ecclesiastic and the confidential adviser of the sovereign in state affairs. It is for this reason that he has been called the keeper of the King's conscience, and it is to this peculiar method of exercising his judicial functions upon equitable or conscientious, as distinguished from purely legal, principles that the Court of Chancery (q.v.), over which he presided, became of the highest importance in English jurisprudence. The Lord High Chancellor is the highest civil officer of the crown, ranking next after the royal family and the Archbishop of Canterbury. The chancellor is a privy councilor by his office, a member of the cabinet, and prolocutor, or presiding officer in the House of Lords, by prescription. The writs for the convocation of Parliament are issued in his name. Though the form in which his tenure of office is terminated is by the resumption of the Great Seal by the sovereign, the chancellor practically resigns office with the party to which he is attached. He has the appointment of all justices of the peace throughout the kingdom, but this privilege he exercises generally on the recommendation of the Lords Lieutenants of the several counties. But the most important and, as it now seems, somewhat anomalous branch of his patronage arises out of his having been originally an ecclesiastic. Though the last bishop who held the office was John Williams, Archbishop of York, who was Lord Keeper from July 10, 1621, to Nov. 1, 1625, the chancellor still continues to be patron of all the crown livings of the value of £20 per annum, or under, and visitor of all hospitals and colleges of the King's foundation. As representing the paternal character of the sovereign, again, the chancellor is the general guardian of all infants, idiots, and lunatics, and has the supervision of all charitable trusts in the kingdom. The chancellor appoints in general all the judges of the superior courts, except the two Chief Justices, who are nominated by the Prime Minister of the day. All these functions the chancellor performs in addition to his extensive duties as the supreme judge of the Court of Chancery, both as an ordinary court of common law and of record and as an extraordinary court of equity. Much inconvenience had arisen from the accumulation of duties in the single person of this high dignitary, and various expedients had been devised for lessening the evil. Vice chancellors had been appointed, and the duties of the Master of the Rolls had been extended. One of the most important changes effected by the Judiciary Acts (1874–75) was the consolidation of all the vice chancellors' courts into one division, called the "Chancery Division of the High Court" under the presidency of the Lord Chancellor. The salary of the chancellor is £10,000 a year, and he has an annuity of £5000 on his retirement from office. The style of the chancellor, since the union with Scotland, has been Lord High Chancellor of Great Britain; but he has scarcely any jurisdiction in Scotland, and in Ireland there is a separate chancellor, having powers in most respects the same as those of the chancellor of Great Britain. To slay the chancellor is treason under 25 Edw. III, c. 2.

The *Chancellor of the Exchequer* is the Minister of Finance under the British government. He is a member of the cabinet and of the House of Commons. Formerly he was a judge ex officio of the Chancery Division of the Court of Exchequer, but the equity jurisdiction of the Court of Exchequer was transferred to the Court of Chancery by Statute of 5 Viet. V, since which he has had no judicial functions. See CURIA REGIS; EXCHEQUER.

The *Chancellor of the Duchy of Lancaster* is an officer who formerly presided over the courts of law and equity in the Duchy of Lancaster.

He is a member of the cabinet. The office is now a sinecure.

In several of the United States the term "chancellor" has been applied to the chief judicial officer of the Court of Chancery when such court has been maintained as a distinct court from the courts of common law. In several of the States the judges of law courts have been given equity jurisdiction, thus doing away with the separate Court of Chancery. The title has not been used in New York since 1848, when the law courts of that State were given equity jurisdiction. The court and title still exist in Delaware, New Jersey, and some other States. (See CHANCERY; EQUITY.) In Oxford and Cambridge the title "chancellor" is bestowed on the honorary head of the university, usually some person of distinction. He has little or no connection with university administration, which is in the hands of the vice chancellor, chosen from among the heads of the colleges. In the United States chancellor is used in a few instances for president, to designate the head of an educational institution.

In the ecclesiastical use of the term the *chancellor of a cathedral* is a dignified official, usually a canon, who superintends the arrangements for the celebration of the religious services. His office is quite distinct from that of the *chancellor of a diocese*, who is vicar-general to the bishop, and an ecclesiastical judge appointed to assist the bishop in questions of ecclesiastical law and hold his courts for him.

CHANCELLOR, CHARLES WILLIAMS (1833–). An American physician, born in Virginia. He was educated at the University of Virginia and practiced medicine at Alexandria. During the Civil War he was medical director on the staff of General Pickett. In 1868 he was appointed professor of surgery in the Washington College of Maryland, and from 1893 to 1897 was United States Consul at Havre, France. He is the author of: *Charitable Institutions of Maryland* (1875); *Mineral Water and Seaside Resorts* (1883); *Drainage of the Marsh Lands of Maryland* (1884); *Heredity* (1886); *Sewerage of Cities* (1886).

CHANCELLOR, RICHARD (?–1556). An English navigator, who in 1550 was the companion of Roger Bodenham on his voyage to Candia and Chios. In 1553 he was appointed pilot general of the northern expedition under Sir Hugh Willoughby, the purpose of which was primarily to seek a northeast passage to China. During a hurricane off the Lofoden Islands the ships were scattered. The *Edouard Bonaventure*, under Chancellor, alone entered the White Sea, landing near the present site of Archangel. From here Chancellor proceeded to Moscow, where he was well received by the Czar, with whom he succeeded in negotiating a treaty of commerce, and shortly afterward the Muscovy Company was established. Chancellor and his crew were shipwrecked and drowned while returning from a second voyage to Russia in 1556.

CHANCELLOR, WILLIAM ESTABROOK (1867–). An American lecturer and author, born at Dayton, Ohio. He was educated at Amherst College and Harvard Law School, and in 1895–96 was instructor in history at Erasmus Hall High School, Brooklyn, N. Y. He served as superintendent of schools at Bloomfield, N. J., in 1897–1904, at Paterson, N. J., in 1904–06, in the District of Columbia in 1906–08, and then at Norwalk, Conn. He lectured on more than 3000 occasions in 42 States, and at Chicago, Wooster, George Washington, Johns Hopkins, and Northwestern universities. His works include: *Mathematical Series* (10 vols., 1902); *American History* (1903); *Graded City Spellers* (1903); *Evening School Text Books* (5 vols., 1904–11); *Our Schools* (1904); *Washington Word List* (1906); *A Theory of Education* (1907); *Our City Schools* (1908); *Class Teaching and Management* (1910); *Our Presidents and their Office* (1911); *The Life of Silas Wright* (1913).

CHANCELLOR OF THE EXCHEQUER. See EXCHEQUER.

CHAN'CELLORSVILLE, BATTLE OF. One of the most important battles of the Civil War, fought May 2–4, 1863, at Chancellorsville, Va., 11 miles west of Fredericksburg, between the Federal Army of the Potomac, numbering about 130,000, under General Hooker, and the Confederate Army of Northern Virginia, numbering about 60,000, under General Lee. Hooker had superseded Burnside on January 26, and by the middle of April had succeeded in thoroughly reorganizing his army, restoring its *morale*, and

CHANCELLORSVILLE.

preparing it for action. At this time the Federal and Confederate armies lay facing each other across the Rappahannock at Fredericksburg. Hooker resolved to turn the Confederate left flank, first sending nearly all his cavalry, under Stoneman, to destroy Lee's communications with Richmond. The main movement began on April 27, when Hooker sent a portion of the army, under Sedgwick, to distract Lee's attention by crossing below Fredericksburg, while the main force effected a crossing above the town. This movement was successfully executed, and during the night of April 30 the main force was concentrated at Chancellorsville, on Lee's left flank. Lee then turned to face Hooker, and on May 1 the latter timidly drew in his advance and placed himself on the defensive. Early on May 2 Lee ordered Jackson, who had been stationed on his extreme right, with 30,000 men, to make a wide détour, and, swinging round to the extreme right of the Federal position, make an unexpected assault upon the enemy's flank. The direction of this movement was not apparent to the Federals, who began to regard it in the nature of a retreat. About 6 P.M., after a march of some 15 miles, Jackson fell suddenly upon the flank and rear of Howard's corps, which constituted the right flank of the Federal army, and, taking it by surprise, stampeded it. Jackson, while in advance of his troops, was fired upon and mortally wounded by his own men, who mistook his escort for a

detachment of Federals. During the progress of this movement Lee sought to divert the attention of Hooker by a lively demonstration on his front. On the morning of May 3 Lee made a vigorous attack on front and flank, in which Jackson's force, now commanded by Stuart, played a leading part. The brunt of the assault fell upon General Sickles, on the Federal right, and General Slocum, at the centre. Hooker, who was stunned by the impact of a ball on a pillar against which he was leaning, showed indecision; Sickles, who had stayed Stuart's fierce onslaught, fell short of ammunition; some 30,000 fresh troops were not called into action; and at last the Federal line gave way, the army, however, falling back only a short distance to a strong defensive position. Lee was deterred from immediately following up his advantage by the news that his position was threatened on the right by the advance of the Federal force under Sedgwick. At night, on May 2, Hooker had sent word to Sedgwick to advance on Chancellorsville from Fredericksburg. On May 3 Sedgwick attempted to execute the order and capture Fredericksburg and the heights behind it. Lee sent reënforcements which checked his advance, and on the night of May 4–5 Sedgwick recrossed the Rappahannock. Lee then prepared to advance against Hooker on the 5th, but the latter hastily withdrew his army across the river during a heavy storm. In the four days, May 1–4, the Federals had lost about 17,300 in killed, wounded, and missing; the Confederates about 12,465. Lee had clearly outgeneraled Hooker at every point, and had won an important victory with greatly inferior forces; but his success was almost counterbalanced by his loss of Jackson. Emboldened by this victory and the apparent demoralization of the Federal army, he planned his invasion of Pennsylvania, which ended in the battle of Gettysburg (q.v.). Consult: Dodge, *The Campaign of Chancellorsville* (Boston, 1881); Doubleday, *Chancellorsville and Gettysburg* (2d ed., New York, 1882); Johnson and Buel (eds.), *Battles and Leaders of the Civil Law*, vol. iii (4 vols., New York, 1887); *Official Records*, vol. xxv (Washington, 1889).

CHANCE MEDLEY (Eng. *chance* + *medley*), and CHAUD MEDLEY, or MELLÉ (OF. *chaude*, hot + *medlée*, fray). French expressions borrowed by the Scottish law. Though sometimes used interchangeably, they are, in reality, distinct in meaning—the former signifying a casual affray, the latter an affray in the heat of blood or passion. Both are, in the United States and in most countries, recognized as pleas in mitigation of the offense of homicide (q.v.). See also DEFENSE; SANCTUARY.

CHAN'CERY (Fr. *chancellerie*, It., ML. *cancelleria*, from *cancellarius*, chancellor, from Lat. *cancelli*, lattice), COURT OF. In English law, the court presided over by the Lord High Chancellor, and until recently the highest court in England, inferior only to Parliament. Originally a chancery was the office of a secretary or chancellor (q.v.), where official documents were put in form, sealed, and dispatched, or filed as records.

The jurisdiction of the Court of Chancery was developed subsequently to the establishment of the English courts of law, and consisted of that portion of the King's judicial prerogative in civil causes which he had not delegated to the courts of law. Whenever, in the early history of the common law, a suitor conceived that he had suffered an injury or wrong for which the courts of law afforded no remedy by means of a common-law writ (q.v.), his only recourse was to petition the crown. These petitions came to be addressed to the chancellor, who, as the chief officer and adviser of the crown and Keeper of the Great Seal, was deemed to be a personal representative of the King and thus endowed with his judicial prerogative. The practice of obtaining relief in this manner gradually took on the character of a judicial proceeding, and the chancellor's office, or chancery, came to be known as the Court of the Chancellor or the Court of Chancery, or, in modern times, as the Court of Equity (q.v.). To this peculiar origin of chancery jurisdiction are due several peculiarities in the manner in which jurisdiction is exercised which are fundamental in equity jurisprudence. Thus, as the chancellor was the personal representative of the King, his authority was personal. It could be exercised at any time, whether in term time or vacation, and at any place in the kingdom. Unlike the judges of the courts of law, he could command an act to be or not to be done. As, by virtue of his office, his commands were the commands of the sovereign, he who refused obedience was guilty of contempt of the King, and his disobedience was punishable by imprisonment; and, as an ecclesiastic, the chancellor could invoke the power of the Church and punish the contempt by excommunication. By reason of these powers of the chancellor, the Court of Chancery became a court acting in personam, as distinguished from courts of law, which acted in rem.

The common-law procedure was founded on the theory that the parties to an action owed no obedience to the court. Thus, if the plaintiff brought an action at law to recover property wrongfully withheld from him by the defendant, or to recover damages for tort or breach of contract, the court could give judgment for the plaintiff, and then by its writ direct the sheriff to seize the property and deliver it to the plaintiff or levy upon the defendant's property and then satisfy the judgment; but if the defendant concealed the property of the plaintiff or his own, or removed it from the jurisdiction, the court of law was powerless to act. On the other hand, the Court of Equity, in a proper case, could direct the defendant to perform his contract, or to turn over property to the plaintiff, or to do any act required by justice or the necessities of the case. It followed, from the difference in the character of the jurisdiction that was exercised by the two courts, that while the relief afforded by the court of law was necessarily remedial, the relief afforded in chancery might be, and frequently was, preventive. Thus the court of law had no power to restrain a defendant from doing an act which might injure the plaintiff in the future, but the chancellor, by reason of his power to command, might issue an injunction directing the defendant to refrain from such an act.

Another important consequence of the difference in kind of jurisdiction exercised by the two courts was the ability of the chancellor to deal with a many-sided controversy. A controversy at law was necessarily two-sided. The law court could only find a verdict and direct a judgment for either the plaintiff or the defendant; but, inasmuch as the chancellor might

require obedience to his decrees on pain of punishment for contempt, it was possible for him, in a single proceeding, to determine and adjust the rights of numerous parties, not only as between plaintiff and defendant, but as between those who, nominally codefendants, actually had some controversy among themselves. As recourse to the chancellor was originally due to the inability of the litigant to obtain relief at law, it became a fundamental principle of the Court of Chancery that it would take jurisdiction of the cause only when it appeared that there was no adequate remedy at law. Moreover, as the chancellor was originally an ecclesiastic and the "keeper of the King's conscience," he was said to exercise his jurisdiction on conscientious or equitable principles, for the purpose of doing justice, without regard to the strict rules of the common law. This gave rise to certain basic equitable principles unknown to the law, which, however, when once established by precedent, were applied by the Court of Equity in much the same manner that courts of law applied legal principles.

Upon these principles chancery, as do our modern courts of equity, afforded relief in cases of fraud (q.v.) and mistake (q.v.). It compelled defendants before it to give discovery (q.v.), administered trusts, etc., all matters of which courts of law took no cognizance. It also obtained an administrative jurisdiction over the affairs of married women, infants, and insane persons, by virtue of the chancellor representing the King in his administrative capacity.

Thus there grew up with the common law a great legal system which, while consistent with and, indeed, supplementary to it, was largely independent of it. Its office was to mitigate the rigor of the rules of the common law and supply its deficiencies, and this it was able to do because of the manner in which it exercised its jurisdiction. The jurisdiction of the Court of Chancery is (*a*) coördinate, (*b*) supplementary, and (*c*) exclusive.

Jurisdiction is said to be coördinate when the litigant has his election to seek relief at law or in chancery. Hence, for breach of contract the plaintiff has the alternative of recovering damages at law; or, if legal damages are inadequate, securing specific performance of the contract by decree of the chancellor.

The jurisdiction of chancery is said to be supplemental when, for the purpose of protecting rights recognized and enforced by courts of law, it confers and enforces new equitable rights; thus the right of the mortgagor to redeem mortgaged property and of the mortgagee to foreclose in equity, and, in a similar manner, the exercise of its jurisdiction over waste (q.v.), are typical examples of the supplemental jurisdiction of chancery. (See MORTGAGE.) The jurisdiction of chancery is exclusive when its powers are exerted in protecting purely equitable rights—i.e., rights which are recognized in chancery, but of which the law takes no cognizance. The most notable example is the jurisdiction exercised in chancery over uses and trusts (q.v.).

Before 1873 the constitution of the Court of Chancery in England consisted of the Lord High Chancellor, the Master of the Rolls, and three vice chancellors. In that year an act was passed by which the Court of Chancery became one division of the High Court of Justice, retaining only its equity jurisdiction, its ordinary jurisdiction being transferred to other divisions of the court. This forms an important part of that "fusion of law and equity" under the Judicature Acts (1873–76), which has so simplified and made orderly the practice of English courts.

In the United States the terms "court of chancery" and "chancery" are used in some States as equivalent to "courts of equity" and "equity." The principles and practice of equity were generally transferred to this country as they existed in England; but in most of the States there are no separate courts of chancery, the same judge sitting, according to the nature of the case, either as a common-law or equity court. A few States, however, instituted courts of chancery under that name; these were Alabama, Delaware, Florida, Mississippi, New Jersey, Tennessee, and Vermont. As early as 1848 the State of New York not only abolished the distinction between courts of equity and common law, but did away with the old forms of practice in both.

Many of the States have followed this reform. By the United States Constitution, Federal courts are especially given jurisdiction in equity as well as in common law, and the distinction between procedure at law and equity has been maintained, though both systems are administered by the same courts. Consult: Kerly, *Historical Sketch of the Equitable Jurisdiction of the Court of Chancery* (Cambridge, Eng., 1890); Gilbert, *History and Practice of the High Court of Chancery* (London, 1758; first Amer. ed., Washington, 1874); Marsh, *History of the Court of Chancery and of the Rise and Development of the Doctrines of Equity* (Toronto, 1890). See EQUITY; EQUITY PLEADING; PRACTICE.

CHANCES, THE. A comedy by John Fletcher, first printed in the folio edition of 1647. It was altered by George Villiers, Duke of Buckingham, in 1682; but "the licentiousness of that nobleman's pen rendering the play improper for representation" at later and more refined periods, it was revised a second time by Garrick in 1773. Its source is Cervantes' novel *La Señora Cornelia*. A musical drama entitled *Don John, or the Two Violettas*, produced in 1821, was based on it.

CHANDA, chŭn'dȧ. The capital of a district of the same name, in the Nagpur division, Central Provinces, British India (Map: India, C 4), lat. 19° 57′ N., long. 78° 58′ E. The town stands on the left bank of the Virâi, near its junction with the Jharpat, 90 miles south of the town of Nagpur. Its walls, built of cut stone and surrounded by a high parapet, are 6 miles round, from 15 to 20 feet high, 10 feet thick, and flanked with rough towers large enough for the heaviest guns. Its archæological remains, temples, regal tombs, and gigantic monolithic figures of the later Gond kings are interesting. Being surrounded by mountains and forests, it is well supplied with water. Outside the walls is a large water tank constructed under Gond rule, and a collection of ancient statuary known as Rayappā's idols, the largest of which is 26 × 18 × 3 feet. Pop., 1901, 17,803; 1911, 19,866. Chanda is the commercial centre of the district with manufactures of silk, cotton, dyestuffs, slippers, bamboo work, and gold and silver work. It has numerous schools and a mission station. The district contains considerable iron and coal deposits. Area, 10,156 square miles. Pop., 1891, 697,600; 1901, 581,315; 1911, 677,544.

CHANDÂLA, chŭn-dä'lȧ (Skt. *caṇḍâla*).

The lowest of the impure classes in Hindu caste. See CASTE.

CHANDELEUR (shăn'de-lo͝or') **ISLANDS.** A group of about 15 small islands lying in the Gulf of Mexico from 20 to 30 miles off the east coast of Louisiana, from which mainland they are separated by Chandeleur Sound (Map: Louisiana, G 4). A lighthouse on the north end of the northernmost island is in lat. 30° 2′ N. and long. 88° 52′ W.; it has a fixed white light.

CHANDERNAGAR, or **CHANDERNAGORE,** chŭn'dĕr-nŭg'ĕr (Skt. *candranagara,* city of the moon, from *candra,* moon + *nagara,* city). A city in India with a territory of about 3 square miles, belonging to France, situated on the west bank of the Hugli, 21 miles above Calcutta by rail, in lat. 22° 52′ N. and long. 88° 23′ E. (Map: India, E 4). A former rival to Calcutta in commercial importance, its trade has declined owing to the silting of its river approaches. It is under the French Governor-General of Pondicherry. The population (1901, 26,831) includes a French subgovernor with a small military detachment, and a few Europeans and Eurasians, the great bulk being natives. The settlement dates from 1673. It was taken three times by the English, but was finally restored to France in 1816.

CHAND'LER, CHARLES FREDERICK (1836–). An American chemist, born at Lancaster, Mass. He was educated at the Lawrence Scientific School of Harvard University and at the universities of Göttingen and Berlin. After being director of the chemical department of Union College, Schenectady, N. Y. (1857), he was appointed professor of chemistry in the New York College of Pharmacy (1858). In 1864 he became professor of analytical and applied chemistry in the School of Mines, Columbia University, and in 1876 he was appointed to the chair of chemistry and medical jurisprudence in the College of Physicians and Surgeons. In 1865 he became chemist, and in 1873 president, of the Board of Health of the City of New York. He was president of the American Chemical Society in 1881 and 1889, of the British Society of Chemical Industry in 1899, and of the Chemists' Club in 1899–1900. In association with his brother, Prof. W. H. Chandler, of Lehigh University, he, in 1870, established the monthly publication entitled the *American Chemist* (1870–77). His numerous papers, most of which are published in the above-mentioned journal and in the annual reports of the Health Department of New York, include: *Report on Waters for Locomotives and Boiler Incrustations* (1865); *Chemistry of Gas Lighting* (1876); *Dangerous Kerosene; Lecture on Water* (1871); *Photo-Mechanical Processes* (1890); *Report on Dangerous Cosmetics* (1870); *Report on Petroleum as an Illuminator* (1871); *Report on the Waters of the Hudson River* (1872); *Synopsis of Organic Chemistry* (printed for the class of '65, Union College, Schenectady, 1864); *Manual of Qualitative Analysis* (pamphlet, 1873). Among the numerous reforms introduced during the administration of Professor Chandler were the segregation of slaughterhouses and the passage of the Tenement House Act, providing that the plans of every tenement house must first be submitted to the Board of Health.

CHANDLER, FRANCIS' WARD (1844–). An American architect, born in Boston. He worked with Ware and Van Brunt, architects, in 1864–67, and after that studied in Paris for two years. In 1869–70 he was assistant in the architectural department of the Massachusetts Institute of Technology, and in 1871–74 assistant architect in the Treasury Department, Washington. For six years he was in partnership with E. C. Cabot, Boston, in 1888 becoming professor of architecture at the Massachusetts Institute of Technology. Besides editing *Municipal Architecture in Boston* (1898) and writing articles for the *Technology Quarterly,* he is author of *Construction Details* (1892) and *Notes on Limes, Cements, Mortars, and Concretes* (1892).

CHANDLER, SETH CARLO (1846–1913). An American astronomer, born in Boston, Mass. He was long attached to the Harvard Observatory; was awarded the gold medal of the Royal Astronomical Society of London in 1896 for his determination of the laws of the variations of latitude or movements of the earth's pole and his researches on variable stars, of which he has prepared a catalogue. He was elected a member of the National Academy of Sciences in 1888 and is the inventor of the instrument known as the almucantar (q.v.). In 1896 he assumed the editorship of the *Astronomical Journal.*

CHANDLER, WILLIAM EATON (1835–1917). An American politician. He was born in Concord, N. H., and graduated at the Harvard Law School in 1854. He was Speaker of the New Hampshire Legislature in 1863–64, and was First Assistant Secretary of the Treasury under Secretary McCulloch from 1865 to 1867. He was Secretary of the Navy from 1882 to 1885, and it was during his administration that the building of the modern navy was begun. He was United States Senator from New Hampshire in 1887–1901, when he became president of the Spanish Treaty Claims Commission, and was a member of the New Hampshire Constitutional Convention in 1902.

CHANDLER, ZACHARIAH (1813–79). An American merchant and politician. He was born at Bedford, N. H., was educated in a common school, and in 1833 removed to Detroit, Mich., where he became a wealthy and prosperous dry-goods merchant. He was an active member of the Whig party and in 1851 was elected mayor of the city. In 1852 he was nominated for Governor, but was defeated. He took an active part in the organization of the Republican party, and in 1857 was sent to the United States Senate, where he soon became conspicuous as a radical opponent of all schemes for the extension of slavery. When the Civil War broke out, he was one of the foremost advocates of a vigorous prosecution of hostilities, and urged that 500,000 volunteers instead of 75,000 be called for at the start. He was reëlected to the Senate in 1863 and again in 1869; served as Secretary of the Interior in the cabinet of President Grant from 1875 to 1877; was chairman of the Republican National Committee in 1876, taking an active part in the presidential campaign; and in February, 1879, was again elected to the Senate, where he soon attracted general attention by a virulent attack on Jefferson Davis. He died suddenly in Chicago, whither he had gone to make a political speech. He was a man of great force and of unusual administrative capacity, but excited widespread antagonism by his radicalism in politics and his unscrupulousness. See his *Life* by W. E. Curtis (New York, 1879).

CHANDOGYA, chŭn'dō-jī'â. In Hindu literature, the name of a Brāhmana of the Sāmaveda, in 10 books, of which the eight known in Europe

up to the present day form the important *Chandogya Upanishad*, treating of the values of the sacred syllable Om. It has been translated by Müller in vol. i of the *Sacred Books of the East*.

CHANDOS, chăn'dŏs, Sir John (?–1370). An English soldier. He participated in the siege of Cambrai (1337) and in the battles of Crécy (1346) and of Poitiers (1356). In the last-named engagement he saved the life of the Black Prince and for this was rewarded by being made regent and lieutenant of the English King in France. Having been made Constable of Guienne, he won the victories of Auray (1364) and Navarette in Spain (1369) over Du Guesclin, whom he captured each time. He became Seneschal of Poitiers in 1369, but in the next year was mortally wounded in an engagement near the bridge at Lussac. Chandos was one of the original knights of the Order of the Garter.

CHANDRAGUPTA, chŭn'drà-gōōp'tà. See Sandrocottus.

CHA'NEY, Lucian West (1857–). An American biologist, born at Heuvelton, N. Y. Educated at Carleton College, he spent three years as principal and superintendent of schools in Minnesota, and then returned to Carleton to be instructor in biology in 1882 and professor from 1883 to 1908. In 1907 he became a special agent of the United States Bureau of Labor to investigate dangerous occupations of women and children, and in 1909 was appointed the bureau's expert in industrial hygiene. He also explored Rocky Mountain glaciers and was a delegate to various economic and geographic congresses.

CHAN'FRON, or Chan'frain. See Chamfron.

CHANGARNIER, shän'gär'nyâ', Nicolas Anne Théodule (1793–1877). A French general, born at Autun. He was educated at the military school of Saint-Cyr, entered the army, and took part, in 1823, in the Spanish expedition. In 1830 he went as captain to Algeria, where he distinguished himself and rose to the rank of general of division. After the revolution of 1848 he superseded Cavaignac (q.v.) as Governor of Algeria, but when chosen a member of the National Assembly he returned to Paris in the same year and was appointed commander in chief of the National Guard, and, when Louis Napoleon became President, of the troops in Paris. He was a member of the Assembly and held at the same time his double office in the army, until the coup d'état of December, 1851, when he was exiled. He returned to France in 1859 after the proclamation of general amnesty. On the outbreak of the Franco-German War Changarnier offered his services to the government, but they were rejected by Marshal Lebœuf, the Minister of War. In August, however, the Emperor asked him to join the army of Bazaine. He assisted in the defense of Metz and was employed by Bazaine in the negotiations with Prince Frederick Charles which led to the capitulation of Bazaine's army, on Oct. 27, 1870. He returned to France in 1871 and served in the Assembly until 1873, when he participated in the proceedings which caused the downfall of Thiers. In 1875 he voted against the constitutional law recognizing the Republic, and in the Senate, of which he was made a life member, in the same year, he showed himself an enemy of Republican institutions. He died in Paris, Feb. 14, 1877.

CHANG-CHOW, chäng'chou'. The capital of the Department of Chang-chow, Fu-kien, China, on the Kiu-lung estuary, 35 miles west of Amoy (Map: China, E 7). It is a walled city, inclosed within a circuit of 4½ miles, and has broad granite-paved streets with fine stores. The chief building is a Buddhist temple, dating from the eighth century. A wooden bridge nearly 800 feet long, resting on 25 stone piles, spans the river. The town has manufactures of silk, sugar, crystal, and bricks, and carries on an extensive domestic and export trade in tea and sugar. Pop. (est.), between 900,000 and 1,000,000.

CHANGELING. It was at one time a common superstition that infants were taken from their cradles by fairies, who substituted for them their own weakly and starving elves. The children so left were called *changelings* and were known by their peevishness as well as their backwardness in walking and speaking. As it was supposed that the fairies had no power to change children that had been christened, infants were carefully watched until that ceremony had been performed. This superstition is alluded to by Shakespeare, Spenser, and other poets.

CHANGELING, The. A drama, by Middleton and Rowley, produced in 1623 and published in quarto in 1653. After the Restoration, in 1661, it was successfully revived. It is in great measure founded on an episode in Reynolds's *The Triumphs of God's Revenge*.

CHANGE-OF-DAY LINE. See International Date Line.

CHANGO, chäŋ'gô. An Indian tribe living in the rainless coast region bordering upon the desert of Atacama, northern Chile; their territory formerly included the region between 22° and 24° S. lat., particularly the country about Cobija. Their language, now extinct, constituted, apparently, a distinct stock. Consult Boman, *Antiquités de la Région Andine*, vol. i, pp. 67–73 (Paris, 1910), and Chamberlain, in *Journ. de la Soc. des Amér. de Paris*, N. S., vol. vii, p. 183 (1910).

CHANGRA. See Goat.

CHANG-SHA, chäng'shä'. Capital of the Chinese Province of Hu-nan, situated on the Sian-kiang, about 350 miles north of Canton (Map: China, D 6). It is surrounded by a wall and has an important silk industry. Pop., 1911 (est.), 250,000.

CHANK SHELL (Hind. *śankh*, from Skt. *śankha*, conch shell). The top-shaped shell of any of several gastropod mollusks of the genus

1. Chank Shell. 2. Arm of Vishnu, with Chank Shell.

Turbinella, specifically *Turbinella pyrum*. They are obtained chiefly by diving in water 12 or 15 feet deep, along the coasts of southern India and Ceylon, the chief fishery being at Tuticorin,

on the Gulf of Manar, where about 325,000 are obtained each winter, and are chiefly sent to Dacca. They are much used as ornaments, often elaborately carved, by Hindu women, the arms and legs being encircled with them; and many of them are buried with the bodies of opulent persons. This esteem among the Hindus is due to the fact that the shell is a sacred emblem of Vishnu, who is usually represented as holding one.

CHAN'LER, WILLIAM ASTOR (1867–). An American politician and traveler, born in Newport, R. I. After extensive foreign tours he undertook, with Chevalier Ludwig von Höhnel, the exploration of the region east and west of Mount Kenia in Africa. They left Zanzibar in September, 1892, and reached the coast again in July, 1893. Their experiences and scientific work on this trip Chanler embodied in his book, *Through Jungle and Desert* (1896). Upon his return to the United States he entered political life and became a member of the New York State Legislature, from the fifth assembly district in 1897, and from the fourteenth in 1899. He served with special commendation from Shafter, general in command, in the battles before Santiago, Cuba (July 1–2, 1898).

CHANNEL. See ENGLISH CHANNEL.

CHANNEL OF A STREAM. The hollow or depression between the banks through which the water flows. A river may have several channels in parts of its course. In such a case the main channel has been defined by judicial authority to be "that bed of the river over which the principal volume of water flows." It may or may not be coincident with the deepest water or the best currents for navigation. See RIPARIAN RIGHTS; RIVER.

CHANNEL, or **CHANNELING** (OF. *chanel,* from Lat. *canalis,* groove, connected with Skt. *khan,* OPers. *kan,* to dig). The name given to any concave grooving of architectural features. Its most common occurrence is on the shafts of classic columns. It is usual to distinguish the shallow channels on a Doric column, which are separated by *arrises* or sharp edges, from the narrower and deeper "flutes" of Ionic and Corinthian columns, which are separated by narrow fillets. The triglyphs of a Doric frieze are decorated by two vertical channels of V-section, and two half-channels or chamfers at the edges. Many Roman and Renaissance cornices have the face or front of the corona adorned with vertical flutes or channelings, and during the late Empire and early Christian periods, sarcophagi were sometimes covered with a decoration of curious S-shaped channels. See COLUMN; ARCHITECTURE; DORIC ORDER; IONIC ORDER.

CHANNEL BASS. A sciænid fish. See REDFISH.

CHAN'NELBILL'. A large Australian cuckoo (*Scythrops novæ-hollandæ*), having a very large and curiously grooved beak, so that it was long considered a species of hornbill. See Plate of CUCKOOS.

CHANNEL CAT. See CATFISH.

CHANNELING MACHINES. See QUARRYING.

CHANNEL ISLANDS (Fr. *l'Archipel de la Manche,* the Channel Archipelago). A group of islands geographically connected with France, but politically attached to the United Kingdom, in the English Channel, to the west of the peninsula of Cotentin. The islands lie 10 to 30 miles distant from the Normandy coast, and 50 to 120 miles south of the English coast (Map: France, N., C 3). They include Jersey, Guernsey, Alderney, and Sark, and a number of islets. Their combined area is about 75 square miles.

Famous for their strategic position, history, antiquities, genial climate, and picturesque and varied scenery, they constitute favorite and fashionable resorts for English, French, and even American invalids and tourists. The small and highly cultivated farmholdings, ranging from 5 to 12 acres, and the good military roads, give the islands the appearance of carefully laid-out pleasure grounds, and gained from Victor Hugo, long a resident, the designation of "gardens of the sea." The principal industry is agriculture. The soil produces good crops; horticulture and floriculture flourish, potatoes are extensively cultivated for exportation, the annual yield in Jersey exceeding 60,000 tons, valued at $1,320,000, while Guernsey supplies London and Paris with enormous quantities of fruit, grown under glass. The chief fertilizer is *vraic,* or seaweed, the regular gathering of which, controlled by legislation, is one of the characteristic insular scenes. A large quantity of kelp is used in the manufacture of iodine, its value to Guernsey being estimated at $150,000 annually. The three larger islands are noted for distinctive breeds of cattle, the purity of each breed being jealously guarded; they are remarkable for their small size, symmetry, color, and beauty, and for the yield and quality of their milk, making dairy farming a profitable industry. Cattle in 1912 numbered 18,853; horses, 3726; swine, 8466. There are important fisheries of turbot, John Dory, conger eels, oysters, lobsters, monster crabs, etc. The quarries of Jersey and Guernsey are extensively worked and export fine granite for building purposes. There is daily communication by steamer with various English and French ports, and an average of 3000 vessels of 200,000 gross tonnage enter and clear the Channel Islands ports annually.

The geology of the islands is particularly interesting in the primary formation of granite rocks; vegetation is rich and varied, and scientists here find a comprehensive field of study in a small compass. The coasts are rocky and dangerous and the tidal currents treacherous; lighthouses stand on the more important headlands and outlying reefs. The population, April 3, 1911, was 96,900. The chief town is St. Helier, on the island of Jersey. Among the farming population the vernacular is old Norman French, which differs in peculiarities of spelling and pronunciation in each island and even in parishes of the same island. English predominates in the town districts, which contain a large proportion of British and many French residents. The islands are self-governed and afford interesting examples of home rule, forming, as Freeman states, "distinct commonwealths." They include the two bailiwicks of Jersey and Guernsey—the latter including Alderney, Sark, Herm, and adjacent isles—each presided over by a "bailiff" or chief magistrate of native extraction appointed by the British crown, and assisted by a "states" or legislative assembly, composed of "jurats" or magistrates, the rectors of the parishes, all life officers, the "constables" or parochial mayors, and a number of "deputies" or representatives elected for a term. Judicial affairs are managed by a royal court, consisting of the bailiff and jurats, who

thus fill the anomalous dual positions of lawmakers and law dispensers. The British government is represented by lieutenant governors, generally army officers of distinction, who are appointed for five years, command the military forces in the islands, have the right of veto and an equal seat with the bailiff in the States Assembly, but no vote. French is the official language of the legislatures and courts, but after long opposition the optional use of English has been allowed. There are also ecclesiastical courts. Taxation is light, living is inexpensive. Military service at fixed periods is compulsory on all male natives and residents.

The laws of the islands are derived from the *Coutumier de Normandie*, the islands having once formed part of the Duchy of Normandy. They are the sole remains of that duchy, attached to the British crown, whence their independence and the humorous local contention that Great Britain is an appanage of the Channel Islands, legal documents referring to the monarch as Duke of Normandy and King of Great Britain and Ireland. The islands originally were joined to the continent; raised beaches and other traces of disruption exist. Cave dwellings and numerous megalithic cromlechs, tumuli, and menhirs prove the habitation of a prehistoric race; a few old Norman chapels remain; the oldest churches, St. Brelade's, Jersey, and St. Sampson's, Guernsey, date from 1111, and earthworks, fortifications, and castles dating from Roman and subsequent periods exist. The Romans occupied the islands during the third and fourth centuries; Cæsarea (Jersey), Cæsar's Isle, and Sarnia (Guernsey) occur in the *Itinerary* of Antoninus. Christianity was introduced by Irish missionaries about 460 A.D., St. Helier being the apostle of Jersey and St. Sampson of Guernsey. The islands were taken by Rollo previous to his invasion of Normandy; the famous *Roman de Rou*, by Wace (q.v.), a native of Jersey, who wrote in the twelfth century, celebrating his deeds.

After the Conquest the islands alternated between Norman and English rule until 1204, when with the loss of Normandy they remained faithful to England and steadfastly resisted many subsequent attempts on the part of France to capture them. In Henry VI's reign the French held part of Jersey for six years. During the Civil War they were the scene of many notable events, Jersey remaining loyal and Episcopal, and Guernsey republican and Presbyterian. During the Revolutionary War in America a French expedition landed in Jersey in 1781, but was defeated with great loss. During the French and American wars, when shipbuilding was an important local industry, the islanders fitted out many privateers, and, in Burke's words, became "one of the naval powers of the world," capturing many rich prizes. The islands are favorite asylums for political refugees. Their numbers have included Charles II, Earl Clarendon, Victor Hugo, and General Boulanger. Consult: Urquhart, *Channel Islands, Norman Law* (London, 1844); Pegot-Ogier, *Histoire des îles de la Manche* (Paris, 1881); Ansted, *The Channel Islands* (3d ed., London, 1893); De Cléry, *Les îles normandes* (Paris, 1898); Boland, *Les îles de la Manche* (Paris, 1904). See ALDERNEY; JERSEY; GUERNSEY; SARK.

CHANNEL TUNNEL. See TUNNELS.

CHAN'NING, EDWARD (1856–). An American historian, born in Dorchester, Mass., and in 1878 graduated at Harvard, where he was instructor in history in 1883, assistant professor in 1887, and professor in 1897. He wrote: *Town and County Government in the English Colonies of North America* (1884); *The United States of America* (1896), in the "Cambridge (Eng.) Historical Series"; *A Student's History of the United States* (1897; rev. ed., 1908); *A Short History of the United States for School Use* (1900), and *History of the United States*, vols. i–iii (1905, 1908, 1912); *The Jeffersonian System, 1801–1811* (1906), in the "American Nation Series." He collaborated with Justin Winsor in vols. ii, vi, and vii of the *Narrative and Critical History of America* (1886–88), with T. W. Higginson in *English History for Americans* (1893), with A. B. Hart in the *Guide to the Study of American History* (1896), and with A. B. Hart and F. J. Turner in a new edition of this work in 1912.

CHANNING, EDWARD TYRREL (1790–1856). An American scholar, the brother of William Ellery Channing. He was educated at Harvard and began the practice of law in Boston, but devoted his attention chiefly to literature. From 1817 to 1819 he edited the *North American Review* and was a regular contributor to it through a large part of his life. He was professor of rhetoric and oratory in Harvard College from 1819 to 1851. A volume of his lectures was published in 1856 with a memoir by R. H. Dana.

CHANNING, WILLIAM ELLERY (1780–1842). An American Unitarian preacher and author. He was born April 7, 1780, in Newport, R. I., entered Harvard at the age of 15, and took his degree in 1798. He taught for two years in Richmond, Va., and then studied divinity. In 1803 he was ordained minister of Federal Street Church in Boston. During the earlier years of his ministry his theological peculiarities had little prominence in his discourses, and in consequence he stood upon friendly terms with his brethren in more orthodox churches. In 1819, however, he preached a sermon at the ordination of the Rev. Jared Sparks, in which he pointed out the inadequacy of the Calvinistic theology then current, and advocated the Unitarian doctrine with so much zeal and ability that he was termed "the apostle of Unitarianism." This involved him in a controversy, a thing which he naturally loathed. To the end of his life he preserved a devoutly Christian heart, shrinking with the delicate instinct of a refined nature from everything cold, one-sided, and dogmatic, whether Unitarian or Trinitarian. As late as 1841 he wrote, "I am little of a Unitarian, have little sympathy with the system of Priestley and Belsham, and stand aloof from all but those who strive and pray for clearer light." In 1822 he visited Europe and made the acquaintance of several English authors, among them Wordsworth and Coleridge, both of whom were strongly impressed in his favor. Coleridge said of him: "He has the love of wisdom and the wisdom of love." In 1823 he published *Remarks on National Literature;* in 1826, *On the Character and Writings of John Milton;* in 1829, *On the Character and Writings of Fénelon;* in 1835, an essay on *Negro Slavery*, strongly opposing it from the moral point of view; and in 1838 an essay on *Self-Culture*. Besides these he wrote a variety of other essays and treatises, all characterized by vigor, eloquence, pure taste, and a lofty tone of moral earnestness. He died, Oct. 2, 1842, at Bennington, Vt. His complete works

have been several times reprinted (e.g., in 1 vol., Boston, 1903). In an age of mental timidity Channing stood forth conspicuous for his intellectual bravery. But more important than his purely theological speculations was the public exercise of a wide influence on his contemporaries in regard to social and philanthropic questions and the organization of charity, in the interest of peace, of temperance, and of education, the ethics of political life, and the question of slavery. In the last-named matter, while never taking the extreme abolition position, he gave much moral support to the movement; and in concert with Emerson and other great intellectual leaders, was a great factor in the strenuous New England life of the middle of the nineteenth century. An interesting memoir of him was published by his nephew, William Henry Channing (3 vols., London, 1848, and reprinted in Boston, 1880). A bronze statue of him by Herbert Adams was unveiled in the Public Garden of Boston in 1903. Consult Chadwick, *W. E. Channing* (Boston, 1903), and Eliot, *Four American Leaders* (Washington, Franklin, Emerson, and Channing) (Boston, 1906).

CHANNING, William Ellery (1818–1901). An American journalist, poet, and essayist, a nephew of the great Unitarian preacher of the same name. He was born in Boston, was educated at Harvard, and was for many years connected with various newspapers and magazines. He published volumes of poems, and in prose: *Youth of the Poet and Painter; Thoreau, the Poet-Naturalist* (1873); *Conversations in Rome between an Artist, a Catholic, and a Critic* (1847).

CHANNING, William Henry (1810–84). An American Unitarian clergyman and author. He was born in Boston, Mass., May 25, 1810, and was a nephew of William Ellery Channing. He graduated at Harvard in 1829, at Cambridge Divinity School in 1833, and was ordained and installed over the Unitarian church in Cincinnati in 1835. After filling several pastorates in the United States, he succeeded (1857) James Martineau as minister of the Hope Street Unitarian Chapel, Liverpool, England. At the commencement of the Rebellion he returned (1862) and took charge of the Unitarian church in Washington, D. C. He was one of the early supporters of the socialistic movement in this country, was editor of the *Present* and the *Harbinger*, and in 1848 presided over a socialistic association in Boston. He was a prolific writer, contributing to the *North American Review*, the *Dial*, the *Christian Examiner*, and other serials. Among his larger works are a translation of Jouffroy's *Ethics* (1840); *Memoir of* [his uncle] *William Ellery Channing* (3 vols., 1848); *Memoir of* [his cousin] *the Rev. James H. Perkins* (1851); *Memoir of Margaret Fuller Ossoli* (in conjunction with Emerson and J. F. Clarke) (1852). He died in London, Dec. 23, 1884. For his life, consult O. B. Frothingham (Boston, 1886).

CHANSON DE ROLAND, shăn'sôn' de rō'läN' (Fr., song of Roland). The best-known and oldest of the extant French *chansons de geste* (q.v.); the type of the class in its best and purest form. It was written demonstrably not later than 1095, possibly as early as 1066. The supposed author's name is given in the text as Turoldus, but he was probably a Norman from Avranches. The poem, which consists of about 4000 lines, deals with the death of Roland at Roncesvalles, and its avenging by Charlemagne. The "Chanson de Roland" lost its vogue in France at an early date, its place being taken by the Breton romances. It never took root in England, but flourished in Germany and in Italy, where Boiardo and Ariosto used its theme. The only ancient manuscript still preserved, dating probably from 1170, is in the Bodleian Library at Oxford. It was first edited in modern times by Michel (Paris, 1837), but more recent scholars have added much to our knowledge. Consult especially the editions by Müller (Göttingen, 1878), Léon Gautier (Tours, 1872 et seq.), and Stengel (Heilbronn, 1878); Seelmann, *Bibliographie des altfranzösischen Rolandsliedes* (Heilbronn, 1888); Gaston Paris, *La poésie du moyen âge* (1885–1906); Gustav Gröber, *Grundriss der römanischen Philologie* (Strassburg, 1904); Léon Gautier, *Les épopées françaises* (1892); P. A. Becker, *Gründriss der altfranzösischen Litteratur* (1907); W. M. Hart, *Ballad and Epic* (1907); C. H. C. Wright, *History of French Literature* (London, 1912); Edmund Stengel, *Das altfranzösische Rolandslied* (1900).

CHANSONS DE GESTE or **GESTES,** zhĕst (Fr., songs of achievement or adventure). The name generally given by scholars to the large and important class of epic poems which sprang into existence in France in the latter part of the tenth century or the beginning of the eleventh. The history of their origin is obscure, and there is no evidence for the existence of preceding ballads out of which they were compiled. The earlier ones are written in decasyllabic iambic lines, arranged in groups (called in French *laisses* or *tirades*) of varying number, connected by assonance or vowel rhyme, the consonants of the final syllables not being the same. This assonance was soon replaced by rhyme, and the 10-syllable line about 1200 by the 12-syllable, or Alexandrine, which is said to take its name from the poem "Alexandre le Grand," by Alexandre de Bernay and Lambert le Tors. Their subject is uniformly French history, treated in a romantic spirit, and generally centring around Charlemagne as the epic hero. As their name implies, they were composed, not to be read, but to be sung or recited. About 110 of them are preserved, averaging 6000 lines apiece. Excepting the oldest and best known, the "Chanson de Roland" (q.v.), and the thirteenth-century "Fierabras," the following, all of the twelfth century, are the best in the judgment of the most competent critics: "Aliscans," "Amis et Amiles," "Antioche," "Berte aux grans Piés," "Garin le Loherain," "Gerard de Roussillon," "Huon de Bordeaux," "Ogier de Danemarche," "Raoul de Cambrai," and the "Voyage de Charlemagne à Constantinople." Consult: Léon Gautier, *Les épopées françaises* (2d ed., 4 vols., Paris, 1878–94); id., in Petit de Julleville, *Histoire de la langue et littérature française* (Paris, 1896–98); Rajna, *Le origini dell' epopea francesca* (Florence, 1884); Saintsbury, *The Flourishing of Romance and the Rise of Allegory* (New York, 1897); G. Paris, *Histoire poétique de Charlemagne* (Paris, 1865). See French Literature; Trouvère; Jongleur.

CHANT (Fr. *chant*, from Lat. *cantus*, from *cancre*, to sing). A form of choral music between singing and recitative and especially used for litanies and psalms in the Roman Catholic and Protestant Episcopal services. The chant is the ancient style of church song, certainly as old as Christianity, which seems to have inherited it from the Jewish church. The ancient Persians

chanted or intoned their religious hymns, the Gâthâs (q.v.); St. Paul exhorts believers to sing (to chant) psalms and hymns and spiritual songs; and Pliny the Younger mentions the early morning assembling of Christians to chant hymns to Christ. As rhymed and metrical hymns, now so common, were the product of a later art, so the tunes accompanying them are modern as compared with chants. See AMBROSIAN CHANT; GREGORIAN CHANT; PLAIN CHANT.

CHANT, MRS. LAURA ORMISTON (1848–). An English reformer, composer, and writer, born at Chepstow. She was at various times a teacher, nurse, student of medicine, dress reformer, and crusader against London music halls. Subsequently she became known as a speaker on various social and literary themes, and at the time of the Græco-Turkish War (1897) took bands of nurses to Crete and to the Greek frontier. She visited the United States in 1896, and in many public addresses told what she was doing and purposed to do for the betterment of society in general and women in particular. Her publications include: *Sellcuts' Manager* (novel); *Verona and Other Poems;* several short stories; many pamphlets on temperance, politics, purity, and economic reform; some hymns; and the songs: *Ode to a Skylark* (words by Shelley); *Toddlekin's Songs; Thistledown Action Songs; Galloping Horses Action Songs;* and *The Prodigal* (1907).

CHANTAL, shän'tàl', JEANNE FRANÇOISE FRÉMYOT, BARONESS DE (1572–1641). The founder of the Order of the Visitation. She was the daughter of Benigne Frémyot, President of the Parliament of Burgundy, and in her twentieth year married Christophe de Rabutin, Baron de Chantal. While out shooting, he was accidentally killed in 1600. In 1604 his widow met St. Francis de Sales and passed under his spiritual direction. At his suggestion, in 1610, she joined two other pious women in a community, and, when it was confirmed as the Order of the Visitation, made the solemn vows, adding a special one always to choose, in a doubt between two actions, that which tended the more towards perfection. She died at Moulins, was buried at Annecy, and was canonized by Clement XIII in 1767. Her festival is August 21. See VISITATION, SISTERS OF.

CHANT DU DÉPART, shän' dụ dā'pär', LE (Fr., song of departure). A song of the French Revolution with words by Marie Joseph Blaise Chénier, music by Méhul. It was composed for the fête on the fifth anniversary, July 14, 1794, of the taking of the Bastille. This was the only French national air written during the Reign of Terror, and when sung it created as great an effect as the Marseillaise (q.v.).

CHANTECLER, shän't'-klär'. A fantastic play by Edmond Rostand, produced in Paris in 1910. Under the guise of a farmyard scene, it is a bitter satire on modern society. Chantecler, the cock who imagines he rouses the sun, typifies man, the earnest idealist, beguiled by the Pheasant, the fascinating woman, and scorned and persecuted by the other animals, who represent the malicious and selfish elements of society. See CHANTICLEER.

CHANTELOUP, COUNT DE. See CHAPTAL, JEAN ANTOINE.

CHANTEPIE DE LA SAUSSAYE, shän't'-pē' de là sō'sā'. See LA SAUSSAYE.

CHANTERELLE, shän't'-rĕl'. See MUSHROOM.

CHAN'TICLEER (OF. *Chantecler,* name of the cock in the Renart epic, from *chanter,* Lat. *cantare,* to sing + *cler,* Lat. *clarus,* clear). An imaginative name for a cock. It occurs both in Old French and Middle English. The cock in the mediæval version of Æsop, *Reynard the Fox* (q.v.), goes by this name, as does also the barnyard hero of Chaucer's *Nun's Priest's Tale,* who "had in his governance seven hennes," one of which "was cleped faire Damoselle Pertelote."

CHANTILLY, shän'tē'yē'. A town of France in the Department of Oise, about 23 miles north-northeast of Paris (Map: France, N., H 3). Its environs are very picturesque, and the place derives additional interest from its two châteaux surrounded by a magnificent park, both of which belonged to the Condé family from 1632 to 1830. The smaller of the two châteaux is of more recent construction and is regarded as one of the finest specimens of French Renaissance. The older and larger château under Louis II, Prince of Condé, was made famous by the presence of the most brilliant men of its time, La Fontaine, Racine, Molière, La Bruyère, and Boileau, and with its splendid art collections is now, through the gift of the Duc d'Aumale, who built it in 1830, in the possession of the Institut de France. The forest of Chantilly, 5000 acres, is near by. Chantilly lace was once a byword, but the manufactures have fallen off. Chantilly is also a horse-racing centre, with a fine course, and noted for the three annual race meetings held here. Pop. (commune), 1901, 4791; 1911, 5556. Consult "Le Château de Chantilly," in *Revue de l'art ancien et moderne,* vol. iii (Paris, 1898).

CHANTILLY, shăn-tĭl'lĭ. A post village in Fairfax Co., Va., 20 miles west of Washington, where, during a furious thunderstorm on Sept. 1, 1862, after the second battle of Bull Run (q.v.), an indecisive engagement occurred between a part of Pope's army under Generals Hooker, Reno, and Kearny, and two divisions of Lee's army under General Jackson. On the following day the Federal troops were withdrawn to the fortifications about Washington. Each side lost heavily, and among the Federal dead were Generals Isaac I. Stevens and Philip Kearny.

CHANTREY, chăn'trĭ, SIR FRANCIS LEGATT (1781–1842). An English sculptor. He was born at Norton, Derbyshire, April 7, 1781, where he first studied art. He began as a portrait painter, but in 1804 removed to London and, after studying modeling at the Royal Academy, rapidly gained great popularity through his portrait busts. In 1818 he was elected to the Royal Academy for his bust of Benjamin West, and in 1819 to the academies of Florence and Rome. In 1830 he was appointed court sculptor and in 1835 he was knighted. Chantrey was a typical representative of the academic classical school, and was greatly overestimated by his contemporaries. In his portrait busts he seized the most characteristic and pleasing expression of his sitter, and his statues are not without a certain dignity, though somewhat tame. His children are full of grace and tender sentiment. His chief claim to fame, however, is the "Chantrey bequest," a fund of 150,000 pounds which he made to the Royal Academy "for the purchase of British works of art." Among his important works are the

colossal busts of Howe, Duncan, St. Vincent, and Nelson for the Seaman's Hospital, Greenwich; portrait busts of Pitt (Trinity House, London), Scott, Wordsworth, James Watt, and others; the charming tomb of the two children of the Rev. W. Robinson in Lichfield Cathedral; the monuments of Watt, Canning, and Sir John Malcolm in Westminster Abbey; the statues of George III in the London Guildhall and the younger Pitt in Hanover Square; and the equestrian statues of George IV in Trafalgar Square and Wellington before the Royal Exchange. Consult the biographies by Jones (London, 1849) and Raymond (London, 1904).

CHANTRY (OF. *chanterie*, ML. *cantaria*, chantry, from Lat. *cantare*, frequentative of *canere*, to sing). A foundation to provide masses for the repose of the soul of the patron or his friends, or the chapel or altar in a church where such service was performed. Legislation against chantries began under Henry VIII in 1545, when they were dissolved by law and the property given to the King; but, the law being inoperative, another Act was passed under Edward VI in 1547, which had the desired effect, and the King entered into possession of the funds, which amounted to a large sum, as at the time there were 1000 such foundations in England, with certain very carefully ordained exceptions. The text of this important Act is found in Henry Gee's *Documents Illustrative of the History of the English Church*, pp. 328–357 (London, 1896). Private chapels erected with such bequests or gifts are numerous in England, having served, since the Act of 1547, as family chapels for attendance at the regular worship. Some of those of the fifteenth century are highly ornate.

CHANUTE, chă-nōōt'. A city in Neosho Co., Kans., 126 miles south-southwest of Kansas City, Mo., on the Atchison, Topeka, and Santa Fe, and the Missouri, Kansas, and Texas railroads (Map: Kansas, A 4). The extensive repair shops of the former railroad are situated here, and there are a number of manufacturing plants of importance, all operated by natural gas, and including glassworks, brick and cement plants, smelters, drilling-tool works, flour mills, and oil refineries. An extensive oil and gas district surrounds the city, nearly 2000 oil and gas wells having been drilled. The city owns and operates its gas and electric-light plants and water works. Settled in 1872, Chanute was incorporated in 1873, and adopted the commission form of government in 1912. Pop., 1900, 4208; 1910, 9272; 1920, 10,286.

CHANZY, shăn'zē', Antoine Eugène Alfred (1823–83). A French soldier, born at Nouart (Ardennes). He studied at the military school of Saint-Cyr, received a commission in the Zouaves, served in Algeria, and rose to the rank of major. He fought in the Lombardy campaign of 1859 and participated in the Syrian expedition of 1860–61. Commissioned general of brigade, he remained in Algeria until the outbreak of the Franco-Prussian War. Suspecting him of contributing to the press, the government refused his request for a brigade command, but in October he obtained from the Government of National Defense the command of a division, and soon after of the Sixteenth Corps of the Army of the Loire. In December he became commander in chief of the Second Army of the Loire (known also as the Army of the West), and distinguished himself in the stubborn retreat from Beaugency to Laval. Upon the conclusion of the armistice he was elected to the National Assembly, and in 1872 was appointed commander of the Seventh Army Corps. From 1873 to 1879 he was Governor of Algeria, and in 1875 was elected a life senator. In 1879 he received a third of the total vote at the presidential election and in 1880–81 was Ambassador at St. Petersburg. He was probably the most prominent figure in the French resistance to German invasion. He published *La deuxième armée de la Loire* (1871). Consult the biographies by Chuquet (Paris, 1884) and Villefranche (Paris, 1890).

CHAO-CHAU, chou'chou'. A town in the Province of Kwang-tung, China, 15 miles north of the treaty port of Swatow (Map: China, E 7). Pop., 1898 (est.), 200,000.

CHAOS, kā'ŏs (Lat., from Gk. *χάος, chaos*, abyss, from *χαίνειν, chainein*, to yawn, *χάσκειν, chaskein*, to gape). In the ancient cosmogonies, the original infinite space, which was filled with clouds and darkness, from which sprang all things that exist. It gave birth to Erebus and Night, and, as a cosmic form, was the mother of Eros. In the later poets and philosophers the word *chaos* was applied to the confused, shapeless mass out of which the universe was formed into a *cosmos*, or harmonious order. *Chaos* was sometimes used also with reference to the universe as a whole, or to the space between heaven and earth, or to the lower world.

CHAPACU'RAN. An important South American Indian linguistic stock, massed chiefly on the rivers Mamoré, Machupo, Báures, Guaporé, and Blanco in northeast Bolivia, and including the following: Chapacura (or Tapacura; also called Huachi), Quitemoca, Pawumwa, Napeca, and Iten—possibly also, according to De Créqui-Monfort and Rivet, the Rocorona and the Mure. The relationship of the Pawumwa and Iten to Chapacura was simultaneously determined by Rivet and Chamberlain in 1912. Consult Chamberlain, "The Pawumwa Indians," in *American Anthropologist*, N. S., vol. xiv, pp. 632–635 (1914), and De Créqui-Monfort and Rivet, "La famille linguistique Capacura," in the *Journal de la Société des Amér. de Paris*, N. S., vol. x, pp. 119–171 (1913).

CHAPAIS, shà'pâ', Joseph Amable Thomas (1858–). A Canadian legislator and writer. He was born at St. Denis de la Bouteillerie, P. Q., and was educated at Ste. Anne's College and at Laval University, where he graduated in 1879. In the same year he was called to the bar. In 1879–84 he was private secretary to the Lieutenant Governor of Quebec. He edited *Le Courier du Canada* (city of Quebec) during 1884–1901. In 1892 he was appointed a member of the Legislative Council, of which he became Speaker in 1895. In 1893 he was a member without portfolio of the cabinet of Louis Olivier Taillon (q.v.) and was Minister of Colonization and Mines in 1897, in which year he retired from office and was appointed professor of history in Laval University. In 1902 he was made a chevalier of the Legion of Honor. He published: *Les congregations enseignantes et le brevet de capacité* (1893); *Discours et conférences* (1898); *Le serment du roi* (1901); *Jean Talon, intendant de la Nouvelle France* (1904); *Mélanges de polémique et d'études religieuses, politiques et littéraires* (1905); *Le Marquis de Montcalm, 1712–1759* (1911).

CHAPALA (chà-pä'là) **LAKE.** The largest

lake in Mexico, situated in the State of Jalisco, in lat. 20° 15′ N. and long. 103° W. (Map: Mexico, G 7). It lies at an altitude of about 6000 feet and covers an area of about 1400 square miles. Its chief tributary stream is the Río Lerma, which enters from the east, and its outlet is the Río Santiago, which leaves the lake on the north side, a few miles west of the mouth of the Río Lerma. The lake contains a number of islands. Few towns are found on its shores.

CHAPARRAL, chă′pȧ-rȧl′ (Sp. *chaparra,* live oak, probably from Basque *achaparra,* from *aitza,* rock + *abarra,* evergreen oak). A thorny xerophytic (dry-ground) type of thicket, especially characteristic of Texas, Arizona, and the Mexicos. See THICKET.

CHAPARRAL COCK. See ROAD RUNNER.

CHAPBOOKS (Eng. *chap,* AS. *cēap,* bargain, Eng. *cheap,* Ger. *Kauf,* trade, Lat. *caupo,* innkeeper + books). The name given to a variety of old and scarce tracts or small books usually of a homely kind, which at one time formed the only popular literature. In the trade of the bookseller they are distinguishable from the ordinary products of the press by their inferior paper and typography, and are reputed to have been sold by chapmen, or peddlers; hence their designation. The older chapbooks issued in the early part of the seventeenth century are printed in black letter and are in the form of small volumes. Those of a later date are in the type now in use, but are equally plain in appearance. Of either variety, they were mostly printed in London, many being without dates. They were of a miscellaneous kind, including theological tracts, lives of heroes, martyrs, and wonderful personages, interpretations of dreams, fortune telling, prognostications of the weather, stories of giants, ghosts, hobgoblins, and witches, histories in verse, and songs and ballads. An inferior class of tracts succeeded these books for the common people and are best known as *penny chapbooks.* For the most part they consisted of a single sheet, duodecimo, or 24 pages. Besides the title, the first page usually contained a coarse woodcut embellishment. The paper was of the coarsest kind adapted for printing, and the price, as the name imports, was a penny each. The subjects, besides being of a similar nature to the above, included stories of roguery and broad humor. These penny chapbooks were issued by an obscure class of publishers in London and several English provincial towns, particularly Newcastle-on-Tyne. They were also issued from various presses in Edinburgh, Glasgow, Falkirk, and Paisley. After 1800 the chapbooks rapidly declined in popularity, their place being taken by Hannah More's *Repository Tracts,* the *Penny Magazine,* and other cheap publications. Collections of the older chapbooks are now found only in the libraries of bibliophiles, by whom they have been picked up at extravagant prices from dealers in secondhand books. Consult: *Notices of Fugitive Tracts and Chap-Books,* Percy Society, vol. xxix (London, 1851), *Popular English Histories,* Percy Society, vol. xxiii (London, 1848), both edited by Halliwell; Fraser, *Humorous Chap-Books of Scotland* (1873); and Ashton, *A History of the Chap-Books of the Eighteenth Century* (London, 1882). Other countries have their chapbooks. For France, consult Nisard, *Histoire des livres populaires* (Paris, 1854); for Germany, Simrock, *Deutsche Volksbücher* (13 vols., Berlin, 1839–67; new ed., 1887). See also Faxon, "Ephemeral Bibelots," in *Bulletin of Bibliographical Pamphlets* (Boston, 1903); and "Catalogue of English and American Chap-Books," in *Bibliographical Contributions,* No. 56 (Cambridge, 1905).

CHAPEL (OF. *chapele, capele,* from ML. *capella,* chapel, sanctuary for relics, probably referring to the covering of the altar during mass, from *capellus,* dim. of *capa, cappa,* hood, mantle, of uncertain origin, probably not connected either with Lat. *capere,* to take, or *caput,* head). During the Middle Ages the term grew to signify a small building or room for worship, either detached, annexed to, or an integral part of, a larger structure, and not possessing the full privileges and characteristics of a church. Ordinarily mass could be said in chapels only on certain dates, especially on their saints' days; otherwise they were mainly oratories. Baptism could never be administered in them, nor cemeteries attached to them. The extent of their privileges depended on the pleasure of the local bishop. Episcopal palaces had their chapels; one of the earliest was that at Ravenna (fifth century). Civil rulers also had chapels in their palaces (palatine chapels). The Byzantine Duke of Rome had his in the old palace of the Cæsars. That of the doges of Venice was St. Mark's. Charlemagne had his largest one at Aix-la-Chapelle, in the present cathedral; that of the Saxon emperors was at Goslar; the Sainte-Chapelle at Paris was the palatine chapel of St. Louis and his successors; another was built at the Château of St. Germain. (See SAINTE-CHAPELLE.) The feudal nobility regarded a chapel as indispensable in every great castle, as at the Wartburg in Germany, Coucy in France, and later at the châteaux of the dukes of Berry and Burgundy, at Pierrefonds, Urbino, and elsewhere.

In the great communal palaces of mediæval republics there were extremely artistic chapels, as at Nuremberg, Siena, Perugia, and Florence. The great associations, such as the Knights Templars (Tortosa), Knights of St. John (Krak des Chevaliers)—both of these in Syria—the Prussian Knights of the Cross (Schloss Marienburg), had large chapels to hold all the members of the orders. A beautiful modern reproduction of such feudal mediæval chapels is at Neuschwanstein, in the Bavarian highlands, built for King Ludwig II. Other corporations, such as universities and guilds, either had separate structures or chapels in their larger buildings, e.g., that of King's College at Cambridge.

To another class belong chapels connected with churches. Before the eighth century it was rare for chapels or oratories to form an integral part of any church, or for any altar to be erected except in the main apse and later in each of the two side apses. But after this date, with the multiplication of relics and the increased fervor of the worship of saints, altars were multiplied in chapels which were at first excrescences from, but soon became a part of the plan of, the church itself. The richness of the choirs of Romanesque and Gothic churches is due to the symmetrical projection of radiating chapels. Often the central chapel, or Lady Chapel, dedicated to the Virgin Mary, was longer than the rest. (See LADY CHAPEL.) Sometimes a continuous line of chapels opened out of the side aisles, as in Notre Dame in Paris (twelfth century) and a multitude of later churches. The cathedral of Albi has no side

aisles, but a very wide nave flanked by deep chapels on either side. In this way it was possible to pay special separate devotion to each saint whose relics were preserved in any church and to allow wealthy families to build separate chapels for their patron saints. These private chapels were used as private oratories for the donors' families and as burial places for their members and were decorated with paintings and sculptures at their expense. Another class is composed of the numerous small places of prayer and worship scattered over the country and not connected with any church; such as chapels of stations of the cross, votive chapels on the site of some miracle, and wayside shrines.

The term is also applied, at least in the United States, to places of worship, even of large size, erected to serve various subdivisions of a great parish. Thus Trinity Church in New York maintains a number of large churches as its chapels ("chapels of ease"), as St. Paul's, St. John's, and St. Agnes. It was also used to designate places of worship erected by Dissenters in England, the term "church" being restricted by usage to the buildings of the Establishment. Modern universities have their chapels for faculty and students, such as Appleton Chapel at Harvard, the Battell Chapel at Yale, the Marquand Chapel at Princeton, St. Paul's at Columbia University, and many others, in imitation of the magnificent chapels possessed by each college at Oxford and Cambridge. There are also special classes of chantry, domestic, memorial, mortuary, parochial, and proprietary chapels. Consult: Martin, *Manual of Ecclesiastical Architecture* (Cincinnati, 1897); Gilbert Scott, *Mediæval Architecture* (London, 1879); Bond, *Westminster Abbey* (London, 1909); Viollet-le-Duc, *Dictionnaire raisonné de l'architecture française*, article "Chapelle."

CHAPELAIN, shà'plăN', JEAN (1595–1674). A French poet and man of letters, born in Paris. He was one of the first and most influential members of the Academy. His scholarly instincts prompted him to pursue classical studies. He was for many years tutor of the sons of Grand Provost de la Trousse. He wrote a preface for Marini's notorious *Adone*, then translated the *Guzman de Alfarache* of Aleman, and by four inferior odes won from Richelieu a pension and a place in the new Academy. Here he helped Richelieu with his dramas, planned the Academy's *Grammar* and *Dictionary*, and edited its observations, made to order, on Corneille's *Cid*. In 1656 he published half of a long-heralded epic on Joan of Arc, *La pucelle d'Orléans*. His literary reputation now collapsed under a shower of epigrams from Boileau, Furetière, and Montdor. The manuscript of the latter half of the epic remains still unpublished in the National Library. Yet when, in 1662, Chapelain was asked by Colbert to draw up a memorial to guide the King in pensioning literary men, he showed himself learned, just, and generous. He continued a favorite of the court; but though in his earlier years an excellent and amiable man, in old age he is said to have become miserly; but the statements of Ménage and Tallemant des Réaux to this effect should perhaps not be accepted as final. His *Lettres*, edited in part by T. de Larroque (2 vols., Paris, 1880–82), are of great interest, as also his *Lettres inédites* (ed. by L. G. Pellissier, 1894). Consult: Julien Duchesne, *Les poèmes épiques du XVII^e siècle* (1780); A. Fabre, *Les ennemis de Chapelain* (1888); E. de Molènes, *La pucelle, par Jean Chapelain* (Paris, 1891); Fabre, *Chapelain et nos deux premières Académies* (Paris, 1890); Mühlan, *Jean Chapelain: Eine biographisch-kritische Studie* (Leipzig, 1893); Searles, *The Library of Jean Chapelain* (Chicago, 1910); George Saintsbury, *History of Criticism*, vol. ii (1911).

CHAP'EL HILL. A town in Orange Co., N. C., 28 miles (direct) west by north of Raleigh; on the Southern Railroad (Map: North Carolina, C 2). It is the seat of the University of North Carolina (q.v.) and has a Carnegie library. The lumber interests are extensive, and there are cotton and knitting mills and a woodworking plant. It was incorporated in 1851 and is governed by a mayor and a council. Pop., 1900, 1099; 1910, 1149.

CHAPELLE, shà-pĕl', PLACIDE LOUIS (1842–1905). An American prelate, born in the diocese of Mende, France. He studied theology and philosophy at St. Mary's College, Baltimore, Md., was an instructor in St. Charles's College in 1863–65, and was ordained priest in 1865. In 1870 he became assistant pastor of St. John's Church, Baltimore, of which he was later pastor, and in 1882 pastor of St. Matthew's, Washington, D. C. He was in 1891 appointed Coadjutor Bishop to Archbishop Salpointe, of Santa Fe, whom in 1894 he succeeded. In 1897 he was appointed Archbishop of New Orleans, in 1898 apostolic delegate to Cuba and Porto Rico, and in 1899 apostolic delegate also to the Philippine Islands. Upon his return Archbishop Chapelle confined his attention to the affairs of his church in Cuba, Porto Rico, and Louisiana, especially the last. He died at New Orleans of yellow fever.

CHAPELLE ARDENTE, shà'pĕl' är'dänt' (Fr., glowing chapel). A room or mortuary chapel wherein the dead body of a person of high rank, whether ecclesiastical or civil, is laid. The hangings are in black, and burning candles illuminate the scene until the final removal for burial. The custom is of great antiquity in the Catholic church. See CATAFALQUE.

CHAPEL ROYAL (Fr. *chapelle royale*). In the Church of England a chapel royal is composed of two deans (a dean and a subdean), 36 royal chaplains, 10 priests, and a lay choir, styled "gentlemen of the chapel," a clerk and several deputy clerks of the closet, and an organist. The services are performed in London in the small oratory in St. James's Palace. In Scotland the appointments to the chapel royal are purely honorary, involving no services and carrying with them no compensation, though formerly it was attached to the palace at Holyrood and corresponded with the similar establishment in England.

CHAPIN, ANNA ALICE (1880–1920). An American author, born in New York City. She received a private education and studied music under Harry Rae Shelley. She began writing at an early age; her first book, *A Story of Rhinegold*, was published in 1897, when she was but 17 years old. This was followed by *Wonder Tales from Wagner* (1898); *Wotan, Siegfried, and Brunnhilde* (1898); *Masters of Music* (1901); *Discords* (1905); *The Heart of Music* (1906); *Königskinder* (1911); *The Nowadays Fairy Book* (1911); *The Topsy Turvy Fairy* (1913); *The Eagle's Mate* (1914). She also wrote many short stories for magazines, and with Robert Peyton Carter, whom she married in

1906, wrote a play called *The Deserters*, which was produced in New York in 1910.

CHA'PIN, EDWIN HUBBELL (1814–80). An American Universalist clergyman. He was born in Washington Co., N. Y., and in 1837 began preaching in Richmond, Va., to a congregation of Unitarians and Universalists. In 1846 he went to Massachusetts, and in 1848 to New York, where he became pastor of the Fourth Universalist Church, which later became the church of the Divine Paternity, and remained until his death. Before the Civil War he was a conspicuous opponent of negro slavery. In 1872 he succeeded Dr. Emerson as editor of the *Christian Leader*. Besides his regular sermons, he delivered many lectures and published several volumes, including *Duties of Young Men* (1840; 9th ed., 1856); *Duties of Young Women* (8th ed., 1856); *Characters in the Gospels* (1852); *Discourses on the Lord's Prayer* (1850); *The Crown of Thorns* (1860); *Discourses on the Beatitudes* (1853); *Moral Aspects of City Life* (1853); *True Manliness* (1854); *God's Requirements* (1881). Consult Ellis, *Life of E. H. Chapin* (1883).

CHAPIN, HENRY EDGERTON (1859–). An American biologist, born at Wilbraham, Mass. He was educated at Massachusetts Agricultural College and Boston University. After teaching in secondary schools and engaging in agricultural journalism he was an instructor in the Pennsylvania State Normal School from 1888 to 1890, and professor of biology in Ohio University from 1891 to 1900. In the latter year he became instructor in biology and physiography in a New York high school. Besides his scientific monographs he is joint author of *Chapin's and Rettger's Elementary Zoölogy and Guide* (2d ed., 1896).

CHAPLAIN (AS. *capellane*, OF., Fr. *chapelain*, ML. *capellanus*, chaplain, from *capella*, chapel). Originally the title of the ecclesiastic who accompanied an army and carried the relics of the patron saint. (See CHAPEL.) It has now come to signify a clergyman not having charge of a parish, but employed to officiate at court, in the household of a nobleman, or in an army, garrison, ship, etc. Thirty-six clergymen of the Church of England hold office as chaplains of the sovereign. Six clergymen of the Church of Scotland have a similar title in Scotland; but their only duty is to conduct prayer at the elections of Scotch representative peers. A statute of Henry VIII limits the right of nominating private chaplains in England; thus, an archbishop may have eight, a duke six, a baron three; and chaplains so appointed have certain privileges and may hold two benefices with cure of souls.

CHAPLAIN. A military clergyman, having the rank and status of a noncombatant officer. In the United States army chaplains are appointed by the President and assigned or transferred by the Secretary of War. Usually they are attached to the various army posts of the departments, under the department commander, who is authorized to recommend to the Secretary of War such transfer of the chaplains in his command as may be deemed for the best interests of the service. By Acts of Congress, approved Feb. 2, 1901, April 21, 1904, June 12, 1906, and Jan. 25, 1907, it is provided that the establishment of chaplains shall consist of 67 men, 15 of whom may be majors; those having less than seven years' service, first lieutenants; and the remainder captains; apportioned as follows: one to each regiment of cavalry, infantry, field artillery, to the coast artillery, and one to the Corps of Engineers. They are chosen from all religious denominations and must not have passed the age of 40 on date of appointment. Chaplains are required to render to the adjutant general of the army monthly reports of duties performed, and keep a record of all marriage, baptismal, and funeral services performed by them. In time of war or on active service chaplains are assigned to the various units of command. The instruction of the enlisted men in the common English branches of education is made by law one of the duties of chaplains.

In the United States navy there are 24 chaplains who perform religious duties on board naval vessels; 4 with the rank of captain, 7 with the rank of commander, 5 with rank of lieutenant commander, 1 with rank of lieutenant, 7 with rank of lieutenant (junior grade). In 1913 the Secretary of the Navy recommended that the number be increased, as well as their duties and responsibilities, and that the battleships and shore stations be provided with Y. M. C. A. or welfare secretaries to assist in the religious and educational as well as general welfare work among the enlisted force.

The pay of army chaplains is that pertaining to their grade: $2000 per annum for a first lieutenant, $2400 for a captain, $3000 for a major, with a 10 per cent increase for each 5 years' service, not to exceed 40 per cent in all, or $4000 for a major.

The navy chaplain receives the corresponding pay of his relative army rank, except that, under the Act of May 13, 1908, his pay and allowances shall not exceed those of a lieutenant commander corresponding to the grade of major in the army.

Chaplains are a part of the establishment of all European armies, attendance at the regulation religious services conducted by them being compulsory for all officers and men, except in the French army and navy.

In the British army there are two classes of chaplains, permanent and temporary. In the permanent class are 100 chaplains, all of whom hold permanent commissions as noncombatant officers. The senior, with the rank of major general, is known as the chaplain general. He has charge of the Anglican chaplains only, who form a majority of the corps. The subordinate officers have the rank of colonel, lieutenant colonel, major, or captain. Roman Catholic and Presbyterian chaplains are detailed for duty with regiments in which the majority of the enlisted men profess the corresponding faith. The chaplains' corps is administered by the War Office. Their duties include holding divine service, officiating at funerals, visiting the sick and wounded, and performing the duties and functions of a parish priest at military stations. In war they accompany their regiments. Temporary or special chaplains, known as acting chaplains for temporary service, may be appointed under the Army Chaplain Act of 1868 for special duty wherever needed. The territorial forces were given a chaplains' department in 1909. For India there is provided a special service.

In the British navy the larger ships are each provided with an Anglican chaplain, who must not be over 35 years of age at date of entering

the service and is retired at 60. Pay varies from £129 to £401. Those performing additional duty as instructors receive compensating allowances. The service is administered by its head, the chaplain of the fleet, with the pay of £1000, the same as the chaplain general of the army.

In the French army the office of chaplain was abolished on the separation of church and state. In all other armies the office is officially recognized. The Austrian army, recruited from different nationalities, contains Roman Catholic, Jewish, Greek church, and Mohammedan chaplains. The several states of the German Empire have different systems. In Prussia there are two *Feldprobste* under the War Minister—one Lutheran, one Catholic. The latter is a bishop and has spiritual authority over soldiers. To army corps and divisions chaplains of both faiths are assigned.

CHAPLEAU, shȧ'plō', Sir Joseph Adolphe (1840–98). A Canadian politician. He was born at Ste. Thérèse de Blainville, Quebec, was educated at the colleges of Terrebonne and St. Hyacinthe, and in 1861 was called to the bar. He sat in the Quebec Legislature for Terrebonne, and was at different times Solicitor-General, Provincial Secretary, Provincial Premier, and Minister of Agriculture and Public Works in the government of Quebec. He was also for a time leader of the Conservative Opposition in that province. In 1882 he entered the cabinet of Canada as Secretary of State, under Sir John Macdonald. This office he held until 1892, when he was appointed Minister of Customs and subsequently Lieutenant Governor of Quebec. For some years he occupied the chair of international law in the Montreal section of Laval University. In politics he was a determined Conservative, and as an orator he was perhaps the most brilliant among French Canadians.

CHAPLET (OF. *chapelet*, dim. of *chapel*, Fr. *chapeau*, hat, from ML. *capellus*, hood, dim. of *capa*, *cappa*, hood, mantle). A garland or headband of leaves and flowers; sometimes also of gold or jewels. In heraldry a chaplet is always composed of four roses, the other parts being leaves.

CHAPLIN, shȧ'plăn', Charles (1825–91). A French painter. He was born of English parents at Les Andelys, France, and studied under Drolling and at the Ecole des Beaux-Arts. He was principally known for his decorations in the Tuileries, the Elysée, and other public and private buildings in Paris. His portraits of women and children, in which he follows the traditions of the eighteenth century, are much praised. Chaplin was a popular teacher. One of his best pictures, "Souvenirs," is in the Luxembourg; another, "Haidee," is in the Metropolitan Museum, New York. He etched after Rubens, Watteau, and some of his own works.

CHAPLIN, Charles Spencer (1888–). Leading comedian on the movie stage. He was born in London, England, made his début as a film performer in the United States in 1914, and soon became the most familiar figure in screen productions. He starred in many pieces of his own creation including *The Kid* (1920–21), which was highly popular with all classes. In 1921 he visited Europe where he received a popular welcome almost without precedent. He established a motion picture plant at Hollywood, Cal.

CHAPMAN, Alvan Wentworth (1809–99). An American botanist. He was born at Southampton, Mass., and graduated at Amherst College in 1830. He was a botanist of exceptional ability, and a genus of plants, *Chapmannia*, was named after him. He published the work entitled *Flora of the Southern United States* (1860; 3d ed., 1897).

CHAPMAN, Carlton T. (1860–). An American marine and battle painter and illustrator. He was born at New London, Ohio, and received his first artistic instruction at the National Academy of Design and the Art Students' League in New York, and afterward at the Académie Julian in Paris. He made a specialty of depicting the naval battles of the United States, from John Paul Jones to the Spanish-American War, and his representations show a remarkable knowledge of the structure and manœuvres of battleships, both past and present. His most recent works include "The Derelict" and "The U. S. S. Gloucester and the Spanish Torpedo Boats" (1904); "A Squally Day—North River," "The Walls of New York," and "Off Ellis Island" (1905); "The Argus and the Pelican," "The Bonhomme Richard and the Serapis," and "The Lighthouse" (1910); "O'er the Dark Sea," "The Pacific Coast," and "October" (1911); "The Mystic Pool" and "Battle of Cape St. Vincent" (1912). He was elected a member of the National Academy of Design and received medals at the Pan-American Exposition at Buffalo in 1901 and at the Charleston Exposition in 1902.

CHAPMAN, Frank Michler (1864–). An American ornithologist, born at Englewood, N. J. He was appointed assistant curator in vertebrate zoölogy in the American Museum of Natural History, New York City, in 1887. In 1897 he was elected to the presidency of the Linnæan Society of New York. He made some excellent close-range photographic studies of bird life, and in addition to many contributions to the *Auk*, of which he became associate editor, and to *Bird Lore*, of which he became editor in chief, he published a *Handbook of Birds of Eastern North America* (1895); *Bird Life, a Guide to the Study of our Common Birds* (1897); *Bird Studies with a Camera* (1900); *A Color Key to North American Birds* (1903); *The Economic Value of Birds to the State* (1903); *The Warblers of North America* (1907); *Camps and Cruises of an Ornithologist* (1908).

CHAPMAN, George (c.1559–1634). An English poet and dramatist, born near Hitchin, Hertfordshire. According to Anthony Wood, he studied at Oxford and Cambridge. In 1598 he was already known as a successful playwright. Among his earliest and best plays are: *The Blind Beggar of Alexandria* (printed 1598); *All Fooles* (printed 1605); *Eastward Hoe!* in collaboration with Jonson and Marston (1605); *The Gentleman Usher* (1606); *Bussy d'Ambois*, a tragedy, the most popular of all (1607); *The Conspiracy and Tragedy of Charles, Duke of Byron* (1608); *May-Day* (1611); *The Widdowe's Teares* (1612); and *Cæsar and Pompey* (1631). Though Chapman's plays are usually weak in plot and in the development of character, they abound in striking passages. Besides plays, Chapman wrote much else: *The Shadow of Night* (1594); *Ovid's Banquet of Sence* (1595); *De Guiana, Carmen Epicum* (1596); a continuation of Marlowe's *Hero and Leander* (1598); *The Teares of Peace* (1609), and several other poems. He is, however, best known as the first translator of Homer into English verse. The *Iliad* appeared in installments (1598–1611); likewise the *Odyssey* (1614–15). Both were pub-

lished together in 1616. For the former, Chapman employed rhymed verse of seven accented syllables; for the latter, rhymed verse of five accented syllables. The translation of the *Iliad* has been criticized for its inaccuracy. On the other hand, it has been praised for its rapid movement, and it is a noble poem. Like Pope's *Iliad*, however, but on different grounds, it is scarcely Homeric. The complete works of Chapman, in 3 vols., were edited by Shepherd, with an elaborate introductory essay by Swinburne (London, 1874–75). A literal reprint of the plays was published by Pearson (London, 1873). Selections from the plays are to be found in the "Mermaid Series," edited by Phelps (London and New York). Consult: Coleridge, *Literary Remains*, vol. i (London, 1836–39); Swinburne, *George Chapman: A Critical Essay*, a reprint of the introduction to the Shepherd edition named above (London, 1875); Matthew Arnold, the essay "On Translating Homer" (1895); Ward, *History of English Dramatic Literature*, vol. ii (1899); Lohff's *George Chapman's Ilias Uebersetzung* (Berlin, 1903); and a facsimile reproduction of a curious play, *Alphonsus*, carefully ed. by H. F. Schwarz (New York and London, 1913).

CHAPMAN, John Jay (1862–). An American author, born in New York City. He was educated at Harvard University, was admitted to the bar in 1888, and practiced law until 1898. Meanwhile he had attracted attention as an essayist of unusual merit. His work is marked by originality and felicity of expression, and in the opinion of many critics has placed him in the front rank of the American essayists of his day. His publications include *Emerson and Other Essays* (1898); *Causes and Consequences* (1898); *Practical Agitation* (1900); *Four Plays for Children* (1908); *The Maid's Forgiveness* (1908); *A Sausage from Bologna* (1909); *Benedict Arnold: A Play for a Greek Theatre* (1911); *Learning and Other Essays* (1911); *William Lloyd Garrison* (1913).

CHAPMAN, J. Wilbur (1859–1918). An American Presbyterian clergyman and writer, born in Richmond, Ind. He graduated from Lake Forest University in 1879 and from Lane Theological Seminary in 1882, and, being ordained to the Presbyterian ministry, was pastor of the First Reformed Church at Albany, N. Y., and of the Bethany Presbyterian Church at Philadelphia. After three years (1893–96) of evangelistic work, in which he was very successful, he was again for a time pastor of Bethany Church; and from 1900 to 1905 he filled the pulpit of the Fourth Church of New York. In 1903 he was appointed executive secretary of the General Assembly's committee of evangelistic work for the Presbyterian church, and later became representative at large for this committee. His writings include *The Lost Crown; The Secret of a Happy Day* (1899); *The Surrendered Life* (1899); *Life and Work of Dwight L. Moody* (1900); *Present-Day Evangelism* (1903); *Present-Day Parables* (1911); *The Problem of the World* (1911); *Chapman's Pocket Sermons* (1911); *Revival Sermons* (1911); *Personal Touch* (1912); *Present-Day Evangelization* (1912).

CHAPMAN, Mrs. Maria (Weston) (1806–85). An American reformer, prominent as an Abolitionist during the antislavery struggle. She was born in Weymouth, Mass., was educated partly there and partly in England, and in 1829–30 was principal of the Young Ladies' High School in Boston, Mass. In 1830 she married Henry G. Chapman, who died 12 years later. After 1834 she was active as an Abolitionist, writing much for the press and speaking occasionally in public. She was treasurer for several years of the Massachusetts Antislavery Society, and was the editor of the *Liberty Bell*, an antislavery annual, which, says Samuel J. May, "year after year rung out the clearest notes of personal, civil, and spiritual liberty." She wrote the pamphlets *Right and Wrong in Massachusetts* (1839) and *Right and Wrong in Boston* (1836), which had a wide circulation, and compiled the official antislavery hymn book, *The Songs of the Free* (1836). From 1848 to 1856 she lived in Paris, France. She was an intimate friend of Harriet Martineau, and published the latter's *Autobiography, with Memorials*, in 1877.

CHAPMAN, William (1850–). A Canadian poet. He was born at St. François de la Beauce, P. Q., and was educated at Levis College. He studied law, afterward engaged in commercial pursuits, and later entered the civil service of the Province of Quebec. He was for some time in journalistic work in Quebec and Montreal; but in 1902 became a French translator for the Dominion Senate and removed to Ottawa. His publications include: *Les Quebecquoise* (1876); *Le laureat* and *Les deux Copains*, two critical works (1894); *Les aspirations* (1904), which received the highest prize of the French Academy; and *Les Royons du Nord* (1910), which also gained the highest prize of the French Academy.

CHAPONE, shȧ-pōn′, Hester (1727–1801). An English essayist, born at Twywell, Northamptonshire. When 10 years old she wrote a romance entitled *The Loves of Amoret and Melissa*, and while still very young became proficient in Italian, Latin, music, and drawing. She wrote for the *Rambler*, *Adventurer*, and *Gentleman's Magazine*, but is best remembered by her *Letters on the Improvement of the Mind* (1772), which went through many editions. In 1760 she married Mr. Chapone, an attorney, who died 10 months afterward. Her *Works, with a Life Drawn up by her own Family*, appeared in 1807, in 4 vols.

CHAPPAUL. See Squawfish.

CHAPPE, shȧp, Claude (1763–1805). A French abbé and inventor, born in Brûlon (Sarthe). In 1792 he contrived the first working ocular telegraph of importance. His "semaphore" consisted of an upright post, on the top of which was fixed a transverse bar, and at the ends of the bar two smaller arms movable on pivots. The position of the bars represented letters or words; and, by means of such machines placed at remote but easily visible points, messages were conveyed 50 leagues in a quarter of an hour. Almost until electric telegraphy was introduced, Chappe's semaphore was used for military purposes, and especially for noting the arrival of ships, in nearly all the countries of Europe. A similar invention had been produced by Hooke as early as 1684, and Chappe was so harassed by charges that he had stolen his ideas from others that he committed suicide. Consult the *Histoire de la télégraphie* (1824) by his brother, Ignace Urbain Jean Chappe (1760–1829).

CHAPPE D'AUTEROCHE, shȧp′ dō′trōsh′, Jean (1722–69). A French astronomer, born at Mauriac, Auvergne, an uncle of the preceding.

He was ordained to the priesthood, but afterward devoted himself to astronomy. In 1761 he observed the transit of Venus at Tobolsk, and he wrote a *Voyage en Sibérie fait en 1761* (2 vols., Paris, 1768). In reply to his criticisms of Russia expressed in this work, Catharine II and Shuvaloff caused the publication of the *Antidote ou examen du mauvais livre superbement imprimé, intitulé: Voyage de l'abbé Chappe d'Auteroche* (1771). Chappe's report on the transit of Venus, observed by him in California (where he died) in 1769, was published in Paris (1772).

CHAPPED HANDS. A form of eczema (*eczema fissum*) produced by undue exposure to extremes of cold and heat, and affecting chiefly the most exposed joints, over which the skin swells and cracks, with itching, pain, and heat. In severe cases there is ulceration, which is difficult to heal in proportion to the length of time the disease has lasted. Chapping may generally be avoided if the hands are washed always with tepid water and a bland soap, and not habitually exposed to great cold or wind, or, when cold, to the heat of a fire. They should not be washed very frequently, and always thoroughly dried. When formed, the lesions may be treated with oxide of zinc ointment; or with dilute solution of borax in glycerin and rose water; or with glycerin alone, diluted with water; the hands in any case being protected by warm gloves in cold weather. See FROSTBITE.

CHAPRA, or CHUPRA, chŭp'rà. A town in India, in the Province of Behar, Bengal, on the north bank of the Ganges, at its confluence with the Gogra 35 miles west of Patna (Map: India, D 4). It extends nearly a mile along the river and has several pagodas, mosques, and churches. The government conducts an English school, and there are also private high schools and several Christian missions. There is trade in cotton, sugar, saltpetre, opium, linseed, and shellac. Pop., 1901, 45,901; 1911, 42,473.

CHAPTAL, shàp'tàl', JEAN ANTOINE, COUNT DE CHANTELOUP (1756–1832). A French chemist and statesman. He studied medicine and chemistry at Montpellier, and became professor of chemistry there in 1781. Subsequently he established chemical works near by, and for producing chemicals which had hitherto been imported he was ennobled. The Spanish government offered him a large pension to go to Spain and apparently Washington invited him to come to America. During the Revolution he was imprisoned for a time for a *Dialogue entre un Montagnard et un Girondin*. In 1793 the Committee of Public Safety put him in charge of the saltpetre works of Genelle. After the 18th Brumaire (Nov. 9, 1799) he was made a Councilor of State by Napoleon. As Minister of the Interior, succeeding Lucien Bonaparte, he established chambers of commerce and a school of arts, and in many ways contributed to the material development of the country. In 1804 he lost Napoleon's favor, but he was recalled the following year and made a member of the Senate. Upon the return from Elba, he was made Director General of Commerce and Manufactures and Minister of State. The downfall of the Empire sent him to private life, but in 1816 he became a member of the Academy of Sciences. His most important works were on practical chemistry, especially of agriculture and viticulture and wine making.

CHAPTER. A stated assembly of monks or canons; from this, the canons and other dignitaries of a cathedral or collegiate church, considered as the council of the bishop. The name arose from the practice of reading at daily meeting a chapter of the rule under which the monks or canons lived. It is applied in modern usage to the body of canons, whether in a Roman Catholic or Anglican cathedral. They have special stalls assigned to them in the choir of the cathedral and usually a house in the precincts. The obligations of members of the chapter are substantially the same in both, and include daily participation in divine service, residence during a fixed portion of the year, and assistance in the deliberations of the body. Roman Catholic canons are distinguished by the title "very reverend" and by permission to wear the rochet and mozetta in choir. The bishop in both churches may appoint honorary canons, who are not members of the chapter. It was formerly the custom so to appoint secular princes; thus the Emperor was always an honorary canon of Cologne. Consult Bouix, *De Capitulis* (Paris, 1852).

CHAPTER COFFEEHOUSE. An eighteenth-century resort for wits and literary men. Its site is on the south side of Paternoster Row, London, at the corner of Chapter-House Court, St. Paul's. It is at present a tavern.

CHAPTER HOUSE (Eng. *chapter*, Fr., OF. *chapitre*, from Lat. *capitulum*, chapter, dim. of *caput*, head + *house*). The building in which the monks and canons of monastic establishments, and the dean and chapter of cathedral and collegiate churches, meet for the management of the affairs of their order or society. (See CATHEDRAL; CHAPTER.) Chapter houses frequently exhibit the most elaborate architectural adornment; as, e.g., those at York, Southwell, and Wells. The original stained-glass windows remain at York and are of exquisite beauty. On the walls of that at Westminster the original fresco painting has been discovered. Chapter houses are of various forms: those at York and Westminster are octagonal; those at Oxford, Exeter, Canterbury, Gloucester, etc., are parallelograms; Lichfield is an oblong octagon; Lincoln, a decagon; and Worcester, a circle. They are always contiguous to the church and are generally placed to the west of the transepts. They generally either open into the church or are entered by a passage. Chapter houses were often used as places of sepulture and have sometimes crypts under them, as at Wells and Westminster.

CHAPTERS, THE THREE. The name given to the condemnation issued by the Emperor Justinian in 544 against the three persons or writings —viz., (1) the person and writings of Theodore of Mopsuestia (q.v.); (2) the writings of Theodore against Cyril and for Nestorius; (3) the letter which Ibas of Edessa is said to have written to the Persian Maris. The word "chapter" in this use was understood to mean a form of anathema which threatened with excommunication every one who maintained the deprecated doctrine. The Emperor interfered in the theological disputes of the period in the interest of orthodoxy. Unwittingly he stirred up a great controversy, because he seemed to be condemning the Council of Chalcedon (451). Consult Harnack, *History of Dogma*, vol. iv (New York, 1900).

CHAPU, shà'pŭ', HENRI MICHEL ANTOINE (1833–91). A French sculptor. He was born at Le Mée, Seine-et-Marne, and studied in Paris

under Pradier and Duret, and in the Ecole des Beaux-Arts, winning the Roman prize in 1855. His art represents academic-classical tendencies, strongly modified by the modern naturalistic influences, which increase in his later work. His numerous works include several monuments, among them those of Henri Regnault (Ecole des Beaux-Arts)—of which the celebrated figure "Youth" forms a part—the novelist Flaubert, and the brothers Galignani. Among his portrait busts are those of Léon Bonnat, Alexandre Dumas (Comédie Française), Carnot, and Alexandra, the Princess of Wales. His ideal and mythological subjects include "Mercury Inventing the Caduceus" (Luxembourg), the "Transformation of the Nymphe Clytie" (Dijon), and "The Cantata," on the façade of the Paris Opéra. His masterpiece is the kneeling statue of "Joan of Arc at Domrémy" (Luxembourg), in which the expression of intense spiritual exaltation is quietly and effectively rendered. Consult his biography by Fidière (Paris, 1894).

CHAPULTEPEC, chä-pōōl'tä-pĕk' (Aztec, hill of the grasshoppers). A small hill, 3 miles southwest of the city of Mexico, rising about 150 feet above the surrounding plain. On it the Aztec monarchs are said to have made their summer home; and here, in 1785, Galvez, then Viceroy of Mexico, began to erect an imposing fortified castle, which, though never fully completed, was subsequently used partly as a military school and partly as a national observatory. In the war between Mexico and the United States the hill was strongly fortified by the Mexicans and was the scene (Sept. 12–13, 1847) of the last serious conflict of the war. After the battle of Molino del Rey (q.v.) Scott planned a movement against Chapultepec and on September 12 opened a heavy bombardment, under cover of which, on the following day, Generals Pillow and Quitman, supported respectively by Generals Worth and Smith, made gallant assaults, the former carrying the fortifications on the west and the latter on the southeast; and the Mexicans, after making a stubborn defense, were driven in confusion back towards the city. On the 14th the Americans entered the city of Mexico, and the war was virtually ended. During the three days (12th, 13th, and 14th) the Americans lost 863 in killed and wounded (General Pillow being among the latter), while the Mexicans are known to have lost a much larger number. On the side of the Americans about 7500 men were engaged; on the side of the Mexicans, about 4000. Consult H. H. Bancroft, *History of Mexico*, vol. v (San Francisco, 1885), and C. M. Wilcox, *History of the Mexican War* (Washington, 1892). See Mexico City.

CHAR (Gael. *ceara*, blood-colored, from Gael., Ir. *cear*, blood). A name given to the numerous varieties of *Salvelinus alpinus*, a fish of the salmon family, and extended to several American "trout." The char has smaller scales than the true trout (*Salmo*), differs in the structure of the vomer, and has red instead of black spots, especially during the breeding season. The color is "grayish or green above, the lower parts red, especially in the male; lower fins anteriorly margined with white. Sides of body with round red spots; back not marbled." This species has a wide distribution, occurring in cold lakes and mountain streams of central and northern Europe, of northeastern America, and probably also in Siberia. It is extremely variable, and has consequently received a host of specific names, such as "saibling," "sälbling," "ombre chevalier," "Greenland trout," etc. The chars "are by far the most active and handsome of the trout, and live in the coldest, clearest, and most secluded waters" (Jordan and Evermann). The best known of the distinctively American chars is the brook trout, or speckled trout; but trout of the Rangeley Lakes, in Maine, is somewhat nearer the European type. See Trout.

CHARACEÆ, kä-rā'sē-ē. See Charales.

CHAR'ACTER (Lat., from Gk. χαρακτήρ, *charaktēr*, feature, graving tool, from χαράσσειν, *charassein*, to engrave). A name given in ethics to the nature of a self-conscious agent. This nature manifests itself in and as the continuity of the various successive voluntary and habitual acts of the agent. Character has popularly been construed as a sort of causal substrate, underlying acts of conduct and giving rise to them. This popular conception has been responsible for the difficulties ordinarily thought to be involved in free will (q.v.). The conception of character not as the substrate, but as the temporal continuity, of a man's voluntary acts and of his habits enables us to escape all these difficulties, and also keeps us in touch with the facts as they actually appear in experience. No one has ever known his own or his neighbor's character as a substrate. But what every one knows is the general way in which he or another acts, and that is what constitutes character. It is upon this experienced character of a man that we pronounce our moral judgments, condemning one character and approving another. A stable character is one in which the successive acts form a continuity according to some recognized or recognizable fixed principle. A strong character is one in which the principle controlling the successive acts maintains itself against temptations which in the average person would be effective. A good character is one whose successive acts are prevailingly directed towards beneficent social ends. Consult Whitby, *The Logic of Human Character* (London, 1905); Eliot, *The Happy Life* (New York, 1905); MacCunn, *The Making of Character* (New York, 1900). See Substance; Ethics; Determinism.

CHAR'ACTERIS'TIC. A term variously employed in mathematics, requiring specific definition in each case. The integral part of a logarithm is called its characteristic; thus, in $\log 125 = 2.0969$, $\log 0.013 = \bar{2}.1139$, $\log 5 = 0.6990$, the characteristics of the three logarithms are respectively, 2, -2, and 0. The characteristic of the common logarithm of a number containing an integral part is one less than the number of integral places; that of a decimal is negative, and is one more, in actual value, than the number of ciphers preceding the first significant figure. On account of this simple relation the characteristic is not ordinarily given in the tables of common logarithms.

In the method of characteristics due to Chasles (q.v.), which appeared in the *Comptes rendus* (1864), may be found the first trace of the "numerative geometry," the object being to determine how many geometric figures of given definition satisfy a certain number of conditions. A number which expresses how many simple singularities may replace a higher singularity of an algebraic curve or surface is called a characteristic number. The elementary right-angled triangle, whose hypotenuse is sensibly equal to the element of the arc of a curve,

was called by Pascal the characteristic triangle. In the application of determinants (q.v.) to the solution of equations the minors of a certain order in the resultant may not all vanish, while all minors of higher order become zero, in which case the equations have a known number of solutions. The number expressing the highest order in which some minor does not vanish is called the characteristic of the determinant. In the theory of functions (q.v.) certain rational integral functions are called characteristic functions. In the theory of certain types of differential equations there are certain algebraic equations every root of which determines an integral of the given differential equations. These are called characteristic equations.

CHARADE, shȧ-rȧd′ (Fr., Languedoc *charrade*, idle talk, probably from Sp. *charrada*, speech or action of a *charro*, clown). A form of amusement which consists in dividing a word of one or more syllables into its component syllables or into its component letters, something predicated of each; and then, the whole being reunited, and something predicated of that also, the reader or listener is asked to guess the word. As a specimen of the charade depending upon syllables, we adduce the following:

"My *first* is plowed for various reasons, and grain is frequently buried in it to little purpose. My *second* is neither riches nor honors, yet the former would generally be given for it, and the latter are often tasteless without it. My *whole* applies equally to spring, summer, autumn, and winter; and both fish and flesh, praise and censure, mirth and melancholy, are the better for being in it. Answer: *Sea-son.*"

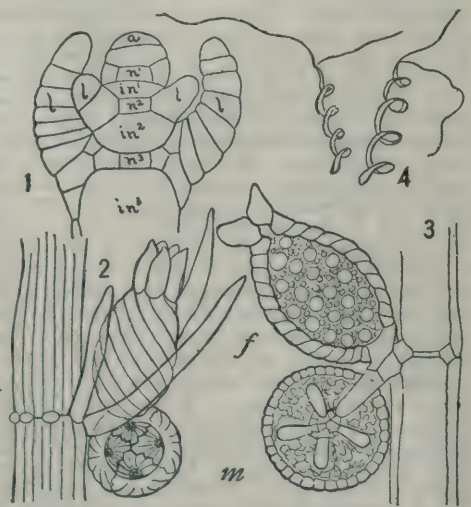
As a specimen of the second class of charades, we take the following example from the French:

"Quatre membres font tout mon bien,
Mon dernier vaut mon tout, et mon tout ne vaut rien."

The word is *zéro*. It is composed of four letters, of which the last (viz., *o*) is equal to *zero;* the whole, zero itself, being equal to nothing.

But, besides charades of this nature, there is another kind, rather popular at evening parties —the *acted* charades—the character of which is entirely dramatic. Half a dozen or so of the company retire to a private apartment, and there agree to select a certain word as the subject of the charade. The next things done are to take the first syllable and arrange a little scene and dialogue, each member taking a certain part. This being accomplished, the amateur actors return to the drawing-room and commence their performance, the rest of the company constituting the spectators. Care is taken to mention conspicuously, and yet not obtrusively, in the course of the dialogue, the syllable which is the subject of the scene. On its conclusion the party again retires to devise a new series of incidents for the next syllable, and so on. Finally, they retire to contrive the final scene, into which the whole word must be dexterously introduced at an odd moment, when the spectators are thought to be off their guard. The company are then asked to guess the word. For the effective performance of a charade of this sort, the actors must possess a good share of inventiveness, self-possession, and ready talk, as the greater portion of the dialogue has to be extemporized.

CHARALES, kȧ-rȧ′lēz (Neo-Lat. nom. pl., from Gk. χαρά, *chara*, delight, from χαίρειν, *chairein*, to rejoice). Usually classed as the most highly developed order of the Green Algæ, Chlorophyceæ (q.v.). They are often called "stoneworts," because the bodies of certain species, notably those of *Chara*, are incrusted with lime. The body of Charales consists of a



CHARALES: 1, apex, showing apical cell (*a*), the succession of nodal (*n*) and internodal (*in*) cells, and the young leaves (*l*); 2, oögonium (above) and antheridium; 3, the same enlarged and showing connections; 4, sperms.

stem differentiated into nodes and internodes. Each node consists of a plate of cells and gives rise to whorls of branches which were formerly regarded as leaves. Each internode consists of a very much elongated cell, which in *Chara* is invested by small cortical cells, and in *Nitella* remains uncovered. For this reason the internodal cells of *Nitella* are peculiarly favorable for showing the movement of protoplasm. The nodes produce two kinds of branches: those of limited growth, which arise in a whorl; and those of indefinite growth, that resemble the parent axis. It is upon the branches of limited growth that the sex organs occur, arising from the nodes of these branches. The female organ consists of a large cell containing the egg, surrounded by spirally wound filaments, whose tips form a sort of crown at the top of the organ. This whole structure is called the oögonium, and it differs from the ordinary oögonium of Thallophytes in being incased by the spirally wound filaments. The male organ (antheridium) is a spherical, many-celled structure arising near the oögonium. It is the most complex male organ known in the plant kingdom. The wall consists of platelike cells called shields, each of which bears within a stalk, and from the tip of the stalk there arises a variable number of long filaments. When the antheridium is opened, it seems to contain a tangle of these filaments, each of which consists of approximately 200 cells, and each cell produces a sperm. The sperm output of a single antheridium may range between 20,000 and 50,000. Although Charales are included among the Green Algæ, there seems to be no question but that this is an arbitrary association. They differ from Green Algæ (see ALGÆ) in their vegetative body, sex organs, sperms, and life history, and in all of these particulars the resemblances are with the higher plants. The opinion is general that they should either be isolated as

a distinct group of Thallophytes or should constitute a group between Thallophytes and Bryophytes. The North American genera and species of Charales have been described by Allen, *The Characeæ of North America* (New York, 1888); Braun, *Fragmente einer Monographie der Characeen*, ed. by Nordstedt (Berlin, 1882); Filarsky, *Die Characeen* (Budapest, 1893).

CHARBON, shär'bŏn'. See ANTHRAX.

CHARBON ROUGE, shär'bŏN' rōōzh' (Fr.), or RED CHARCOAL. A variety of charcoal obtained by subjecting wood to the action of heated air from furnaces, or of steam, which has been raised to a temperature of 572° F. Air-dried wood, by the ordinary process of charring, yields at the best 21 to 26 per cent of black charcoal; but when acted on by heated air or steam, as mentioned above, 36 or 42 per cent of charbon rouge is obtained. It is used in the manufacture of gunpowder. It has a dark-red color and consists of about 75 per cent pure carbon and 25 per cent hydrogen and oxygen.

CHAR'CAS. See CHUQUISACA.

CHAR'COAL (probably from ME. *charken*, to crackle, AS. *cearcian*, to creak, variant of *cracian*, to crack + *cole*, coal; less plausibly from *char*, turn, from AS. *cerr*, Ger. *Kehr*, turn + *cole*, coal). A black, porous substance burning without smoke or flame, and formed by the imperfect combustion of organic matter, either animal or vegetable. *Animal charcoal* is produced by calcining the bones and ivory of animals in closed retorts. In this process the charcoal proper, which consists of the earthy and saline portions of the bone, combined with carbon, is left in the retort, while the volatile matter is allowed to escape into another compartment, where it is distilled. The escaping gas contains, among its other components, an oil which, when burned in closed chambers, deposits a soot which is known as *boneblack* or *ivory-black* pigment. (See LAMPBLACK.) Animal charcoal, or boneblack, is itself a most useful material in the arts, on account of its power of absorbing coloring matter and odors. It is the best material known for filtering saccharine solutions (see SUGAR), and various processes have been invented for recalcining boneblack after it has been used until no longer effective.

Wood charcoal may be produced either in mounds formed by simply covering piles of wood with earth or sand, or in retorts in connection with the manufacture of acetic acid and wood alcohol. If the former method is employed, the wood is fired usually at the top, a central space being left from bottom to top for the progress of the fire. The gases are allowed to escape through holes left in the top. By this method the yield of charcoal is not over 20 per cent, while all the volatile by-products are lost. By the retort method about 30 per cent of charcoal is obtained. A charcoal furnace is usually a dome-shaped structure with openings at the top and side for putting in the wood and a pipe or tube near the top for the escape of the volatile products. The wood rests on grates, and the quantity of air is regulated by a closely fitting ash-pit door. The wood is fired at the bottom, and when the process of combustion has sufficiently advanced, the ash-pit door is closed. The wood is now slowly carbonized, and the gaseous products escape into another chamber, where they are treated as described under LAMPBLACK.

Wood charcoal has many uses. It is employed to some extent as a fuel (q.v.), a polish, and a filter, but its chief use is as an absorbent of gases and aqueous vapors. It is an ingredient in gunpowder and fireworks. See WOOD DISTILLATION.

CHARCOAL, RED. See CHARBON ROUGE.

CHARCOAL BLACKS. Pigments prepared both from animal and vegetable substances, e.g., burnt ivory, bones, vine twigs, peach stones, nut and other shells, the smoke of resin condensed, etc. See CHARCOAL.

CHARCOT, shär'kō', JEAN BAPTISTE ETIENNE AUGUSTE (1867–). A French Antarctic explorer, born at Neuilly-sur-Seine. In 1890–94 he was an interne at the Hospital of Paris and at the same time an investigator in the Pasteur Institute. From 1896 to 1898 he was head of the clinic in the faculty of medicine of the University of Paris. In 1903–05 and in 1908–10 he was leader of Antarctic scientific expeditions, and later he became director of the Marine Laboratory of Higher Studies. His Antarctic expeditions on the *Pourquoi Pas?* took him as far as Adelaide Island, and he saw the inaccessible coast of Alexander I Land. His publications include: *Arthropodes* (1907); *Expédition antarctique française, 1903–1905* (1908); *Deuxième expédition antarctique française, 1908–1910* (1911); *"Pourquoi Pas?" dans l'Antarctique* (1911).

CHARCOT, shär'kō', JEAN MARTIN (1825–93). A French neurologist, born in Paris. He received his degree of M.D. in 1853 and in 1856 was appointed physician to the Central Bureau of Hospitals. In 1873 he was elected a member of the Academy of Medicine, in the section of pathological anatomy, and in the same year became professor of pathological anatomy in the faculty of medicine in Paris, a position which he exchanged in 1882 for the professorship of diseases of the nervous system which was created especially for him and which he occupied until his death. He wrote: *De l'expectation en médecine* (1857); *Leçons cliniques sur les maladies des vieillards* (1868); *Leçons sur les maladies du système nerveux* (4th ed., 1880); *Leçons sur les maladies du foie, des voies biliaires et des reins* (1877); *Localisations dans les maladies du cerveau et de la moelle épinière* (1876–80); *Leçons sur les maladies du système nerveux faites à la Salpêtrière* (1880). Charcot also annotated the French translation of Baring Garrod's *Treatise on Gout*. He was one of the editors of the *Archives de physiologie*. His researches in hypnotic suggestion were notable, but his fame chiefly rests on his original discoveries in nerve pathology.

CHARD, SWISS CHARD, or SEA KALE. A form of the common garden beet (q.v.), in which the edible portion is the enlarged fleshy stalk and midrib of the leaves. Unlike garden beets, the roots are small and woody. Chard is used as a pot vegetable for greens and salad. It is grown in the same manner as garden beets.

CHARDIN, shär'dăN', JEAN (SIR JOHN) (1643–1713). A French-English traveler, born in Paris. In 1664–69 and again in 1671–75 he made extensive journeys to Persia and India, where he had many adventures and acquired much wealth by trade in jewels. Partly because he was a Protestant, in 1681 he settled in London, where he was knighted by Charles II. In 1683 he became representative of the East India Company in the Netherlands and devoted his later years to Oriental studies. In

1686 he published a portion of the *Travels of Sir John Chardin into Persia and the East Indies*, which was completed in a French version in 1711. The best reprint is by Langlès (Paris, 1811).

CHARDIN, JEAN SIMEON (1699–1779). The principal French still-life and genre painter of the eighteenth century. He was born in Paris and studied principally with Coypel. His celebrated "Skate" (1728, Louvre) and "The Buffet," a kitchen interior, established his reputation and gained him admission to the Academy. After his first marriage, in 1731, he took up genre subjects, excelling especially in the portrayal of children, as in "Boy Blowing Soap-Bubbles" and "Girl with Cherries," and of family life, as in the celebrated "Bénédicité" ('The Blessing'), painted in 1740, the "Diligent Mother," both in the Louvre, and the "Amusements of Private Life" (1746). The best known of his portraits are a pastel of himself, now in the Louvre, and the excellent likeness of Rameau d'Alembert and Sedaine. In 1755 he reverted to still-life subjects. From 1765 to 1767 he painted a series of decorative panels for the castles of Choisy and Bellevue, of which the "Attributes of the Sciences, Arts, and Music" are now in the Louvre. His works, the largest collection of which is in the Louvre, are characterized by naïve and charming realism. His cool and restful color scheme, with its wonderful treatment of light and atmosphere, is a century in advance of his age, and he was not truly appreciated until the middle of the nineteenth century. Consult the monographs by Edmund and Jules de Goncourt (Paris, 1864) and Edmund Pilou (Paris, 1909); Dayot and Vaillat, *L'Œuvre de Chardin et Fragonard* (Paris, 1907).

CHARDON, shär'dŏn. A village and the county seat of Geauga Co., Ohio, about 30 miles (direct) east by north of Cleveland, on the Baltimore and Ohio and the Cleveland and Eastern Suburban railroads (Map: Ohio, H 2). It is the centre of an agricultural region, carries on a trade in creamery and maple products, and has a macaroni factory. The electric-light plant is owned by the village. Pop., 1900, 1360; 1910, 1542.

CHARENTE, shà'rănt' (connected with OIr., Welsh, Corn., Bret. *car*, friend, Gall. *Carentus*, Brit. *Carantinus*, Lat. *carus*, dear). A river in the west of France, rising in the Department of Haute-Vienne, about 14 miles northwest of Châlus (Map: France, S., D 3). It first flows northwest to Civray, where it turns southward into the Department of Charente to Angoulême; thence it flows westward past Châteauneuf, Jarnac, and Cognac, and, entering Charente-Inférieure, runs northwest past Saintes, and falls into the Atlantic below Rochefort, opposite the islands Oléron and Aix. This river gives its name to two departments, remarkable for the productiveness of their vineyards. Length, 224 miles. The tide is felt as high as Saintes, and the river is navigable to Angoulême, 104 miles.

CHARENTE. A department in southwest France, named after the Charente River. The raising of fruit, chestnuts, and potatoes, grazing, quarrying, and the manufacture of flour, paper, naval guns, leather, gunpowder, and brandy are the leading industries. (Map: France, S., E 3.) Pop., 1896, 356,236; 1901, 350,305; 1911, 346,424. Capital, Angoulême. Consult Coquand, *Description physique, géologique, etc., du département de la Charente* (Paris, 1859), and Lièvre, *Exploration archéologique du département de la Charente* (Angoulême, 1881).

CHARENTE-INFÉRIEURE, shà'răn'tăn'-fâ'rê-ēr'. A maritime department in the western part of France, including part of the former Province of Angoumois, with the greater part of Saintonge and a small portion of Poitou (Map: France, S., D 3). Area, 2792 square miles. Pop., 1896, 453,455; 1901, 452,149; 1906, 453,793; 1911, 450,871. It is watered on its boundaries by the Sèvre-Niortaise and the Gironde, and in the centre by the navigable Charente and the coast stream Sendre. The surface is level, and the department is one of the most fertile in France. The soil produces hemp, flax, saffron, oats, wheat, rye, potatoes, and fruit. The industries include the manufacture of salt, brandy, machinery, porcelain and fayence ware, and oyster and pilchard fisheries. The chief harbors are those of Rochefort and La Rochelle; the latter town is the capital of the department.

CHARENTON-LE-PONT, shà'răn'tôn'-le-pôn' (connected with Gall. *Carentus*, Lat. *carus*, dear). A town of France, in the Department of Seine, situated on the right bank of the Marne, where it meets the Seine 1 mile southeast of Paris (Map: Paris and Vicinity). The bridge over the river, which is considered one of the keys of the capital, is defended by two forts, forming a part of the fortifications of Paris. At the other side of the river is the national lunatic asylum, formerly called Charenton Saint-Maurice, now Saint-Maurice. This establishment also contains a hospital for the care of accident victims in Paris, and a hospital for workingmen. The industries of Charenton are boat building, piano making, and the manufacture of porcelain and India-rubber goods. Pop., of commune, 1901, 17,980; 1911, 19,499.

CHARES, kā'rēz (Lat., from Gk. Χάρης) (?–c.324 B.C.). An Athenian general, the son of Theochares. He was appointed general in 367 B.C., and in the same year relieved the Phliasians, who were besieged by the Argives and the Sicyonians. When Oropus was taken, he was recalled from the Peloponnesus; but soon after, the Athenians and Arcadians, having entered into an alliance, returned and made an unsuccessful attempt to seize Corinth. In 361 he was sent to Corcyra, where, through his uncompromising bearing, he destroyed the Athenian influence. In 358 or 357 he was in the Chersonese, whither he had been sent to demand the withdrawal of Cersobleptes. When the Social War broke out and Chios revolted from Athens, Chares and Chabrias (q.v.) led an attack on the island and town—the former at the head of a land force, the latter with a fleet. The attack proved unsuccessful, Chabrias being killed and Chares forced to retire. In 356, being sent, in joint command with Iphicrates, Menestheus, and Timotheus, to relieve Samos, he fought alone at Embatta, against the judgment of the other commanders, and was defeated. At the trial of accountability Chares appeared as the formal accuser of his colleagues, who were convicted and deposed. Chares was now put in sole command, and, in order to secure funds for his troops, in 355 he joined the rebellious satrap Artabazus, and gained a brilliant victory over the King's forces.

Much booty was obtained, and Chares was rewarded by the Athenians with a golden crown. In 353 he recaptured Sestos, which had revolted from Athens during the Social War, and in 349 he was sent to the aid of Olynthus, with what result we do not know. In 338 he fought, as one of the Athenian generals, at Chæronea. After the seizure of Thebes, his surrender being demanded by Alexander, he withdrew from Athens, but appeared again in 332 at Mitylene, at the head of 2000 Persians. At the approach of the Macedonian fleet he surrendered the town on condition that the troops be allowed to depart in safety.

CHARES (Gk. Χάρης). A Grecian worker in bronze, a native of Lindus, and the designer of the Colossus of Rhodes. He lived in the third century B.C. and was a pupil of Lysippus. See COLOSSUS.

CHARETTE DE LA CONTRIE, shâ'rĕt' de lâ kôn'trē', FRANÇOIS ATHANASE (1763–96). A French Royalist, born at Couffé, Loire-Inférieure. In 1793 he became the head of the Royalist bands of Lower Poitou and finally gained control of all of Lower Vendée. He entered into a treaty with the Convention on Feb. 15, 1795, which, however, did not end the war. After several leaders of the Vendeans had been executed by General Hoche, Charette de la Contrie resumed operations. He was defeated at Saint-Cyr and then confined himself to guerilla warfare. He was severely wounded in one of his encounters with the Republican troops, and was captured, March 29, 1796, and shot at Nantes. Consult the biography by Le Bouviers (Nantes, 1823).

CHARGE (from OF., Fr. *charger*, It. *caricare*, to load, from ML. *carricare*, to load a car, from Lat. *carrus*, car, from Gall. *carros*, OIr., Welsh, OBret. *carr*, car). The quantity of gunpowder or other explosive used in loading a gun, torpedo, or projectile. The *full* or *service charge* of gunpowder is the amount with which a gun is designed to give its maximum velocity in service. *Reduced charges* are used for target practice or for high-angle fire when it is desired to fire over an intervening obstacle and have the shell fall behind it. The charge for a projectile is called the *bursting charge*. See BALLISTICS; GUNNERY.

CHARGE, in military tactics. A sudden onset or rush of troops against the enemy. See ATTACK; BATTLE; TACTICS. For heraldic charges, see HERALDRY.

CHARGE AND SPECIFICATION. The formal written statement before a general court-martial of the offense alleged to have been committed by the accused. In the United States service a military charge consists of two parts—the technical *charge*, designating the general character of the offense, and the *specification*, giving the statement of the offense in detail. The article of war under which the offense comes is mentioned in the charge. See COURTS, MILITARY.

CHARGÉ D'AFFAIRES, shär'zhâ' dâ'fâr' (Fr., charged with affairs). A diplomatic agent, ranking fourth, after ambassadors, ministers, and resident ministers. He is accredited not to the sovereign, but to the Minister for Foreign Affairs of a foreign power, and he holds his credentials only from the Minister for Foreign Affairs of his own state. In the absence from his post of a regularly accredited minister or ambassador, some member of the staff, usually the Secretary of the Legation or Embassy, is appointed to serve as chargé d'affaires. When the relations of two governments are strained to such a degree as to preclude formal diplomatic relations, chargés d'affaires are employed to exercise the ordinary diplomatic functions of ministers.

CHARGE OF THE LIGHT BRIGADE, THE. A poem by Alfred, Lord Tennyson, written in commemoration of the famous episode at the battle of Balaklava (Oct. 25, 1854) and published in quarto (London, 1855). An altered version appeared under the title of *In Honorem* (1856, octavo). In the second edition the line "some one had blundered," which had been erased from the original draft, was restored. The metre is that of Drayton's "Battle of Agincourt."

CHARGER. A war horse; a saddle horse suitable for the military uses of commissioned officers; a handsome, showy saddle horse qualified for use on all ceremonial occasions; often used synonymously with *officer's mount*, meaning a horse with a minimum height of 15 hands 2 inches, weighing not less than 975 pounds. See HORSE, for a discussion of the military uses of the horse.

CHARICLEA, kăr'ĭ-klē'ȧ. Daughter of Persina, the Queen of Æthiopia, and heroine of the story, in a fourth-century novel by Heliodorus, entitled *Theagenes and Chariclea*.

CHARING (châr'ĭng) **CROSS.** A district on the northwest bank of the Thames between the Strand and Whitehall, adjacent to a great cross, which is 1¼ miles from St. Paul's and is at present contained within the yards of the Southeastern Railway Company. The district stands upon the old site of the thirteenth-century village of Cherringe, where in 1291 a Gothic cross was erected by Edward I as a token that the bier of his beloved wife, Eleanor, had been set down there during its journey from Grantham, Lincolnshire, to Westminster Abbey. In 1647 the cross was demolished by the parliamentary party as a relic of popish superstition. The present copy was erected near the original site in 1865. The site itself, as near as it can be guessed, is now occupied by Le Sueur's equestrian statue of Charles I, which was cast in 1633 and erected in 1674. See CROSS.

CHARIOT (OF. *chariot*, dim. of *char*, car). In ancient times, a kind of carriage used either for pleasure or in war. Its use in war and peace was general in the East; it is common on Egyptian, Babylonian, and Assyrian monuments. It was early introduced among the Greeks and is represented on Mycenæan works of art. In the Homeric poems the chariot conveys the heroes to the field of battle and on journeys; they usually fight on foot. In historical times the war chariot was not used by Greeks or Romans, though still a part of the Persian armies. Cæsar also found chariots in use among the Britons; they are frequently mentioned in the Irish epics. The ancient chariot was a light two-wheeled car, usually with a closed front and sides, but open behind. It had no springs. It was generally of wood, strengthened by bronze or iron; the wheels had tires of bronze or iron. In the earliest times the chariot was drawn by two horses, yoked to a pole; this type was not uncommon later. (See BIGA.) The racing chariot was the *quadriga* and was drawn by four horses, harnessed abreast. The centre pair were attached to the yoke, the outer were attached, each by a single trace, to the chariot

body. The *quadriga* used in the Roman triumph was often elaborately adorned; it was drawn by white horses. The war chariots used by the Britons, Persians, and other peoples were often armed with scythes attached to the axles. For abundant illustrations of the ancient chariot in its many forms, consult Daremberg and Saglio, *Dictionnaire des antiquités*, s. v. *Currus*. Consult Ginzrot, *Die Wagen und Fahrwerke der Griechen und Römer* (1817); Leaf, *Journal of Hellenic Studies*, vol. v; Helbig, *Das Homerische Epos aus der Denkmälern erläutert* (1884); the article "Currus" in Smith, *Dictionary of Greek and Roman Antiquities* (3d ed., London, 1890). An Etruscan chariot, reconstructed, may be seen in the Metropolitan Museum, New York City. See CARRIAGE; CIRCUS.

CHARIOT RACES. See CHARIOT; CIRCUS.

CHARIS, kā'ris. In Homer's *Iliad*, xviii, 382, the wife of Hephæstus, the personification of the grace which should characterize the works of a divine artificer. For a later development of this conception, see CHARITES.

CHARISIUS, kā-rish'ī-ūs, FLAVIUS SOSIPATER. A Roman grammarian, born in Africa, summoned to Constantinople in 358 A.D. to take the place of Euanthius. Only a portion of the five books of his *Ars Grammatica* is preserved. It is largely a compilation, but is valuable for its many quotations from early authors. For the text, consult Keil, *Grammatici Latini* (Leipzig, 1857).

CHARISTICARIES, kăr-is'tī-kā'rīz (ML. *charisticarius*, from Gk. χαριστικός, *charistikos*, generous, from χαρά, *chara*, favor, from χαίρειν, *chairein*, to rejoice). In Greek ecclesiastical history, officers who had full power over the revenues of hospitals and monasteries.

CHARITABLE TRUSTS, or CHARITIES. Property, real or personal, vested in trustees to be administered by them for religious, eleemosynary, educational, or other benevolent purposes of a public nature. The origin and use of the term is due to the difficulty, more apparent than real, experienced by the English Court of Chancery in enforcing trusts created for the benefit of a class of indefinite and unascertainable beneficiaries, as a trust for the benefit of the insane, generally, or for the benefit of the poor of London. Inasmuch as there was no ascertained person having the right to invoke the jurisdiction of the court to compel the trustee to perform the duty imposed on him, such a trust was held to be unenforceable and void. To avoid this consequence when the attempted trust was of a salutary character, an early English statute, known as the Statute of Charitable Uses (43 Eliz., c. 4, 1601), was passed, declaring such trusts valid and enforceable by commissioners appointed by the Court of Chancery. Such trusts have since been known as charitable uses, or charitable trusts. It is probable that the administration of such trusts fell to some extent within the prerogative jurisdiction of the chancellor before the statute, and its principal effect was to enlarge the jurisdiction of the Court of Chancery and to define the uses which were to be recognized as charitable, as distinguished from those which, after the Reformation, were deemed superstitious and void as pertaining to the Catholic church.

The charitable trust is distinguished from the private trust, which includes all other trusts, in that (1) it always exists for charity or public beneficence; (2) its beneficiaries are indefinite and undetermined; and (3) it may create a perpetuity.

I. An enumeration of the charitable objects for which such trusts may be created and upheld is found in the statute of Elizabeth. Those objects may be grouped, as appears by the definition given, under four general heads, as follows: (1) Gifts for *strictly eleemosynary* objects, i.e., for charity in its narrow, popular sense, such as gifts for the poor, for sick, disabled, or demented persons, and for hospitals, homes, and asylums. (2) Gifts for *educational purposes*, as for schools and colleges, to build or equip libraries, and to endow scholarships, fellowships, and the like. (3) Gifts for the purposes of *religion*, such as those for the building or repairing of churches, for missions, and for spreading the gospel. (4) Gifts for *lightening the expenses of government*, such as bequests for the erection of public buildings, docks, wharves, canals, etc.

II. *Indefiniteness in the beneficiaries*, either as to the class to be benefited, or as to the individuals in a determined class who will be the objects of the bounty, is the predominant distinguishing feature of charitable uses or trusts. If the beneficiaries be definitely specified, no matter how charitable the object of the gift, it constitutes a private trust and is valid without the aid of the statute, and must be construed and governed accordingly. Thus, a trust for the support and comfort of designated persons in a certain hospital would be private, while a trust for all those who should be cared for by such an institution would be public, or charitable. This feature of trusts for charity, coupled with the liberal spirit in which courts construe such gifts, has led to the method of executing them, called *cy pres* ('as near as'). By this doctrine is meant that, when such gifts cannot be applied according to the precise intention of the donor, although the general purpose of the trust is proper, they will be employed for the purpose in a manner as near as possible to that which was designated. It assumed two forms in England. In one form it was employed by the chancellor in the exercise of a prerogative, executive power, delegated to him under the sign manual of the crown, and was carried to the extent of applying a trust for charities to *some* charitable purpose, even when the particular objects for which it was intended were illegal and void. In its other form it was exercised by the chancellor in the performance of his *judicial* functions and was applied only to such charitable trusts as were legal and valid in their inception, but which, because of some change in law or circumstances, could not be carried out in exactly the manner indicated by the donor. In this latter form, but not in the former, the *cy-pres* doctrine is recognized and applied in some, though not in all, of the American States, where trusts for charity are allowed. For example, a bequest made before the fall of slavery in the United States, to trustees, to be applied to various methods of creating a sentiment against negro slavery in America, was applied, after the close of the Civil War, by the Massachusetts courts, to the American Freedmen's Union Commission.

III. It is no objection to a trust that it necessarily suspends, during its continuance, the power of free and unrestrained alienation of property. However, when a trust is created to shift at a possibly remote period from one class of beneficiaries to another, it constitutes

what is known as a *perpetuity*. A perpetuity is an estate or interest, legal or equitable, which may vest in the beneficiary at a period more remote than (any number of) lives in being at the time of its creation plus 21 years, and was void by reason of such possible remoteness of vesting. But the beneficial character of charitable trusts led to their being recognized as an exception to this rule, and such a trust will therefore be sustained without reference to the fact that it creates a perpetuity. Similarly a provision for accumulation (q.v.), void under the same rule in case of a private trust, does not impair a charitable trust.

Gifts for charitable uses are of considerable antiquity. They were known and fostered by the Christian emperors of Rome as "pious uses," and it was in this form and under this description that the doctrine passed from the civil law into the law of England, where, as has been said above, pious or charitable uses were enforced to some extent by the chancellor long before the Statutes of 39 and 43 Elizabeth.

In England the system of charitable trusts and the method of administering them is now based upon a series of modern statutes of the most enlightened character, known as the Charitable Trusts Acts, passed in 1853, 1855, 1860, 1869, and 1888, and, lastly, upon the Mortmain and Charitable Uses Act, passed in 1891. In the United States the statutes of Elizabeth have not generally been enacted, but in most of the States the principle embodied in those acts and enforced by the English Court of Chancery has been judicially recognized as a part of the body of legal principles brought over from the mother country, and many trusts not strictly within the English statute are here held to be valid by analogy. New York, long a conspicuous exception, has recently by statute made possible the creation of trusts for charitable purposes, but there are still several States in which no distinction is made between charitable trusts and trusts for private purposes. See MORTMAIN; TRUST; PERPETUITY.

Bibliography. The literature of the subject is extensive. Among the most important works dealing exclusively with it are Shelford, *Treatise on the Law of Mortmain, and Charitable Uses and Trusts* (London, 1836); Tudor, *Law of Charities and Mortmain* (ib., 1890). Consult also the general treatises on trust and equity jurisdiction, as Perry, *Treatise on the Law of Trusts and Trustees* (5th ed., Boston, 1899), and Pomeroy, *Treatise on Equity Jurisprudence, etc.* (3d ed., San Francisco, 1905). See MORTMAIN; TRUST.

CHARITES, kăr'ĭ-tēz (Gk. Χάριτες, *Charites*). In Greek mythology, the goddesses of grace and charm, called Gratiæ by the Romans. (See CHARIS.) They were described usually as three in number, the offspring of Zeus, and were named Euphrosyne ('joy'), Thalia ('bloom'), and Aglaia ('brilliance'). Their home was on Olympus, with the Muses. They were companions also, naturally, of Aphrodite and Peitho ('persuasion'). Their oldest shrine was at Orchomenus in Bœotia, where their festival, the Charitesia, was celebrated. In later days their worship was widespread. In sculpture they usually appear as three beautiful maidens hand in hand.

CHARITIES. The public and private institutions of society whose object is the relief, without compensation and solely from the motive of human sympathy, of those suffering from poverty, sickness, and all forms of human disease.

In ancient times few such institutions existed. The unfortunate individual who was unable to care for himself had to look to the immediate circle of his nearest of kin, or, more frequently, was allowed to perish, or was actually put to death because he was regarded as a burden by the community which had to struggle for existence without being able to accumulate any social surplus of wealth. This is peculiarly the case in a nomadic society. The historical growth of the spirit of charity is briefly and admirably described in Lecky's *History of European Morals*.

The first efforts at institutional relief were those of the early Christian Church. They were carried out in response to the teaching of the Church that it is more blessed to give than to receive, that there is merit in the very act of giving, and that the future welfare of the giver is in a measure dependent on his generosity. Such a doctrine gave little thought to the effect of the gift on the recipient, or, indeed, to the welfare of the recipient after the gift was once bestowed. Naturally a reckless system of charity developed, which in some cases had to be suppressed, and in other cases, where the Church, especially in northern Europe during the Reformation period, lost most of its property and was unable to continue the support of large numbers of undeserving poor, something had to be done as a substitute by public authorities.

In this way a system of public charity grew up in England, though in the beginning it was a part of the criminal law, providing not measures of relief, but regulations and institutions for the repression of "vagabonds" and "sturdy beggars."

The earliest and most popular really charitable institutions were hospitals. Private charities, supported entirely by voluntary contributions, had their beginning, usually, in institutions for the relief of foundlings and abandoned children. By the end of the eighteenth century in Europe many such institutions existed, and the public almshouse or workhouse, supported from public funds, had been established in most countries especially for the relief of the aged poor. At the beginning of the nineteenth century a great movement for the reform and extension of these institutions began. In America the almshouse was then practically the only public institution provided for the needy and helpless. In most parts of the country no attempt was made to segregate the different classes of dependents. The evils of this system were in some degree mitigated by the free employment of outdoor relief for persons who had become destitute through no fault of their own. This plan, however, was in many cases unduly extended, with the inevitable result of pauperization of classes that might otherwise have become self-supporting. The first effort to systematize charitable relief was made in New York in the year 1842, by a committee of philanthropic citizens organized by Robert M. Hartley. As a result of the work of this committee, the New York Association for Improving the Condition of the Poor was founded in 1843. Similar associations were organized in other cities in the next three decades, and in 1876 there were 63 in existence. The object of these associations was to cover all charitable needs save those provided for by public authority.

Modern charities may be classified under the following heads: 1. Institutional care of destitute adults; 2. Care of defectives, insane, feeble-minded, epileptic; 3. The treatment of criminals; 4. Hospitals, dispensaries, nursing; 5. Care of destitute, neglected, and delinquent children; 6. Care and relief of needy families; 7. Supervisory and educational movements; 8. Preventive and constructive philanthropy. The public authorities have in most modern countries assumed responsibility for 1, 2, and 3; 4 and 5 are divided between public and private agencies; 6, 7, and 8 are still largely in private hands.

The line cannot be clearly drawn between public and private charities. Public charities are those supported entirely or in part from funds raised by taxation, while private charities are those supported by voluntary contributions, administered by societies organized for the purpose. Private charitable societies are frequently placed under some public supervision. Public charities should provide for those well-defined and more or less permanent needs of the community for the relief of which experience has been sufficient to enable us to formulate very definite rules and regulations which can be carried out, more or less mechanically, by public officials who must interpret laws more often literally than in the spirit in which they were framed, while private charities should deal with those forms of relief still in the experimental stage, with a view of demonstrating what can be done by the public authorities on a larger scale.

Private philanthropy centres in the home and the family. It views the home as the important element which must be protected and preserved. Public charity has followed private initiative, gradually taking up those institutions shown to be necessary. To protect the home, the tenements are brought under regulation. (See HOUSING PROBLEM.) To insure the family against loss of income through injury to the breadwinner or through his death, dangerous employments are regulated (see FACTORY INSPECTION) and various plans of indemnification are instituted. (See EMPLOYER'S LIABILITY; WORKINGMEN'S COMPENSATION.) The family is relieved of the burden of provision for old age. (See OLD AGE PENSIONS.) Sanatoria are built for consumptives. Children are properly cared for. (See DEPENDENT CHILDREN; JUVENILE COURTS; JUVENILE OFFENDERS; CRUELTY TO CHILDREN, PREVENTION OF.) Foundling hospitals and children's aid societies rescue the abandoned. It is sought to get at the causes of distress and to remove them rather than to minimize results of bad conditions. (See PAUPERISM; CHARITY ORGANIZATION SOCIETY; SOCIAL SETTLEMENTS.) Visiting nurses attend the sick poor, and diet kitchens furnish suitable food. Playgrounds are established for the children. Charity is becoming less sentimental and more methodical and scientific. Its administrators are trained experts. All civilized nations are pursuing similar courses. See also POOR LAWS; SOCIAL DEBTOR CLASSES. Consult: Lowell, *Public Relief and Private Charity* (New York, 1894); Warner, *American Charities* (New York, 1894); Mackay, *Public Relief of the Poor* (London, 1901); Leonard, *Early History of English Poor Relief* (Cambridge, 1900); Loch, *Charity and Social Life* (London, 1910); Devine, *The Spirit of Social Work* (New York, 1912); Gray, *History of English Philanthropy* (London, 1905); Devine, *Principles of Relief* (New York, 1904); Henderson, *Modern Methods of Charity* (New York, 1904); and current numbers of the *Survey* (New York, weekly). See CHARITABLE TRUSTS.

CHARITIES AND CORRECTION, THE NATIONAL CONFERENCE OF. An association of some 3000 members in the United States, Canada, and Mexico, who are interested in philanthropic efforts. Many of the members are actively connected with charitable activities in various cities. All shades of thought are represented. The conference has no platform and adopts, usually, only resolutions of thanks. All persons are privileged to participate in the discussions. It is simply an exchange for the comparison of views and experiences, not a body organized to accomplish any undertaking. One result of its deliberations was to arouse public interest leading to the establishment of local or State conferences and in securing needed legislation.

The first session was held in New York City in 1874 at the invitation of the Social Science Association, with which body joint meetings were held till 1878, though the proceedings were published separately after 1876. In 1879 the first separate convention met in Chicago, with delegates from 12 States. The membership and attendance have steadily increased. The State governors frequently appoint representatives, as do the mayors of large cities. Delegates from foreign lands are often present. In 1880 the first report on the organization of charity was read, and thenceforth this topic has had great attention. In 1893 a membership fee was charged, the expense previously having been met by contributions. The membership fee is $2.50, entitling the members to the volume of *Proceedings* and the quarterly *Bulletin*. These volumes contain a vast amount of valuable information on the charitable activities of America. The conference holds annual meetings in the various cities of the country. The evening sessions are devoted to general questions. Section meetings are held during the day. These sections are in charge of special committees on State supervision, needy families, children, defectives, criminals, care of sick, neighborhood improvement, etc.

Consult *Proceedings of the National Conference of Charities and Correction* (published at Boston, New York, and other cities, 1874 et seq.).

CHARITON, shăr'ĭ-ton. A city and the county seat of Lucas Co., Iowa, 56 miles south by east of Des Moines, on the Chicago, Burlington, and Quincy, and the Chicago, Rock Island, and Pacific railroads, and on the Chariton River (Map: Iowa, D 3). It is in a fertile agricultural and stock-raising region, has coal mines, and manufactures carriages and wagons, ice, cement blocks, agricultural implements, flour, windmills, tanks, pumps, pipes, etc. The city contains a public library and owns its water works. Pop., 1890, 3122; 1900, 3989; 1910, 3794.

CHARITON, kăr'ĭ-tŏn (Gk. Χαρίτων). A Greek prose writer, of Aphrodisias in Caria, the author of a romance entitled *Chæreas and Callirrhoë* (q.v.), written about 200 A.D. The views of Rohde, *Der griechische Roman und seine Vorläufer* (2d ed., Leipzig, 1900), concerning Chariton, have been corrected through the finding of a fragment of *Chæreas and Callirrhoë* in a papyrus which must be dated before 225 A.D. Consult J. S. Phillimore, "Greek Ro-

mances," in *English Literature and the Classics* (Oxford, 1912).

CHARITY, Brothers and Sisters of. See Brothers and Sisters of Charity.

CHARITY ORGANIZATION SOCIETY. Associations bearing this name or known as Associated Charities, United Charities, or Bureau of Charities exist in about 150 cities of the United States, with a large number of other societies partially adopting their methods, and in several Canadian cities. In Great Britain nearly 100 societies exist, and they are also found in Australian cities, and organizations more or less closely resembling them exist in Europe. The parent society, known as The Society for Organizing Charitable Relief and Suppressing Mendicity, was started in London in 1869 under the leadership of Mr. Goschen, then President of the Poor Law Board, the Bishop of London, the Earl of Shaftesbury, and Edward Denison. The first Charity Organization Society in America was organized in Buffalo, N. Y., in 1877, through the influence of Rev. S. H. Gurteen. The New York Charity Organization Society was founded in 1882. The primary object of the Charity Organization Society is to bring about such a coöperation between existing charities as to avoid overlapping of fields and duplication of efforts. To many of the earlier charitable societies the reason for existence was almsgiving to those in distress, little, if any, careful investigation being made as to the cause of the trouble and less attention being paid to the work of other agencies. Whenever such a condition obtains, it is always found that "charity tramps" and professional beggars abound. The very existence of these varibus dissociated agencies is a temptation to those on the border line of self-support to seek assistance. The charity organization societies are of course unable to prevent altogether the practices of unwise almsgiving, but through securing a measure of coöperation and of free discussion of methods they have contributed materially towards the reform of methods of charity.

Coöperation. They act as a clearing house for all philanthropic societies and individuals. Careful records are kept of all cases. These are preserved in envelopes, one for each family. In these envelopes are put all the information regarding the individual and family history, the reports of investigations, all letters and other relevant matter. The record is kept as nearly up to date as possible. These envelopes are so filed that they can be found in a moment. The records are confidential and are given only to persons or societies having a legitimate interest in the family. Their use prevents duplication and fraud. Public officials frequently find them of great assistance. The society undertakes to know just what the other organizations do. As they seek to cure distress, not merely to relieve it, whenever a case comes under their care an investigation is made of the family's condition, sources of income, possible means of assistance, friends, former employers, etc. In cases of emergency assistance is at once given or secured. Then some plan is formed—comprehensive, but subject to constant modification—and this plan is followed until, if possible, the family becomes self-supporting, or, if this is impossible, until some permanent disposition may be made so that the family may have no excuse for asking further assistance. This often involves the calling upon a number of institutions for their services. There is, however, a clearly defined end in view, so that the organizations assisting are rendering a most valuable coöperation. The Charity Organization Society does not duplicate existing agencies, but seeks to supplement them. Some charity organization societies have even had no relief fund, preferring to act wholly as mediators.

Personal Service. The pursuit of a comprehensive plan involves an immense amount of time and labor. Under the old system a sum of money or other necessities was given and the recipient disappeared from sight and notice till trouble brought him back. The Charity Organization Society seeks to show a personal, friendly interest in the family. To further this aim, a corps of "friendly visitors" is developed, who undertake to visit a family regularly, to share sympathetically in its troubles and its pleasures. The influence of this personal interest of a tactful and resourceful person upon the family life is hard to estimate. These friendly visitors are always unpaid, and thus their interest is wholly unselfish. The way is opened for all sorts of suggestions for improvement, for making the home attractive to the children and father. The friendly visitors hold regular conferences.

Social Service. Growing out of the intimate knowledge gained by frequent personal visits comes the opportunity to influence the community regarding the necessity for playgrounds, better sanitary and housing conditions, factory legislation, and the like. Such service is of the highest value, often accomplishing great reforms. The present movement to reform the tenements in New York City is largely the result of the labors of the Charity Organization Society and interested individuals. Here should be noted the possibility of handling special relief funds in times of emergency. The Charity Organization Society, with its trained force and intimate knowledge of local conditions, can act to great advantage. Mention should be made of the influence exerted to cut down unwise appropriations for supposed charitable purposes. Another valuable service is the investigation of charitable organizations for the information of intending donors. By no means the least valuable part of this social work is in getting so many persons directly interested in the work of the society.

Self-Help. The object of the Charity Organization Society is to "help to self-help." It is not sought to give something for nothing. The self-respect and the independence for the individual are always to be preserved. Work rather than alms is given. Laundries, sewing rooms, wood yards, employment bureaus, are maintained according to local needs. In some cities the vacant lots and waste places have been transformed into vegetable gardens, carried on, under expert guidance, by the poor. When necessary, the professional beggars are prosecuted; lists of unworthy alms seekers are published, to compel them to seek honest employment.

Preventive Work. The head of the family is dealt with, whenever possible. The children who ask for assistance on behalf of parents are told that the parents must come in person. The child must not form the begging habit. All workers will testify to the value of preventive efforts on behalf of the children. Summer camps, home libraries, local associations, mother's meetings, penny savings banks, are among the forms this work assumes.

It will be seen from the foregoing that the work of the Charity Organization Society is to an unusual degree administrative—personal. This is the secret of the great work it is able to do, but is frequently a cause of complaint to those who do not grasp the situation. Personal service is considered the highest form of giving. A large part of the income of the Charity Organization Society is therefore spent in salaries. The complexity of the organization naturally increases with the size of the city. There is a board of directors chosen from among those who contribute to the society, and under the directors an executive committee. The administrative officer is the superintendent, who has his necessary assistants. The larger cities are divided into districts, each in charge of a district superintendent, who is responsible for the work in the district. Applicants for help are referred to the district in which they live. The central and district offices are open daily. The central office keeps on file a digest of all cases from each district. In each district a "decisions committee" meets weekly to discuss the various cases and decide upon courses of action. The funds come from private donors.

Expert Service. The work of the Charity Organization Society calls for educated and trained men and women. The mere desire to do good is no qualification, nor is charitable work in general any longer a dumping ground for those who have failed in other professions. The highest abilities are sought, and some societies are conducting special schools for portions of the year for the training of workers.

Publications. The best American periodical devoted to charities is the *Survey* (formerly *Charities and the Commons*), published in New York City. In England this place is filled by the *Charity Organization Review* of the London Society. Consult: Loch, *Charity Organization* (London, 1890); Warner, *American Charities* (New York, 1894); Devine, *The Practice of Charity* (New York, 1901); id., *Principles of Relief* (New York, 1904); Henderson, *Modern Methods of Charity* (New York, 1904); Brandt, *The Charity Organization Society of the City of New York* (New York, 1907); *Reports of Societies* (Boston, New York, Philadelphia, etc.). See PAUPERISM; SOCIAL-DEBTOR CLASSES.

CHARIVARI, shȧ'rē'vȧ'rē' (LL. *charivarium*). A French term used to designate a wild tumult and uproar, produced by the beating of pans, kettles, and dishes, mingled with whistling, bawling, groans, and hisses, and got up for the purpose of expressing a general dislike to the person against whom it is directed. The etymology of *charivari* is obscure; the Germans translate it by *Katzenmusik*, the English of which is *caterwauling*. In France, during the Middle Ages, a charivari was generally raised against persons contracting second nuptials, in which case the widow was especially assailed. On these occasions the participators in it, who were masked, accompanied their hubbub by the singing of satirical and indecent verses and would not cease till the wedding couple had purchased their peace by ransom. It was also organized against an unequal match, e.g., where there was great disparity in age. In some of the rural districts of the United States a like custom prevails, the instruments of discord being horns, tin pans, horse fiddles, and whistles. The rustic American corruption of the word "charivari" is "shivaree," for which a synonym is "skimmerton." Similar customs seem to have existed under different names in all parts of Europe, and sometimes they were of such a licentious and violent character as to require military interference to put them down. Even as early as the fourteenth century the Church found itself forced to threaten punishment, and even excommunication, against those who participated in them. In more recent times the charivari has taken a purely political coloring; as, e.g., during the Restoration in France, at which time, however, the popular voice began to seek vent by casting its satirical darts against public men through the press. Among the papers of this sort the most famous is the *Charivari*, established in Paris, Dec. 2, 1832, on which was patterned the English publication *Punch* (q.v.).

CHARKOV, kär'kôv. See KHARKOV.

CHARLEMAGNE, shär'le-mān, *Fr. pron.* shär'l'-mȧ'ny'. See CHARLES THE GREAT.

CHARLEMAGNE CYCLE OF ROMANCES. A division of one of the three principal cycles of romances which took form in France in the thirteenth century. These three cycles may roughly be designated as the *gestes royales*, the *gestes de Guillaume*, and the *gestes de Doon de Mayence*. The first of these divisions was composed of all the poems which had been written about the three regal historic figures Pepin, Charles, and Louis, and the *Charlemagne Cycle* was composed exclusively of all those poems which centred about the life and court of the second of these characters. It consisted of a collection and arrangement made by certain itinerant musicians, who were editorially minded, of whatever of the ancient *chansons de geste* pertained particularly to the deeds of this one hero. Many of these chansons were founded on certain heroic ballads which Charlemagne himself had caused to be preserved in writing. These had already formed the basis of two Latin chronicle histories by a monk of St. Gall (890), and by Benedict of St. André (968), entitled *De Gestis Caroli Magni;* and the two latter works were doubtless of great aid to the thirteenth century codifiers of the *gestes*. The cycle is composed of the following individual narrative poems: *Fierabras; Garin de Montglane; Gallien le Rhetoré; Ogier le Danois; Les Quatres Filz Aymon*, and others of varying dates. A prose version of it, in French, was printed at Bagnyon in 1478. Consult G. Paris, *Histoire poétique de Charlemagne* (Paris, 1865).

CHARLEROI, shär'l'rwä' (Fr., Charles king). A Belgian town and railroad centre in the Province of Hainaut, situated on the Sambre and on the Charleroi Canal, between Mons and Namur (Map: Belgium, C 4). It has an archæological museum, with a mineralogical collection and an industrial school, and is altogether dependent upon the activities of the surrounding region. The district is rich in coal and iron, and there are a number of smelting furnaces and nail factories in the neighborhood. The iron works of Couillet, which yield a third of all the cast iron produced in Belgium, are near by. It also produces machinery, glass, and cutlery. Pop., 1890, 21,900; 1900, 24,800; 1910, 27,396. In 1666 the village, originally Charnoi, was fortified by the Spaniards and named, in honor of the King, Charles II, Charleroi.

CHARLEROI, shär'le-roi'. A borough in Washington Co., Pa., 40 miles south of Pittsburgh, on the Monongahela River, and on the Pennsylvania Railroad (Map: Pennsylvania, B 7).

Industries include mining and the manufacturing of various kinds of glass and shovels. Charleroi was settled in 1890 and incorporated in the following year. The government is vested in a burgess, elected every four years, and a borough council, chosen on a general ticket. Pop., 1900, 5930; 1910, 9615; 1920, 11,516. Charleroi is the home of John K. Tener, former Governor of Pennsylvania.

CHARLES THE GREAT, or **CHARLEMAGNE** (from Lat. *Carolus Magnus,* Charles the Great) (742–814). King of the Franks after 768, and Roman Emperor from 800 to 814. He was the son of Pepin the Short, the first Carolingian King, and of Bertha, a daughter of Charibert, Count of Laon, and was born probably on April 2, 742. His birthplace is unknown; but from the fondness which he displayed throughout his life for the cities of Aix-la-Chapelle and Ingelheim, it has been conjectured that he was born in one of these places. Of his early youth and education nothing is known, even from Einhard, his contemporary biographer. He was brought up at the court of his father and received the thorough military training which constituted the education of the time. He took part in his father's expeditions against Aquitaine in 761 and 762. On Pepin's death, in 768, the Frankish Kingdom was divided between his two sons, Charles receiving the eastern part, or Austrasia, which was predominantly Germanic, together with a part of Aquitaine, while his brother Carloman received Neustria, the Romance part of the Frankish domains. Carloman died in 771, and Charles, with the consent of the Frankish nobles, took possession of the entire kingdom, to the exclusion of the young sons of his brother. Their mother fled to Desiderius, King of the Lombards, and the ensuing complications led to the first great war of Charles's reign. Charles had, ere this, in 770, offended Desiderius by repudiating his second wife, Desiderata, who was that monarch's daughter. The latter therefore received Carloman's widow hospitably, and urged Pope Adrian I to crown the sons of Carloman. Upon the Pope's refusal he invaded the papal territory. The Pope thereupon summoned the Frankish King to his aid. Charles endeavored to avert the war; but upon the refusal of Desiderius to restore the papal cities of the Pentapolis, he crossed the Alps, with two armies, from Geneva by the Great St. Bernard and Mont Cenis, in 773, and besieged Desiderius in Pavia, forcing him after a 10 months' siege to surrender and retire to a monastery. In 774 he proclaimed himself King of the Lombards and was acknowledged as such by the Lombard dukes. He secured the Pope's favor by confirming the donation of lands made to the holy see by Pepin. In the winter of 776 he again crossed the Alps and crushed a Lombard revolt, henceforth ruling over northern and central Italy as far south as Spoleto. In 780 he went to Italy, where the Pope crowned his second son, Pepin, King of Italy, and his third son, Louis, an infant, three years old, King of Aquitaine. In 787 he completed the conquest of the Lombards by the subjugation of the Duke of Beneventum.

The severest war undertaken by Charles was his contest with the Saxons. The struggle was of long standing, having been waged by his father and grandfather, and contemplated the incorporation of the Saxons into the Frankish Kingdom and their conversion to Christianity. The obstinate resistance of the Saxons has scarcely been equaled in history. In 772 Charles advanced as far as the Weser and destroyed the famous "Irminsul"—according to heathen belief, the column supporting the earth. There were incessant revolts, but in 775 Charles carried his arms as far as the Elbe. In 777 he could even hold the Frankish National Assembly on Saxon soil, at Paderborn. But in 778, on news of Charles's absence in Spain, the Saxons again arose and advanced almost to Cologne; but Charles again drove them back to the Elbe. They destroyed a Frankish army in the Süntel Highlands in 782; and Charles, after a new victory, avenged this disaster by the massacre, at Verden, of 4500 prisoners in one day. This caused a general rising of the Saxons; but in 783–785 the Frankish monarch at last succeeded in reducing them to subjection. Their great leader, Widukind, submitted to baptism, and their principal chiefs became Charles's vassals. The Saxons north of the Elbe submitted in 804, and 10,000 of them were led into the interior of Germany as hostages. Charles proceeded to extend his arms beyond the boundaries of Saxony. The neighboring Slavs were either his allies or else were made tributary, and even the Bohemians were in part subdued. The Danes were confined to the north of the Eider, which became the northern boundary of Charles's kingdom.

Charles was equally successful in the southeast. His marriage, in 771, with Hildegarde, daughter of Duke Godfrey of Suabia, secured his influence in that duchy. In Bavaria his cousin, Tassilo, ruled practically as an independent sovereign. He had been allied with the Lombards, but in 781 he took the oath of allegiance to Charles. In 787 he rebelled, but was forced to surrender, and was deposed in 788. Tassilo had also been allied with the Avars, a fierce nomadic tribe which occupied the great plain of the middle Danube. The wars which Charles undertook against them in 791–796 resulted in the entire destruction of the nation, the Raab becoming the southeastern boundary of the Frankish Kingdom. In 778, at the invitation of the Emir of Saragossa, who was in revolt against his suzerain, the Caliph of Córdova, Charles invaded northeastern Spain. This campaign against the infidel figures very prominently in mediæval legends, but in reality it was without direct result. Charles was summoned home by the news of a Saxon revolt, and in his return over the Pyrenees, the rear guard of his army was assailed and annihilated, probably in the Pass of Roncesvalles, by the Basques. In this battle Roland, afterward the hero of a vast legendary literature, fell. In 779 Charles sent his son Louis to Spain, and after the fall of Barcelona he established the Spanish "mark," extending from the Pyrenees to the Ebro. It was the policy of Charles to establish such marks on the borders of his dominions as bulwarks against the uncivilized nations by which they were surrounded. Against the Danes he established the Danish mark south of the Eider; against the Sorabians the Thuringian mark; against the Bohemians the Frankish mark; and against the Southern Slavs the marks of Carinthia and Friuli. The land in these districts was parceled out among Frankish vassals, and the margraves who ruled over them had far greater power than the ordinary counts. Charles also made use of the Church to secure his conquests. In the Saxon

wars the Saxons were baptized by the thousands, and the bishoprics of Halberstadt, Paderborn, Minden, Verden, Bremen, Münster, and Osnabrück were erected. He also founded great monasteries, like Corvey and Herford, which were in fact fortresses in the enemy's country.

By the conquest, organization, and rule of such extensive dominions and of peoples so different in race and political tradition, Charles had virtually established an empire. His assumption of the Imperial title and the revival of the Western Roman Empire were but the logical consummation of his great work. This event took place on the occasion of an expedition to Italy, the object of which was to support Pope Leo III against the rebellious Romans. While Charles was worshiping in St. Peter's on Christmas Day, 800, the Pope unexpectedly, as it appeared, set a crown upon his head, and amid the acclamations of the people saluted him as "Carolus Augustus, Emperor of the Romans." Whether or not the Emperor was aware of the intention of the Pope is a matter of conjecture only. In his familiar conversations he was wont to protest his ignorance of the projected coronation. In itself it added nothing directly to Charles's power, yet it greatly confirmed and increased the respect entertained for him, such was the lustre of a title with which were associated recollections of all the greatness of the Roman Empire. There is said to have been a scheme for the union of the newly revived Western Empire with the Empire of the East, by Charles's marriage with Irene, the Byzantine Empress. If so, it failed by reason of Irene's overthrow. Besides the moral weight of Roman tradition, the Imperial title added to Charles's office of King the powerful temporal guardianship of the Church. This was strongly emphasized in the new oath of allegiance to him, as Emperor, which Charles caused all his subjects to swear in 802. He proceeded to organize the Empire with a view to strengthening the Imperial power. The old national dukedoms having been abolished, Charles governed his dominions through counts, whom he himself appointed. Each count presided over an ancient canton (*Gau*), a subdivision of the dukedom. Three times a year the count held a regular court, which all freemen were bound to attend, and in times of war he assembled the military levy of the Gau. To watch over the counts Charles sent his "Missi Dominici," usually a count and a bishop, to the extreme ends of the Empire. Their functions were to look after the administration of the Church, to collect the Emperor's revenues, and hold the superior court. Charles did not attempt to interfere with local Germanic institutions, but caused the ancient laws to be codified and reduced to writing. Although his rule was in fact absolute, he retained the ancient national assemblies, which every freeman might attend. They met twice a year, in spring (*Maifeld;* see CHAMP DE MAI) and in autumn, and decided upon matters of state, particularly on peace and war. Here the "Missi Dominici" made their reports, and the Church councils were held. Besides the "Missi" (q.v.) and his councilors, there were two chief court officials—the Apocrisiarius, who stood at the head of Church affairs, and the Count Palatine (Comes Palatinus), who presided over the secular administration. The income from the royal domains, which Charles skillfully managed, together with the revenues from the administration of justice and so-called free-will offerings, provided for the expenses of the state.

Charles promoted to the fullest extent the interests of the Church. He recognized in it a powerful ally, both in increasing and ruling his dominions. His wars were religious as well as political; he introduced Christianity into the countries which he conquered. He made the system of tithes compulsory throughout the Empire, and richly endowed bishoprics and monasteries. His zealous coöperation with the bishops in bringing about disciplinary reform, his always active interest in doctrinal matters and solicitous participation in the national synods, contributed wonderfully to increase the power and influence of the Church. No sovereign in the history of Christendom contributed more actively and efficaciously than Charles to the propagation and strengthening of religion and the upbuilding of the Church, though the revival of the Western Empire in his person led eventually to the memorable conflict, which filled subsequent centuries, between papacy and the Empire. He also effected a closer Church organization, by subordinating more strictly the bishoprics to the archbishoprics and by strengthening the hold of the Bishop over the churches of his diocese.

No less glorious than his political achievements was the revival of science, literature, and art which Charles brought about—a renaissance all the brighter for the gloom by which it was preceded and followed. He summoned to his court the greatest scholars of the age: Alcuin, the Englishman, who became the head of the Palace School; Paulus Diaconus, the Lombard, who wrote a history of his people; Peter of Pisa, the grammarian; Angilbert and Theodulf, the greatest poets of the day, who wrote in imitation of the ancient authors; finally, Einhard, Charles's secretary and friend. In this circle of scholars Charles moved as a comrade and friend, much as did Lorenzo de' Medici in the Platonic Academy of Florence. He himself possessed an amount of learning unusual in his age, in spite of the fact that he could not write, having begun to learn too late in life. He was very fond of his native tongue—the Frankish—and is said to have drawn up a grammar of the language. He invented Frankish names for the months of the year and for the winds and caused a collection of old German poems and legends, then current, to be made, which his pious son Louis is said to have destroyed because of its heathenism. In his Palace School his own sons and those of the nobility received a liberal education; but he also commanded that each cathedral and monastery should have a school to which laymen, as well as clergy, should be admitted. The school which Alcuin established at Tours, under his patronage, was famous for centuries. He also attempted to establish public schools for all freemen in connection with the monasteries and parishes. He was no less liberal in his patronage of the fine arts. He built palaces, particularly at his favorite residences, Aix-la-Chapelle and Ingelheim—for he had no fixed capital—and many churches, chief among which was the minster of Aix. He endeavored zealously to promote agriculture, manufactures, and commerce. He projected great national works, one of which was a canal to connect the Rhine and the Danube; but he deemed nothing beneath his attention which concerned the interests of his Empire or of his people. He re-

quired his subjects to plant certain kinds of fruit trees, the cultivation of which was thus extended northward in Europe. His own domains were an example of superior cultivation.

Charles the Great was one of the most imposing figures, not only of the Middle Ages, but of all history. His personality impressed itself upon the imagination of the people of the Middle Ages as that of no other man has done. Romances and legends grew up around his name and those of his nobles, or paladins. According to contemporary accounts, he was above the ordinary stature and of a noble and commanding presence. He was fond of manly exercises, particularly of hunting, and his strength was prodigious. His mode of life was simple. In eating and drinking he was very moderate. He wore the simple, ancient costume of his people, except on great state occasions, when he used Roman robes and ceremonial. His death took place on Jan. 28, 814. He was buried in the minster of Aix and was succeeded by his son Louis, known as the Pious.

Bibliography. Besides his capitularies (q.v.), there are extant letters and Latin poems ascribed to Charles the Great. Consult Dümmler, *Poetæ Latini Ævi Carolini* (Leipzig, 1881–84). The chief source for his history is the biography, by his secretary, Einhard, *Viti Caroli Magni*, edited by Pertz, in the *Monumenta Germaniæ Historica*, and separately (Hanover), 1863; Eng. trans. by Glaister, London, 1877). Other sources are the letters and poems of Alcuin, Paulus Diaconus, and Angilbert, and the contemporary annals, for a description and editions of which consult Wattenbach, *Deutschlands Geschichtsquellen im Mittelalter*, vol. i (Berlin, 1904). The most detailed modern account of his reign is Abel and Von Simson, *Jahrbücher des fränkischen Reiches unter Karl dem Grossen* (Leipzig, 1883; 1888). Consult also: Vétault, *Charlemagne* (Tours, 1876); Döllinger, *Das Kaisertum Karls des Grossen und seiner Nachfolger* (Munich, 1864); Haureau, *Charlemagne et son cour* (Paris, 1888). The best English works on Charles are: *The Cambridge Medieval History*, vol. ii (New York, 1913); Mombert, *History of Charles the Great* (New York, 1888); Hodgkin, *Charles the Great* (London, 1897); Davis, *Charlemagne*, in "Heroes of the Nations Series" (New York, 1900); and Prutz, *Age of Charlemagne* (Philadelphia, 1905); consult also: Clemen, *Die Porträtdarstellungen Karls des Grossen* (Aachen, 1890).

CHARLES II. Holy Roman Emperor. See CHARLES I, THE BALD, King of France.

CHARLES III. Holy Roman Emperor. See CHARLES II, THE FAT, King of France.

CHARLES IV (1316–78). Holy Roman Emperor from 1355 to 1378. He was born at Prague, May 14, 1316, and was the son and successor of John of Luxemburg, King of Bohemia, who fell in the battle of Crécy in 1346. With the aid of Pope Clement VI, to whom he had previously taken an oath sacrificing several Imperial prerogatives, he was elected King of Germany by five electors on July 11, 1346. This was done because the Emperor Louis IV, who, as such, was also King of Germany, had been placed under the greater excommunication by the Pope. Charles and Louis contended for the prize until the death of the latter in 1347. On Easter Day, 1355, Charles IV was crowned Emperor at Rome. In 1356 he issued the Golden Bull, establishing a new rule for the election of the King of the Romans. On June 4, 1365, he was crowned King of Arles. In 1376 he had his son, Wenceslaus, elected King of the Romans, to succeed him after his death, and secured the Pope's confirmation of the election, in spite of the provisions of the Golden Bull. He died at Prague, Nov. 29, 1378. Charles was an artful politician and directed his efforts mainly to securing power for his own family and for his hereditary Kingdom of Bohemia, which was very flourishing under his reign. He, with the Archbishop of Prague, founded the University of Prague, on the model of that of Paris, in 1348. For his early years, till 1346, we have an autobiography, "Vita Caroli IV ab ipso conscripta," in Boehmer, *Fontes rerum Germanicarum*, vol. i (Leipzig, 1885). Consult Wernusky, *Geschichte Kaiser Karls IV und seiner Zeit* (Innsbruck, 1880–92).

CHARLES V (1500–58). Holy Roman Emperor and, under the title of Charles I, King of Spain. He was born at Ghent, Feb. 24, 1500, and was the eldest son of Philip, Archduke of Austria, and Joanna, the daughter of Ferdinand and Isabella of Spain. Philip's parents were the Emperor Maximilian and Mary, daughter and heiress of Charles the Bold, Duke of Burgundy. On the death of his father in 1506, Charles, at the age of six, inherited the Burgundian realm, consisting in the main of the rich and populous provinces of the Netherlands, then at the height of their prosperity. On the death of his grandfather, Ferdinand, in 1516, he became King of Spain, as his mother, Joanna, was of disordered intellect and incapable of reigning. To the Spanish crown belonged Naples, Sicily, and Sardinia; the Spaniards were just entering upon their great career of conquest in the New World. Charles was not very favorably received by the Spanish nobles, who were doubtful of his rights and jealous of the followers whom he brought from Flanders, where he had been educated. The repression of the liberties of the people, which had already gone far under his grandfather, and which his son was to reduce to a system, continued unchecked under Charles, in spite of the appeals of the Cortes. All the abilities of his famous minister, Cardinal Ximenes, were requisite to prevent an open rupture. In the early part of his reign (1520) the towns of Castile were driven to revolt for the maintenance of their ancient liberties. It was with difficulty that the insurrection was put down (1521). (See PADILLA, JUAN DE.) On the death of his grandfather, Maximilian, in 1519, Charles conjointly with his younger brother, Ferdinand, succeeded to the possession of the hereditary dominions of the house of Hapsburg (house of Austria). On June 28, 1519, he was raised to the Imperial throne of Germany by the choice of the electors, the rival candidates being Francis I of France and Henry VIII of England, and was crowned at Aix-la-Chapelle, Oct. 23, 1520. Owing to the jealousy of his Spanish connections, he was required to sign an election agreement (*Wahlkapitulation*) guaranteeing certain rights to the German nation—a practice followed by his successors in the Imperial office. Charles was now by far the most powerful sovereign in Christendom. In his earlier years he had been frivolous and dissolute, but he now became mindful of the duties and dignity of his high position. He ascended the Imperial throne at a time when Germany was in a state of un-

precedented agitation, because of the movement set on foot by Luther. To restore tranquillity, a great diet was held at Worms in 1521, before which Luther made the memorable defense of his doctrines. Just at this moment the great struggle between France and Spain broke out afresh, Francis I taking up arms against his rival, whose attention was drawn away from the internal affairs of Germany. Thus, instead of vigorously assailing the Protestant movement when it might still have been in his power to quell it, Charles, who was not alive to its significance, permitted it to take deep root.

The war between Charles and Francis, in which the former had Henry VIII of England as an ally, and was strengthened by the defection of the powerful Charles of Bourbon, proved disastrous to France. The French were swept out of Lombardy, and in an attempt to regain possession of it Francis was defeated before the walls of Pavia, Feb. 24, 1525, and taken prisoner. He was forced to sign a humiliating treaty at Madrid, January, 1526; but hardly had he been set at liberty when he prepared to renew the struggle, with Henry VIII now on his side and with the support of Pope Clement VII, of the house of Medici, who, alarmed at the victories of Charles, was anxious to rid Italy of the Imperialists and induced some of the Italian states to join him. The Emperor's forces, under Frundsberg and Charles of Bourbon, took Rome itself by storm (1527), plundered it, and made the Pope a prisoner. Charles pretended great regret, went into mourning with all his court, and caused prayers to be said for the Pope's liberation, while by his own direction the Pope was kept for seven months a captive. The Peace of Cambrai, between Charles and Francis, in 1529, deprived France of Lombardy, for the possession of which she had fought so furiously. In 1530 Clement VII, into whose scheme for the restoration of the Medici in Florence Charles had entered, crowned the victorious monarch at Bologna as King of Lombardy and Emperor of the Romans (the last coronation of a German emperor by the Pope). Simultaneously with these events a great drama was being enacted in the basin of the Danube, which brought a still greater concentration of power in the hands of the Hapsburg dynasty. In 1526 the Ottoman Sultan, Solyman the Magnificent, laid low the power of Hungary in the battle of Mohács. The Hungarian monarch, Louis II, who was also King of Bohemia, did not survive the defeat, and Ferdinand of Hapsburg, his brother-in-law, was chosen his successor in Bohemia, while some of the nobles in Hungary also conferred upon him the royal crown. Thus were laid the foundations of the modern Hapsburg monarchy of Austria-Hungary. Previous to this, in 1521–22, Charles had relinquished to Ferdinand the sole sovereignty over the principal portion of the old hereditary Austrian dominions. Having made peace with his formidable rival, Charles now thought to put an end to the religious differences in Germany and to repel the Turks, who had overrun Hungary and laid siege to Vienna. But the Diet at Augsburg, in 1530, proved how vain was the hope of restoring the former state of things in Germany; and when the Emperor refused to recognize the confession of the Protestants (see Augsburg Confession), they refused to help him against the Turks. In 1531 the Protestant princes formed the League of Schmalkald (q.v.) and allied themselves with France and England for their own protection. This, and the continued assaults of the Turks, compelled the Emperor to yield in some measure to the demands of the Protestants and to conclude the Peace of Nuremberg (1532). In 1535 Charles undertook an expedition from Spain against the pirate Barbarossa, who had established himself in Tunis, and whose vessels did great injury to the commerce of Spain and Italy. In this expedition he was completely successful and set free no fewer than 22,000 Christians who had been held as slaves. War again broke out with France. An armistice for 10 years was concluded at Nice in 1538, which left the bulk of the dominions of the despoiled Duke of Savoy in the hands of Francis. Charles visited Paris, where he was magnificently entertained. In 1540 the proud city of Ghent, the birthplace of the Emperor, received a terrible chastisement at his hands for daring to resist his mandates. In 1541 Charles undertook an expedition against Algiers, but returned discomfited. In 1542–44 he was engaged in a fresh war with France, Henry VIII being once more his ally. It was terminated by the Treaty of Crespy, advantageous to the Emperor. The suspension of the struggle with France left the Emperor at liberty to turn his arms against the Protestants of Germany, at whose head were Philip the Magnanimous, Landgrave of Hesse, and John Frederick, Elector of Saxony. Charles received the support of the ambitious Protestant Prince Maurice, Duke of Saxony (of the Albertine line). The victory of Mühlberg, April 24, 1547, placed the Protestants at the mercy of Charles, who deprived John Frederick of his territories. In 1548 the Augsburg Interim was published, fixing the degree of religious toleration to be accorded in Germany pending the decision of the Council of Trent, which had been opened in 1545. In 1551 Magdeburg, a great stronghold of Protestantism, succumbed to the arms of Maurice of Saxony. But this Prince himself now became thoroughly alarmed at the arbitrary manner in which the Emperor was proceeding to carry out his political aims, and suddenly turned his arms against him, allying himself with Henry II of France. Charles was compelled to flee before the arms of the Protestants, and in 1552, through his brother Ferdinand, he concluded with them the Peace of Passau, by which the Lutheran states were allowed the exercise of their religion. A more definite settlement was made, in the Peace of Augsburg, in 1555. In the meanwhile Henry II seized the three bishoprics of Toul, Metz, and Verdun (1552), and an attempt of the Emperor to reconquer Metz failed miserably.

Weary of the constant struggles and heavy responsibilities of his ill-assorted realms, Charles now declared his resolution to seek repose and devote the remainder of his days to God. In 1555–56 he resigned the Netherlands and Spain to his son Philip, and in 1557 abdicated the Imperial crown in favor of his brother Ferdinand and retired to the monastery of Yuste, in Estremadura. At Yuste Charles spent two years, partly in mechanical pursuits, partly in religious exercises, which are said to have assumed a character of the most rigid asceticism, and partly in active participation in politics. He died Sept. 21, 1558. By his wife, Isabella, daughter of King Emmanuel of Portugal, he had one son, his successor, Philip II of Spain,

and two daughters. Charles V was a prince of remarkable executive powers. He showed a shrewd and sometimes statesman-like ability in meeting the difficult problems of his reign; but this gave way more and more to the religious temperament inherited from the Spanish side of his house. While he spared his Protestant subjects in Germany for political reasons, he persecuted heresy unsparingly in Spain, where policy imposed upon him no restraint. As a general he ranks high. In temperament and disposition he was cold, phlegmatic, stoical, and devoid of chivalry.

Robertson, *History of the Reign of Charles V* (London, 1886); Baumgarten, *Geschichte Karls V* (3 vols., Stuttgart, 1885–92); Lanz, *Korrespondenz des Kaisers Karl V* (Leipzig, 1844–46); Sandoval, *Historia de la vida y hechos del Emperador Carlos V* (Valladolid, 1604); Sepulveda, *De Rebus Gestis Caroli V* (Madrid, 1780); Ranke, *Deutsche Geschichte im Zeitalter der Reformation* (Leipzig, 1894); Armstrong, *The Emperor Charles V* (2 vols., London, 1902).

CHARLES VI (1685–1740). Holy Roman Emperor from 1711 to 1740, and the last of the direct male line of the house of Hapsburg. He was the second son of the Emperor Leopold I and was born Oct. 1, 1685. His father wished to secure for him the crown of Spain; but Charles II of Spain assigned it by testament to Philip of Anjou, whereupon arose the great War of the Spanish Succession, Britain and Holland taking part with the Emperor against France, for the maintenance of the balance of power in Europe. (See SUCCESSION WARS.) Charles was acknowledged by the allies as Charles III of Spain, but had not succeeded in obtaining permanent possession of the kingdom when the death of his brother, the Emperor Joseph I, recalled him to Germany in 1711; and as he now became Emperor of Germany, England and Holland concluded the Peace of Utrecht with France in 1713, not wishing to see him also King of Spain. Charles continued the war for some time, but by the Peace of Rastadt (1714) gave up his claim to Spain, being confirmed, however, in possession of the Spanish Netherlands and of the Spanish possessions in Italy. He was successful in a war against the Turks, marked by splendid Austrian victories under Prince Eugene and concluded by the Treaty of Passarowitz (1718), and in a war with Spain, which arose out of the project of the Spanish Minister, Alberoni (q.v.), and in which the Quadruple Alliance was formed—France, England, and Holland joining the Emperor against Spain. Charles had lost his only son and, being anxious to secure the throne to his own descendants, named his daughter, Maria Theresa, as his heiress, by a Pragmatic Sanction, which he began to prepare as early as 1713. For more than 20 years the foreign policy of Charles was dictated by the sole desire of obtaining the ratification of the Pragmatic Sanction from the European Powers. To accomplish this he sacrificed Austrian territories in Italy and Spain, and the commercial prosperity of Flanders to England and Holland. (See OSTEND COMPANY.) He won over Prussia by the concession of extensive privileges and bribed Russia by allowing it a free hand in Poland. He was unsuccessful in the so-called War of the Polish Succession, waged against France and Spain, in the course of which Don Carlos conquered the Two Sicilies in 1734–45. He was also worsted in a second war with the Turks, terminated by the Peace of Belgrade in 1739, in which Austria made some cessions of territory. He died Oct. 20, 1740. He was of a mild and benevolent disposition, but full of superstition and conservative prejudices. Consult Mailâth, *Geschichte des österreichischen Kaiserstaates* (Hamburg, 1834–50), and Coxe, *History of the House of Austria*, vol. iii (3d ed., London, 1873). See HAPSBURG, HOUSE OF.

CHARLES VII (1697–1745). Holy Roman Emperor from 1742 to 1745. He was the son of Maximilian Emanuel, Elector of Bavaria, and for some time Governor of the Spanish Netherlands. After the conquest of the Bavarian territories, and the pronunciation of the ban of the Empire against his father by the Emperor Joseph I (see SUCCESSION WARS), he was for some time a prisoner; but after the death of Joseph, Charles married the latter's youngest daughter and in 1726 succeeded his father as Elector of Bavaria, as such styled Charles Albert. He refused his consent to the Pragmatic Sanction and, on the death of Charles VI, in 1740, advanced a claim to the Austrian dominions in right of his wife and upon the further ground of a testament of Ferdinand I. At first he was successful with the aid of the French forces and caused himself to be proclaimed Archduke of Austria at Linz and King of Bohemia at Prague. In 1742 he was elected Emperor. The Hungarians, however, rose in favor of Maria Theresa, and he was driven from Austria and from Bohemia and for a time even from his Bavarian capital, Munich. Disease and calamities combined to cause his death, Jan. 20, 1745. "Misfortune," he said, "will never leave me till I leave it." Consult Arneth, *Geschichte Maria Theresias* (Vienna, 1863–1879), and Heigel, *Der oesterreichische Erfolgestreit und die Kaiserwahl Karls VII* (Munich, 1877).

CHARLES I (1600–49). King of England, Scotland, and Ireland from 1625 to 1649. The second son of James I of England and VI of Scotland, he was born at Dunfermline, Nov. 19, 1600, and created Duke of Albany at his baptism, December 23. He was a delicate child, tongue-tied, and troubled with weak joints and ankles. In 1605 he was created Duke of York and on the death of his brother Henry, Nov. 6, 1612, became heir apparent, but was not created Prince of Wales until Nov. 3, 1616. He outgrew his physical defects, with the exception of a slight stutter; became a diligent theological student, an accomplished scholar, and skillful in the sports of tilting, tennis, and marksmanship. At 22 years of age he had developed artistic and musical tastes and was distinguished for modesty of conduct and morals. Negotiations for his marriage were made, first with Princess Christian, sister of Louis XIII of France, in 1613, and then with the Infanta Maria of Spain, daughter of Philip III in 1614. In February, 1623, occurred his journey to Spain, at the suggestion of his favorite companion, Buckingham, who accompanied him. Unannounced, he arrived in Madrid, to the consternation of the Spanish statesmen, who had already decided against the marriage. After much duplicity on both sides Charles returned to England in October, being received with popular acclamation. Negotiations were broken off on religious pretexts, although the unwillingness of Philip to help in the restoration of Charles's

brother-in-law; Frederick, to the Palatinate was the real cause. Charles aroused national enthusiasm by advocating war and expressed his readiness to conquer Spain; but his father wished for a military expedition to the Palatinate. On March 27, 1625, James died, and Charles succeeded to the throne. To gain France as an ally, on May 1 he married, by proxy, Princess Henriette Marie, of France (1609–69), receiving his bride at Canterbury on June 13. The national admiration was quenched by this marriage, with its accompanying violations of parliamentary anti-Roman pledges; and before a year had elapsed Charles, finding the Queen's Roman Catholic retinue of 440 persons too troublesome, deported them to France. His marriage subsequently proved particularly happy. His reign, however, was doomed to failure. He was a puppet in the hands of his favorite, Buckingham, whom he had appointed Prime Minister in defiance of public wishes and whose warlike schemes ended ignominiously. Three parliaments, convoked in four years, were dissolved in royal exasperation at their refusal to comply with his arbitrary measures, and public feeling became embittered. The third Parliament presented the *Petition of Right* (q.v.) in 1628. The King temporized and conceded, then—although Buckingham's assassination had removed one cause of the contention—dissolved Parliament and caused some of the leading members to be imprisoned, one of whom, Sir John Eliot, was allowed to sicken and die in the Tower, although he presented several petitions for a temporary release. Influenced by the Queen, and with Laud and Wentworth as chief advisers, Charles governed without a Parliament for 11 years, the despotic Star Chamber and High Commission courts giving semblance of legal sanction to forced loans, poundage, tonnage, ship money, and other extraordinary measures to meet governmental expenses. Republican principles developed and expanded, towards which Charles opposed a policy of severe repression. His attempt to impose episcopacy provoked the Scotch to restore Presbyterianism and to adopt the Solemn League and Covenant, Feb. 28, 1638. In 1639 Charles assembled an army to enforce his will; the Covenanters retaliated and advanced to the border. Unable to proceed without supplies, in 1640 Charles summoned the "Short Parliament," which he dissolved in three weeks, as the members refused to listen to his demands, but drew up a statement of public grievances, demanded an inquiry into Eliot's death, and insisted on peace with Scotland. Obtaining money by irregular means, Charles advanced against the Scots, who crossed the border and defeated his army at Newburn-upon-Tyne, and soon afterward occupied Newcastle and Durham, everywhere receiving popular sympathy and support. His money exhausted, the King was compelled to call the "Long Parliament" which met Nov. 3, 1640. Led by the ripe, sagacious, and dauntless Pym, it proceeded to redress grievances and showed its resolution by impeaching and imprisoning the instigators of royal despotism, Laud, and Wentworth, who had been created Earl of Strafford. The peers, before whom Strafford was tried, refused to condemn him, but a luckless plot, of which Charles probably knew almost nothing, to overcome Parliament by military force sealed the fate of the ministers. A bill of attainder was passed, and Charles, in trepidation for the life of his Queen, which he considered in danger from mob violence, signed Strafford's death warrant and confirmed a bill by which Parliament was not to be dissolved without its own consent. The King was now pledged to constitutional rules, but unhappily was imbued with extreme notions of kingly prerogative. He visited Scotland, hoping by concessions to win favor and armed support; but while there the Irish Rebellion and Ulster Massacre occurred, and, suspecting that Charles had intrigued for the military assistance of the Irish Catholic lords, Parliament enlarged its demands. The Commons accepted a petition against the royally appointed bishops who disputed their authority, and who were mobbed on their way to the House of Lords.

On his return from Scotland the King had yielded to the provisions of "The Grand Remonstrance"; but now, learning of the impending impeachment of his Queen, who had sought assistance from Rome, he appeared in the Commons with an armed force and, accusing Pym, Hampden, Hollis, Haselrig, and Strode of treason, demanded their arrest and delivery to him.

Intense excitement ensued; shouts of "Privilege of Parliament" were raised; the indicted members, forewarned, had taken refuge in the city, and the King retired with undignified threats. The country was aroused, Parliament and the nation were declared in peril, and London prepared to defend itself. Met with his own weapons, the alarmed King fled with his family to Hampton Court. Seven months later he raised the royal standard at Nottingham, Aug. 22, 1642, and civil war commenced and proceeded, although arbitration was vainly attempted from time to time. The Royalists at first were the victors; but after several reverses the parliamentary forces acquired experience and discipline, and Cromwell and Fairfax annihilated the royal army at Naseby, June 14, 1645. Guerrilla warfare continued until Charles gave himself up to the Scottish army at Newark, on May 5, 1646. Negotiations were fruitlessly renewed, and he was delivered to the English Parliament, who assigned him a residence at Holmby House, near Northampton. After four months his qualified reply to a parliamentary proposal resulted in his conveyance by Cornet Joyce to Hampton Court. He continued his intrigues and opposition to all constitutional propositions, and after three months escaped to the Isle of Wight, where he hoped to receive aid from the governor of Carisbrooke Castle, but was imprisoned. Cromwell and the Independents lost patience and compelled Parliament to pass an act of treason against further negotiation with the King, who was removed to Hurst Castle. The Scots and English Presbyterians, deeming the regal person sacred and inviolable, thought to rescue him, but were defeated, and their representatives expelled from Parliament, which appointed a court to judge the King. He was removed from Hurst Castle to Windsor on Dec. 23, 1648, and on Jan. 20, 1649, was taken to Westminster Hall, where the court was opened with great solemnity. Charles repudiated its legality and refused to plead. On the 27th he was sentenced to death as a tyrant, murderer, and enemy of the nation, by 67 out of the original 135 judges. Scotland protested, the royal family entreated, France and the Netherlands interceded, in vain. After a pathetic parting from two of his children he calmly prepared for death and bore

himself with dignity. He was beheaded at Whitehall, Jan. 30, 1649. His last words were: "I must tell you that liberty and freedom consist in having of government those laws by which the lives and the goods of the people may be most their own. It is not having share in the government, sirs; that is nothing pertaining to them," a sentiment that was plagiarized by the opponents of Chartism as late as 1848.

In private character Charles was a man of culture, kind, of irreproachable life, and of great physical courage; but in political affairs he was unscrupulous and blindly obstinate in his belief in the "divine right of kings." In religious affairs he was loyally attached to the national church of England and steadfastly refused to assent to the abrogation of episcopacy, which he held an essential in church government. By Charles II's personal edict at the Restoration, until its cancellation by Parliament in 1859, January 30 received special observances in the Anglican church as "the day of the martyrdom of the Blessed King Charles I." After his death appeared *Eikon Basilike: The Portraiture of his Sacred Majesty in his Solitude and Sufferings*, attributed to the King, but written by Bishop Gauden, who in 1651 published at The Hague *Reliquiæ Sacræ Carolinæ, The Works of that Great Monarch and Glorious Martyr, King Charles I.* The best works on the reign are: Gardiner, *History of England, 1603–42* (10 vols., London and New York, new ed. 1883–84), and his *Civil War* (4 vols., London, New York, and Bombay, 1894–97), containing full citation of the original sources; also his *Puritan Revolution* (London, 1876); Ranke, *History of England* (trans. by C. W. Boase and G. F. Kitchin; 6 vols., Oxford, 1875); Trevelyan, *England under the Stuarts* (London, 1905); Chancellor, *Charles I, 1600–25* (London, 1886); Harris, *Life and Works* (London, 1758); Skelton, *Life of Charles I* (London, 1898); Masson, *Life of Milton* (7 vols., London, 1873–94); Disraeli, *Commentaries on the Life and Reign of Charles I* (5 vols., London, 1828–31). Original materials are contained in: *Letters of Charles I to Henrietta Maria* (London, 1836); Clarendon, *Great Rebellion* (6 vols., Oxford, 1888); Whitelocke, *Memorials* (4 vols., new ed., Oxford, 1853); Gardiner, *Constitutional Documents* (Oxford, 1889); the *Calendars of State Papers*, edited by Hamilton (London, 1890–93).

CHARLES II (1630–85). King of England, Scotland, and Ireland from 1649 (reigned from 1660) to 1685. He was the second, but eldest surviving, son of Charles I, and was Prince of Wales from his birth. He was born at St. James's Palace, London, May 29, 1630, and baptized by Bishop Laud on June 27, Louis XIII of France being one of his sponsors. At eight years of age an establishment was provided for him as heir apparent, with William Cavendish, Earl of Newcastle, as governor, and Dr. Brian Duppa as tutor. The following year he broke his arm, and his life was endangered by a severe illness. He took his seat in the House of Lords in 1641, and his first public act was to carry his father's letter in favor of Strafford to the peers. He held a nominal command in the early campaigns of the Civil War, and was present at Edgehill in 1642, where he narrowly escaped capture. Appointed general of the western forces, he parted from his father at Oxford, March 4, 1645, and remained in safety in Somerset, Devon, and Cornwall; after Naseby, he escaped by way of Scilly and Jersey and joined his mother in Paris, where he remained for two years, to his moral disadvantage. In July, 1648, he sailed from Helvoetsluis with a small fleet for the Thames, where he took several prizes. He issued a proclamation of conciliation to the Londoners and Scots, and returned to The Hague, where during his father's trial he did his utmost to save him, forwarding a blank charter with his signature attached for Parliament to inscribe its own terms of clemency. At his father's death he assumed the title of King and was proclaimed in Scotland, Ireland, the Channel Islands, and one or two places in England. After vacillating between Holland, France, and Jersey, with the intention of invading Ireland, he returned to Holland, and, embarking at Terheyden for Scotland, landed in Cromarty Firth, June 24, 1650, despite an attempt to intercept him. On September 3 a Scottish force fighting for him was defeated at Dunbar, and this hastened his coronation at Scone, Jan. 1, 1651, after an acknowledgment of his father's faults and various declarations and concessions of a feeble character. He suddenly invaded England the following August with 10,000 men and was proclaimed King at Carlisle and other places on his advance. Cromwell hastened to meet and surround him and after two encounters routed his army at Worcester, Sept. 3, 1651. Charles was hunted and a price was put upon his head, but after hiding at Boscobel and other places, through the loyalty of friends and his own courage and address, he safely embarked at Shoreham on October 15 and landed at Fécamp, Normandy, the next day. Eight years of impecunious and profligate exile were variously spent in France and at Cologne and Bruges, until not long after Cromwell's death, when, the country being threatened with military despotism, the popular wish throughout England for the restoration of royalty was consummated by General Monk (q.v.), after Charles's conciliatory Breda declaration, and he was proclaimed King at Westminster, May 8, 1660. He landed at Dover on the 26th, and was welcomed, at Whitehall, by the two Houses of Parliament on May 29, 1660, after an enthusiastic acclamation by thousands on his progress through London. He was crowned on April 23, 1661. His first Parliament, distinguished by abasement and insistence on "royal prerogative," gave him an untrammeled course. Clarendon, his dignified companion in exile, was appointed chief minister. Episcopacy was restored, and English and Scotch Nonconformists and Presbyterians subjected to persecution. He extended an indemnifying Act, dating from Jan. 1, 1637, to June 24, 1660, to all political offenders, excluding the regicides, of whom 13 were executed, while the bodies of Cromwell and Ireton were hung in chains, and the remains of Blake, Bradshaw, and others cast out of Westminster Abbey into potter's fields. Extravagant, and always in want of money, Charles gladly assented to the abolition of the feudal rights of knight service, wardship, and purveyance in consideration of an annuity of £1,200,000, which, however, was never fully paid. On May 20, 1662, he married Catharine of Braganza for her large dowry. The failure of the subsidies to produce the amount agreed on and the chronic mismanagement of the English finances brought the King to a desperate need of money. The choice faced him of secur-

ing this from Parliament or else of selling the control of England's foreign policy to the highest bidder. But to accept the first alternative meant to become the slave of Parliament, and, beneath his easy-going exterior, Charles cherished the desire to recover the absolute power that had been lost by his father and grandfather. On the other hand, a ready purchaser of the foreign policy was found in Louis XIV, who desired to extend French power on the Continent and needed England's aid, or, at least, England's neutrality, for the success of his plans. In return for French subsidies Charles plunged England into a war with Holland in 1672, from which the country as a whole had little to gain. The war, however, was not unpopular; commercial rivalry had already brought about two wars between the two countries, the last one having occurred in the early years of the reign (1665–67). The Dutch War of 1672 did not prove a success, and some knowledge of the negotiations with France, joined with Charles's efforts towards absolutism, brought him into conflicts with his Parliament, which lasted nine years, until Charles, aided by French subsidies, was able to dissolve his last Parliament (1681). The last years of the struggle were especially embittered on account of fear of Roman Catholicism, towards which church the King was suspected to have leanings and to which his brother and heir, the Duke of York, confessedly belonged. This feeling culminated in the Popish Plot (see OATES), which resulted in the execution of many innocent victims. From 1681 to his death Charles ruled as an absolute king. An attempt, the Rye House Plot (q.v.), was made to check this, but failed, and Charles ruthlessly struck down all who opposed him. He never lost, however, the favor which his easy manners had won from the people, and at his death, Feb. 6, 1685, he was sincerely mourned. In his dying hours he received absolution from a Roman Catholic priest, although he had not previously avowed his attachment to that religion. Undoubtedly able, Charles's carelessness and love of ease prevented him from showing the ability he really had. To have maintained absolute rule in England for four years, and that within a half century from the Great Rebellion, is no small feat. Totally lacking in moral fibre and surrounded by men like himself, he made his court one of the most dissolute England has ever known. Yet in his easy way Charles fostered the arts and sciences and did much to bring to England the best results of continental learning.

Bibliography. The best general accounts of the reign are Macaulay, *History of England*, (8th ed., London, 1852), and Ranke, *History of England* (Eng. trans., 6 vols., Oxford, 1875). The best biography is by O. Airy, *Charles II* (London, 1904). For the social side, consult: Sydney, *Social Life in England, 1660–1690* (London, 1892); Pepys, *Diary*, ed. Wheatley (London, 1899); Evelyn, *Diary* (new ed., London, 1854). A good short account is given by Stephen in the *Dictionary of National Biography*, vol. x (New York, 1887), under the heading "Charles II."

CHARLES I, THE BALD (trans. of Fr. *Charles le Chauve*) (823–877). King of France from 843 to 877; as Roman Emperor, Charles II. He was the son of Louis the Pious by his second wife, Judith. The determination of Judith to secure a kingdom for her son led to repeated wars between the sons of Louis, until, by the Treaty of Verdun, in 843, Charles received the western portion of the Empire, which from this time may be called the Kingdom of France, or, more strictly, the West-Frankish Kingdom. The government of Charles was weak; the great nobles were rapidly becoming independent; the Northmen pillaged the country, almost without resistance on the part of Charles, who bribed them to depart. Yet on the death of the Emperor Louis II, in 875, Charles received the Imperial crown through the favor of the Pope. Consult Dümmler, *Geschichte des ostfränkischen Reiches* (3 vols., Leipzig, 1887–88).

CHARLES II, THE FAT (trans. of Fr. *Charles le Gros*, Ger. *Karl der Dicke*) (832–888). King of France after 885; as Roman Emperor, Charles III. He was the third son of Louis the German (q.v.). At his father's death, in 876, he became King of only a portion of Germany; but in 882, after the death of his two brothers, he became King of Germany; within eight years seven kings of the Carolingian line met with untimely deaths, and only one left a legitimate heir. In 885 the only two representatives of the male line were Charles and a boy five years old, afterward Charles the Simple of France. Consequently, Charles was recognized as King, and ruled over almost all the lands which had formed the Empire of Charles the Great. He had been crowned Emperor of the Romans in 881. He was a weak and cowardly ruler. When the Northmen besieged Paris, he made no resistance, but bribed them to leave the capital and allowed them to plunder elsewhere. His subjects revolted. He was deposed in 887 and died in January, 888. Consult Dümmler, *Geschichte des ostfränkischen Reiches*, vol. iii (Leipzig, 1888).

CHARLES III, THE SIMPLE (trans. of Fr. *Charles le Simple*, or *le Sot*) (879–929). King of France from 893 to 929. He was the posthumous son of Louis the Stammerer. At the death of Charles the Fat, Eudes, Count of Paris, was chosen King of France; but many of the Franks were still faithful to the Carolingian dynasty and rallied about Charles. In 893 he assumed the crown and after three years of fighting forced Eudes to promise him the succession to the kingdom. Consequently, on the death of Eudes, in 898, he was generally recognized as King. He has usually been regarded as a weak ruler, but his reign was marked by two events of great importance, for both of which he was responsible. Of these the more important was the cession of the future Normandy to the Northmen. The other event was the conquest of Lorraine, a kingdom which he preferred to France and in which he remained as much as possible. In 922 his subjects revolted. Charles at first defeated them, but by treachery in 923 he was made a prisoner, and died in captivity in 929. Consult Eckel, *Charles le Simple* (Paris, 1899).

CHARLES IV, THE FAIR (trans. of Fr. *Charles le Bel*) (1294–1328). King of France from 1322 to 1328, and the last of the Capetian line. He was the youngest son of Philip IV the Fair and succeeded his brother, Philip V. His policy was to strengthen and consolidate the royal power. This he did by repressing unruly nobles, increasing the royal revenue, and adding cities, such as those of the Agenais, which he took from the English, to the royal domains. He introduced some changes in the coinage,

which still further aggravated the debasement begun under Philip the Fair. Consult Lavisse, *Histoire de France*, vol. iii (Paris, 1901).

CHARLES V, THE WISE (trans. of Fr. *Charles le Sage*) (1337–80). King of France from 1364 to 1380. He was the son of King John II the Good, and on his father's being made prisoner by the English at the battle of Poitiers (Sept. 19, 1356) he assumed the regency. The most significant event of his rule was the vigorous effort of the peasants, aided by a part of the bourgeoisie (see MARCEL, ETIENNE), to deliver themselves from the tyranny of nobles and the court, which resulted in the popular uprising called the Jacquerie. Upon the death of his father, in 1364, Charles ascended the throne. By his cautious policy he succeeded in introducing order in the kingdom and in re-establishing the power of the crown, which had been much shaken. War with England raged for a number of years, but with results highly favorable to Charles, who stripped his enemies of all their conquests in France except a few fortified places. He died Sept. 16, 1380. Charles was a generous patron of literature and the arts. He founded the Bibliothèque Royale and increased the privileges of the university. He rid himself of the so-called "grand companies," bands of mercenaries who were terrorizing many parts of the country, by employing them in wars outside of France. (See DU GUESCLIN.) He built the Bastille to keep the turbulent citizens of Paris in order. See Delacheval, *Histoire de Charles V* (Paris, 1908).

CHARLES VI (1368–1422). King of France from 1380 to 1422. He was the son and successor of Charles V and less than 12 years of age at his father's death. For several years he was under the guardianship of four uncles, one of whom (the Duke of Anjou) acted as regent. Their ambitions led to civil war. In 1388 Charles took the government into his own hands and ruled well for some years, till he became insane. A regent was appointed, and party strife broke out again. The two great parties into which the nation was divided were those of Orléans and Burgundy. Each party at different times called in the English to its aid. Henry V took advantage of the civil conflict and at the battle of Agincourt, in 1415, won a victory which left France almost helpless. Murders, massacres, and all the horrors of civil war devastated France until, in 1420, a peace was made at Troyes, by which Charles VI disinherited his son and accepted Henry V as his successor. He died Oct. 21, 1422, leaving most of France in the hands of the English. See AGINCOURT; ARTEVELDE, PHILIP VAN; FRANCE. Consult Lavisse, *Histoire de France*, vol. iv (Paris, 1902).

CHARLES VII (1403–61). King of France from 1422 to 1461. He was the fifth son and the successor of Charles VI and was born on Feb. 22, 1403. When his father died, Charles had little prospect of ruling France. Paris and almost all the north were in the hands of the English, who proclaimed as King Henry VI of England, who was then 18 months old, and made the Duke of Bedford regent. For the first six years Charles showed little energy and was compelled by the English to evacuate Champagne and Maine. In 1427 the French forces obtained their first success, when the English failed in their siege of Montargis; but in October, 1428, the latter invested Orléans, which was the most important city held by the party of Charles, and on Feb. 12, 1429, the French met with a disastrous defeat at Harengs. At this critical moment Joan of Arc came to the King's aid, and the siege of Orléans was raised on May 8, 1429. Charles was consecrated King at Rheims, July 17, 1429. The English gradually lost their possessions in France, and the Duke of Burgundy, their ally, went over to Charles. The latter entered Paris in 1436, and in the following years the English lost all their French possessions except Calais. The last battle, a disastrous defeat for the English, was at Castillon, July 17, 1453. After he was established on the throne Charles devoted himself to the reorganization of the government, to the reform of the finances, and to the formation of a powerful and well-disciplined army. He strove by every means to increase his own power, but his government was not despotic, and France recovered from the effects of the terrible calamities of the long war. Charles encouraged commerce and literature and had the prosperity of his subjects at heart; but he was timid and irresolute, afraid of plots against himself, and almost continuously under the control of some woman. He made no effort to save the Maid of Orléans from her fate. For many years he yielded in almost everything to the wishes of his mistress, Agnes Sorel, who, however, exercised a beneficent influence over him. See AGNES SOREL. Consult Lavisse, *Histoire de France*, vol. iv (Paris, 1902).

CHARLES VIII (1470–98). King of France from 1483 to 1498. He was born at Amboise and succeeded to the throne on the death of his father, Louis XI, in 1483. For some time the government was carried on under the regency of his sister, Anne of Beaujeu, who displayed fine political statesmanship in defending the rights of the crown against the encroachments of the States-General, in the repression of the feudal princes, and in the annexation to France of Brittany through the marriage of its Duchess, Anne, to the young King. When Charles attained his twenty-first year he took the royal power into his own hands. He was a high-spirited, generous youth and a good king; but his fame rests less on his rule in France than on the part he played in the history of Italy. Solicited in 1494 by Ludovico il Moro, Duke of Milan, to help him against Alfonso of Naples, Charles revived the ancient claims of the house of Anjou to the Kingdom of Naples and achieved its conquest the following year. The Italian princes were alarmed at his success, and the League of Venice was formed against him, by the Pope, the Emperor, Maximilian I, Ferdinand of Aragon, Venice, and Milan. An attempt was made to bar his exit from Italy; but at Fornovo, near Piacenza, Charles broke through a powerful army and safely effected his retreat. It was with difficulty that he was deterred by his councilors from resuming his warlike designs on Italy. Charles's incursion into that country marks an epoch in the history of the peninsula. Left to itself, Italy might have attained national unity, as Spain did, or France. With the incoming of Charles began the intrusion of the northern nations into Italian affairs, and that play of policy which went on for 400 years in the distracted country and did not end till the last foreigner (the French at Rome) departed from Italian soil in 1870. Consult: *Memoirs of Philip de Comines* (trans., London, 1855); Dela-

borde, *Charles VIII en Italie* (Paris, 1884); Ségur, *Histoire de Charles VIII* (Paris, 1884); Lavisse, *Histoire de France*, vol. v, part i (Paris, 1903).

CHARLES IX (1550–74). King of France from 1560 to 1574. He was born at Saint-Germain-en-Laye, June 27, 1550. Charles succeeded his elder brother, Francis II, at the age of 10, under the regency of his mother, Catharine de' Medici. He was declared of age three years later, but his mother continued to rule in his name, though he bore the responsibility for her violent deeds. Intrigues and civil wars marked the whole course of his unhappy reign. The Huguenots were driven to take up arms in 1562. The barbarities and excesses practiced both by the followers of Guise and by the partisans of Condé (outrages in which Catholics and Huguenots were alike involved) would have been sufficient to characterize this reign as one of the most miserable in French history. But the diabolical Massacre of St. Bartholomew, which was deliberately planned and executed by Catharine solely for political purposes, eclipsed all the other brutalities of the epoch. Charles's character is somewhat of an enigma: well-meaning, but passionate and fundamentally weak, he never emancipated himself from the guidance of his mother, who involved him in his worst mistakes. He died at the Château de Vincennes, May 30, 1574. Consult Mérimée, *Chronique du règne de Charles IX* (Paris, 1889).

CHARLES X (1757–1836). King of France from 1824 to 1830, the last sovereign of the elder line of the house of Bourbon. He was born in Versailles, Oct. 9, 1757. He was the younger brother of Louis XVI and Louis XVIII, bore the title of Count of Artois, and in 1773 married the Princess Maria Theresa of Savoy. After the outbreak of the Revolution in 1789 he became the leader of the *émigrés*. In 1795 he sailed with an English expedition to Brittany to arouse the French Royalists against the Revolutionary government. Although the Vendéans were ready to rally around his standard in great force, his courage failed, and he returned to England, abandoning his deluded supporters in France to their fate. With the Restoration he reappeared in France and became the head of the bigoted ultra-Royalist faction. (See CHAMBRE INTROUVABLE.) In the circle of Jesuits, priests, and nobles of the old school that surrounded him originated most of those extreme measures against which the better-minded Louis XVIII ineffectually protested at times. The death of Louis, Sept. 16, 1824, brought Charles to the throne. He took the oath of adherence to the charter, but soon displayed his intention of restoring the absolutism of the old French monarchy. Popular discontent rapidly increased during the succeeding five years. The King sought in vain to allay it by embarking the nation in a military enterprise, the expedition against Algiers, undertaken in 1830. In March, 1830, Charles adjourned the chambers on account of an address of remonstrance in reply to a royal speech. In May the Chamber of Deputies was dissolved and new elections were ordered. The deputies who signed the address were reëlected. On July 25 the celebrated ordinances were signed putting an end to the freedom of the press, already largely curtailed, decreeing a new mode of election, and dissolving the recently elected chamber. The people of Paris took up arms, and the revolution of July 27–29 overthrew the Bourbon monarchs. As a last resource Charles abdicated the throne, Aug. 2, 1830, in favor of his grandson, Henry, Duke of Bordeaux. It was too late, however, as the revolution was accomplished, and Louis Philippe, Duke of Orléans, was chosen King of the French. Charles made his escape to England, resided for some time at Holyrood and afterward at Prague. He took no part in the political intrigues and attempts of the Duchess of Berry. He died of cholera at Görz, Nov. 6, 1836. Charles X was a characteristic example of that type of Bourbons who "never learn anything and never forget anything."

CHARLES III (1345–86). King of Naples from 1381 to 1386, also known as Charles of Durazzo and Charles II of Hungary. His father, Louis of Durazzo, Count of Gravina, died in prison, having rebelled against Joanna I of Naples. The Queen adopted Charles, but afterward abandoned him in favor of Louis I of Anjou. Charles descended into Italy, at the invitation of Pope Urban VI, and seized the crown of Naples (1381), causing Joanna to be strangled in prison (1382). Louis of Anjou contested the throne, and Charles had to wage war with his rival, who died in 1384. He was invited to accept the crown of Hungary by a party dissatisfied with the rule of Queen Elizabeth and her daughter and was crowned at the close of the year 1385; but soon a revolt was incited against the Italians, and Charles was poisoned in prison. Consult Sayous, *Histoire générale des Hongrois* (2d ed., Paris, 1900).

CHARLES II (1332–87). King of Navarre, known as THE BAD. He was the son of Philip of Evreux and Joanna, the daughter of the French King, Louis X. He became King of Navarre in 1349 on the death of his mother and in 1352 married Joanna, the daughter of John II of France. Between the two rulers an implacable hatred prevailed, resulting in great misfortunes to France. In 1354 war broke out, as King John had not given Charles Angoulême, which had been promised as a part of his bride's dowry, and in revenge Charles formed an alliance with the English and made preparations for the invasion of France. The two kings, however, became reconciled; Charles's territories were restored to him, and in 1355 he was ostensibly on terms of friendship with the King, but in reality plotting with the nobles against him. As a result, he was thrown into prison and was not freed until November, 1357. In the same year he was in Paris, at peace with the Dauphin, and enjoying great popularity with the bourgeoisie. As a champion of the people, he sided with Etienne Marcel in the revolt of Paris against the royal authority, and in June, 1358, was made captain general of the city. His perfidiousness and cruelty in repressing the Jacquerie destroyed his popularity, and after playing fast and loose with the Dauphin and the English he formed an alliance with the latter, which lasted until the Treaty of Brétigny in 1360. After 1362 his importance in French politics waned, but he found sufficient scope for the exercise of his talent for duplicity in the complicated politics of the Iberian Peninsula. In 1378 Charles V of France deprived him of his possessions in that country, while a Castilian army invaded Navarre. With the aid of the English, however, he succeeded in warding off the danger. He died on Jan. 1, 1387. Charles was possessed of great political genius and fine

oratorical gifts; but he was mercenary, cruel, and perfectly unscrupulous in the attainment of his ends. He was twice accused of attempting to poison the French King, not without sufficient evidence. Consult Lavisse, *Histoire de France*, vol. iv (Paris, 1902), and Meyer, *Charles II, roi de Navarre* (Paris, 1898).

CHARLES I (1863–1908). King of Portugal after 1889. The son of Luiz I and María Pía, the daughter of Victor Emmanuel II of Italy, he was born Sept. 28, 1863. He succeeded to the throne Oct. 19, 1889. He married, in 1886, Marie Amélie of Orléans, the daughter of the Comte de Paris. Of this union came two sons, Luiz Philippe, Duke of Braganza, born March 21, 1887, and Manoel, born Nov. 15, 1889. His reign has witnessed the rise of a strong radical party in Portugal, traceable in great measure to the financial difficulties under which the country labored during the last decade of the nineteenth century. In international affairs the political status of Portugal has been enhanced by the growth of European colonization in Africa. He and his eldest son were assassinated Feb. 1, 1908.

CHARLES I (1839–1914). King of Rumania. He was born April 20, 1839, the second son of Prince Karl Anton of Hohenzollern-Sigmaringen. He served in the Prussian army and after the dethronement of Alexander John (Cuza) was elected Prince of Rumania, April 20, 1866, and arrived in the capital, Bucharest, in May. The country was in a wretched condition, the prey of rival factions and foreign intrigues. The new Prince showed tact and statesmanship in the work of reorganization. At the outbreak of the Russo-Turkish War, in 1877, the Rumanian army was mobilized, an alliance was concluded with Russia, and Prince Charles took command in person. The army was kept in Rumanian territory for some weeks, after the opening of the campaign, because of Austrian jealousy of military activity on the part of her Balkan neighbors. Prince Charles took the field with his Rumanians, however, when an attack on Plevna had been opened, and rendered valuable assistance in the hardest fighting of the war. A few weeks after the beginning of the war Rumania declared her independence (May 21). In 1881 Rumania assumed the title of Kingdom, and on May 22 Charles was crowned as King at Bucharest. Under him the internal development of the country has gone actively forward, education has advanced, and a safe course has been steered in the difficult politics of southeastern Europe. Charles married Princess Elizabeth von Wied (known by her pen name "Carmen Sylva"), Nov. 15, 1869. Upon the death of the only child of this union the succession was settled upon Prince Ferdinand of Hohenzollern-Sigmaringen, a nephew of the King, in 1889. The Crown Prince has two children. During the recent war of the Balkan states Rumania held aloof and now occupies the position of policeman to keep peace among the petty states. This has enabled King Charles to carry on without interruption the work of making of Rumania a civilized state. He is greatly beloved among the peasantry, but the landowning *Boyards* are opposed to him on account of his agrarian-reform views. Consult Whitman, *Reminiscences of the King of Rumania* (London, 1899).

CHARLES I. King of Spain. See CHARLES V, Holy Roman Emperor.

CHARLES II (1661–1700). King of Spain from 1665 to 1700. He was the son of Philip IV and was but four years old when his father died, the regency being in the hands of the Queen mother, Maria Anna of Austria. During her rule Spain was much weakened by an unsuccessful war with France and by the loss of Sicily. In 1675 Charles assumed the government, taking for his chief adviser that brilliant and popular national hero, the second Don Juan of Austria, an illegitimate son of the late King by his mistress, the renowned actress María Calderón, known as *La Calderona*. By marrying Louise of Orléans, a niece of Louis XIV, Charles maintained harmony with France for several years. After her death Charles married a sister of the Emperor Leopold I, María Ana of Newburg. He joined the Grand Alliance in the war against Louis XIV, which was concluded by the Peace of Ryswick (1697). Charles was childless and was prevailed upon to appoint as his successor Philip of Anjou, grandson of Louis XIV. On his death, Nov. 1, 1700, the claim of Philip of Anjou was contested and the War of the Spanish Succession ensued. See SUCCESSION WARS; CHARLES VI; LOUIS XIV. Consult: Marquis de Villars, *Mémoires de la Cour d'Espagne sous la* [sic] *règne de Charles II, 1678–82* (ed. by William Stirling, London, 1861); Marquis de Villars, *Mémoires de la Cour d'Espagne de 1679 à 1681, publiés et annotés par M. A. Morel-Fatro, et précédés d'une Introduction par M. Le Marquis de Vogüé* (Paris, 1893); the *Letters* of the Marquise de Villars (Paris, 1868); Hume, *The Spanish People* (London, 1901).

CHARLES III (1716–88). King of Spain from 1759 to 1788. He was the first son of the second marriage of Philip V and great-grandson of Louis XIV of France. Parma and Piacenza were obtained for him when he was only 16, to satisfy the ambition of his mother, Elizabeth Farnese. In 1734 he invaded the Two Sicilies, then belonging to Austria, and completed their conquest in 1735, when he was crowned King as Charles III, the Emperor Charles VI being forced to recognize his title in the treaties of Vienna (1735, 1738). On the death of his half brother, Ferdinand VI, in 1759, Charles succeeded to the Spanish throne. He was a man of no great ability (so foreign ministers who had to deal with him agreed), and his foreign policy was disastrous; but he had liberal ideas and effected many reforms, especially in internal affairs and in financial administration. The Jesuits were banished in 1767, and an effort was made to bring the Inquisition under the control of the civil power. This effort was so nearly successful that, although the Inquisition was not abolished, it was rendered nearly innocuous. The power of the church in civil affairs was greatly restricted, and the number of idle clergy, especially the number of monastic orders, was considerably reduced. Charles endeavored to put a stop to brigandage and to Algerine piracy, and interested himself in the development of commerce and the arts and sciences, doing away with much antiquated legislation that was a hindrance thereto. He was an ally of France in the Seven Years' War, and in 1763 was compelled to cede Florida to England, Louisiana being made over to Spain by France. At the close of the American War of Independence Florida was restored to Spain. Unsuccessful

attempts were made in 1781 and 1782 to take Gibraltar from the English. Charles died in Madrid, Dec. 14, 1788. Although he had done much to restrict the power of the church, the Inquisition, and the orders, he was personally a zealous, practicing Roman Catholic and tried earnestly to persuade the Pope to proclaim the dogma of the Immaculate Conception as necessary to salvation. Consult: Colletta, *History of the Kingdom of Naples, 1734–1825*, trans. by Horner (Edinburgh, 1858); Ferrer del Río, *Historia del Reinado de Carlos III en España* (4 vols., Madrid, 1856); Armstrong, *Elizabeth Farnese* (London, 1892); Danvila y Collado, "Reinado de Carlos III," 6 vols., in the *Historia general de España de la Real Academia de la Historia*, published under the direction of Cánovas del Castillo (Madrid, 1892); Conde de Fernan-Núñez, "Vida de Carlos III," annotated ed. in 2 vols. by A. Morel-Fatio and A. Paz y Melia, vols. xiv and xv of the *Libros de Antaño* (Madrid, 1898); F. Rousseau, *Règne de Charles III d'Espagne* (2 vols., Paris, 1907).

CHARLES IV (1748–1819). King of Spain from 1788 to 1808. He was the second son and successor of Charles III and was born in Naples, Nov. 12, 1748. When very young, Charles married his first cousin, Maria Luisa of Parma, who soon acquired great influence over him, despite her coarseness and immorality. In fact, it seems highly probable that he never realized her true character nor the undignified position in which she placed him. The government was conducted chiefly by Godoy (q.v.), a handsome but dissolute guardsman and a favorite of the Queen, who was made Duke of Alcudia and Minister of Foreign Affairs. Peace with the French Republic was concluded in 1795 after a disastrous war, undertaken at the instance of Godoy. Soon after this peace an offensive and defensive alliance was made with France, and Spain speedily became involved in war with Portugal and also with England, the main event of which was the destruction of the Spanish fleet by Nelson at Trafalgar in 1805. In 1807 Charles made a secret treaty with Napoleon according to which Portugal was to be seized by the French and Spanish, and the greater part to be divided between Godoy and the Infanta Maria Luisa, Queen of Etruria, while Charles was to assume the title of Emperor of America; at the same time 16,000 Spanish troops were to be sent to the assistance of the French in Denmark. Meanwhile Napoleon was intriguing with Don Ferdinand, the heir to the throne. On March 19, 1808, Charles, alarmed by disturbances in Madrid, abdicated in Ferdinand's favor. He declared immediately that this act was not voluntary. In a meeting with Napoleon at Bayonne, Charles surrendered the crown on May 5, 1808, to the French Emperor, who gave him a pension of 6,000,000 francs and the castle and grounds of Chambord. He died Jan. 20, 1819, in Rome. See GODOY; SPAIN. Consult also Gen. Gómez de Arteche, "Historia del Reinado de Carlos IV," 3 vols., in the *Historia General de España de la Real Academia de la Historia* (Madrid, 1892 et seq.).

CHARLES IX (1550–1611). King of Sweden from 1604 to 1611. He was the third son of Gustavus Vasa and in 1560 became Duke of Södermanland. In 1592 he became regent of the kingdom after the death of his brother, John, and as such favored the introduction of the Reformed religion into Sweden. In 1593 he secured the adoption of the Augsburg creed as the basis of the national religion, and he confirmed the position of Protestantism by his victory at Staongebro in 1598 over his nephew, Sigismund of Poland, who was rightful King of Sweden, but who, as a decided partisan of Catholicism, was objectionable to the mass of the people. After many attempts at compromise, Sigismund was formally deposed in 1599 and Charles was offered the royal title. At first he merely accepted the regency, but in 1604 he yielded to the popular demand and was crowned King of Sweden. He engaged in wars with Poland, Russia, and Denmark, but his people did not share his ambitions and denied him the support he desired. Charles founded the University of Gothenburg and made a new code of laws. He wrote a rhymed chronicle of the war with Poland.

CHARLES X GUSTAVUS (1622–60). King of Sweden from 1654 to 1660. He was born at Nyköping, Nov. 8, 1622, the son of Catharine, eldest sister of Gustavus Adolphus, and of John Casimir, Count Palatine of Zweibrücken (Deux Ponts). After studying at the University of Upsala, he traveled through France, Germany, and Switzerland, and joined the army of Torstenson (q.v.) in 1642. He fought at the battles of Jankau and Leipzig, and at the close of the Thirty Years' War was the representative of Queen Christina at the conference held subsequent to the Treaty of Westphalia. On the abdication of Christina he succeeded, June 16, 1654, to the throne of a kingdom in an almost bankrupt condition. In 1655 Charles invaded Poland, whose King, John Casimir, indulged in pretensions to the Swedish crown, compelled the Elector of Brandenburg, Frederick William, to enter into an alliance with him, defeated the Polish army in a great battle at Warsaw (July 28–30, 1656), and overran the country, but retired when Russia and Austria prepared to assist the Poles, while the King of Denmark invaded the Swedish territories in Germany. He attacked Denmark in 1658 and secured for Sweden the provinces of Scania, Halland, and Blekinge by the Treaty of Roeskilde. Renewing the war in the same year, Charles laid siege to Copenhagen. The Dutch came to the assistance of the Danes and defeated the Swedish fleet, and in 1659 Charles had to abandon the siege. At the same time his forces were defeated in Pomerania by the Elector of Brandenburg, who had turned against him. He succeeded in holding his own, however, and at the Peace of Oliva, signed a few months after his death, Sweden retained the conquests she had made from Denmark prior to 1658 and those gained south of the Baltic before 1648. Charles died in Gothenburg, Feb. 13, 1660. As a general, Charles ranks equally with his predecessor Gustavus Adolphus and his successor Charles XII. His most famous exploit was the crossing of the straits separating the Danish mainland from the islands on the ice formed by the dense winter cold in 1657–58. This crossing of the "Belt" crushed out the Danish resistance and forced a favorable treaty for Sweden. Consult: Geijer and Carlson, *Geschichte Schwedens*, vol. iv (Gotha, 1855–75); Bain, *Scandinavia* (Cambridge, 1905); Haumant, *La Guerre du Nord et la paix d'Oliva* (Paris, 1893).

CHARLES XI (1655–97). King of Sweden from 1660 to 1697. He was the son of Charles X and Hedwig Eleonora of Holstein and was born Nov. 24, 1655. During his minority the

government was intrusted to his mother, Hedwig, as regent. By the Peace of Oliva (May 3, 1660) with Poland, Sweden obtained Esthonia, part of Livonia, and Oesel, and the Polish monarch renounced all pretensions to the Swedish crown; that of Copenhagen (June 6, 1660) was generally confirmatory of the Treaty of Roeskilde with Denmark in 1658. (See CHARLES X.) A treaty with Russia on the basis of the status quo followed in 1661; and from this period till 1672 the kingdom was free from foreign wars, but it was misgoverned by the regency and the education of the young King was neglected, willfully, it is charged, in order that he might longer be kept in leading strings. Until he reached manhood he could neither read nor write. In December, 1672, Charles assumed the reins of government. In 1674 he was called upon by Louis XIV, under a treaty made by the regency, to engage in the war of France on the German princes and Holland. The Swedes invaded Brandenburg and met a severe defeat at Fehrbellin in 1675. Charles, however, overthrew the Danes, who were allies of Brandenburg, at Halmstadt, Lund, and Landskrona, but his fleet was defeated by the Dutch near Oeland, and again by the Danes at Blekinge and Kiöge; and many of Sweden's recent acquisitions were wrested from her. These, however, were restored by the Peace of Saint-Germain-en-Laye (Sept. 17, 1679). Charles now entered upon an active period of reform in the administration, aided by his most trusted counselor, John Gyllenstern. In 1680 a struggle commenced between the crown, supported by the burghers and peasants, on the one hand, and the nobles on the other; and a considerable diminution of the power of the nobles was the consequence. The resumption of all the crownlands which had been alienated since 1609 was a fatal blow to the power of the nobles, and by a voluntary declaration of the estates, Dec. 9, 1682, the King was invested with absolute authority. By a judicious administration of the revenues, Charles was enabled to extinguish the public debt, reorganize the fleet and army, and by 1693 to dispense with extraordinary subsidies. Though absolute, he never imposed a tax but with the consent of the estates; and he published every year a detailed account of revenue and expenditure. He established the finances on a sound basis and brought the army and navy of the kingdom to a state of high efficiency. The codification of the laws was commenced, but was unfinished at his death, which took place in Stockholm, April 15, 1697. Consult Geijer and Carlson, *Geschichte Schwedens*, vols. iv, v (Gotha, 1855–75).

CHARLES XII (1682–1718). King of Sweden from 1697 to 1718. He was the eldest son of Charles XI and of Ulrica Eleonora of Denmark and was born in Stockholm, June 27, 1682. He received a careful early training under the eye of his father, and on his accession to the throne in 1697 his abilities were favorably commented on by the foreign ministers. He showed his mettle when Sweden, soon after his accession, was threatened by a coalition of Frederick IV of Denmark, Augustus the Strong, Elector of Saxony and King of Poland, and Peter of Russia, who was yet to win his title of "the Great." Sweden had been for 70 years one of the Great Powers of Europe, as a result of the policy of the kings of the house of Vasa; it possessed territory all about the Baltic, and its troops were reputed the best in Europe. The War of the North that was now brought on by the coalition was at first on Sweden's part a war of defense; then, through the successes of Charles, a war of aggression and conquest, and finally, through his failure, a struggle for existence. Its story is a mingling of brilliant triumph and disheartening defeat, both resulting from the meteoric and ill-balanced genius, reckless ambition, and fatal obstinacy of the Swedish King—qualities that have won for him in history the name of "Madman of the North." He was a born soldier and had taken Alexander the Great for his favorite hero. He was fond of all daring sports, careless of exposure, and unsparing of himself and others. When intelligence of the hostile league that threatened him reached Stockholm, the young King surprised every one around him by the energy and efficiency he displayed. Frederick IV of Denmark had invaded Schleswig-Holstein, whose Duke, a brother-in-law of the Swedish King, had called the latter to his assistance. In a six weeks' campaign Denmark was brought to terms, and Frederick signed the Peace of Travendal on Aug. 8, 1700. Charles now turned promptly to the defense of the Swedish possessions on the Baltic menaced by Russia and Poland. Russia sought to obtain the Swedish provinces of Ingra and Carelia, while Livonia and Esthonia, whose nobility detested the firm and often severe rule of Sweden, wished to put themselves under the weaker Polish monarchy. Hastening towards Riga, Charles compelled the Poles to raise the siege of that place, and then by forced marches brought his army of a little over 8000 men to the relief of Narva in Esthonia, which was beleaguered by 40,000 Russians, while Peter himself had gone to hasten the advance of 20,000 more. The disciplined Swedish troops, although jaded by forced marches, administered a severe defeat to the Russians before the walls of the city (Nov. 30, 1700), and Europe expected to see the whole Russian Empire brought under the sway of the young Swede who seemed to have revived the martial glory of the great Gustavus. Unfortunately for Charles, he seems to have entertained the same mad dream of conquest. Only the astute Peter looked the situation squarely in the face and sought to learn its lesson for Russia. He strengthened his alliance with Augustus of Poland, and at Birsen, in February, 1701, it was agreed that Augustus should occupy the attention of the Swedes in the west and Peter in the east, and that they should divide the Baltic provinces. The war thus opened in Denmark and the Baltic provinces involved the control of the Baltic and lasted for 21 years, ending in the marked diminution of the power of Sweden and the rise of Russia as the great Baltic power. Its first years, however, pointed to no such result. Influenced by the advice of his generals, Charles did not follow up his success against Peter, who was really his dangerous antagonist, but sought the overthrow of the King of Poland, while Peter was left to develop his resources. The conquest of Poland was accomplished, owing to the chronic disagreements among the nobility in that unfortunate country, but five years were necessary for its completion. The country was overrun by the Swedish troops, Augustus was finally driven into Saxony, and Charles, who had determined, against the advice of his principal counselor, Piper, to accomplish his enemy's de-

thronement, secured the election of Stanislas Leszczynski, who was crowned in Warsaw, in October, 1705. Meanwhile the Czar had been engaged in the conquest of the Baltic provinces and had been preparing for the ultimate contest with Charles. The latter now carried the war into Saxony, marching through Silesia and posing as the protector of the Protestants. Seeing his hereditary dominions in danger, Augustus sued for peace. Charles exacted from him in the Treaty of Altranstädt (1706) a renunciation of the Polish crown and of all alliances, the recognition of Stanislas, and the delivery to Charles of Patkul, the head of the Livonian malcontents, who had been instrumental in bringing about the coalition between Augustus and Peter. Patkul was executed as a traitor. Charles was now at the height of his power, with a disciplined army of 40,000 men, stationed near Leipzig, holding Germany in awe. If his military ability had been seconded by moderate and wise statesmanship, he might have made himself the most powerful sovereign of Europe. France hoped that he might attack the Grand Alliance, and the members of the Alliance feared it, but, after exacting humiliating terms from the Emperor Joseph I, Charles turned his face eastward to reconquer the Baltic provinces, and then to conquer Russia and perhaps Asia. He entered upon this daring plan with about 46,000 men. The tactics of the Russians were those afterward employed to defeat Napoleon. Charles was lured on into the interior of Russia, his army harassed on the way, and finally, on July 8, 1709, while besieging Poltava, on the border of the Ukraine, he was attacked by the Russian army in force, and the entire fabric of his military success was shattered in one disastrous engagement. His army was annihilated, and he himself barely escaped into Turkish territory, with 300 of his guard. He prevailed upon the Sultan to take up arms against Russia, and in 1711 Peter the Great found himself in a most precarious position on the banks of the Pruth. He was permitted, however, to escape, and the treaty which he was forced to conclude with the Turks was of no benefit to Charles. The Swedish monarch spent the next three years in semicaptivity among the Turks, engaged in fruitless intrigues to induce the Ottoman government to attack Russia. Had he at once returned to his kingdom and turned his real abilities to good use for the state, the history of Sweden might have been different. Instead, with an obstinacy that was simply madness, he wasted his time in this scheme for revenge. When he found that his plots were of no avail he defied the Turkish power, was made a prisoner, but escaped in 1714, and, dashing on horseback disguised through Hungary and Germany, reached Stralsund, which was at once invested by a combined force of Danes, Prussians, and Saxons, and after a year's siege compelled to surrender. The King was wounded in the siege. After driving the Danes from Scania, he invaded Norway and was killed by a cannon ball while besieging Frederikshald, Dec. 11, 1718. In private life Charles was almost an ascetic. See SWEDEN; PETER I; RUSSIA; POLAND.

Bibliography. The best English biography is by Bain, *Charles XII* (London, 1895). There are valuable Swedish works relating to his reign: Axelson, *Bidragtill kännedomen om Sveriges tillstånd på Karl XIII:s tid* ('Contribution to the Knowledge of the Condition of Sweden in the Time of Charles XII') (Wisby, 1888); E. Carlsen, ed., *Karl XII:s egenhändiga bref* ('Autograph Letters of Charles XII') (Stockholm, 1893); Carlson, *Sveriges historia under konungarne af det pfalziska huset* ('History of Sweden under the Kings of the Palatine House') (Stockholm, 1855–81), also in German abridgment (Gotha, 1887). Consult also Voltaire, *Histoire de Charles XII* (Rouen, 1730), which cites much valuable contemporary evidence. A very full bibliography may be found in Lavisse and Rambaud, *Histoire générale*, vol. vi (Paris, 1896). This work also contains an admirable account of the struggle for the Baltic.

CHARLES XIII (1748–1818). King of Sweden from 1809 to 1818. He was the son of King Adolphus Frederic. As high admiral of Sweden, he distinguished himself by winning a notable victory over the Russians in the Gulf of Finland in 1788. He also rendered important political and diplomatic services to his brother, Gustavus III, who created him Duke of Södermanland. After the assassination of Gustavus III, in 1792, Charles assumed the regency for Gustavus IV Adolphus and held it until 1796. In 1809, when at a critical juncture Gustavus had proved unequal to the situation, Charles was made administrator of the kingdom. A few months later Gustavus was deposed, and Charles accepted the kingship, under a constitution adopted by the Diet. He cultivated friendship with Russia and England. In 1814 the union of Norway and Sweden under one sovereign was effected, and he became its first king. In the latter years of his reign he was the mere vassal of his adopted son Bernadotte, who became Charles XIV upon his death. He died Feb. 5, 1818. See SWEDEN. Consult Bain, *Gustavus III and his Contemporaries* (London, 1895).

CHARLES XIV JOHN (1763–1844). King of Sweden and Norway from 1818 to 1844, and before his elevation to the throne Gen. Jean Baptiste Jules Bernadotte, a celebrated marshal of Napoleon. He was born in Pau, France, Jan. 26, 1763, the son of a French lawyer. He fought in the revolutionary wars (from 1794 as general of division) in Belgium, Germany, and Italy, and in 1799, in the last year of the Directory, was Minister of War. In 1800 he suppressed a rising of the Chouans, and in 1804 Napoleon created him marshal. He bore a distinguished part in the victory of Austerlitz in 1805, for which he was made Prince of Pontecorvo, and won fresh laurels in the campaign against the Prussians in 1806–07 and at Wagram in 1809. He was never one of the personal following of Napoleon, who appears to have been jealous of the general. He was chosen by the Swedish Diet in 1810 Crown Prince and successor of Charles XIII. The only condition of moment was that he should become a Protestant. Bernadotte agreed, changed his name to Charles John, and soon began to exercise many of the royal functions. The Crown Prince resisted the efforts of Napoleon to involve Sweden in his designs against England. The country was soon engaged in war with France, and at the head of the northern troops Prince Charles joined the allies in the final struggle with Napoleon and contributed to the victory of Leipzig (October, 1813). He forced Denmark in the Treaty of Kiel to give up Norway and conducted the campaign for its subjugation (1814). Charles XIII died in 1818 and was succeeded by Prince Charles John as Charles XIV John. The period of his admin-

istration was characterized by progress in all directions, both public and private. Charles was the only one of Napoleon's generals who founded a permanent dynasty. He died March 8, 1844. The present ruling house of Sweden is descended from Marshal Bernadotte, but intermarriage with Germans has made it thoroughly Teutonic. See SWEDEN. Consult: Meredith, *Memorials of Charles John, King of Sweden and Norway* (London, 1829); Sarrans, *Histoire de Bernadotte, Charles XIV Jean* (Paris, 1845); *Recueil des lettres, discours, et proclamations de Charles XIV Jean* (Stockholm, 1858).

CHARLES XV (1826–72). King of Sweden and Norway from 1859 to 1872. He succeeded his father, Oscar I, who was a son of Charles XIV John (q.v.). The rule of Charles was liberal and popular. Of him it is said that his motto was: "Build up the land upon the laws!" His legal reforms in the communal, ecclesiastical, and criminal branches of the law are evidences of his belief in the motto. To the political activity of Minister of Justice, Charles owes much of his reputation as a reformer. The most important event was the change (in 1866) in the constitution of the Parliament, which has since consisted of two chambers, one elected by the provincial representatives and the other by the people. He had a taste for literature and art and published a volume of poems. In 1850 he married Louisa, daughter of the King of the Netherlands, by whom he had one daughter, who became the wife of Prince Frederick of Denmark. He died Sept. 18, 1872. Consult Bååth-Holmberg, *Carl XV, somenskild mau, konung och Roustnär* (Stockholm, 1891).

CHARLES, ELIZABETH, née RUNDLE (1828–96). An English popular novelist, religious in bent and largely in subject matter, whose stories and novels, mildly interesting as narratives and historical pictures, touch almost every century and every country of Christendom. She wrote profusely, beginning with *Tales and Sketches of Christian Life* (1850) and ending with the last of 16 productions published between 1885 and 1896 for the Society for Promoting Christian Knowledge. *The Schönberg-Cotta Family* (1863), a story of the German Reformation, is her noteworthy book.

CHARLES, shärl, JACQUES ALEXANDRE CÉSAR (1746–1823). A French physicist. He made the first balloon using hydrogen gas (called *Charlière*, as distinguished from the *Montgolfière*, or fire balloon), and on Dec. 1, 1783, made a successful ascent to the height of nearly two miles. He invented a thermometric hydrometer and a number of optical instruments. In 1787 he anticipated Gay-Lussac's law of dilatation of gases.

CHARLES, LOUIS JOHN (1771–1847). Archduke of Austria. He was the third son of the Emperor Leopold II and was born in Florence, Sept. 5, 1771. He pursued his military studies with much ardor and, having displayed great ability in inferior commands in the battles of Jemmapes, Neerwinden, and Wattignies, was intrusted, in 1796, with the chief command of the Austrian Army of the Rhine. After inflicting repeated defeats upon Moreau, Jourdan, and Bernadotte, he drove the French across the Rhine and captured the stronghold of Kehl, Jan. 10, 1797. In 1799 he was again at the head of the Army of the Rhine, was several times victorious over Jourdan, protected Suabia, and successfully opposed Masséna, but suffered defeat at Zürich, June 4. In 1800 bad health compelled him to retire from active service, but, being appointed Governor-General of Bohemia, he formed a new army there. After the battle of Hohenlinden (1800) he was again called to the chief command and succeeded in staying the rapid progress of Moreau, but almost immediately entered into an armistice with him, which was followed by the Peace of Lunéville. In 1805 he commanded the army opposed to Masséna in Italy and fought the hard battle of Caldiero, but, upon bad tidings from Germany, retreated from the left bank of the Adige to Croatia. This retreat was one of his greatest military achievements. Made generalissimo of the Austrian forces, he won in 1809 the great battle of Aspern (q.v.); which first showed Europe that Napoleon was not invincible; but he did not promptly enough follow up his victory, and Napoleon, who hastened to reënforce his army, retrieved his fortunes at Wagram. The Archduke was now compelled to give way before the enemy, till he reached Znaim, where an armistice was concluded on July 12. In the campaigns of 1813 and 1814 he had no part. He lived in retirement till his death, which occurred April 30, 1847. He was author of *Grundsätze der Strategie* (1814). Consult Duller, *Erzherzog Karl* (Vienna, 1844–45), and Zeissberg, *Erzherzog Karl* (Vienna, 1895).

CHARLES, ROBERT HENRY (1855–). A British divine and author. He was born in county Tyrone, Ireland, and was educated at Queen's College, Belfast, Trinity College, Dublin, and Queen's University. He was ordained in 1883; was curate of St. Mark's, Whitechapel, in 1883–85, of St. Philip's in 1885–86, and of St. Mark's, Kensington, in 1886–89. In 1898 he became professor of Biblical Greek at Trinity College, Dublin, and from 1905 to 1911 was Grinfield lecturer on the Septuagint, Oxford. In 1898–99 he delivered the Jowett lectures on *The Doctrine of a Future Life in Israel, in Judaism, and in Christianity* (2d ed., 1913). He was made a canon of Westminster Abbey in 1913. His special field was the apocryphal books, and his publications include: *Book of Enoch* (trans. from the Ethiopic, 1893); *Ethiopic Text of the Book of Jubilees* (edited from four manuscripts, 1894); *Book of the Secrets of Enoch* (1895); *Apocalypse of Baruch* (trans. from the Syriac, 1896); *The Assumption of Moses* (1897); articles in the *Encyclopædia Biblica, Hastings Bible Dictionary,* and the *Encyclopædia Britannica; The Ascension of Isaiah* (trans. from Greek, 1900); *Testaments of the XII Patriarchs* (1908); *The Zadakite Fragments* (1912); *Studies in the Apocalypse* (1913).

CHARLES ALBERT (1798–1849). King of Sardinia from 1831 to 1849. He was the son of Prince Charles Emmanuel of Savoy-Carignan and in 1800 succeeded to his father's title and estates in France and Piedmont. In 1817 he married Maria Theresa, daughter of the Archduke Ferdinand of Tuscany. On the outbreak of the revolutionary movement in Piedmont in 1821, he was made regent upon the abdication of Victor Emmanuel I, until Charles Felix, the brother of the late King, should arrive to assume the sovereignty. He displeased, during his short reign of a week, both the Liberal party and its opponents, and Charles Felix disavowed all his acts and for some time forbade his appearance at court, exiling him to Florence. In

1829, however, he was appointed Viceroy of Sardinia. On the death of Charles Felix, April 27, 1831, he ascended the throne and performed several acts of constructive statesmanship by a reorganization of the finances and the creation of an army. Under the impulse of the movements of 1848 Charles Albert granted to Sardinia a constitution, the *Statuto*, which became the constitutional basis of the new Italy (see CAVOUR). The King entered warmly into the project of Italian unity and evidently expected to place himself at the head of the whole movement and of the new Kingdom of Italy. He was not, however, in real sympathy with the democracy of the new liberalism, and he was too visionary and unpractical to lead Sardinia along the difficult road that lay before her. When the Lombards and Venetians rose against the Austrian government, he declared war against Austria, March 23, 1848, and at first was successful; but his army was deficient in organization and leadership, and at Custozza, July 25, 1848, and at Novara, March 23, 1849, his hopes were wrecked by crushing defeats at the hands of the Austrians. On the battlefield of Novara he resigned the crown to his son, Victor Emmanuel. He retired to Portugal and died in Oporto in the same year. Consult: Cappalletti, *Storia di Carlo Alberto* (Rome, 1891); Bianchi, *Storia della diplomazia europea in Italia* (Turin, 1865); Costa de Beauregard, *La Jeunesse du roi Charles Albert* (Paris, 1809). See ITALY; SARDINIA; SAVOY, HOUSE OF.

CHARLES AUGUS'TUS (1757–1828). Grand Duke of Saxe-Weimar. He lost his father in the first year of his life and, together with a posthumous brother, was educated with great care during the regency of his mother, a woman of liberal ideas and great strength of character. Wieland, Knebel, and other prominent men were among the teachers of young Charles Augustus. In December, 1774, he made the acquaintance of Goethe, and they at once became friends. As soon as Charles Augustus assumed the reins of government, on his eighteenth birthday, he called Goethe to Weimar, and their intimacy was interrupted only by death. Owing to his own love of letters and the influence of his mother, Amalie (q.v.), the court of Saxe-Weimar became the shrine of German literature. Schiller, Herder, Wieland, and others lived under Augustus' protection, and the Court Theatre at Weimar witnessed the first production of *Iphigenie* (1786) and *Tasso* (1789). In 1786 Charles Augustus entered the Prussian army, in which he remained until the defeat at Jena in 1806, when he joined the Rhenish Confederacy and aided the French. In 1813 he joined in the coalition against Napoleon and commanded an army of Saxons, Hessians, and Russians. He fought among the allies in 1815, and the Congress of Vienna rewarded his services by enlarging his principality and making it a grand duchy. Goethe's influence was a lasting one in the character of Charles Augustus. His liberality in political opinions was the despair of Europe after the Congress of Vienna, but it made Saxe-Weimar one of the few well-governed and contented principalities of the age. Consult Düntzer, *Goethe und Karl August* (2d ed., Leipzig, 1888).

CHARLES CITY. A city and the county seat of Floyd Co., Iowa, 40 miles northwest of Cedar Falls, on the Illinois Central, and the Chicago, Milwaukee, and St. Paul railroads, and on Cedar River (Map: Iowa, E 1). The city has an opera house, home for the aged, public library, and parks, and is the seat of Charles City College (German Methodist), organized in 1891. It has good water power and manufactures store fixtures, wood furnishings, furniture, sashes and doors, harrows, and gasoline traction and stationary engines. Live stock, dairy products, nursery stock, and poultry are extensively shipped. Settled in 1856, Charles City was incorporated in 1869 and is governed by a mayor, elected biennially, and a council. The water works are owned and operated by the municipality. Pop., 1910, 5892.

CHARLES CITY CROSS ROADS, BATTLE OF. See FRAZIER'S FARM, BATTLE OF.

CHARLES DE BLOIS, shärl de blwä, or **DE CHÂTILLON** (?–1364). A claimant to the Duchy of Brittany. He was a nephew of Philip VI of France and contested the possession of the duchy with Jean de Montfort, who defeated him at the battle of Auray.

CHARLES EDWARD. See STUART, CHARLES EDWARD.

CHARLES EMMAN'UEL I, Duke of Savoy (1580–1630). See SAVOY, HOUSE OF.

CHARLES FRED'ERICK AUGUS'TUS WIL'LIAM (1804–73). Duke of Brunswick, son of Duke Frederick William, who fell at the battle of Quatre-Bras. He was born in the Duchy of Brunswick and after his father's death was put under the care of King George IV of England. He ascended the ducal throne in 1823, but his administration was intolerable, and he was expelled by his subjects in 1830. The remainder of his life he passed chiefly in London, Paris, and Geneva, and at his death he bequeathed his immense fortune to the last-named city.

CHARLES GRAN'DISON, THE HISTORY OF SIR. A novel by Samuel Richardson (1753), depicting the author's ideal of a faultless hero.

CHARLES MARTEL' (Fr., Charles the Hammer) (c.688–741). Mayor of the Palace under the last Merovingian kings, and the illegitimate son of Pepin of Heristal. After his father's death, in 714, he was at first imprisoned by his father's widow, but escaped in 715 and was proclaimed Mayor of the Palace by the Austrasians. A war between Austrasia and Neustria followed, which ended in Charles becoming undisputed ruler of all the Franks, the titular kings being mere puppets in his hands. He was engaged in long wars against the revolted Alemanni, Bavarians, and against the Saxons, but his importance as a historic personage is chiefly due to his wars against the Saracens, who, having conquered Septimania from the Visigoths in 720, advanced into Aquitaine, and in the succeeding years conquered Bordeaux, defeated the Duke of Aquitaine, crossed the Garonne, advanced to the Loire, and threatened Tours. Charles overthrew them near Poitiers, in 732, in a great battle, in which their leader, Abd-er-Rahman, fell, and their progress, which had filled all Christendom with alarm, was checked for a time. He drove them out of the Rhône valley in 739, when they had again advanced into the Burgundian territories as far as Lyons, deprived them of Languedoc, which he added to the Kingdom of the Franks, and left them nothing of their possessions north of the Pyrenees beyond the river Aude. Charles attempted to convert Saxony and Frisia to Christianity and gave aid to St. Boniface in his missions. He died

on Oct. 22, 741, at Quiercy on the Oise, leaving the government of the kingdom divided between his two sons, Carloman and Pepin the Short. Consult Breysig, *Jahrbücher des fränkischen Reiches, 714–741* (Berlin, 1869), and *Cambridge Mediæval History*, vol. ii (New York, 1913).

CHARLES OF ANJOU, ăn'zhōō', Count of Provence and King of Naples and Sicily (1226–85). He was the seventh child of Louis VIII of France and wedded Beatrice, heiress of Provence. In 1248 he went on a crusade in company with his brother, Louis IX, suffered captivity in Egypt with him, and returned to Provence in 1250. Exceedingly ambitious, he sought everywhere for opportunities to increase his possessions. For aid rendered Margaret of Flanders he was promised the Province of Hainaut, but Louis interfered, and Charles was compelled to relinquish Hainaut for a large sum of money. In 1262 Pope Urban IV invited Charles to assume the crown of the Two Sicilies and to assist in the overthrow of the bastard Manfred, the Ghibelline King. In 1263 Charles was made Senator of Rome and in 1266 was crowned King of the Two Sicilies. A crusade was preached against Manfred, who was overwhelmed and slain in the battle of Benevento. In 1268 the young Conradin, the legitimate heir, was defeated at Tagliacozzo, captured, and executed; a like fate was dealt out to many Italian nobles; estates were confiscated to reward the French mercenaries, and Charles established himself firmly in power. In 1270 Charles participated in the disastrous crusade of his brother, Louis IX, and later (1282), when he was preparing for another expedition, news was brought of the rebellion afterward known as the Sicilian Vespers (q.v.). Charles at once sent his fleet against Messina, refusing all offers of capitulation; but the city held out until assistance came from Don Pedro of Aragon, and Charles's fleet was burned. In 1285 the King died at Poggio. Charles of Anjou was one of the most powerful rulers of his time in Christendom. He was all-powerful in the councils of France; ruled over Anjou, Provence, and the Two Sicilies; was Senator of Rome, Imperial Vicar of Tuscany, Governor of Bologna, and lord of several other cities; he had also bought the rights to the Kingdom of Jerusalem. Consult: Sternfeld, *Karl von Anjou* (Berlin, 1888), which treats of Charles's career up to 1265; *Archivio storico Italiano* (3d series, vols. xxii–xxvi, Florence, 1875–77; 4th series, vols. i–vii, Florence, 1878–81); Jordan, *Les origines de la domination angevine en Italie* (Paris, 1909).

CHARLES OF ORLÉANS, ôr'lā'ăn' (1391–1465). A French poet and nobleman, the son of Duke Louis of Orléans. He was brought up at the court of Blois, married Isabella, widow of Richard II of England, in 1406, and upon the death of his father (who was murdered, in 1407, by the Burgundians and Valentino of Milan) succeeded to his estates. At the battle of Agincourt (1415) he was joint commander and was taken prisoner. He was never in close imprisonment, but it was nearly 25 years before he was ransomed and returned to Blois. Here he married Mary of Cleves and gathered about him the literary people of the day—Villon, Chastelain, and others. He is best known by his poems, some written in prison and some, of particular interest to the philologist, composed in English. His favorite subjects were Love and Spring, and on these two themes he composed many rondels, one of which is the charming *Le temps a laissié son manteau*, so often introduced into anthologies. His son became Louis XII of France. The best edition of his works is that by D'Héricault (1874), with a memoir. Consult Beaufils, *Etudes sur la vie et les poésies de Charles d'Orléans* (2 vols., Paris, 1875), and R. L. Stevenson, *Familiar Studies of Men and Books* (1882).

CHARLES RIVER. A river of eastern Massachusetts (Map: Massachusetts, E 3). It rises in the western part of Norfolk County in a number of small head streams which connect small lakes and, pursuing a zigzag northeasterly course, empties into Boston harbor. In the middle and lower parts of its 47-mile course the Charles is very attractive for boating excursions. The chief towns on its banks are the Newtons, Waltham, Watertown, Cambridge, Brookline, and Boston. Below Watertown the stream is tidal, and between Cambridge on one side and Boston on the other it widens into an estuary, part of which has been filled in, forming the Back Bay, the Fenway, and an extensive system of parked boulevards.

CHARLES'S WAIN. A common name for the constellation Ursa Major.

CHARLES THE BOLD (trans. of Fr. *Charles le Téméraire*) (1433–77). The last Duke of Burgundy. He was the son of Philip the Good, of the house of Valois, and of Isabella of Portugal, and was born in Dijon, Nov. 10, 1433. During his father's life he bore the title of Count of Charolais. He was of a fiery, ambitious, and violent disposition. From an early period to the end of his life he was a declared enemy of Louis XI of France, the nominal feudal superior of Burgundy, and when Louis caused Philip to deliver up some towns on the Somme, Charles left his father's court and formed an alliance with the Duke of Brittany and some of the great nobles of France for the maintenance of feudal rights against the crown. Their forces ravaged Picardy and Île de France, threatened Paris, and defeated the King at Montlhéry (1465). The result was a treaty by which the Count of Charolais obtained the towns on the Somme and the counties of Boulogne, Guines, and Ponthieu for himself. In 1467 he succeeded his father as Duke of Burgundy. The Burgundian realm comprised Flanders, Brabant, and nearly all the rest of the Netherlands, in addition to Burgundy and Franche-Comté. Richer and more powerful than any other prince of his time, Charles the Bold conceived the design of restoring the old Kingdom of Burgundy, which involved the conquest of Lorraine, Provence, Dauphiny, and part of Switzerland. War raged between him and France afterward with but little intermission till 1475. In September of that year Charles found himself at leisure to attempt the prosecution of his favorite scheme of conquest and soon made himself master of Lorraine. In the following year he invaded Switzerland, stormed Granson, but was soon after terribly defeated by the Swiss near that place and lost his baggage and much treasure. Three months later he appeared again in Switzerland with a new army of 25,000 men and laid siege to Morat, where he sustained in June, 1476, another and still more overwhelming defeat. Nevertheless he refused to listen to terms and laid siege to Nancy in the fall of 1476. His army was small, and, in a battle fought on Jan. 5, 1477, before that town, he was overwhelmed by René of Lorraine and his Swiss mer-

cenaries and lost his life. His daughter and heiress, Mary, married the Emperor Maximilian I. With his life ended the long resistance of the great French vassals to the power of the centralized monarchy. Consult Kirk, *History of Charles the Bold* (3 vols., Philadelphia, 1864–68), and Lavisse, *Histoire de France*, vol. iv (Paris, 1902).

CHARLESTON, chärlz'ton. A city and the county seat of Coles Co., Ill., 46 miles west of Terre Haute, Ind., on the Cleveland, Cincinnati, Chicago, and St. Louis, and the Toledo, St. Louis, and Western railroads (Map: Illinois, D 4). It is the seat of the Eastern Illinois Normal School and possesses a Carnegie library, a fine courthouse, and parks. It is the centre of a region having extensive oil, gas, and coal fields, and manufactures flour, brooms, stoves, and tiles. Charleston was settled in 1830, incorporated in 1855, and at present is governed under a charter of 1870 which provides for a mayor, elected biennially, and a council. The water works are owned by the city. One of the famous Lincoln-Douglas debates was held here in 1858. Pop., 1910, 5884.

CHARLESTON. A city and the county seat of Mississippi Co., Mo., 14 miles west by south of Cairo, Ill., on the St. Louis, Iron Mountain, and Southern Railroad (Map: Missouri, G 5). It is in a highly productive agricultural region and ships grain, flour, fruits, potatoes, and live stock. The industries include flour and saw mills, stave and heading factories, and manufactures of shoe braces, axe handles, etc. The water works are property of the municipality. There are many Indian mounds of historic interest near the city. Pop., 1890, 1381; 1900, 1893; 1910, 3144.

CHARLESTON. A port of entry and an important commercial centre, the largest city in South Carolina and the county seat of Charleston County (Map: South Carolina, D 4). It is 7 miles from the ocean, on a low peninsula formed by the Ashley and Cooper rivers, which unite in a broad bay affording an excellent harbor, 130 miles by rail from the State capital, Columbia, and 82 miles northeast of Savannah, Ga.

Charleston is a city of great historic and scenic interest, with picturesque houses surrounded by pleasant gardens and with some irregular and narrow streets. In the southern part of the city are White Point Garden—a finely wooded park, containing a monument to the Second Regiment, South Carolina Line, Continental Army, which defended Fort Moultrie, June 28, 1776, and a bust of William Gilmore Simms—and the Battery, a popular promenade commanding a view of the harbor. The corner of Broad and Meeting streets is the site of the courthouse, post office, and city hall, the last containing a collection of historic relics and portraits. Other prominent buildings are St. Michael's Church, opened for worship in 1761, the Roman Catholic Cathedral, St. Philip's Church (Protestant Episcopal), the custom-house of white marble, the Memminger Normal School, and the Charleston Museum. The city has a valuable library (subscription) of 40,000 volumes, dating from the year 1748, and a number of charitable institutions, the more notable of which are the Roper Hospital, Charleston Orphan House, Enston Home, and Home for Mothers, Widows, and Daughters of Confederate Soldiers. The Gibbes Memorial Art Gallery, founded through the beneficence of J. S. Gibbes, is well filled with art treasures. As an educational centre, Charleston is the seat of the College of Charleston, founded in 1785; the Medical College of the State of South Carolina; the Citadel, the Military College of South Carolina, which became known for the part its students played in 1861 in the Civil War; Porter Military Academy; and Avery Normal Institute for colored students. The city maintains a well-equipped system of public schools, dating from 1810, and comprising primary and grammar schools, and a girls' high or normal school in which are enrolled over 5000 pupils. About $60,000 is devoted annually to the educational department. Monuments of William Pitt, John C. Calhoun, Wade Hampton, and Gen. G. T. Beauregard, and a bust of Henry Timrod, the poet, are among the objects of interest. Outside of the city are found several resorts attractive on account of popular amusements and for natural beauties: the Charleston Country Club, just north of the city; the Isle of Palms, north of Sullivan's Island and directly on the ocean; Magnolia Gardens, 12 miles distant on the Ashley; and Sullivan's Island, with a fine beach for surf bathing. Magnolia Cemetery, three miles north of the city hall, is a beautiful spot, with fine trees, shrubs, and flowering plants. Hampton Park is a large and attractive public park in the northern part of the city on the Ashley. It is on the site of the Washington Race Course, founded shortly after the Revolution.

The harbor, landlocked and one of the safest on the coast, has been so improved since the construction of jetties as to admit large vessels, the depth of water on the bar at mean high water being over 30 feet. West of the channel is a lighthouse with a fixed light at an elevation of 155 feet. The harbor defenses include Fort Moultrie on Sullivan's Island—where the Federal government, at an expenditure of over $500,000, has made extensive improvements designed to render the artillery post at that point one of the most completely equipped in the United States—and Fort Sumter. The other forts, well known in history, are now abandoned. The United States Navy Yard on the Cooper River, about 7 miles from the city, is large and well equipped. Several millions have been expended in developing and improving it.

The city has about 9 miles of water front, most of the wharves lying on the Cooper River. Good transportation facilities, by rail and water, form a feature of its equipment as a commercial centre. The Clyde Line connects Charleston with New York, Boston, and Jacksonville, and freight steamers go to important foreign and domestic ports; the Atlantic Coast Line, Southern, and Seaboard railways afford railroad communication.

In the early years of the nineteenth century Charleston was the chief cotton port in the United States, and until 1860 it held third place among the cotton-receiving ports. Since the Civil War, however, the Charleston trade has developed but slowly, and some years ago the export trade actually began to decline, but in the past decade has begun to increase again, until now there are but two ports in the South exporting more products. Besides cotton exports there are exports of oil cake (cottonseed), cottonseed fertilizers, and lumber products. The import trade has been steadily advancing, and there is an important wholesale and jobbing trade

with cities of the interior. Large quantities of fruit, early vegetables, and lumber are shipped to Northern cities, the total income from the truck crops amounting to more than $5,000,000 annually. Charleston, though known rather as a commercial centre, is the seat of considerable industrial interests, the principal of which is the manufacture of fertilizers. Other leading manufactures are clothing, foundry and machine-shop products, lumber and timber products, including sash, doors, blinds, and confections and cigars.

The government is administered, under the charter of 1836, by a mayor, who holds office for four years, and a city council, the members of which are elected one-half by wards and one-half at large. The executive controls appointments to the board of health and, with the consent of the council, nominates commissioners of the city hospital, board of fire masters, commissioners of the Colonial Common, and park commissioners. All other administrative officials are elected by the municipal council. The annual expenditures of the city amount to about $600,000, the main items of expense being $30,000 for street lighting, $50,000 for the fire department, $60,000 for charitable institutions, and $75,000 for the police department.

Pop., 1790, 16,359; 1860, 40,522; 1870, 48,956; 1890, 54,955; 1900, 55,807, including 31,522 persons of negro descent and 2592 of foreign birth; 1910, 58,333; 1920, 67,957.

History. In 1670 an English colony under Gov. William Sayle came to Albemarle Point, on the west bank of the Ashley River, 3 miles from the present city, and founded Charles Town (named in honor of Charles II), the first permanent settlement in Carolina. In 1680 the public offices were removed to the present site of Charleston, where a number of families had previously settled. The population was increased, in 1685–86 by a company of Huguenot refugees, in 1755 by 1200 Acadian exiles, and in 1793 by 500 French refugees from Santo Domingo. In 1775 Charleston was one of the chief cities and the third seaport in importance in America, and it was the first Southern city to join the revolutionary movement. In February, 1776, the Provincial Congress of South Carolina met in Charles Town and on March 26 adopted the first independent State constitution. On June 28, 1776, the garrison on Sullivan's Island, under Colonel Moultrie (see Fort Moultrie), repulsed an attack by the British fleet, and in 1779 the city was again successfully defended, this time against General Prévost; but on May 12, 1780, with its garrison of 7000 under General Lincoln, it was captured after a siege of six weeks by a British force of 16,000 under Sir Henry Clinton, its loss being regarded as one of the greatest disasters of the Revolutionary War. On Dec. 14, 1782, the British evacuated the city and the Americans again took possession of it. Charleston was incorporated in 1783 and until 1790 was the capital of the State. In 1784 the first bale of cotton exported from America to Europe was shipped from this port. Charleston was the centre of the nullification movement of 1832, and in 1860 the Democratic convention, being afterward adjourned to Baltimore, met here, as did also the State convention which, on December 20, passed the first ordinance of secession. On April 12–13, 1861, the Civil War was opened by the Confederate bombardment and capture of Fort Sumter (q.v.) in Charleston harbor. In 1863 a Federal fleet under Admiral Dupont unsuccessfully attacked the fortifications of the harbor, and, though closely besieged and frequently bombarded, the city remained in possession of the Confederates until Feb. 17, 1865, when it was evacuated. On the following day the Union forces under General Gillmore took possession. On Aug. 31, 1886, Charleston suffered terribly from an earthquake shock, the severest in the history of the United States. Seven-eighths of the houses were rendered unfit for habitation, many persons were killed, and property valued at over $8,000,000 was destroyed. The damage, however, was quickly repaired. The South Carolina Interstate and West Indian Exposition (q.v.) opened here Dec. 2, 1901.

Consult: McCrady, *South Carolina under the Proprietary Government* (New York, 1897), *South Carolina under the Royal Government* (New York, 1899), and *South Carolina in the Revolution* (New York, 1901); also Powell, *Historic Towns of the Southern States* (New York, 1900), and Ravenel, *Charleston, the Place and the People* (New York, 1905).

CHARLESTON. The capital of West Virginia and the county seat of Kanawha County, about 369 miles west-northwest of Richmond, Va., on the Chesapeake and Ohio, the Kanawha and Michigan, the Kanawha and West Virginia, and the Coal and Coke railroads, and at the confluence of the Kanawha and Elk rivers (Map: West Virginia, C 3). The chief features are the capitol, customhouse, Federal building, public library, monument to Stonewall Jackson, and the county courthouse. The city has regular steamboat communication with the principal river ports, and is an important shipping point for coal, salt, and timber. There are deposits of natural gas, coal, and oil in the neighborhood. The manufactures include axes, glass, engines, boilers, furniture, carriages, fire brick, and lumber. Charleston has also boat-building yards and color and veneer works. The government is vested in a bipartisan board of affairs, consisting of the mayor and three commissioners, and a city council with limited power. A fort was built at Charleston about 1786; the town was incorporated in 1794, and the city in 1870. It has been the capital of West Virginia since 1870, with the exception of the period, 1875–85, when Wheeling was the seat of government. Pop., 1890, 6742; 1900, 11,099; 1910, 22,996; 1920, 39,608.

CHARLESTON EXPOSITION. See South Carolina Interstate and West Indian Exposition.

CHARLESTOWN. Formerly a city of Middlesex Co., Mass., now incorporated with Boston (q.v.). Charlestown was settled in 1629 by a small company from Salem and was organized as a town in 1634. The territory originally within its limits has from time to time been divided up to form the towns of Woburn, Malden, Stoneham, Burlington, and Somerville, and parts of Medford, Cambridge, Arlington, and Reading. The battle of Bunker Hill was fought here on June 17, 1775, when the British set fire to the town, destroying 320 buildings, valued at $525,000. The battle is commemorated by the Bunker Hill Monument (q.v.). Charlestown was chartered as a city in 1847. It contains a United States Navy Yard. It was the home of John Harvard, the earliest benefactor of Harvard College, and the birthplace of Samuel F. B. Morse, the inventor of the electric telegraph. In 1874, its population then being 23,373,

Charlestown was annexed to Boston. Consult: Frothingham, *History of Charlestown* (Boston, 1845); Hunnewell, *A Century of Town Life: A History of Charlestown from 1775 to 1887* (Boston, 1888); Sawyer, *Old Charlestown* (1902).

CHARLES TOWN. A city and the county seat of Jefferson Co., W. Va., 55 miles northwest of Washington, D. C., on the Baltimore and Ohio and the Norfolk and Western railroads (Map: West Virginia, G 2). It is the seat of Powhatan College and Stephenson Seminary, both for young women. The city is in a fertile agricultural district, has deposits of limestone and iron ore in the vicinity, and manufactures brass fittings, harness, collars, fly nets, various wooden products, and fertilizers. It is known as a summer resort. Charles Town was settled about 1750 and was first incorporated in 1873. It was here that John Brown, after his raid at Harper's Ferry, was tried, condemned, and hanged on Dec. 2, 1859. On Oct. 18, 1863, a Confederate cavalry division, under General Imboden, captured the place and secured 424 prisoners and large quantities of military stores, but, on the approach of a superior Union force, almost immediately withdrew. Pop., 1890, 2287; 1900, 2392; 1910, 2662.

CHARLES WILLIAM FERDINAND, Duke of Brunswick (1780–1806). See Brunswick, House of.

CHARLET, shär'lā', Nicolas Toussaint (1792–1845). A French lithographer and painter. He was born in Paris, studied with the painter Gros, and soon became renowned for his lithographed designs of military subjects, like the "Grenadier of Waterloo." He did not confine himself to lithograph subjects, but worked rapidly in water colors and in sepia and oil. Among his pictures in oil are the "Episode in the Retreat from Russia" (Lyons) and "Wounded Soldiers Halting in a Rain" (Valenciennes). He took delight in representing humorously rustic scenes of peasants and children and in attaching to these designs quaint descriptive mottoes. His last important work was his illustration of Napoleon's Diary at St. Helena. By his continual glorification of the First Empire he helped to awaken popular sentiment against the Bourbons, preparing the way for the revolution of 1830. About 1092 of his lithographs survive. Consult his biography by Lacombe (Paris, 1856); Dayot (ib., 1893); id., *Les peintres militaires Charlet et Raffet* (ib.).

CHARLEVILLE, shär'l'-vēl' (Fr., Charles's town). A town of France, on the Meuse, in the Department of Ardennes, opposite Mézières, with which it communicates by a suspension bridge over the Meuse (Map: France, N., K 3). It is a thriving place, well built, with clean spacious streets; it has a teachers' college, a lyceum, and a library. It still adheres to plans for streets and buildings laid down by its founder, Charles III, Duke of Nevers, in 1606. It manufactures hardware, leather, sugar, brushes, and beer, and the Meuse affords facilities for considerable trade in metals, coal, iron, slate, wine, and nails. Pop. (commune), 1901, 18,772; 1911, 22,654. It was the mediæval Arcæ Remorum and Carolopolis, and an important military station until the destruction of its fortifications in 1687.

CHARLEVOIX, shär'le-voi'. A city and the county seat of Charlevoix Co., Mich., 210 miles by rail north by east of Grand Rapids, on the Pere Marquette Railroad, and on the Pine River, which flows into Lake Michigan (Map: Michigan, D 3). It is a popular summer resort and has important fishing and lumbering interests. It manufactures cement, lime, and stone and lumber products. The United States Fish Hatchery has a substation here, and the city contains a Carnegie library and municipal electric light plant and water works. The city was chartered in 1905. Pop., 1900, 2079; 1910, 2420.

CHARLEVOIX, shär l'-vwä', Pierre François Xavier de (1682–1761). A French missionary and traveler, best known as the historian of "New France." He was born in Saint-Quentin, became a member of the Society of Jesus in 1698, and from 1705 to 1709 taught in Quebec, Canada. He then returned to France; but in 1720 was sent to America by the Duke of Orléans to gather information concerning the "Western Sea," then supposed to be only a short distance from the Mississippi River. Arriving at Quebec in September, he ascended the St. Lawrence and the Great Lakes as far as Michilimackinac, and, after questioning the Indians, reported that the Pacific could probably best be reached by way of the Missouri. He proceeded by way of Lake Michigan and the Illinois River to the Mississippi, descended in a small vessel to New Orleans, and, after suffering a shipwreck, went to the island of Santo Domingo, whence, in December, 1722, he returned to France. Subsequently he was sent on various missions by his order, and from 1733 to 1755 collaborated on the *Journal des Trévoux*. He is best known for his *Histoire et description générale de la Nouvelle France avec le journal historique d'un voyage fait dans l'Amérique septentrionale* (1744; Eng. trans. by J. G. Shea, 1865–72), which contains much valuable material. Among his other writings are: *Histoire et description générale du Japon* (1715); *Vie de la mère Marie de l'Incarnation* (1724); *Histoire de l'île espagnole, ou de Saint-Domingue* (1730); and *Histoire du Paraguay* (1756; Eng. trans., 1769).

CHARLOCK. See Mustard.

CHARLOTTE, shär-lōt'. A city and the county seat of Eaton Co., Mich., 18 miles southwest of Lansing, on the Grand Trunk and the Michigan Central railroads (Map: Michigan, E 6). Charlotte contains a Carnegie library. It is of importance as a manufacturing centre, the principal products being furniture, automobiles, scythe swats, ball bats, horse pokes, bridges, and road culverts. There are also grain elevators and grist mills. Settled in 1835, Charlotte was incorporated as a village in 1863 and in 1871 as a city. The government is administered by an annually elected mayor and a council. The city owns and operates the water works. Pop., 1900, 4092; 1910, 4886.

CHARLOTTE, shär'lōt. A city and the county seat of Mecklenburg Co., N. C., 174 miles by rail west by south of Raleigh, on the Southern, the Piedmont and Northern, the Norfolk Southern, and the Seaboard Air-line railroads, and on Sugar Creek (Map: North Carolina, B 2). It is in the gold region of the State, and a branch mint was established here in 1838. It was closed by the breaking out of the Civil War, reopened in 1869, and was made an assay office. The city has two colleges for women, a military institute, a Carnegie library, a library for the colored population, hospitals for white and colored persons, a United States courthouse, and Vance Park. Biddle University (Presbyterian), for colored students, opened

in 1867, is just outside the city limits. Charlotte is an important commercial and industrial centre. There are more than 300 cotton mills situated within 100 miles of the city. Iron, mill supplies, farm machinery, scales, caskets, show cases, leather belting, and clothing are manufactured also. There are in the city and vicinity several electric plants, which furnish power for manufacturing at a very low cost. The government, under a charter of 1866 and subsequent amendments, is vested in a mayor, biennially elected, and a council. There are municipal water works. Pop., 1890, 11,557; 1900, 18,091; 1910, 34,014; 1920, 46,338.

Settled about 1750, Charlotte was incorporated in 1768 and in 1774 was made the county seat. The so-called Mecklenburg Declaration of Independence (q.v.) was adopted here on May 20, 1775, the signers of which are commemorated by a monument. In September, 1780, Lord Cornwallis entered Charlotte and occupied it for several days. He referred to it as a "hornet's nest," and this has since been adopted as the city's emblem. Later in the year General Gates made his headquarters here. The city was the last meeting place of the full Confederate cabinet. Consult W. H. Foote, *Sketches of North Carolina* (New York, 1846).

CHARLOTTE. 1. The daughter of Sir Jasper in Fielding's farce, *The Mock Doctor.* The character was suggested by Lucinde in Molière's *Médecin malgré lui.* 2. The gay fiancée of Cantwell, who later marries Darnley, in Bickerstaffe's *Hypocrite,* suggested by Marianne in Molière's *Tartufe.* 3. The simple wife of Albert, whom Werther loves, in Goethe's *Sorrows of Werther.* 4. The sweetheart of Wrangle in Cibber's comedy, *The Refusal.*

CHARLOTTE AMALIE, shär-lŏt' ȧ-mäl'ē-e. The only town of the island of St. Thomas, in the West Indies (Map: West Indies, F 3). It has a spacious harbor, furnished with a floating dock for ships up to 3000 tons, and is an important coaling station. Pop., 1901, 8540.

CHARLOTTE HARBOR. A shallow inlet on the gulf coast of Florida, extending inland about 25 miles (Map: Florida, F 5). The inner harbor is about 10 miles wide at its widest part. The outer harbor is separated from the Gulf of Mexico by a line of keys which reduces the main entrance to the bay to a width of three-fourths of a mile. Pine Island partly divides the inner from the outer harbor. Wild waterfowl and fish are plentiful.

CHARLOTTENBURG, shär-lŏt'ten-bo͝orĸ (Ger., Charlotte's town). A prosperous town and residential suburb of Berlin in the western outskirts of the city (Map: Prussia, E 2). It is connected with Berlin by street railway, by the Stadtbahn and the Hochbahn (an elevated road). It has numerous educational institutions, including a gymnasium, high school, royal academy of music, royal academy of art, artillery and engineering school, technical academy, physical-technical institute, and a military preparatory school. The Technical Academy is a spacious and noteworthy building, containing statues and busts and a valuable architectural museum. A splendid municipal opera house was opened in 1912. The Schiller Theater and an equestrian statue of Emperor Frederick III are also interesting. The manufacturing interests of the city are important; chief among them is the Royal Porcelain Factory, founded in 1761. There are also iron foundries and manufactures of machinery, glass, pottery, electrical apparatus, dyes, wagons, woodworking machinery, asphalt, beer, paper, leather, and chemicals. Horses from the surrounding territory are marketed here. The palace, the main portion of which was finished by 1699, under Schlüter's direction, for Sophia Charlotte, second wife of Frederick I, consists of a group of buildings, with a garden laid out by the French landscape gardener Le Nôtre. The rococo ornamentations and the porcelain chamber are noteworthy. Emperor Frederick III was confined here during a part of his fatal illness. In the garden is the handsome Doric mausoleum, erected in 1810 by Gentze, according to the designs of Schinkel, containing the tombs of Frederick William III and Queen Louisa, and Emperor William I and Empress Augusta. Pop., 1890, 77,000; 1900, 189,305; 1910, 305,181. Consult Schultz, *Story of Charlottenburg* (Charlottenburg, 1888).

CHARLOTTESVILLE, shär'lŏts-vĭl. A city of Virginia, 182 miles by rail, and direct, 97 miles northwest of Richmond, on the Chesapeake and Ohio and the Southern railroads, and on Rivanna River (Map: Virginia, F 3). It is the seat of the University of Virginia (q.v.), founded by Thomas Jefferson, and of St. Anne's School for Girls, Jefferson School, Miller's Manual Training School, and the University Summer School. It contains also two hospitals and two sanitariums. Monticello, Jefferson's home, is but 3 miles distant, to the southeast. The city has woolen, flour, silk, and planing mills, tanbark, locust-pin, and cigar factories, wine presses, etc., and is in a rich agricultural and fruit-growing region. Settled as early as 1744, Charlottesville was chartered as a city in 1888. The government is administered by a city manager elected by the city council. The water works and gas plant are owned and operated by the municipality. Pop., 1890, 5591; 1910, 6765; 1920, 10,688.

CHARLOTTETOWN, shär'lŏt-toun. Capital of Prince Edward Island, Canada, in Queen's County, situated on the south coast, on Hillsboro Bay, and at the confluence of three rivers (Map: New Brunswick). There is steamship connection with various Dominion ports. A railway and carriage bridge, half a mile long, spans the Hillsboro River east of the city. Charlottetown has a fine harbor. It stands on rising ground and is intersected by wide streets at right angles to each other. The Provincial Government and Dominion buildings, courthouse, Young Men's Christian Association building, Roman Catholic cathedral, public library, city hall, insane hospital, normal school, Prince of Wales College, and St. Dunstan's College are noteworthy features. The industrial establishments include iron foundries, railroad workshops, pork-packing, condensed-milk, woolen factories, etc. Agricultural produce and fish are exported. Charlottetown is the seat of a United States consul. Pop., 1901, 12,080; 1911, 11,203. Charlottetown was founded about 1767, the site having been selected in 1764 by Captain Holland, surveyor-general for eastern Canada. In 1775 the town was looted by two American privateers, an act which was condemned by Washington, who liberated the prisoners and restored their property. Canadian confederation originated at a conference held in 1864 in Charlottetown.

CHARLTON, John (1827–1910). A Canadian statesman. He was born near Caledonia, N. Y., and was educated at Springfield Academy.

He went to Ontario in 1849, was engaged for some years as farmer and merchant, and after 1861 acquired a considerable fortune in the lumber business. He was elected a Liberal member of the House of Commons for North Norfolk in 1872 and represented that constituency for 24 years. He commanded attention in the House and gained a high reputation in the country by his mastery of trade and tariff questions; but an exacting conviction that government should promote private and public morality and assure equal rights led him at times to take a legislative course in which he was in notable conflict with his party and a leader of a vigorous and discontented minority. During the agitation in 1885 and later over the execution of Louis Riel (q.v.) he supported the Conservative Premier, Sir John A. Macdonald. When dissatisfaction was aroused among the Protestant element by the Jesuit Estates Act (see MERCIER, HONORÉ), he was one of 13 members who in 1889 voted for a parliamentary resolution against the act; and among those who adhered to the Equal Rights' party, formed at that time, Charlton was a leader. Mainly through his efforts a measure, commonly known as the Charlton Act, was enacted for the protection of women and girls, in the case of the latter raising the age of consent to 16 years. He was a founder of the Dominion Lord's Day Alliance, an organization established in 1888. In the same year he was appointed chairman of the Ontario Mining Commission. He was a stanch advocate of reciprocity with the United States and in 1897 visited Washington in that behalf. He died at Lynedoch.

CHARM. See INCANTATION; MAGIC.

CHARMES, shärm, FRANCIS (1848–1916). A French editor, born at Aurillac. He was educated at the Collège d'Aurillac and the lycées of Clermont-Ferrand and Poitiers. From 1872 to 1880 and from 1889 to 1907 he was editor of the *Journal des Débats* and was also editor of the *Revue des Deux Mondes* from 1893 to 1907, when he became its manager. He held several offices in the Department of Foreign Affairs, was deputy for Contal in 1881–85 and 1889–98, and senator for Contal in 1900. In 1908 he became a member of the Academy. Besides his literary and political articles in the journals mentioned, he published *Études historiques et diplomatiques* (1892).

CHARMIDES, kär'mi-dēz (Lat., from Gk. Χαρμίδης) (c.450–404 B.C.). A pupil of Socrates, cousin of Critias, and maternal uncle of Plato, who introduces him in one of the *Dialogues.* He was one of the "Thirty Tyrants" at Athens in 404 B.C., but was slain the same year, while fighting against Thrasybulus. Consult Plato, *Charmides,* and Xenophon, *Memorabilia.*

CHARMIDES. One of the dialogues of Plato representing a conversation between Socrates, young Charmides, and two other Athenians on the subject of moderation.

CHARNAY, shär'nâ', CLAUDE JOSEPH DÉSIRÉ (1828–). A French traveler, born in Fleurieux, Rhône. In 1857, under the auspices of the French government, he began a long series of expeditions to Mexico and other parts of the world. With the further assistance of Pierre Lorillard, he in 1880 undertook the exploration and excavation of the ancient cities of Mexico. He made many important discoveries, the chief results of which are set forth in the collection at the Museum of the Trocadéro and in his work *Les anciennes villes du nouveau monde* (1884), of which an English translation appeared in 1887 (*The Ancient Cities of the New World,* by Mesdames Gonino and Conant; introduction by Allen T. Rice). He has also published: *Cités et ruines américaines* (1863), with an atlas; *A travers les forêts vierges* (1890); and *Histoire de l'origine des Indiens qui habitent la Neuvella Espanga selon leurs traditions* (1903).

CHARNEL HOUSE (OF. *charnel, carnel,* ML. *carnale,* charnel, from *caro,* flesh + *house*). A chamber situated in a churchyard or other burying place, in which the bones of the dead which were thrown up by the gravediggers were reverently deposited. The charnel house was generally vaulted in the roof, and was often a building complete in itself, having a chapel or chantry attached to it. In such cases the charnel vault was commonly a crypt under the chapel, and even in churches it was not uncommon for the vault or crypt to be employed as a charnel house.

CHARNISÉ, shär'nē'zā', CHARLES DE MENOU, SEIGNEUR D'AULNAY DE (c.1605–1650). A French proprietor in Acadia. In 1632 he accompanied the party under Isaac de Razilly which settled at La Have for the purpose of recovering the Acadian possessions of France. In 1635 Charnisé commanded an expedition to the Penobscot River, where he conquered the fort which had been built there by the Plymouth colonists, telling its defenders that in the following year he would annex the entire region to the fortieth degree, north latitude. After the death of Razilly (1636) Charnisé succeeded to the command and made Port Royal (Annapolis) the chief settlement of Acadia, then a vast territory embracing what is now New Brunswick and Nova Scotia and afterward extending to the Penobscot. He later captured Fort La Tour, and in 1645 went to France, where he was appointed Governor and Lieutenant General of Acadia by the government of Louis XIV (1647). As soon, however, as the charge of treachery reached the court, Charnisé was dismissed from office and superseded by La Tour. His widow married La Tour in 1653.

CHAR'NOCK, STEPHEN (1628–80). An English Puritan theologian, was born in the parish of St. Catherine Cree-Church, London, where his father was a solicitor. He was educated at Cambridge and at Oxford, and became proctor at the latter when Oliver Cromwell was Chancellor. He went to Ireland as chaplain to Henry Cromwell, Lord Deputy. In 1660 he was silenced by the Act of Uniformity and returned to London, where he preached for 15 years, but without a settled congregation. He was a man of great piety and vast learning. After his death his writings were published, the chief being *On the Excellence and Attributes of God* (1681–82). In 1860 Prof. James McCosh published an edition of Charnock's works, with a life of the author.

CHARN'WOOD FOREST. A forest in the northwestern part of Leicestershire, England. It lies on a gradual rise of ground culminating in Bardon Hill, which is 900 feet high.

CHARNY, COMTE DE. See CHABOT, P.

CHARON, kâ'ron (Lat., from Gk. Χάρων, Etrusc. *Charun*). In classical mythology, the ferryman of the lower world, who conveys to the realm of Hades the souls of the dead that have been duly buried. He does not appear in

Homer or Hesiod, but was early prominent in popular belief and appeared in one of the lost epics, whence Polygnotus introduced him into his great painting of "Odysseus in the Lower World." From the fifth century B.C. Charon appears frequently in literature. He is also often represented on the Athenian white lecythi, vases buried with the dead, where he is depicted as a bearded old man wearing the short tunic and pointed cap of a seaman, in a skiff with a single oar. To pay the fare a small coin (*obolus*) was placed in the mouth of the dead; bodies with coins in the mouth have been found even in Switzerland and Italy. On Etruscan monuments Charon is represented as a demon of death, with bestial face, huge tusks, and pointed ears, carrying snakes or, more commonly, a large hammer. The bodies of fallen gladiators were dragged from the arena by a man disguised as this Etruscan demon. In modern Greece Charon survives as *Charos* or *Charontas*, who, as a black bird of prey or as a winged horseman, bears victims to the world of the dead. Consult Ambrosch, *De Charonte Etrusco* (Breslau, 1837), and Waser, *Charon, Charun, Charos* (Berlin, 1898).

CHARONDAS, kâ-rŏn'dăs (Lat., from Gk. Χαρώνδας). A Greek of the sixth century B.C., born at Catana, in Sicily, and mentioned, with Lycurgus, Solon, Zaleucus, and others, as a famous lawgiver. To him were ascribed the laws of the Chalcidian colonies in Sicily and Italy, praised by Aristotle as very carefully drawn. Certain citations from his works by Stobæus and Diodorus are to be assigned rather to later modifications of his work.

CHA'RON OF LAMP'SACUS (first half of fifth century B.C.). One of the earlier Greek historical writers, known as logographers (q.v.). He composed a history of Persia, from the point of view of Persia's relation to Greece, which probably included the story of the invasion of Xerxes. He wrote also a work called *Horoi*, dealing primarily with Lampsacus. Consult Kreuzer, *Historicorum Græcorum Antiquissimorum Fragmenta;* Müller, *Fragmenta Historicorum Græcorum* (Paris, 1841); Bury, *The Ancient Greek Historians* (New York, 1909).

CHARON'S (kā'ronz) **STAIRCASE** (trans. of Gk. Χαρώνειος κλίμαξ, *Charōneios klimax*). A series of steps which led up to the stage (the acting place) in the Greek theatre, by which "the ghost" made his entrance. Consult Haigh, *The Attic Theatre* (3d ed., Oxford, 1907).

CHARPENTIER, shär'pän'tyā', François Philippe (1734–1817). A French mechanic, engraver, and designer. He was born in Blois and studied engraving in Paris. He invented the aquatint or nitric-acid process in engraving, but sold his secret to Count Caylus. The earliest engravings in aquatint made by him are the following: "Perseus and Andromeda," after Vanloo; "The Decapitation of John the Baptist," after Guercino; and "The Children's Bacchanal," after De Witt. As "royal mechanician" he afterward effected numerous improvements in the construction of lighthouses, war vessels, and firearms.

CHARPENTIER, Gustave (1860–). A French composer, born in Dieuze, Lorraine. He studied at the Paris Conservatory under Massart, Pessard, and Massenet, taking the Grand Prix de Rome in 1887. He wrote numerous songs and orchestral pieces and a symphonic drama, *La vie du poète*, produced at the Grand Opéra in 1892. But the most notable of his works is the opera *Louise*, of which he wrote both words and music, and which was produced in 1898 at the Opéra Comique. The scene is laid in modern Paris (in Montmartre), and the realism and dramatic power of the libretto, as well as the beauty and originality of the music, took Paris by storm and placed Charpentier in the front rank of the French "impressionists." *Louise* found its way into Germany, England, and the United States, meeting with considerable success. *Julien*, produced in 1913 (in the United States in 1914), was a distinct disappointment. Three other operas, *Marie*, *Orphée*, *Tête rouge*, have not yet been produced. In 1912 Charpentier was elected to a chair in the Paris Academy of Fine Arts.

CHARPENTIER, Johann Friedrich Wilhelm Toussaint (1738–1805). A German mining engineer. He was born in Dresden, studied law and mathematics at the University of Leipzig, and in 1766 was made instructor in mathematics at the Mining School of Freiberg, where he became interested in mining methods and metallurgy. As the introducer into Germany of the processes of amalgamation employed in Hungary and of various other improvements, Charpentier takes high rank among the German metallurgists of the eighteenth century. His scientific methods of mining as well as his geognostic investigations greatly stimulated the development of these branches in Germany. He wrote: *Mineralogische Geographie der kursächsischen Lande* (1778); *Beodachtungen über die Langerstätten der Erze hauptsächlich aus den sächsischen Gebirgen* (1799); *Beitrage zur geognostischen Kenntnis des Reisengebirges schlesischen Anteils* (1804).

CHARPENTIER, Louis Eugène (1811–90). A French historical and genre painter. He was born in Paris and studied there under Gérard and Cogniet. He exhibited first in the Salon of 1831, "Bivouac of Cuirassiers," and afterward became known entirely as a painter of battle pictures in a large panoramic style with great attention to detail. In Versailles, where he became professor of design in 1876, there are several pictures by him—among them "The Battle of Moscow," "An Episode of the Siege of Antwerp," and "The Battle of Tchernaïa."

CHARPENTIER, Marc Antoine (1634–1704). A French composer, born in Paris. He studied under Carissimi in Rome and became chapelmaster to the Dauphin under Louis XIV. At the time of his death he was chapelmaster of the Sainte-Chapelle. He wrote only two operas, *Acis et Galathée* (1678) and *Médée* (1693). His fame rests principally upon his oratorios, of which he wrote 18 in the style of his teacher. One of these, *Le reniement de St. Pierre*, was revived with great success in Paris in 1903. Besides these he wrote 8 masses, 30 Psalms, 6 cantatas, numerous smaller sacred compositions, and some instrumental pieces.

CHARPIE, shär'pē (Fr., from p.p. of OF. *charpir*, to pluck, from Lat. *carpere*, to seize). Ravelings of linen; lint. They were used by surgeons as a dressing for discharging wounds, ulcers, etc., before sterilized gauze came into vogue.

CHARRAS, shà'ràs', Jean Baptiste Adolphe (1810–65). A French military writer, born in Pfalzburg, Lorraine. He entered the artillery and engineering school in Metz, became an officer of artillery, served in Algeria, and in 1848 was appointed a lieutenant colonel and Undersecre-

tary of State in the Ministry of War. In the Assembly of 1848 and of 1849 he vigorously opposed the politics of Louis Napoleon and was banished after the coup d'état, thereafter residing in Belgium, Holland, and Switzerland. He wrote two valuable works, *Histoire de la campagne de 1815: Waterloo* (1858), and an incomplete *Histoire de la guerre de 1813* (1866).

CHARRETTE, shà'rĕt', THE KNIGHT OF THE (trans. of Fr. *Chevalier de la Charrette*). A contemptuous nickname earned by Lancelot in a French variation of the Arthurian legends. According to this version the knight, while galloping to the rescue of Guinevere, fell from his horse and was brought home in a cart (*charrette*). A modernized edition of Chrestien de Troyes's *Roman de la Charrette* appeared in Rheims, 1849, under the direction of Tarbe.

CHARRIERE, shà'ryâr', AGNÈS ISABELLE EMILE DE SAINT-HYACINTHE DE (1740–1805). A Swiss writer. She was born in Utrecht, the daughter of a Dutch nobleman. In 1771 she married M. de Charrière de Penthaz, a Swiss who had been her brother's teacher, and went to live at Colombier near Neuchâtel. As a writer she was entirely French in spirit. Under the pseudonym Abbé de La Tour, she published *Lettres neuchâteloises* (1784); *Caliste, ou lettres écrites de Lausanne* (1788)—her masterpiece—and *Les trois femmes* (1798). She also wrote some plays. She was on terms of close friendship with Madame de Staël and Benjamin Constant and was well known as a brilliant and beautiful woman.

CHARRON, shà'rŏN', PIERRE (1541–1603). A French theologian and philosopher. He was one of the 25 children of a bookseller of Paris. He practiced law for a time in Paris, but, not having immediate success, he studied theology and rose to eminence as a preacher. In Bordeaux he formed a short but important friendship with Montaigne, who, on his death in 1592, requested Charron to bear the arms of the Montaigne family. In 1594 Charron published *Traité des trois vérités*, in which he dogmatically defended the Roman Catholic church. This was followed by a book of sermons, and in 1604 came his most remarkable work, *Traité de la sagesse*, in which he expressed skepticism with regard to science, but asserted the competence of reason to construct an adequate system of morality. Consult Liebscher, *Charron und sein Werk: De la sagesse* (Leipzig, 1890), and Vinet, *Moralistes de 16e et 17e siècles* (1904).

CHARRUA, chär-rōō'à. A savage and warlike tribe formerly roving, without fixed homes, over all of modern Uruguay and somewhat beyond that. They were of dark complexion and heavily built, fought on horseback, and used the bolas. They had the custom of cutting off a finger joint on the death of a relative. They are now practically extinct. Their language, spoken also by the Bohanes, Chanes, Guenoas, Martidanes, Minuanes, and Yaros, constituted a distinct stock. According to Arâujo, "the last of the Charrûas," on exhibition in Paris in 1830, died there some time afterward. The Uruguayan "Gauchos" have a good deal of Charruan blood. Consult the article by Chamberlain on the Charruan stock in *American Anthropologist*, N. S., vol. xiii, pp. 468–471 (1911) and references there cited; also *Rev. de la Univ. de Buenos Aires*, vol. xxiv, pp. 231–237 (1913).

CHART (Fr. *charte*, charter, Lat. *charta*, paper, from Gk. χάρτη, *chartē*, paper). A marine or hydrographic map, exhibiting a portion of a sea or other body of water, with the islands, adjacent coasts, soundings, currents, etc. (See MAP.) Charts are made of convenient size and scale for the purpose desired and are usually constructed on the principle of Mercator's projection; charts of the oceans on the gnomonic projection are, however, published by the Hydrographic Office of the United States Navy for the convenience of navigators who wish to follow great-circle courses; and the coast and harbor charts of the United States, published by the United States Coast and Geodetic Survey, are on the polyconic projection. Charts are constructed with more accuracy than ordinary maps, and efforts are made to embody in them all the information possible. The meridians and parallels of latitude are drawn at convenient intervals, and on harbor charts the exact geographical position of some datum point is given. One or more compass roses (i.e., plans similar to the face of a compass card) are engraved in the chart where most needed, or where they will not interfere with soundings or other matters, and these show the magnetic variation, while the annual change is recorded in a note. In the case of harbor charts the rise and fall of the tide and lunitidal interval are given; this is important when the tidal range is considerable, for the depths, or soundings, recorded are based upon some particular state of the tide, usually that of mean low water. Shoals and shallow waters are indicated by dotted shading, or stippled tint, in order that their presence may more readily be noticed, and rocks are marked by crosses or other conventional signs. The soundings are expressed in fathoms or in feet, whichever will best serve in the particular locality, and a note under the title states which is used. The character of the bottom is indicated by symbols, giving the kind of material (sand, mud, rock) and its hardness, fineness, color, etc.

Lighthouses, buoys, beacons, and other aids to navigation are carefully shown in their proper position; and, when desirable to do so, the proper courses for entering or leaving a port or channel are indicated by broken lines, alongside which the compass courses are printed. The depths and coast line in nearly all parts of the world are constantly changing, as are the lighthouses, buoys, and aids to navigation. This requires unceasing watchfulness on the part of chart-issuing offices, and the correction of charts constitutes more than half the expense connected with their production and issue. Charts already printed and on the shelves of the issuing office are corrected by hand, several draftsmen being constantly engaged in the work. If, however, the correction in this manner takes more than a few minutes, the copies on the shelves are destroyed and a new edition printed with the correction embodied in the engraving. The sources of information for corrections are the reports from men of war or merchant ships, from lighthouse boards, inspectors of harbors, channels, and waterways, new surveys, and the like. These are embodied in *Notices to Mariners* and published at short intervals, usually once a week. The information is arranged in the most convenient manner possible for the use of navigators, the number of each chart affected by a note being stated. In addition to this, the notices give a list of charts of which new edi-

tions have been published or which have been extensively corrected.

For purposes of navigation the character of the projection (i.e., the plan by which the curved surface of the earth is represented on a plane) is most important. The Mercator projection is most used and decidedly the most popular. The meridians are rectilinear and parallel, and this enables the navigator to lay down the compass course as a straight line; and charts on this projection of the same scale and latitude may be joined at the edges. Neither of these important characteristics is possessed by the polyconic, which is best suited to the delineation of small areas such as harbors of moderate extent or certain types of ocean charts. The line of sight and the great-circle course are nearly straight lines on a polyconic chart, and areas and shapes near the central meridian are undistorted. The saving of distance through following great-circle arcs is very slight except on long voyages, and the conditions of average wind and weather are likely to reduce the value of the saving even then, because the great-circle arc, when it differs from the rhumb line (q.v.), always lies on the polar (and therefore usually the colder and stormier) side of it. Whether it is desirable to follow a great circle or not can readily be determined by comparing the course as laid down on a great-circle chart (gnomonic projection) with a wind, weather, and current chart, such as the pilot chart issued by the Hydrographic Office of the United States Navy. See PILOT CHART.

Charts are now chiefly printed from engraved plates (copper, except in France, where many soft steel plates are used), for various reasons, the principle of which is that it facilitates the introduction of new matter in certain parts without the necessity of reproducing the whole. To effect the correction the plate is turned face downward on a smooth anvil or hard surface, and the area to be reëngraved smoothed out and the metal brought up flush with the general surface of the plate by beating on the back over the predetermined area with a round-faced hammer. Preliminary charts, and others of temporary interest, of which the details do not change, are largely produced by photolithography. With this process tough, flexible paper cannot be satisfactorily used, and if a photolithographic chart is to be much handled it requires backing with cloth.

As already stated, there are in the United States two chart-making offices, the Hydrographic Office of the Navy, and the Coast Survey, the latter publishing charts (about 800) of the United States coast only; and the former, charts (about 2000) of the Great Lakes and of foreign territory and seas. The main office of each of these establishments is in Washington, but for the purpose of gathering and disseminating information of service to navigators, the Hydrographic Office has branches in all the principal seaports of the United States and several on the Great Lakes. It is likely that additional ones will soon be opened at Manila and Honolulu, with observing stations at Guam and Tutuila, when these can be reached by telegraph. In Great Britain the Hydrographic Office is under the Admiralty. Charts are also published by nearly all the European Powers, and by Brazil, Chile, and Japan, and there are several private makers who issue charts of special localities. The price of government charts is very low, barely sufficient to cover the cost of printing and paper.

CHARTA, kär'tȧ, MAGNA. See MAGNA CHARTA.

CHARTE, shärt (Fr., charter, from Lat. *charta*, paper). A French term, used especially to designate the constitution or organic law granted by Louis XVIII on his restoration in 1814. It was formerly written *chartre*. The word is an old one and applied to a large class of legal documents. Among the best known of the older chartes was the *Charte Normande* or *aux Normands*, containing the privileges granted to the Normans (1314–15) by Louis X. The Trésor des Chartes of France is one of the important bureaus of the national archives. The Ecole des Chartes in Paris is the leading school of the world for instruction in the study of historical documents. The charte of 1814 has always been considered the fundamental law of constitutional monarchy when that form of government has existed in France. It was an act of royal grace and not in any sense a popular constitution or even a contract between king and people. This fact eventually led to the revolution of 1830. The charte sworn to on the 29th of August of that year by King Louis Philippe explicitly recognized the sovereignty of the people. This document, with some modifications, remained in force till the revolution of 1848. Consult Floquet, *Charte aux Normands, avec ses confirmations* (Caen, 1788).

CHARTER (OF. *chartre*, from Lat. *chartula*, dim. of *charta* from Gk. χάρτη, *chartē*, paper). A formal writing by which property is granted or rights and privileges are conferred. The term was formerly applied to a written conveyance of land, and property held under such an instrument was, in Anglo-Saxon law, called "charter-land," or "bookland." In this sense the word has given way to "deed."

The term "charter" is used to describe a grant of land, franchises, or other privileges by the state, or a solemn guaranty by the sovereign of popular rights. *Magna Charta*, or the great charter issued by King John in 1215, is one of the chief constitutional documents of Great Britain. It has been the custom of the British government for centuries to grant political charters to some of its colonies.

In American Colonial history grants of franchise, governmental privileges, and estates to companies for the purpose of establishing colonies, to the inhabitants of Colonies in general, or to individual proprietors, were embodied in charters. Of the first sort were the charters of Massachusetts Bay, granted by Charles I (1629), and the charter of Georgia, granted by George II (1732). Of the second sort was the charter of Connecticut granted to the people of the Colony by Charles II (1662). Of the third sort were the original charter of New York, granted to the Duke of York by Charles II (1664), and the charter of Maryland, granted to Lord Baltimore by Charles I (1632). Some of the Colonial municipal charters remain in force to the present day, but the general provisions of charters are of little use in the United States, as corporations are now created by the several legislatures or by Congress. Blackstone describes such charter governments as "civil corporations, with the power of making by-laws for their own interior regulations, not contrary to the laws of England; and with such rights

and authorities as are specially given them in their several charters of incorporation." Judge Story criticizes Blackstone's view, declaring that the charter Colonies of America "were great political establishments, possessing the general powers of government and rights of sovereignty, dependent indeed on the realm of England, but still possessing within their own territorial limits the general powers of legislation and taxation."

None of the British colonies are sovereign, their legislative authority being theoretically subordinate to the Imperial Parliament and government of Great Britain, which latter has a power of disallowance over the colonial legislation, exercisable within a limited period. This power has not been exercised as regards the Dominion of Canada for upward of 40 years. After the expiration of the time within which they are subject to disallowance, acts of the colonial legislatures possessing responsible government become just as much acts of the King as the statutes of the Parliament of Great Britain and Ireland.

In modern municipal law the term "charter" is most frequently used to denote the grant of a *franchise* by the sovereign power to a corporation. According to Blackstone, "the king's consent is absolutely necessary to the erection of any corporation, either expressly or impliedly given."

In the United States corporations are chartered, as a rule, by legislative act—either by a special statute which confers upon a particular corporation the special powers and privileges named therein, or under a general law which provides the method to be pursued by persons who would organize a corporation. In the latter case the articles of association, taken in connection with the provisions of the general statute, constitute the charter. If the corporation is a public one, such as a city, county, or town, its charter may be changed at will by the Legislature. Such a corporation is a mere agency of the State for the exercise of governmental powers within a particular area. It has no vested right to any of its powers or franchises. Its charter "is not a contract, but a law for the public good." On the other hand, the charter of a private corporation is a contract between the State and the corporators. As such, it is protected from repeal or modification by the provision of the Federal Constitution which declares that "no State shall . . . pass any . . . law impairing the obligation of contracts" (Art. I, Sec. 10). The State granting the charter may, however, reserve the right to alter, amend, or repeal it. Consult: MacDonald, *Select Charters of American History, 1606–1775* (New York, 1904); Dicey, *Lectures Introductory to the Study of the Law of the English Constitution* (5th ed., London, 1912); Cooley, *General Principles of Constitutional Law in the United States*. See CORPORATION.

CHAR'TERHOUSE' (a corruption of Fr. *Chartreuse*). The name applied in England to Carthusian monasteries. The first was founded at Witham, on the borders of Selwood Forest, in 1181, by King Henry II in fulfillment of a vow made on the occasion of his memorable penance at the tomb of St. Thomas of Canterbury. The second was at Hinton in Somersetshire (1222); the third at Beauvale, Nottinghamshire (1343); the fourth, and most famous, to which the name is restricted in general usage, was situated in London. It was endowed by the will of Michael de Northburgh, Bishop of London, 1355–61, and the monks took possession of it in 1371. Its history is not of much general interest until the reign of Henry VIII, when in 1535 and the following years a number of the monks suffered death for refusing to acknowledge the royal supremacy in spiritual matters, the prior, John Houghton, being the first martyr for the old faith under the Reformation. The monastery was dissolved in 1538. The house passed through various hands, returning to the crown under Mary by the attainder of the Duke of Northumberland, and under Elizabeth by that of the Duke of Norfolk. The latter's son, the Earl of Suffolk, sold it in 1611 for £13,000 to Sir Thomas Sutton, whose coal lands in Durham had made him one of the richest Englishmen of his day. He richly endowed it as a hospital or almshouse for poor old men and a free grammar school, "to feed, clothe, and educate a certain number of poor boys, who without such assistance would be likely to go untaught." The "poor brethren" were 80 in number, none being admitted under 50 years of age; they must be bachelors and members of the Church of England. Each had a separate apartment, a share of attendance from domestics, and ample though plain diet, and an allowance of about £26 a year for clothes and pocket money. This part of the institution is best known by the famous description of it given in *The Newcomes* by Thackeray, who was himself educated at Charterhouse. The school was not long limited to the 40 foundation scholars, and grew until at the present time it ranks among the great public schools of England. Among the eminent men who have been educated here are Blackstone, Addison, Steele, John Wesley, and George Grote. In 1872, the old location amid crowded streets being thought unhealthful, the school removed to Godalming, in Surrey, 30 miles from London. The old premises were sold to the Merchant Taylors' School, which is now installed here in handsome new school buildings erected in 1875. The quaint old hospital and chapel, the latter containing Sutton's tomb, still remain as the home of aged pensioners. Consult: Hendricks, *The London Charterhouse* (London, 1889); Haig Brown, *Charterhouse, Past and Present* (Godalming, 1879); Eardley-Wilmot and Streatfield, *Charterhouse, Old and New* (London, 1894); Tod, *Charterhouse* (London, 1900); Doreau, *Henri VIII et les martyrs de la Chartreuse de Londres* (Paris, 1891); Wilmot and Streatfield, *Charterhouse Old and New*, with etchings by D. Y. Cameron (Stirling, Scotland, 1910); Taylor, *Charterhouse of London* (New York, 1912); Champney, "Charterhouse," in *Architectural Review*, vol. xi (1902).

CHAR'TERIS, ARCHIBALD HAMILTON (1835–1908). A Scottish clergyman and educator. He was born in Wamphray, educated in Edinburgh, Tübingen, and Bonn, and in 1863 was appointed minister of the Park Parish, Glasgow. He was professor of biblical criticism at Edinburgh from 1868 to 1898, when he became professor emeritus. He was a royal chaplain in 1869, and in 1892 moderator of the General Assembly of the Church of Scotland. In 1901 he was appointed chaplain in ordinary to the King in Scotland. His publications include a *Life of Professor James Robertson* (1863), *Canonicity* (1881), *A Faithful Churchman* (1897), and *The Church of Christ* (1905).

CHARTER OAK. A large tree that stood

in Hartford, Conn., until blown down, August, 1856, when its age was computed to be nearly 1000 years. The tradition relating to it is as follows: When Sir Edmund Andros was appointed Governor-General of New England, he came to Hartford in 1687 to receive the Colonial charter. This the colonists were loath to surrender, but, appearing to submit, carried it to the council chamber, where during the debate the lights were extinguished and in the ensuing confusion the document was carried from the room to its subsequent hiding place in the hollow of the tree. Here it remained until 1689, when the deposition of Andros made further concealment unnecessary.

CHARTER PARTY (Fr. *charte partie*, divided deed, one part being given to each party concerned; cf. *indenture*). In maritime law, a contract under seal by the owner or master of a ship, to carry a complete cargo of goods or to furnish a vessel or part of a vessel for that purpose. It is one form of the contract of *affreightment* (q.v.), the other being the familiar *bill of lading* (q.v.), which is employed when goods are shipped to form only a part of an intended cargo. Such a charter may operate as a lease of the ship itself, which thereupon passes under the control of the charterer; or, more commonly, it confers upon the shipper the right to have his entire cargo conveyed in the chartered vessel, in which case the charterer acquires no property right in the ship, nor any voice in its management. In the latter form of charter party the master or owner of the vessel occupies the position of a common carrier (q.v.); but where the charter transfers the possession and control of the ship, the master is the agent of the charterer, who becomes responsible for his acts and for those of the crew, and who, in the event of the chartered ship's earning salvage, becomes entitled to the salvage award.

The ordinary charter party describes the parties, the ship, and the voyage, stipulates that the ship is seaworthy, and will receive the cargo and perform the voyage promptly, and notes those perils of the sea for which the master and shipowner will not be responsible. On the part of the freighter, it stipulates to load and unload within a given time, with an allowance of so many lay or running days for loading and unloading the cargo, and the rate and time of payment of the freightage, and date of commencement of demurrage. Consult Scrutton, *Contracts of Affreightment as Expressed in Charter Parties and Bills of Lading* (4th ed., London, 1899).

CHARTIER, shär'tyā', Alain (c.1390–c. 1440). A French poet and diplomatist of very great literary influence in the fifteenth century, but since then almost forgotten save for the famous kiss bestowed—as legend will have it, in spite of chronology's proofs to the contrary—by Margaret of Scotland, wife of Louis the Dauphin, afterward Louis XI, on the lips of the sleeping poet, who is said to have been the ugliest man of his day. He studied in Paris, served Charles VI in important negotiations, and Charles VII as notary and financial secretary, as well as on a mission to Scotland. That he was Archdeacon of Paris, as asserted in an eighteenth-century epitaph and as generally believed, is, like the story of the kiss, proved false by chronology. Passages of his *Bréviaire des Seigneurs* were set to be learned by heart by court pages; Marot and Saint-Gelais, poets of the second following generation, praise him warmly; the English Lydgate studied and imitated him. His poems are mainly of lovers' controversy, but his *Livre des quatre dames* and *Le quadrilogue invectif* (1422) were evoked by the disasters of Agincourt and show a fine patriotic spirit. His *Lay de la belle dame sans merci* suggested at least a title to Keats. His work shows a boldness and freedom of thought that foreshadow the Renaissance. His works (Paris, 1617) were edited by A. Duchesne. Consult Delaunay, *Etude sur Alain Chartier* (with extracts from his writings, Paris, 1876), and Joret-Desclosières, *Alain Chartier* (1897).

CHARTISM. A Radical reform movement in England which reached its culmination in the period from 1838 to 1848. Its name originated in the *National* or *People's Charter*, which embodied the scheme of reform under six specific titles: (1) the right of voting to every male and every naturalized foreigner resident in the kingdom for more than two years, who should be 21 years of age, of sound mind, and unconvicted of crime; (2) equal electoral districts; (3) vote by ballot; (4) annual parliaments; (5) no property qualification for members; (6) payment of members of Parliament for their services. The Reform Bill of 1832 had failed to satisfy the working classes, and, after a period of terrible commercial depression and want, an unsuccessful attempt was made to institute a more thoroughgoing reform. Upon the failure of this movement six members of Parliament and six workingmen drew up the charter, which was hailed by large numbers of persons with enthusiasm. Immense meetings were held throughout the country, many of them attended by 200,000 or 300,000 people. Fiery orators fanned the excitement, and physical force was spoken of as the only means of obtaining justice. The more moderate were overruled by the fanatics, and the people, aroused by suffering, were easily wrought into frenzy by those who assumed direction. The Chartist propaganda was vigorously carried on by Feargus O'Connor in the *Northern Star*, an organ which attained a circulation of over 50,000. A body calling itself the National Convention, elected by the Chartists throughout the kingdom, commenced sitting in Birmingham in May, 1839. It proposed various means of coercing the legislature into submission, recommending a run on the savings banks for gold, abstinence from excisable articles, exclusive dealing, and, as a last resort, universal cessation from labor. During its sitting a collision took place with the military in Birmingham. Public meetings were forbidden, and alarming excesses were committed by the irritated mob. In June, 1839, a petition in favor of the charter was presented to the House of Commons, ostensibly signed by 1,280,000 persons. The House refused to name a day for its consideration, and the National Convention retaliated by advising the people to cease from work throughout the country. This advice was not followed, but the disturbance increased, and in November an outbreak took place in Newport, which resulted in the death of 10 persons and the wounding of great numbers. In 1842 great riots took place in the northern and midland districts, not directly caused by the Chartists, but encouraged and aided by them after the disturbances began. In the same year an attempt was made by Joseph Sturge to unite all friends of popular enfranchisement in a complete

suffrage union, but he succeeded only in dividing their ranks. In 1848 the turmoil in France created great excitement in England, and much anxiety was felt lest an armed attempt should be made to subvert the institutions of the country. Two hundred thousand special constables were enrolled in London alone, among which number was the subsequent Emperor, Napoleon III.

Adopting the language of Charles I, the opponents of Chartism denied that men *as such* had a right to vote; their right was to be well governed, and universal suffrage was more likely to destroy society than to confer happiness or insure justice. From 1848 Chartism as an organized movement disappeared, owing to the improvement in the circumstances of the people which followed the repeal of the corn laws. The Chartist leaders included Feargus O'Connor, Attwood, Lovett, Stephens, Vincent, Ernest Jones, and Thomas Cooper. Consult: *Life of Thomas Cooper: An Autobiography* (London, 1880); Carlyle, *Chartism* (London, 1839); Kingsley, *Alton Locke* (London, 1856); Gammage, *History of the Chartist Movement* (London, 1894); Dierlamm, *Die Flugschriftenlitteratur der Chartistinbewegung und ihr Widerhall in der öffentlichen Meinung* (Leipzig, 1909); Dolléans, *Le chartisme* (Paris, 1912).

CHARTOPHYLAX. See CHARTULARY.

CHARTRAN, shär'trăn', THÉOBALD (1849–1907). A French portrait and historical painter. He was born in Besançon, studied under Cabanel at the Ecole des Beaux-Arts, winning the Prix de Rome in 1877. Since 1872 he had exhibited at the Salon a series of historical pictures, such as "Joan of Arc" and "Angelica and Roger," which had attracted much attention. While in Rome he painted "The Vision of St. Francis of Assisi" (Museum, Carcasonne) and other religious pictures. After his return to Paris in 1883 he devoted himself almost exclusively to portrait painting, in which line he achieved great celebrity. Towards the end of his life he passed a part of each year in New York, and many members of the social and political world of America were among his sitters. Some of his most celebrated portraits are those of Mounet Sully as Hamlet, Sarah Bernhardt, Leo XIII, President Carnot, President Roosevelt (1903), Mrs. Roosevelt, and Miss Alice Roosevelt, President McKinley, Admiral Dewey, Secretaries Root and Knox, Andrew Carnegie, and Cardinal Gibbons. His "Signing of the Peace Protocol at Washington," an episode of the Spanish-American War, was presented to the United States government by Mr. H. C. Frick of Pittsburgh. His portraits are distinguished by able technique, refined manner, and subtle characterization. He also painted decorations for the Sorbonne, the Hôtel de Ville, and other public buildings in France. Consult Jules Martin, *Nos peintres et sculpteurs* (Paris, 1897).

CHARTRE. See CHARTE.

CHARTRES, shär'tr' (ML. *Carnotum*, Lat. *Carnutum civitas*, Gall. *Autricum*). A city of France, capital of the Department of Eure-et-Loir, and seat of a bishopric, 47 miles southwest of Paris (Map: France, N., G 4). It is built partly at the base and partly on the declivity of a hill overlooking the river Eure, thus consisting of an upper and a lower town connected by streets almost inaccessible to carriages. The upper town has some good streets, but the lower is ill built. Many of the houses are quaintly gabled, timbered buildings. The cathedral of Notre Dame, one of the largest and most imposing cathedrals in Europe, with lofty spires, one of them towering to a height of 413 feet, crowns the top of the hill. It has numerous stained-glass windows, the workmanship of which is unsurpassed, if indeed equaled, elsewhere in France, many of them dating from the thirteenth century. It is also famous for its sculptures. This splendid edifice was the source of inspiration for James Russell Lowell's poem "The Cathedral." The church of Saint-Pierre and the obelisk to the memory of General Marceau are also objects of interest. Chartres has manufactures of woolens, hosiery, and leather, and is the great cattle and grain market of the fertile plain of Beauce and the department. It has a chamber of commerce and a branch of the Bank of France. It has two teachers' colleges, a lyceum, a library of 127,409 printed volumes, a museum, and a botanical garden. Pop. (commune), 1901, 23,431; 1911, 24,103. The city, founded by the Carnutes, is one of the most ancient of France. In mediæval times it was the capital of the Province of Beauce. On several occasions it was besieged by Normans and Burgundians. Francis I conferred upon it the dignity of a duchy, and the title since 1661 has been connected with the Orléans family. Chartres was taken by the English in 1417 and recovered in 1432. It was captured by Henry IV in 1591 and witnessed his coronation in 1594. In 1870 it was occupied by the Germans and formed their base of operations against the army of the Loire. Consult: Doyen, *Histoire de Chartres* (2 vols., Chartres, 1786); Duval, *La cathédrale de Chartres* (Paris, 1867); Joanne, *Chartres* (Paris, 1887); Bulteau, *Monographie de la cathédrale de Chartres* (1887); Plerval, *Chartres, sa cathédrale, ses monuments* (1896); Massé, *Chartres: Its Cathedral and Churches;* Adams, *Mont Saint Michel and Chartres* (Boston, 1913).

CHARTRES, ROBERT PHILIPPE LOUIS EUGÈNE FERDINAND D'ORLÉANS, DUKE OF (1840–1910). A French soldier, the second son of the Duke of Orleans (died 1842), and the grandson of Louis Philippe. He was born in Paris, but when only eight years of age was driven into exile by the Revolution of 1848, and subsequently lived in Germany and England until 1858, when he entered the military school in Turin, Italy. In 1859 he served in the campaign against Austria, and in 1861 went to America with his eldest brother Louis, Count of Paris (q.v.), entered the Federal army, and served on General McClellan's staff during the Peninsular campaign. He returned to England in 1863 and there, in the following year, married his cousin, the eldest daughter of the Prince de Joinville. After the revolution of Sept. 4, 1870, in France, he served for two years in General Chanzy's army under the pseudonym of "Robert le Fort" and before the close of the war had risen successively to the ranks of captain and chief of squadron. He became chief of squadron in the Chasseurs d'Afrique, under his own name, in 1870, served in Algeria, and was appointed colonel of chasseurs in 1878, but in 1883 was suspended from the active service. In 1886 his name was stricken from the army list by a law excluding members of royal families from serving in the army or the navy. He published *Souvenirs de voyages* (1869).

CHARTREUSE, shär'trēz'. A liqueur, named

from the fact that it was made at the Carthusian monastery, La Grande Chartreuse, but when the Carthusian monks were driven out of France in 1903, the secret of its preparation was taken with them to Tarragon, Spain, where it is now prepared. The formula for the preparation is said to be known only to the Father Superior of the order. Three qualities are made—green, yellow, and white. Chartreuse is said to be a most complex product, resulting from the maceration and distillation of balm leaves and tops as a principal ingredient, with orange peel, dried hyssop tops, peppermint, wormwood, angelica seed and root, cinnamon, mace, cloves, Tonquin beans, *Calamus aromaticus*, and cardamoms.

CHARTREUSE, La Grande. A celebrated monastery in France, near Grenoble, in the wild and romantic valley of the Guiers, 3205 feet above the sea. It owed its origin to St. Bruno, the founder of the Carthusian Order, which took its name from a neighboring hamlet. (See Carthusians.) The convent building is a huge structure of no architectural beauty, dating mostly from 1676. The whole neighborhood at one time belonged to the monks, but they were despoiled by the Revolution. At Fourvoire, about 4 miles down the valley, they manufactured the celebrated liqueur which took its name from the monastery. In accordance with the Law of Associations of 1901, dealing with the control of religious congregations, the monks applied to the government for legal authorization. This was refused, and in 1903 the members of the order were expelled from the country and sought refuge in Spain, Italy, and Switzerland.

CHARTREUSE DE PARME, de pärm, La. The title of a French novel (1839), by Stendhal (Henri Beyle), presenting an admirable picture of life at one of the petty courts of Italy after the downfall of Napoleon.

CHARTULARY, kär'tû-lā-rĭ (Lat. *chartularia*, from *charta*, a paper). A collection of charters. So soon as any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, obvious considerations of convenience and safety would suggest the advantage of having them classified and copied into a book or roll. Such book or roll has generally received the name of a chartulary. Mabillon traces chartularies in France as far back as the tenth century, and some antiquarians think that chartularies were compiled even still earlier. But it was not until the twelfth and thirteenth centuries that chartularies became common. They were kept not only by all kinds of religious and civil corporations, but even by private families. Many of them have been printed. For the English reprints, see Grass, *Sources and Literature of English History* (London, 1900). The name "chartulary" was also applied in western Europe to a registrar or keeper of records, who was known as "chartophylax" in the Eastern church and empire.

CHARYBDIS, kà-rĭb'dĭs. See Scylla and Charybdis.

CHASE, Frederick Lincoln (1865–). An American astronomer, born at Boulder, Colo. He was educated at the University of Colorado and at Yale University. He became assistant astronomer in 1891 and acting director in 1910 of the Yale Observatory. Besides articles in the *Astronomical Journal*, he wrote "Heliometer Triangulation of the Victoria Comparison Stars" in *Annals of the Cape Observatory* (1897); and "Triangulation of the Principal Stars of the Cluster in Coma Berenices" (1896), "Parallax Investigations on 163 Stars mainly of Large Proper Motion" (1906), and "Parallax Investigations on 41 Southern Stars mainly of Large Proper Motion" (1912) in the *Yale University Observatory Series*.

CHASE, George (1849–). An American law teacher and writer. He was born in Portland, Me., graduated at Yale in 1870 and at the Columbia Law School in 1873. He became assistant professor of municipal law at Columbia in 1875 and in 1878 professor of criminal law, torts, and procedure. In 1891 he organized and became the first dean of the New York Law School. He edited Chase's *Blackstone's Commentaries* (1876); Stephen's *Digest of the Law of Evidence* (1886); Johnson's *Ready Legal Adviser* (1881); *Leading Cases upon the Law of Torts* (1904); *Chase's Pocket Code* (1911).

CHASE, Philander (1775–1852). A Protestant Episcopal bishop and educator. He was born in Cornish, N. H., graduated at Dartmouth in 1795, and was ordained a deacon of the Protestant Episcopal church in 1798. He labored as a missionary in western New York and in 1811 became rector of Christ's Church, Hartford, Conn. In 1817 he went to Ohio, where two years later he laid the foundation of Kenyon College and Gambier Theological Seminary, of which he was first president. In 1835 he became Bishop of Illinois, where he was instrumental in founding Jubilee College, at Robin's Nest, and in 1843 he became the presiding Bishop of the church. Among his works are: *A Plea for the West* (1826); *The Star in the West, or Kenyon College* (1828); *Defense of Kenyon College* (1831); *A Plea for Jubilee* (1835); *Reminiscences* (1848).

CHASE, Pliny Earle (1820–86). An American scientist. He was born in Worcester, Mass., and educated at Harvard University, graduating in 1839. He engaged in teaching and business in Philadelphia until 1871, when he became professor of logic and philosophy in Haverford College. He investigated many problems in physics and celestial mechanics and was the author of *Elements of Meteorology* (1884). For an investigation on gravity he received the Magellanic gold medal of the American Philosophical Society in 1864 and was a vice president of this organization as well as a member of many scientific societies, both European and American.

CHASE, Salmon Portland (1808–73). An American statesman. He was born in Cornish, N. H., Jan. 13, 1808, and was a nephew of Bishop Chase, who supervised his earlier education in Ohio. He graduated at Dartmouth College in 1826, opened a school for boys in Washington, D. C., where he studied law under William Wirt; was admitted to the bar in 1829, and began to practice in Ohio, where almost his earliest work was the preparation of an edition of the statutes of Ohio with annotations, and a sketch of the history of the State. This work assisted him in gaining practice, and in 1834 he was appointed solicitor in Cincinnati for the Bank of the United States. His first effort in a cause touching slavery was in defense (1837) of a colored woman claimed as a fugitive and of James G. Birney (q.v.) for harboring her. This was the celebrated Matilda case. He

maintained that the Fugitive Slave Law (q.v.) of 1793 was void, because unwarranted by the Federal Constitution, and argued that slavery was a local institution; and that, as the slave had been brought into a free State by her master, she was in fact free. In 1847, in the Van Zandt case, before the United States Supreme Court, he took the ground that under the Ordinance of 1787 (q.v.), no fugitive from service could be reclaimed from Ohio unless he had escaped from one of the original 13 States; that it was the understanding of the framers of the Constitution that slavery was to be left to the disposal of the several States, without sanction or support from the Federal government; and that the clause in the Constitution relating to persons held to service was a compact between the States, conferring no power of legislation on Congress and never intended to confer such power. Chase also took part in many other cases involving the constitutionality of the Fugitive Slave Law and came to be known among the slaveholders of Kentucky as the "attorney-general of fugitive slaves." Being in active correspondence with editors, clergymen, and politicians engaged in the antislavery movement, he soon became a recognized leader of the cause in Ohio. Although favoring the abolition of slavery, he differed radically from Garrison both as to methods of effecting that end and as to the relation of such movements to the existing law of the land. He voted for Harrison in 1840; but after the death of the President, when it became clearly apparent that the Whig party could never be made a party of freedom, he withdrew from it in 1841 and was thereafter prominent as a member of the Liberty party in Ohio, which he helped to organize. He took part in the National Liberty Convention in Buffalo in 1843 and subsequent conventions, until the nomination by the Free-Soilers (in 1848) of Martin Van Buren for President; was a leading member and in most cases directed the proceedings. He was frequently called upon to prepare formal addresses and platforms for his party and in particular was the author of the Liberty Platform of 1843, the Liberty Address of 1845, the resolutions of the People's Convention of 1847, and the Free-Soil Platform of 1848. In February, 1849, he was chosen United States Senator from Ohio, his vote coming from all the Democrats and from a few of the Free-Soil members. In the Senate he was an outspoken opponent of slavery extension, and he refused to accept Clay's compromise measures in 1850. Though under obligations to no one party for his election, he usually acted with the Democrats, until the nomination, in 1852, of Pierce on a strongly proslavery platform, when he withdrew and undertook the formation of an independent Democratic party.

Remaining in the Senate entirely independent of party relations, he became, even at the side of Sumner and Seward, the leader of the opposition to the Kansas-Nebraska Bill (q.v.), and, acting with Giddings and Sumner, he sent out the historic "Appeal of the Independent Democrats in Congress to the People of the United States," which, published in the New York *Times* of Jan. 24, 1854, has been regarded as the earliest draft of the Republican party creed. In 1855 the "anti-Nebraska" elements in Ohio fixed upon him as their candidate for Governor, and after a vigorous and close contest he defeated the candidate of the Old Democrats and brought Ohio into line as a probable Republican State in the campaign of 1856. In that year Chase was put forward as a candidate for the Republican nomination for the presidency, but he withdrew his name. In 1857 he was re-elected Governor of Ohio and became recognized thenceforth as a leader in the new national party. During his service as Governor he was much occupied with matters connected with the slavery problem, and at the expiration of his term he was (in February, 1860) elected again to the Senate for the term beginning March 4, 1861. He was one of the candidates for the Republican nomination for the presidency in 1860, and, failing to secure it, he was later appointed by Lincoln Secretary of the Treasury. In that office, which he held until June, 1864, when he resigned owing to differences between himself and President Lincoln, Chase rendered important public service. The maintenance of national credit and the supply of funds with which to prosecute the war, the provision and regulation of a currency system, the creation of a national banking system, and the administration of a national finance under conditions never before experienced or anticipated, mark these years as the most important in the history of the department and distinguish Chase as one of the great secretaries of the Treasury.

In the autumn of 1864 Chief Justice Taney died, and Chase was appointed as his successor in December of that year, retaining the office through a period in which were handed down a series of decisions second in importance only to those of Marshall. Chase dissented from the court's decision in the Milligan case and in the so-called Slaughterhouse cases; he wrote the decision in Hepburn *v.* Griswold, which held that the Legal-Tender Act, so far as it compelled the acceptance of paper money in payment of debts antedating the statute which provided for such money, was unconstitutional. The effect of this was naturally to disprove an important part of Chase's work as Secretary of the Treasury; and this decision against his own work was soon afterward, in the Legal-Tender cases, reversed by a slightly reorganized court. He also wrote the opinion in the case of Texas *v.* White, in which the nature of the Union and the effect thereon of the Civil War were clearly expounded, the nation being characterized as "an indestructible Union composed of indestructible States." As Chief Justice, Chase presided over the impeachment trial of President Andrew Johnson. He became separated from the Republican party and was in 1868 a candidate for the Democratic nomination for the presidency, while his willingness to secure the same nomination in 1872 emphasized the weakness of his position. There is no doubt that as early as 1864 he set his heart upon a presidential nomination and that he had to some extent intrigued against Lincoln, even while sitting in his cabinet. In 1870 he was stricken with paralysis, from the effects of which he died, May 7, 1873, in New York. For his biography, consult: Warden (Cincinnati, 1874), a work undertaken at Chase's own request; Schuckers (New York, 1874); and for a recent and authoritative *Life*, Hart (Boston, 1899), in the "American Statesmen Series"; also, "Diary and Correspondence," in the *American Historical Association Annual Report for 1902*, vol. ii (Washington, 1903).

CHASE, SAMUEL (1741–1811). An American

jurist, one of the signers of the Declaration of Independence. He was born in Somerset Co., Md., studied law in Annapolis, was admitted to the bar in 1761, soon attained a considerable practice, and became prominent in Colonial politics. He served for more than 20 years in the General Assembly of Maryland; was prominent as one of the "Sons of Liberty" during the Stamp Act excitement; was one of the framers of the "Declaration of Rights of Maryland"; and from 1774 to 1778 and from 1784 to 1785 was a member of the Continental Congress. In 1776 he was associated with Franklin and Carroll in an unsuccessful mission to secure the good will of Canada and soon after his return advocated and signed the Declaration of Independence. As agent for the State of Maryland, he went to England in 1783 to recover the value of stock held by it in the Bank of England before the outbreak of the war and after remaining a year succeeded in obtaining about $650,000. In 1788 he was a member of the convention which ratified the Federal Constitution for Maryland, but was himself, along with Luther Martin, opposed to that document. He was appointed judge of the General Court of Maryland in 1791 and judge of the Criminal Court for Baltimore County in 1793 and in 1796 became an associate justice of the United States Supreme Court. As a judge, though frequently presiding with firmness and ability, he was unable to suppress or conceal his decided political predilections and on various occasions delivered what his political opponents regarded as partisan harangues to the grand jury. A harangue in Baltimore attracted the notice of prominent Democrats, who were then engaged in a general movement to diminish the influence of the judiciary, and, on John Randolph's motion, the House of Representatives passed a resolution of impeachment in 1804. In the following year the trial was conducted with much ceremony before the Senate, Chase being represented by Luther Martin, R. G. Harper, Charles Lee, P. B. Key, and Joseph Hopkinson, and the prosecution by John Randolph, G. W. Campbell, Joseph Nicholson, C. A. Rodney, John Boyle, Peter Early, and Christopher Clark. By the latter, eight articles were exhibited, two setting forth Chase's oppressive treatment of Fries, two more charging similar treatment of Callender, two others charging an infringement of the laws of Virginia in the Callender case, one relating to alleged unbecoming and unfair conduct before a Delaware grand jury, and the last calling Chase to account for his harangue before the Baltimore grand jury. Chase was finally acquitted on all but two charges—partisanship in the Callender trial and "electioneering" before the Baltimore grand jury—and no article received the two-thirds vote requisite for impeachment. This decision has been regarded as of considerable significance in the history of the American judiciary, inasmuch as it served to discountenance impeachment trials unless based on really serious grounds, and at the same time warned judges to suppress all manifestations of partisanship on the bench. "The case," says Henry Adams, "proved impeachment to be an impracticable thing for partisan purposes, and it decided the permanence of those lines of constitutional development which were a reflection of the common law." After the trial Chase continued to serve as a member of the Supreme Court until his death, June 19, 1811. Consult: an article "The Impeachment Trial of Judge Samuel Chase" in the *American Law Review*, vol. xxxiii (St. Louis, 1899); Smith and Lloyd (reporters), *The Trial of Samuel Chase* (Washington, 1805); Adams, *History of the United States* (New York, 1889).

CHASE, THOMAS (1827–92). An American educator, born in Worcester, Mass. He graduated in 1848 at Harvard University, studied at the University of Berlin and the Collège de France, and was professor of Greek and Latin at Haverford College in 1855–75. From 1875 to 1886 he was president of Haverford. He was a member of the American committee for the revision of the New Testament and a delegate to the Stockholm Philological Congress of 1889. He published: *Hellas: Her Monuments and Scenery* (1863); a *Latin Grammar* (1882); editions of *Cicero on Immortality* (1881); *The Æneid* (1868); *Horace* (1869); *Four Books of Livy* (1872); *Juvenal* and *Persius* (1876).

CHASE, WILLIAM MERRITT (1849–1916). An American landscape, portrait, genre, and still-life painter. He was born in Franklin, Ind., Nov. 1, 1849. After studying under B. F. Hays, in Indianapolis, and in the schools of the National Academy of Design, he painted with Piloty and Wagner at Munich (1872), acquiring a thoroughly German method. On his return to New York (1878) he began to change his style of painting, gradually clarifying his color and showing an appreciation for the work of the French school. One of the most facile and brilliant technicians of the American school, Chase succeeds equally well with figure, portrait, and still life. Examples of his still life—particularly his fish, which are especially celebrated—are in the Pennsylvania Academy of Fine Arts, Metropolitan Museum, New York, and Brooklyn Institute Museum. Other well-known works are "A Broken Jug," "Ready for a Ride" (1878, Union League Club, New York), "Alice" (Art Institute, Chicago), a "Lady in Black" (Metropolitan Museum, New York), and a number of portraits (including one of his wife) and genre subjects, which he exhibited at the World's Fair, St. Louis, 1904. His more recent works include "American Fish" (1905); "Flying Clouds" and "Portrait of an Artist" (1906); "Portrait of Mrs. J." (1910); "Studio Interior" and "The Orangery" (1911); the "Portrait of Mrs. H.," awarded the Proctor prize in 1912. He became especially successful as a teacher, received many medals, is a National Academician and a member of the American Academy of Arts and Letters, and was at one time president of the Society of American Artists.

CHASIDIM, kă-sē'dĭm (Heb., saints). A name employed at different periods of history to designate some class of especially pious persons among the Jews. 1. From passages in the Psalter, the books of Maccabees, and the Talmud, it seems evident that the term was used as a designation of those who distinguished themselves by their loyalty to the law and the ancestral customs. They do not appear to have formed a sect or society or party, but were only the congregation of the pious in distinction from the apostates. They firmly opposed all Hellenizing tendencies and clung closer and closer to the ceremonies of Judaism. The members even suffered death in preference to transgressing the rites of their religion. They carried out to the letter the Sabbath laws and incurred loss and personal danger rather than extinguish a fire

on that day; but they were no less stringent in carrying out the purely ethical features of the law and were noted for their kindness and charity. Under Mattathias, the Hasmonean, they took part in the Jewish wars for independence and were keen patriots (1 Macc. ii. 42 ff., cf. also Ps. cxix). According to 2 Macc. xiv. 6, "Those of the Jews that are called Asideans, whose captain is Judas Maccabæus, nourish war and are seditious and will not let the realm be in peace." It is probable, however, that when they perceived the ambitious designs of the Hasmonean family, they made peace with Alcimus (1 Macc. vii. 12 ff.). Some scholars have maintained that they afterward formed the Essene party (see ESSENES); others that they developed into the Pharisaic party. Neither theory can be proved. The term is used as an honorary title of many distinguished rabbis. Consult Hamburger, *Realencyklopädie für Bibel und Talmud*, vol. ii (Leipzig, 1896); Moritz Friedländer, *Geschichte der jüdischen Apologetik*, pp. 43 (1903); Schürer, *Geschichte des jüdischen Volkes*, vol. ii, pp. 472 f. (4th ed., 1907); Schloessinger, in *The Jewish Encyclopædia*, art. "Hasidæans" (1904); Oesterley, in Charles, *The Apocrypha and Pseudepigrapha of the Old Testament*, vol. i, p. 73 (1913).

2. In modern times the name "Chasidim" is applied to a sect which originated in Poland under the leadership of Israel of Miedziboz (died 1759), and after his death of Beer of Mizricz (died 1772). Israel was called "Baal Shem," 'master of the name,' because he professed to perform miracles by using the name of God, and the sect that followed him was characterized by a belief in miracles and in the approach of the coming of the Messiah. They opposed Talmudic learning. Their worship became characterized by its noisiness and the almost frenzied gyrations of its devotees, but also by the intensity of their pious sentiment. Their leader Beer was dignified with the title "Zaddik" ('righteous'). The members of the sect formed a kind of fraternity, and it spread rapidly, numbering about 50,000 in 1770. The new division provoked great opposition on the part of the Talmudists, and in 1781, in Vilna, the Chasidim were declared to be heretics, but the sect continued to flourish, and to-day has a large number of adherents. With their mystical tendencies and their simple fervent faith the Chasidim came into conflict on the one hand with the orthodox party and on the other with the rationalists, and only in recent years have they been made the object of an impartial scientific investigation. Consult Schechter, *Studies in Judaism* (New York, 1896), and especially the instructive and discriminating article by Dubnow in *The Jewish Encyclopædia* (1904).

CHASING (short form of *enchase;* Fr. *enchâsser*, from *en* + *châsse*, frame, OF. *casse*, It. *cassa*, Cat., Lat. *capsa*, case, from *capere*, to hold). The art of working in metals by indenting. This is an art of very early times and was practiced largely by the Greeks in ornamenting the draperies and costumes of religious figures for the temples. It is produced by punching from behind the general character of the design, which is afterward perfected by chiseling the details. This results in a kind of embossed engraving, often of great richness. The favorite metal used for this purpose was silver, although gold, and in very early times even iron, was thus ornamented. That the art was known at a very early period may be inferred from the shield of Achilles, the ark of Cypselus, and other productions of the kind. Such portions of the colossal statues made by Phidias and Polyclitus as were not of ivory were produced by this art. The statue of Athena by the former was richly adorned in this manner. Myron, Mys, and Mentor were also celebrated toreutic artists in antiquity, and among many moderns the most famous is Benvenuto Cellini.

CHAS'KA. A city and the county seat of Carver Co., Minn., 22 miles southwest of Minneapolis, on the Minneapolis and St. Louis and the Chicago, Milwaukee, and St. Paul railroads, and on Minnesota River (Map: Minnesota, D 6). It is the seat of an extensive brickmaking industry, and has a flour mill, sugar-beet, canning, and pickle factories, foundry and machine shops. The electric light plant is owned by the city. Pop., 1900, 2165; 1910, 2050.

CHASLES, shâl, MICHEL (1793–1880). A French mathematician. He was born at Epernon, entered the Ecole Polytechnique, of Paris, in 1812, took part in the defense of Paris in 1814, and reëntered the school in the following year. At graduation he secured the much-coveted promotion to a commission in the engineer corps, but resigned it, with rare generosity, to allow one of his fellow classmates to take the place, retiring to Chartres for the purpose of studying geometry. For a quarter of a century Chasles devoted the leisure which his wealth afforded to a profound study of this science. After a perusal of the works of Lagrange or Laplace, he read Apollonius and Archimedes and sought to clarify the obscure passages of Pappus. Chasles's classical work, *Aperçu historique sur l'origine et le développement des méthodes en géométrie* (1837, 2d ed., 1875), while modest in title, is powerful in exposition, clear in style, and rich in ingenious comparisons. In 1841 he was made professor of geodesy and mechanics at the Ecole Polytechnique, and in 1846 professor of geometry at the Sorbonne, which chair he occupied for 21 years. The appendix to the *Aperçu historique* contains the general theory of homography and reciprocity. Synthetic or projective geometry was elaborated by him, as was also the "method of characteristics" (see CHARACTERISTIC), the basis of enumerative geometry afterward extended by Schubert to n-dimensional space. Chasles contributed also some valuable propositions to the integral calculus; his discussions of the displacement of solid bodies and of static electricity have become classics in the field of science, and his solution (1845) by projective geometry of the difficult problem of the attraction of an ellipsoid on an external point is noteworthy. The words of an illustrious Englishman, "M. Chasles is the emperor of geometry," rightly suggest his title to fame.

It is not an uninteresting fact that Chasles was duped by the notorious forger, Vrain Lucas. In 1867 Chasles announced that he was in possession of 27,000 letters and documents of great value; among them were papers believed to have been written by Dante, Petrarch, Rabelais, Julius Cæsar, and Shakespeare, as well as some by Pascal, which were intended to prove that Pascal had anticipated some of the greatest discoveries of Newton. Scarcely 100 of them proving genuine, Chasles suffered not only the embarrassment of being deceived, but also the loss of his expenditure of 200,000 francs.

Bibliography. Among the chief works of Chasles are, besides the *Aperçu historique* mentioned above, the following: *Traité de géométrie supérieure* (1852; 2d ed., 1880); *Traité des sections coniques* (1868–76); *Rapport sur les progrès de la géométrie* (1871); and *Trois livres de porismes d'Euclide* (1863). His various memoirs on perspective and projective figures, duality, tortuous curves, and the principle of correspondence were published in the *Journal de l'Ecole Polytechnique* (1837–65).

CHASLES, Victor Euphémien Philarète (1798–1873). A French literary critic, born at Mainvillers (Eure-et-Loir). He studied at the Lycée Imperial, was a printer's apprentice, and in 1815 went to England, where he assisted Valpy in an edition of Greek and Latin authors. In 1837 he was appointed curator of the Mazarin Library, and in 1841 professor of continental languages and literatures at the Collège de France. He wrote for periodicals, chiefly the *Journal des Débats* and the *Revue des Deux Mondes*, a large number of articles collected under the title *Esquisses*, dealing particularly with contemporary foreign literature. His other works include *Dix-huitième siècle en Angleterre* (1846); *Oliver Cromwell* (1847); *Galileo Galilei* (1862); *Etudes contemporaines* (1866); and *L'Arétin, sa vie et ses écrits* (1873). Two volumes of his *Mémoires* were posthumously published (1876–77).

CHASMOGAMY, kăz-mŏg'ă-mĭ (Gk. χάσμα, *chasma*, opening + γάμος, *gamos*, marriage). Flowers which open are said to exhibit chasmogamy, as opposed to cleistogamy, in which case the flowers never open. See Pollination.

CHASMOPHYTES, kăz'mō-fīts. Crevice plants. See Rock Plant.

CHASSAIGNAC, shâ'sâ'nyâk', Charles Marie Edouard (1805–79). A French physician. He was born in Nantes and in 1835 became prosector and professor at the university and physician at the central bureau of the hospitals of Paris. He originated the surgical operation known as *écrasement*, by means of which tumors, piles, polypi, and other growths may be removed without the effusion of blood. The general introduction of drainage in surgery is also due to his initiative. He wrote: *Traité de l'écrasement linéaire* (1856); *Leçons sur la trachéométrie* (1855); *Clinique chirurgicale* (1854–58); *Traité pratique de la suppuration et du drainage chirurgical* (2 vols., 1859).

CHASSÉ, shâ-sā', David Hendrik, Baron (1765–1849). A Dutch soldier, born at Tiel, Gelderland. He entered the army at an early age, and when the anti-Orange party was crushed by a Prussian army, in 1787, Chassé joined the French ranks and served for a term under Pichegru. He afterward fought with distinction in the French wars of the Revolution and the Empire, and, for the frequency with which he ordered bayonet charges, was nicknamed "Général Baïonette." He was made lieutenant general for his services in the passes of the Pyrenees. After the conclusion of peace he entered the Dutch army and served with great gallantry on the field of Waterloo. During the Belgian Revolution Chassé commanded the citadel of Antwerp and bravely defended it against an overwhelming force of Belgians and French, from Nov. 29 to Dec. 23, 1832, when he was forced to surrender. He was held by the French as a prisoner of war until May 12, 1833, when he was released and retired to private life.

CHASSELOUP-LAUBAT, shâs'lōō'lô'bâ', François, Marquis de (1754–1833). A French military engineer, born at St. Sernin (Charente-Inférieure). He defended Montmédy in 1792, conducted the engineering operations at Maestricht in 1794, and in 1796 was chief of engineers at Mainz and in the army of Italy under Bonaparte, who promoted him to brigadier general of engineers. Until 1812 he served as head of the engineer corps of the Napoleonic armies. In 1815 he declared for Louis XVIII, who made him a peer. His great work was the fortress of Alessandria in Piedmont, in which he attempted to improve the orthodox bastioned system. His more important writings have never been printed.

CHASSELOUP-LAUBAT, Justin Napoléon Samuel Prosper, Marquis de (1805–73). A French politician, son of the preceding. He entered the Chamber of Deputies in 1837 and afterward became Councilor of State. In the Legislative Assembly of 1849 he supported Louis Napoleon, who in 1851 made him Minister of Marine. After the coup d'état he was elected to the Corps Législatif. In 1859 he became Minister of Algeria and the Colonies and gave a marked impulse to French colonization. In 1869 he was President of the Council of State from July to December.

CHASSEPÔT, shâs'pō'. A kind of breech-loading rifle. The chassepôt derived its name from its inventor, Antoine Alphonse Chassepôt, and was used by the French during the Franco-Prussian War of 1870, but it has since been superseded by the modern Lebel magazine rifle. It was, however, a great improvement on the rifles or guns previously in use, and marked the real commencement of the epoch of needle, breech, and magazine loading firearms generally. The chassepôt had four grooves and could be fired 12 times a minute. Its range was 1200 yards, and its cartridge had a calibre of .433 inch. See Small Arms.

CHASSÉRIAU, shâ'sâ'rē'ō', Théodore (1819–56). A French painter and etcher. He was born on the island of Samaná, near San Domingo. At the age of 13 he entered the atelier of Ingres, and at 16 he received a medal in the Salon. Although his early works show the influence of Ingres and his later of Delaroche, yet Chassériau also possessed undoubted originality. Among his best-known paintings are "Tepidarium at Pompeii," "Susanna," and "Venus Anadyomene," all in the Louvre. Of his mural paintings the "Descent from the Cross" in St. Philippe du Roule, Paris, is the only one in a good state of preservation. His greatest achievement was the decoration of the Palais d'Orsay, which was destroyed by the Communists; a few figures which were rescued have found place in the Louvre. The best of his fine etchings are a series of 15 plates illustrating "Othello."

CHASSEURS, shâ'sĕr' (Fr., from *chasser*, to hunt, chase). A branch of the military forces of France. Before the era of railroads, long-range and rapid-fire artillery and rifles, light cavalry and light infantry were much used, and were very necessary, for service in advance or on the flanks of the army. They were designed and equipped for greater mobility than was possible for the army as a whole and were very generally adopted throughout Europe at large, under various titles. The English Rifles and Light Infantry, Prussian and Austrian Jäger, and later the Italian Bersaglieri, were all of this

type, and while they still retain their former titles, the characteristics that once distinguished them have, in the evolution of the science of warfare, of necessity become general.

Every modern soldier must be a good shot, a marksman or sharpshooter if possible, and in every branch and detail mobility itself. The chasseurs, who derive their name (Fr., hunter) from the same source as the Russian Jäger, are divided into two branches: the mounted chasseurs (*chasseurs-à-cheval*), or light cavalry, and the dismounted chasseurs (*chasseurs-à-pied*), or light infantry. After the reorganization of the French army in 1873 there were 20 regiments of *chasseurs-à-cheval*, besides 4 regiments of *chasseurs d'Afrique* (regiments raised and equipped for special service in Africa), and 30 battalions of *chasseurs-à-pied*. In 1913 there were 23 regiments of chasseurs in the cavalry and 31 battalions of *chasseurs-à-pied*, as well as 4 regiments of *chasseurs d'Afrique*.

CHASTELARD, shà'tlär', PIERRE DE BOSCOSEL (1540–63). A French poet at the court of Francis II and his young wife, Mary, whom he afterward accompanied as page of Damville (1561) to Scotland, where his indiscreet love invited, and at last almost compelled, his execution. He it was who carried to Mary the famous *Regrets* of his poetic master Ronsard. Chastelard and the Queen exchanged also amorous verses of their own composition. His last words are said to have been a profession of undying love. Consult Swinburne, *Chastelard: A Tragedy* (London and New York, 1865; 1906). The story of Chastelard is recounted in an imaginative way by Maurice Hewlitt in his historical novel, *The Queen's Quhair* (New York, 1904).

CHASTELER, shà'tlâ', JEAN GABRIEL JOSEPH ALBERT, MARQUIS DE (1763–1825). An Austrian general. He was born in Belgium, received his military education in Vienna, and entered the Austrian service. He took a prominent part in the campaigns against the Turks in 1789 and those against France during the Revolution and especially distinguished himself at Wattignies in 1793. He fought in the Tirol against Napoleon, but was beaten by Lefebvre, at Wörgl in 1809, and was compelled to fly to Hungary. When the Lombardo-Venetian Kingdom was established, he was made Governor of Venice.

CHASTELLAIN, shà'tlăN', GEORGES (c.1415–75). A French chronicler and poet, born in Flanders. He became attached to the courts of Philip the Good, Duke of Burgundy, and Charles the Bold as chronicler. His *Chronique des choses de ce temps* is more valuable than most such writings, for its veracity and character drawing. He wrote a *Temple de Bocace* for Margaret of Anjou, but probably had no part in the *Book of Deeds* of Jacques de Lalain. Consult De Lettenhove's edition of the works (8 vols., Brussels, 1863–66).

CHASTELLUX, shà'tlüks', FRANÇOIS JEAN, MARQUIS DE (1734–88). A French soldier and writer. He was born in Paris, entered the French army in 1749, distinguished himself in the Seven Years' War, and from 1780 to 1782 served as a major general in the French army, under Rochambeau, in the American Revolutionary War. After his return to France until his death he held the position of inspector of infantry, and in 1786 he became a marquis by the death of an elder brother. His reputation rests chiefly upon his *Voyages dans l'Amérique septentrionale, dans les années 1780, 1781, et 1782* (1786; Eng. trans. by Kent, or more probably George Greive, 2 vols., 1787; reprinted, New York, 1828), in which he gives an interesting account of many persons and places connected with the American Revolution and of many localities visited by him in a tour through the Middle States and the northern part of Virginia. For the most part the book has been considered a reasonably accurate picture of the United States at that time, but certain portions of it met with severe criticism, especially at the hands of Brissot de Warville, who wrote an *Examen critique des "Voyages dans l'Amérique septentrionale" dans lequel on réfute principalement ses opinions sur les Quakers, sur les nègres, sur le peuple et sur l'homme* (London, 1786). Chastellux also wrote: *De la félicité publique, ou considérations sur le sort des hommes dans les différentes époques de l'histoire* (1772; Eng. trans., 1774), which was highly praised by Voltaire (who is said to have ranked it above Montesquieu's *Esprit des lois*), which gave considerable offense to many by its strictures upon Christianity, and which won him a place in the Academy; *De l'union de la poésie et de la musique* (1775); and *Discours sur les avantages et les désavantages qui résultent pour l'Europe de la découverte de l'Amerique* (1787), in which, answering the famous question proposed by Raynal, he asserts that the advantages have greatly outweighed the disadvantages. Consult Chastellux, *Notice sur le marquis de Chastellux* (Paris, 1822), and Pascallet, *Notice historique sur la maison de Chastellux* (Paris, 1844).

CHASTE MAID IN CHEAPSIDE, A. A comedy by Thomas Middleton, printed in quarto (1630) and acted about 1612 at the Swan Theatre, London.

CHASTE TREE. See VITEX.

CHASUBLE, chăz'ů-b'l. See COSTUME, ECCLESIASTICAL.

CHAT (from *chat*, so called on account of its note). Originally one of the Old World ground-keeping warblers or small thrushes of the large subfamily Saxicolinæ, elsewhere described under WHEATEAR, WHINCHAT, ETC. In America, one of a group of large warblers (Icteriinæ), of which the best known is the yellow-breasted chat (*Icteria virens*), a bird some 7 or 8 inches long, common in the eastern United States, at least southward. The tail is considerably longer than the wing. The color is olive green above, bright yellow beneath, fading into white posteriorly. The song is a most extraordinary jumble of whistles, chucks, and caws, and is chiefly uttered when the male is in the air, carrying on aërial evolutions little less remarkable than his song. The chats are insectivorous and are inhabitants of thickets and copses, where they can conceal themselves readily when too closely approached. The nest is built of coarse grass, leaves, and strips of bark, in a bush near the ground, and the eggs, five in number, are white evenly spotted with brown. Consult Chapman, *The Warblers of North America* (New York, 1907).

CHÂTEAU, shà'tô', **CHÂTEL,** shà'tĕl', or **CASTEL,** kà'stĕl' (Fr., castle, from Lat. *castellum*, dim. of *castrum*, camp). Names applied in France and other parts of the Continent to the residences of the feudal lords of the soil. The name *château-fort* is now applied to the fortified castles erected before the fifteenth century. The term "château" is also applied to the

modern French country house, when the proprietor is also the owner of extensive adjoining landed property. Royal residences, like the Louvre, were also called châteaux, although they were in reality palaces (*palais*). The valley of the Loire contains an unusually large number of châteaux, both royal, as Amboise, Blois, and Chambord, and private, as Chenonceaux, Longeais, Châteaudun, Chaumont, and Azai-le-Rideau. The word is also a component part of many names of places in France. See the bibliography of CASTILE; consult also Petit, *Les châteaux de la Loire* (Paris, 1861).

CHATEAUBRIAND, shà'tô'brê-äN', FRANÇOIS AUGUST RENÉ, VICOMTE DE (1768–1848). A French author and statesman. He was born in St. Malo, the most Catholic of French provinces, and the warm piety of his mother and the distant reserve of his father combined with the strange Breton legends and the mysterious vastness of the neighboring ocean to nurse in the child religious sentiment and poetic mysticism. To these elements direction and intensity were given by his education at Dôle and Rennes. At 20 he entered the army, thinking to try his fortune in India, but the Revolution diverted him from this, and in 1790 he obtained a government commission to seek the Northwest Passage, a quest that took him, according to his own possibly inaccurate account, on wide journeys on the Great Lakes and prairies of America and even to semitropical Florida and brought him much association with Rousseau-like Indian "children of nature" and self-communion in primeval forests. These influences first revealed Chateaubriand to himself and were revealed in all his future work, but most brilliantly in *Les Natchez*, planned about this time, though unpublished for 30 years, and in the stories that originally were connected with it—the epoch-making *Atala* (1801) and *René* (1802). The excesses of the Revolution modified Chateaubriand's zeal for political reform, and on his return to Europe (1792) after a hasty and unhappy marriage, of his parents' making, he cast in his lot with the army of the *émigrés*. He was wounded at the siege of Thionville (September, 1792), and suffering and in want he went in 1793 to England, where he supported himself for several years by literary work, and wrote the pessimistic and skeptical *Essai sur les révolutions* (1797). Here, too, he elaborated *Atala*, *René*, and *Les Natchez*, inspired partly by Rousseau's *Emile*, partly by St. Pierre's *Paul et Virginie*. These show a marked change in Chateaubriand's religious attitude, which had been free and unorthodox. This change was attributed by him to the grief caused his mother by his free thought and to his mother's death in 1798.

That France was ready for a Christian and idealistic reaction the Concordat (July 15, 1801) was about to prove. Returning to France in 1800, he struck a note that set all hearts vibrating. *Atala* was immediately and universally popular. It roused a dormant spirit of romantic idealism and, in the mental state that it disclosed, anticipated much in Lamartine and Hugo. The eloquent descriptions of nature showed rare powers of minute observation. Chateaubriand immediately took the leading place in French letters and retained it unquestioned till the appearance of Lamartine's *Méditations* (1820). *Le génie du Christianisme* (1802), a brilliant piece of special pleading, suggests that æsthetic rather than moral interests drew Chateaubriand to the Church. At bottom he was still a pessimist and a skeptic, though perhaps as sincere as he could be, for neither rational nor logical consistency was a dominant characteristic in him. The author of the *Génie*, and its readers also, were less interested to find that Christianity was true than that it was sentimentally poetic, pathetic, and æsthetic.

Chateaubriand, whose apotheosis of Christianity fell in with Napoleon's plans at this time, received a diplomatic post in Rome (1803). He was involved in intrigues, was transferred to Switzerland, and on the execution of the Duc d'Enghien (1804) resigned and began a campaign of criticism against Napoleon, who, he said, "made the world tremble, but me—never." In 1806 he started on an extensive tour in the East, visiting Greece, Turkey, Asia Minor, Palestine, Tunis, and Spain. He embodied his impressions in *Les martyrs* (1809), a prose epic of rising Christianity and sinking paganism; in *Les aventures du dernier des Abencérages* (1826), a Moorish story, and in *Itinéraire de Paris à Jérusalem* (1811), all showing "opulence of imagination and poverty of heart." The fall of Napoleon evoked *De Buonaparte et des Bourbons* (1814), which, according to Louis XVIII, was worth 100,000 men to the Legitimist cause. The work brought its author several diplomatic appointments, which he resigned in order to be free to oppose ministries that displeased him, until towards 1830 he seemed tending to liberalism. The Orléanist triumph brought him back promptly to the lost cause. Chateaubriand now sank into a discouraged silence. He translated *Paradise Lost* (1836), wrote a *Vie de Rancé*, the ascetic (1844), and revised and completed his *Mémoires d'outre-tombe*, published a little prematurely, just before his death (1848), and translated into English (1902). This is a work of some historic interest, great eloquence, remarkable prejudices, and unique self-conceit—"*René* with documentary evidence," as it has been wittily called. For Chateaubriand is his own René and in *René* lies his literary significance.

René and *Atala* mark the beginning of the Romantic school. They are to France what Goethe's *Werther* is to Germany and "Childe Harold" to England, the germ of the so-called *maladie du siècle*, a dilettant, morbid, introspective pessimism that was to infect Senancour, Lamartine, Vigny, Musset, and the youthful work of Sainte-Beuve, Dumas, and George Sand. It can be traced also, masked by stronger powers, in Hugo and in Byron. This moral influence, the helpfulness of which has been questioned, was accompanied by very great services to art. Chateaubriand was the first in France to draw attention to the literary resources of the Middle Ages and Christian antiquity. He was a renovator in imagination, criticism, history, and the founder of the new descriptive school of idealization and personification of nature, and thus as much the father of Loti as of Thierry and Michelet. He made literature national in aspiration, Christian in spirit; he persuaded his generation to break with the imitation of imitation that had sapped the literary life of the eighteenth century. His style left its mark on poetry, history, fiction—on the very language. His effect on morals and religion has been considered morbid and transitory. In literary art he marks an era.

Bibliography. Chateaubriand's works were edited in 20 vols. by Sainte-Beuve, with an intro-

ductory study of his own (1859–60). Consult also: Sainte-Beuve, *Chateaubriand et son groupe littéraire* (Paris, 1860), and other essays in *Portraits contemporains*, and *Causerie de lundis, Nouveaux lundis, Premiers lundis;* Vinet, *Madame de Staël et Chateaubriand* (Paris, 1857); Villemain, *Chateaubriand, sa vie, ses écrits et son influence* (Paris, 1859); France, *Lucile de Chateaubriand* (Paris, 1879); Bardoux, *Chateaubriand* (Paris, 1893); Lescure, *Chateaubriand* (Paris, 1892); Pailhès, *Chateaubriand, sa femme et ses amis* (Bordeaux, 1896); Maurel, *Essai sur Chateaubriand* (Paris, 1899); Bertrin, *La sincérité réligieuse de Chateaubriand* (1901); *Mémoires d'outre-tombe*, trans. by Teixeira de Mattos (6 vols., New York and London, 1902). For the reality and fiction in Chateaubriand's American and other journeys, see J. Bédier, *Etudes critiques* (Paris, 1903); V. Giraud, *Chateaubriand: Etudes litt.* (Paris, 1904); Stathers, *Chateaubriand et l'Amérique* (Grenoble, 1905); E. Champion, *L'itinéraire de Paris à Jérusalem par Julien, domestique de Chateaubriand* (Paris, 1904). Other notable books are: Gribble, *Chateaubriand and his Court of Women* (New York, 1909); Lemaître, *Chateaubriand* (1912); *Correspondance général de Chateaubriand*, ed., with introduction, etc., by L. Thomas (3 vols., Paris, 1912–13).

CHÂTEAUDUN, shâ'tô'dĕN' (Fr. *château*, castle + Gall. *dun*, OIr. *dún*, stronghold). The capital of an arrondissement in the Department of Eure-et-Loir, France, situated on the Loir, about 28 miles northwest of Orléans (Map: France, N., C 4). The town contains an old castle, with an enormous tower, a number of houses dating from the fourteenth, fifteenth, and sixteenth centuries, a college, and a library. The manufactures are of machinery and blankets; trade also flourishes in cattle, grain, wool, and hemp. Pop. (commune), 1901, 7146; 1911, 7296. During the Middle Ages Châteaudun was the residence of the counts of Dunois; it was burned by the Germans in 1870. Consult *Un coin de l'ancien Dunois* (Châteaudun, 1869).

CHÂTEAUGAY, shât'ô-gā', Battle of. An engagement on Oct. 26, 1813, at the junction of the Châteaugay and Outarde rivers in New York State, between 1000 English, strongly intrenched, and about 4000 Americans, the latter being defeated, owing to the incapacity of their leader, General Hampton, who brought less than half of his troops into action. The loss of the Americans was 38; that of the British, 25.

CHÂTEAUNEUF DE RANDON, shâ'tô'nĕf' de rāN'dôN' (Fr., castle of Randon, the hill on which it is situated). A village of France, in the Department of Lozère, 12 miles northeast of Mende, celebrated in connection with an incident of the Hundred Years' War. In 1830 the fortress, then held by French brigands, was besieged by the troops of Charles V, under the command of the gallant Du Guesclin. The garrison finally had to yield. Du Guesclin was on his deathbed when the keys of the fortress were brought, and he received them "in the name of his sovereign liege the King of France." According to another version he was already dead when the keys were brought, so that the chronicler wrote, "He never besieged a place which did not surrender to him, either alive or dead." A monument commemorating the death of Du Guesclin was erected in 1820. Consult Lavisse, *Histoire de France*, vol. iv (Paris, 1902).

CHÂTEAU-RENAULT, shâ'tô're-nô', or **CHÂTEAU-REGNAUD**, -re-nyô', François Louis Rousselet, Marquis de (1637–1716). A French admiral. In 1673, in command of five ships, he dispersed a fleet of eight vessels under Admiral de Ruyter in the North Sea, and in 1677 with six vessels he defeated a Dutch fleet of 25 under Admiral Evertzen off the coast of Spain. He was commander in chief of the fleet sent to Ireland by Louis XIV to support the cause of James II. He became vice admiral in 1701 and marshal of France in 1703. In 1702 when guarding Spanish treasure ships in Vigo he was attacked and defeated by a fleet commanded by Sir George Rooke.

CHÂTEAUROUX, shâ'tô'rōō' (named in honor of Prince Raoul of Déols, who founded it in the tenth century). A town of France, capital of the Department of Indre, situated on the left bank of the river Indre, 166 miles south of Paris by railway (Map: France, N., G 6). The town, which was formerly dirty and ill built, has been greatly improved. Across the Indre lie its beautiful suburbs, Christophe and Déols. Its gloomy castle on a hill above the river was the prison of Cardinal Richelieu's niece, the Princesse de Condé, during 23 years. The Château Raoul, built in the fourteenth century, still stands. The church of St. André (modern), the hôtel de ville with its Flemish paintings and souvenirs of Napoleon I, the statue of Gen. Henri Bertrand, a native, are other points of interest. The town has extensive factories of woolen and cotton goods, hosiery, yarn, hats, paper, parchment, hardware, tobacco, and leather. Pop. (commune), 1901, 24,957; 1911, 26,095. Consult Falconneaux Dufresne, *Histoire de Déols et de Chateauroux* (Chateauroux, 1873).

CHÂTEAUROUX, Marie Anne, Duchesse de (1717–44). A daughter of Marquis de Nesle and favorite of Louis XV. She was born in Paris, and after the death (1740) of her husband, Marquis de la Tournelle, succeeded her three sisters as the mistress of Louis XV of France, who made her the Duchess of Châteauroux (1743). During the war of 1744 she accompanied the King as far as Metz, where he was taken ill and was prevailed upon by the Bishop of Soissons to dismiss her. Upon his return to Paris, however, she consented to a reconciliation on condition that her principal enemies at court should be banished. She died soon afterward. Consult E. and J. de Goncourt, *La duchesse de Châteauroux et ses sœurs* (Paris, 1879).

CHÂTEAU-THIERRY, shâ'tô'tyâr'rê' (named in honor of Theuderich or Thierry IV, for whom it was founded by Charles Martel in the eighth century). The capital of an arrondissement in the Department of Aisne, France, situated on the right bank of the Marne, 59 miles northeast of Paris. Towering above it on the heights are the ruins of the castle from which the town takes its name. Its chief buildings are a commercial college, a public library, and an old cathedral (Map: France, N., J 3). Pop. (commune), 1901, 7083; 1911, 7771. The Champagne district begins here, and, besides its wine trade, it is famous for the manufacture of musical and scientific instruments and woolen yarn; stone is quarried near by. The position of Château-Thierry has subjected it to many disasters. It was captured by the English in 1421, by Charles V in 1545, by the Spanish in

1591; was pillaged in the Fronde wars in 1652 and suffered severely in the Napoleonic campaign of 1814. Château-Thierry was the birthplace of La Fontaine. Consult Poquet, *Histoire de Château-Thierry* (2 vols., Château-Thierry, 1839–40).

CHÂTEAUX EN ESPAGNE, ăN nâ'spâ'ny' (Fr., castles in Spain). Romance castles; castles in the air; daydreams.

CHATEL. See CHÂTEAU.

CHÂTELAIN, shâ'tlăN'. See CASTELLAN.

CHÂTELAIN DE COUCY ET DE LA DAME DE FAYEL, shâ'tlăN' de kōō'sē' â de lâ dâm de fâ'yĕl', HISTOIRE DU (Fr., history of the Châtelain of Coucy and the Lady of Fayel). A French romance founded on the quasi-historical loves of Renaud, Châtelain de Coucy, and belonging to the thirteenth century. An edition by M. Crapelet appeared in Paris in 1829. See COUCY, THE CHÂTELAIN DE.

CHÂTELET, shâ'tlâ'. A town of Belgium in the Province of Hainaut, situated a few miles east of Charleroi on the Sambre opposite Châtelineau. It contains a number of smelting works and iron foundries. Its chief industries are coal mining and the manufacture of cutlery and ironware. It has numerous technical training schools. Pop., 1900, 10,932; 1910, 11,573.

CHÂTELET (Fr., a little castle). A fortification placed at the entrance to towns or at the mouth of rivers. The most noted châtelets were the large and small châtelets of Paris. That either one was built by Julius Cæsar is purely mythical; but it would seem that Charles the Bald spoke of them in his capitulary of 877 as a defense against the Normans. The great châtelet situated on the present Place du Châtelet was remodeled in the years 1506 and 1684, became the seat of royal justice for Paris, and continued such until the Revolution of 1789. Officials were added gradually until just previous to the Revolution the list numbered over 700. The first morgue was established under the châtelet as early as 1363. It was also a noted prison, and although Louis XVI endeavored to abolish it in 1780, it still contained many prisoners at the opening of the Revolution. In 1802 the large châtelet was demolished to open the way for the Boulevard Sébastopol. The small châtelet situated near the present Hôtel-Dieu was rebuilt in the twelfth and thirteenth centuries and used as a prison in the eighteenth century. It was demolished in 1782.

CHÂTELET-LOMONT, shâ'tlâ'lô'môN', GABRIELLE EMILIE, MARQUISE DU (1706–49). A French author, born in Paris. She was distinguished for her wit, talent, and learning, especially in mathematics and physics, but chiefly for her intimacy with Voltaire, who was for several years her guest at Cirey, her complacent husband's countryseat on the Lorraine frontier. In 1747 she exchanged Voltaire's cooling affections for those of Captain Saint-Lambert, but the philosopher remained her devoted and indulgent friend till her death in childbirth two years later. She translated Newton's *Principia*, with annotations, and wrote on the philosophy of Leibnitz, but her *Correspondance* with Voltaire is the most instructive and interesting of her productions. Consult De Graffigny, *Vie privée de Voltaire et de Mme. de C.* (1820), and Capefigue, *La marquise du Châtelet* (Paris, 1868); and see also bibliography under VOLTAIRE.

CHÂTELLERAULT, shâ'tĕl'rô' (ML. *Castrum Heraldi, Castellum Airaldi*, herald's castle). A town of France, capital of an arrondissement in the Department of Vienne, situated on the river of that name, 18 miles north-northeast of Poitiers (Map: France, S., F 6). A handsome stone bridge, with a massive castellated gateway built by Sully, connects it with Châteauneuf, a suburb on the other side of the river. Châtellerault, which is an ill-built, mean-looking town, is one of the chief seats of the manufacture of cutlery in France, and since 1820 has had a national manufactory of swords and bayonets, employing nearly 2000 workmen. There are also extensive manufactures of millstones, watches, leather, candles, and lace, which employ 4000 more. Its river port makes it the entrepôt for the produce of wine, brandy, and prunes of an extensive district. Pop. (commune), 1901, 20,801; 1911, 18,260. Consult Lalanne, *Histoire de Châtellerault* (Châtellerault, 1859).

CHATFIELD-TAYLOR, HOBART C. (1865–). An American author, born in Chicago, and educated at Cornell University. He served as editor of *America* for two years, was Consul of Spain at Chicago in 1892–94, and became a member of honorary societies in France, Spain, Italy, and Portugal. Besides his contributions to the *North American Review*, the *Bookman*, and the *Dial*, he published *With Edge Tools* (1891); *An American Peeress* (1893); *Two Women and a Fool* (1895); *The Idle Born* (1900); *The Crimson Wing* (1902); *Molière: A Biography* (1906); *Fame's Pathway* (1909); *Goldoni: A Biography* (1913).

CHATHAM, chăt'am (AS. *Coteham*, village of huts, from *cot*, hut + *ham*, inclosure). A parliamentary borough, river port, fortified town, and naval arsenal, in the County of Kent, England, on the estuary of the Medway, 34 miles east-southeast of London (Map: England, G 5). It lies a little to the east of Rochester, with which it is politically united, as it is also with Gillingham, on the east. The streets are generally irregular and narrow, but much has been done to improve this since the incorporation of the town in 1890. It sends one member to Parliament. Its gas and water supply is furnished by private companies, but the municipality has built a pier, established a public park and recreation grounds, constructed a fine town hall and municipal offices, and expends a considerable sum on technical education. Chatham owes its importance to its naval and military establishments, situated at New Brompton (a suburb on a height half a mile north of Chatham). The so-called lines or fortifications which inclose these works are the frequent scenes of field operations, sham fights, and reviews. From a military point of view, the lines of detached forts connected with Chatham, which have superseded for defensive purposes the old "lines," constitute a fortification of great strength, and, together with the strong forts erected on the Medway, form an excellent protection to London from invasion from the southeast. Chatham is an important military post with large infantry, artillery, and engineer barracks, a school of military engineering, and a large military hospital. As a naval base, it is one of the most important in the kingdom. The royal dockyard, which was first established by Queen

Elizabeth, embraces an area of about 500 acres and contains building slips and floating docks in which the largest ships of the navy may be built or repaired. One basin, famous for its size, has a frontage of 6000 feet and a width of 800 feet. At times 7000 workmen are employed. In connection with the yard is a metal mill which supplies it with copper plates and bolts. Melville Hospital is a large establishment for sailors and marines. There are also extensive barracks for marines. Pop., 1891, 31,700; 1901, 37,057; 1911, 42,250. Consult "Chatham," in *Municipal Journal* (London, 1900).

CHATHAM. A town in Northumberland Co., New Brunswick, on the Miramichi River, 25 miles above its entrance into Miramichi Bay, 5 miles east of Newcastle, and on the Intercolonial Railway (Map: New Brunswick, D 2). It has a Roman Catholic cathedral, hospital, and a fine city building. It is a port of entry, with a fine harbor, pulp factories, foundries, mills, and a large export trade in fish, lumber, etc. Many hunting parties set out from here. Pop., 1901, 4868; 1911, 4666.

CHATHAM. A city and the county seat of Kent Co., Ontario, Canada, on the Thames River, 45 miles east of Detroit, Mich., reached by the Grand Trunk, the Wabash, the Père Marquette, and the Canadian Pacific railroads, and by steamboats from lakes Erie and Huron and the Detroit River (Map: Ontario, B 9). It is in an agricultural district, has a large trade in grain and lumber, and manufactures lumber products, carriages, flour, boilers and engines, iron goods, woolens, etc. The United States is represented by a consul. Pop., 1901, 9068; 1911, 10,770.

CHATHAM. A borough in Morris Co., N. J., 15 miles west of Newark, on the Lackawanna Railroad, and on the Passaic River (Map: New Jersey, D 2). With a picturesque situation and good roads, it has become a residential suburb of New York and Newark. It is the centre of an extensive rose-growing industry. Chatham owns and operates its water works and electric light plant. It was incorporated as a village in 1892 and as a borough in 1897. The mayor and members of the council are elected annually. Pop., 1890, 780; 1900, 1361; 1910, 1874.

CHATHAM, Earl of. See Pitt, William.

CHATHAM ENGINEERING SCHOOL. See Military Education.

CHATHAM ISLANDS. A small group in the Pacific Ocean, 536 miles east of Lyttelton in lat. 43° 38′ to 44° 40′ S., long. 177° to 179° W. (Map: Australia, L 7). Area, 321 square miles. The group was discovered in 1791 by Lieutenant Broughton, and the name of his brig was given to both the cluster and its chief member. A salt or brackish lake, 72 miles in area, occupies the interior of Chatham Island. The soil and climate of the archipelago, in general, are good. Wheat yields abundantly, and horses, cattle, sheep, and pigs thrive well. Considerable trade is carried on in supplies for whalers and passing ships. The greater portion of the two principal islands is used for sheep grazing. The native canoe, instead of being cut out of a single tree, is merely wickerwork bound together by cordage of native flax. The aboriginal Morioris, who in 1831 were 1200, have been supplanted by a mixed population of Maoris and whites, a few only surviving. Pop., 1911, 453 (234 Europeans and 219 Maoris and Morioris). The Chatham Islands are politically attached to New Zealand.

CHATI, shä′tē′. See Wild Cat.

CHATILLON, Charles de. See Charles de Blois.

CHÂTILLON-SUR-SEINE, shä′tē′yôN′ sür-sän′ (Fr., castle; cf. Sp. *castillo*, castle). The capital of an arrondissement in the Department of Côte-d'Or, France, on the Seine, about 45 miles north-northwest of Dijon (Map: France, N., K 5). The town is divided into two parts by the river. Of the château which gave the town its name nothing now remains save several ruined walls. The ground on which it stood has been converted into a cemetery, but the Château Marmont, built by Marshal Marmont, who was born in Châtillon, still stands. The church of the ancient château, Sainte-Vorle, has an interesting Holy Sepulchre done in stone. There are important manufactures of woolens, cottons, hats, and leather, and ironworks. Pop. (commune), 1901, 4807; 1911, 4698. Châtillon was an important fortified town in the twelfth century and the seat of the dukes of Burgundy. It was the capital of the Pays de la Montagne, part of Burgundy. From Feb. 5 to March 19, 1814, a congress of the Allied Powers assembled at Châtillon vainly endeavored to come to terms with Napoleon. The failure of negotiations was followed by the resumption of hostilities. Here a German detachment suffered a severe repulse, on Nov. 19, 1870, at the hands of Ricciotti Garibaldi, and was driven back upon Château-Villain.

CHAT'MOSS. A bog in Lancashire, England, about 12 miles square, which reaches at some places a depth of 30 feet. It is celebrated as the scene of successful efforts for the reclaiming of bogs in the end of the eighteenth and beginning of the nineteenth century, and of one of the great engineering triumphs of George Stephenson in the construction of the Liverpool and Manchester Railway.

CHATOYANT, shä-toi′ant, *Fr. pron.* shä′twä′yäN′ (Fr., from *chat*, cat). A mineral is chatoyant when it exhibits a changeable internal band of light. The phenomenon is said to be due to minute internal parallel striations or inclusions. It is especially noticeable when the mineral is cut with a convex face (*en cabochon*). See Cat's-Eye.

CHATRIAN, shä′trē-äN′, Alexandre. See Erckmann-Chatrian.

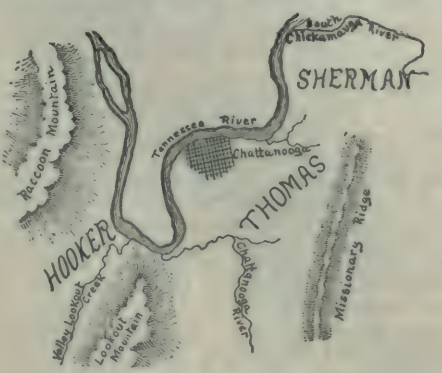
CHATS'WORTH. The mansion of the dukes of Devonshire and one of the most splendid private seats in England. It is situated in Derbyshire, on the Derwent. Sir William Cavendish in 1570 began the old mansion, which was finished by his widow, afterward Countess of Shrewsbury. In this building Mary, Queen of Scots, was imprisoned for 13 years. The present edifice includes the Ionic pile, 183 by 172 feet, built 1687–1706, by the first Duke of Devonshire, after designs by Talman and Wren. The façade is 720 feet long or, with the terraces, 1200 feet. The grounds around are 9 miles in circuit and are surpassed only by those at Versailles.

CHAT'TAHOO'CHEE (Creek *châtu*, rock; *hutchas*, mark; pictured rocks). A river rising on the south slope of the Blue Ridge, in northern Georgia. It traverses the State in a southwesterly direction to its west edge, where, turning south, it becomes the boundary between Georgia and Alabama, and finally, after receiving the Flint from the east, crosses Florida under the name "Appalachicola." It empties

into the Gulf of Mexico (Map: Alabama, D 4). The Chattahoochee is over 500 miles long, is navigable to Columbus, 200 miles, and drains an area of about 17,000 square miles.

CHAT'TANOO'GA. A city and important railroad centre and the county seat of Hamilton Co., Tenn., 150 miles by rail southeast of Nashville, on the Alabama Great Southern, the Central of Georgia, the Cincinnati, New Orleans, and Texas, the Nashville, Chattanooga, and St. Louis, the Southern, the Tennessee, Alabama, and Georgia, and the Western and Atlantic railroads; and on the Tennessee River, which is navigable as far as this place eight months of the year (Map: Tennessee, F 5). To the south is Lookout Mountain, from which seven States can be seen. Chattanooga has a fine marble customhouse, the Baroness Erlanger Hospital, a Carnegie library, a museum, two opera houses, University of Chattanooga (Methodist Episcopal), the Chattanooga College of Law, Baylor School, McCallie School, and Girls' Preparatory School. The Chickamauga National Military Park, laid out by the Federal government on the site of the battle of Chickamauga, is south by east of the city. Other features of interest are Fort Oglethorpe, a brigade post, and the National Cemetery, containing 13,322 graves. A large trade is carried on in grain, iron, coal, and lumber, and there are extensive manufactures of iron and steel, machinery, cotton goods, furniture, bricks and tiles, wagons, stoves, textiles, leather goods, etc. In November, 1913, a $9,000,000 lock and dam and power plant was completed at Hale's Bar, on the Tennessee River, near this city. Chattanooga adopted the commission form of government in 1911. The annual income and expenditures balance at nearly $800,000. The main items of expense are: $94,000 for the fire department; $73,000 for police; $152,000 for schools; $10,000 for health department; $110,000 for streets and sewers; $69,000 for parks and buildings. Originally called Ross's Landing, Chattanooga was settled in 1836 and was incorporated in 1839. It became of great military importance in the Civil War, and the vicinity was the scene of several hotly contested battles, notably those of Chickamauga, Missionary Ridge, Lookout Mountain, and Chattanooga (q.v.). It was from here that Sherman began his famous march to the sea. In 1863 it was occupied by the Union forces. The city was almost destroyed during the Civil War. Chattanooga has been chosen as the southern headquarters of the Interstate Commerce Commission. Pop., 1870, 6093; 1900, 30,154; 1910, 44,604; 1920, 57,895.

CHATTANOOGA, Battle of. One of the most important battles of the Civil War, fought in the vicinity of Chattanooga, Tenn., Nov. 23–25, 1863, between a Federal army of 60,000, under General Grant, and a Confederate army of about 40,000, under General Bragg. After the battle of Chickamauga (q.v.) Bragg had held the Federal troops closely besieged in Chattanooga and, by seizing nearly all of their lines of supply, threatened them with starvation. In October Thomas superseded Rosecrans, who had commanded at Chickamauga, and on the 23d Grant, recently placed in command of the military operations in the West, arrived in person. Grant immediately reopened his communications with the Federal base of supplies at Nashville (October 26, 27, and 28), by advancing Hooker's troops from Bridgeport and sending a small force from Chattanooga to seize the points in Lookout valley which controlled Brown's Ferry. After awaiting reënforcements under Sherman, he took the aggressive on November 23, when Thomas, in an engagement lasting two



BATTLEFIELD OF CHATTANOOGA.

hours, drove back Bragg's advanced guards and established a new Federal line a mile in advance of the old one. On the 24th Sherman, on the left, carried a detached point of Missionary Ridge, and Hooker, on the right, in the famous "Battle above the Clouds," carried Lookout Mountain, the Confederates retreating from his front during the night. At daylight on the 25th Sherman renewed his attack on the Confederate right, but, owing to the unavoidable delay of Hooker in coming to his assistance, was placed in a precarious position, and as a diversion Grant ordered an assault by Thomas's troops, under Sheridan and Wood, against the Confederate centre. These troops quickly drove the enemy from his rifle trenches, and then, without orders from Grant or Thomas, rushed impetuously up the steep hill (Missionary Ridge) and, in one of the most remarkable charges known in military history, carried the fortifications under a terrific fire, gained possession of the crest of the ridge, and drove the Confederates, panic-stricken, from the field. The Confederate retreat now became general, and during the night Bragg, hotly pursued by Sheridan, withdrew rapidly up the Chickamauga valley. The losses in killed, wounded, and missing were for the Federals 5815; for the Confederates, 6687. The victory not only relieved Chattanooga, but also forced Longstreet, then besieging Burnside at Knoxville, to retreat into Virginia. Consult: the *Official Records*, vol. xxxi (Washington, 1890); Cist, *The Army of the Cumberland* (New York, 1897); Nicolay and Hay, *Abraham Lincoln: A History*, vol. viii (10 vols., New York, 1897); and Grant, *Personal Memoirs* (2 vols., new ed., New York, 1895).

CHATTANOOGA, University of. A coeducational college under the auspices of the Methodist Episcopal church, founded at Chattanooga, Tenn., in 1867. The university has a preparatory department at Athens, Tenn., with a college department at Chattanooga. They are under the same management, but the instructors are different. At the college department there were, in 1913, 119 students and 12 members of the faculty. In the preparatory department there were 285 students and 12 instructors. The value of the buildings and grounds of the university in 1913 was $416,750. The endowment was $375,739. About $350,000 was

recently subscribed for endowment and buildings to be paid in installments. This increased endowment was made possible by a subscription of $150,000 by the general education board on condition that $350,000 additional be raised in Nov. 1, 1912. The library of the college department contains about 8000 volumes and the preparatory department about 3000. The president is John H. Race, D.D.

CHAT'TEL (OF. *chatel, catel*, ML. *captate, capitale*, property, from Lat. *caput*, head). A term nearly, though not quite, coextensive with the term "personal property" (q.v.), i.e., property which passes to the executor or administrator, as distinguished from real property, which is inheritable and passes to the heir. By chattel is meant that species of personal property which is capable of physical delivery and possession. Thus, *choses* (things) in possession are chattels, but *choses* in action (i.e., legal claims for moneys due), although personal property, are not chattels in the technical sense.

Chattels are classified as *chattels real* and *chattels personal*. A *chattel real* is any interest or property in land less than a freehold. As opposed to freeholds, *chattels real* are regarded as personal property; but, as being interests in real property, they are called *chattels real*, to distinguish them from other chattels, which are called *chattels personal*.

Certain objects which are a part of the real estate may become chattels upon being severed from the real estate—as, e.g., timber which has been cut, or ore which has been mined and removed from the land; and certain other objects which are still attached to and form a part of real property—as, e.g., growing annual crops or emblements (q.v.)—are for some purposes regarded as chattels. On the other hand, in general, chattels which become attached to the land or are used as a part of the real estate lose their character as chattels and become real estate. Thus, the materials used in constructing a house or other structure forming a part of the real estate are real estate. Certain chattels, however, affixed to the real estate, but capable of removal—as, e.g., machinery, articles of furniture, etc.—retain their character as chattels for some purposes, while for others they are deemed to be real estate. Chattels of the Church are known as fixtures.

At common law, titles to *chattels personal* in existence are transferable by mere agreement, except in case of gift, when delivery of the chattel is required in order to confer a title upon the grantee. The various branches of the law of chattels are specifically treated under the several titles relating to them, such as GIFT, SALE, PERSONAL PROPERTY, FIXTURES, and the authorities mentioned under those titles may be consulted for a fuller statement of the law. For the early law as to ownership of chattels in England, consult Pollock and Maitland, *History of English Law* (Boston, 1899).

CHATTEL MORTGAGE. The transfer of personal property as security for a debt or obligation in such manner as to pass title to the transferee or mortgagee which may be revested in the transferor or mortgagor upon payment of the debt or performance of the obligation; but upon his failure to pay or perform, the title becomes absolute in the mortgagee. Courts of equity, however, will allow the mortgagor to redeem the mortgaged chattel after the debt or obligation becomes due. (See MORTGAGE; PLEDGE.) The mortgagor of chattels is generally held to have title even in jurisdictions where the mortgagee of real estate is deemed to acquire only an equitable lien, as distinguished from a legal title. At common law, a chattel mortgage might be made without writing or other formality, provided the chattel was delivered to the mortgagee; but under modern statutes, particularly those relating to registration (q.v.) of mortgages, a chattel mortgage is required to be in writing and recorded in order to give it validity against third parties, and in some jurisdictions, by statute, chattel mortgages become void unless refiled or otherwise renewed, as by statute required, from year to year. Consult Cobbey, *A Practical Treatise on the Law of Chattel Mortgage* (St. Paul, 1893).

CHATTERER. A term formerly applied to the waxwings and some related birds with little applicability. It is now, with more or less propriety, restricted by ornithologists to the South American passerine family Cotingidæ, which may be better called cotingas. See BELL BIRD; COTINGA; WAXWING.

CHAT'TERTON, EDWARD KEBLE (1878–). An English author and journalist, born at Sheffield. After graduating from Oxford University he entered journalism in London, writing especially art and dramatic criticisms. He was at various times subeditor of the *Art-Record*, subeditor of the *Daily Mail*, editor of the *Lady's Realm*, and that journal's dramatic critic. His publications include: *T. Sidney Cooper: His Life and Art* (1903); *The Marriages of Mayfair* (1909); *Modern Journalism* (1909); *Down Channel in the Vivette* (1909); *The Boy's Book* (1910); *The Story of the British Navy* (1911); *Royal Love Letters* (1911); *Through Holland in the Vivette* (1912); *King's Cutters and Smugglers* (1912); *Ships and Ways of Other Days* (1913).

CHAT'TERTON, THOMAS (1752–70). An English poet, born in Bristol, Nov. 20, 1752. His father, who had once been a sexton of St. Mary Redcliffe, Bristol, and also master of a charity school, died about two months before the poet's birth. Chatterton was educated at the school of which his father had been master and was thought a dull child; but, making acquaintance with a black-letter Bible which his mother often used, the dormant spirit flashed up. From this book he learned to read. From early years he was fond of all kinds of antiquities; he clung around old walls like the ivy and haunted twilight ruins like the bat. At the age of 14 he was apprenticed to John Lambert, an attorney. His situation here was uncomfortable; he took his meals in the kitchen with the footboy and, when refractory, was chastised with a ruler. In October, 1768, the new bridge at Bristol was opened, and Chatterton sent to a newspaper an account, in antique phraseology and spelling, of the ceremonies attending the opening of the old one in 1248, the whole purporting to be taken from an ancient manuscript. In the preceding year he presented himself to a certain Bristol pewterer, Burgum by name, and astonished the craftsman by the sight of a parchment in which his pedigree was traced back to the Norman Conquest. He also exhibited to his friends copies of old poems, which, he said, were composed by one Thomas

Rowley, a mythical monk of the fifteenth century. These manuscripts made some stir in his native city, but not enough to satisfy Chatterton. Accordingly Horace Walpole, at that time collecting additional materials for his *Anecdotes of Painting in England*, received from Chatterton several pages of antique writing, accompanied by a short note (1769). The pretended manuscript gave biographical sketches of celebrated painters who had flourished in England several centuries before, and of whose existence Walpole had never dreamed. Walpole, put off his guard, answered his unknown correspondent at once, expressed his delight at receiving the manuscript, and desired, as a personal favor, that all the other antique writings, poems included, mentioned in the note should be forwarded. Chatterton immediately sent accounts of a great many more painters and poets and also gave some slight sketch of his personal history. On receipt of this second communication Walpole suspected a trick. The poems he showed to Mason and Gray, who at once pronounced them forgeries. He then wrote Chatterton, administering a great deal of excellent advice. Chatterton replied, desiring that the manuscript should be returned at once; but by the time the letter reached London Walpole was about to start for Paris, and it was allowed to remain unanswered. It was returned three months later. From his earliest youth Chatterton had a ghastly familiarity with the idea of suicide. Among his papers preserved in the British Museum is a last will and testament, "executed in the presence of Omniscience, the 14th of April, 1770," full of the wildest wit and profanity. This, and similar documents falling into the hands of his friends, led to his dismissal from Lambert's office. Released from the slavery of law, Chatterton left for London, April 24, 1770, taking with him the Rowley manuscripts. He found shelter in the house of one Walmsley, a plasterer, in Shoreditch. No sooner had he settled there than he began to work as with a hundred hands. During the last few months of his life he poured forth squibs, satiric poems, political essays, burlettas, letters in the style of Junius, and meditated writing a history of England, to appear in parts. For a time his prospects seemed very bright. He obtained an introduction to Lord Mayor Beckford; he sent glowing letters home, accompanied by presents to his mother and sisters. Ultimately he left the plasterer's in Shoreditch and took lodgings in Brooke Street, adjoining Holborn. Unhappily for him, editors of opposition papers were willing enough to insert and praise his articles, but were disinclined to render an equivalent in cash. The means of life were now fast failing. On Aug. 25, 1770, his landlady, alarmed that her lodger did not make his appearance, had the door of his room broken open; saw the floor littered with small pieces of paper, and Chatterton "lying on the bed with his legs hanging over, quite dead." He had taken arsenic, in anticipation of a slower death from starvation.

Chatterton, dying before he was 18 years old, was certainly a "marvelous boy." While a peculiar interest is attached to all that he wrote, he is best remembered as the author of the so-called "Rowley Poems." Of them only one—"Elinour and Juga"—appeared during his life. The rest were collected and published by T. Tyrwhitt in 1777. Some of them possess that rare beauty of imagination which we associate with Coleridge and Keats. Indeed, these latter poets owed much to Chatterton. So, too, did Dante Rossetti and William Morris. We may cite especially "The Ballade of Charity," the first and third "Eclogues," the "Tragedy of Ælla," the "Tragedy of Godwin," "The Tournament," and the "Parliament of Sprites." Perhaps the best edition of Chatterton is *The Poetical Works of Chatterton* (1871, introductory essay by W. W. Skeat in vol. ii) in the "Aldine Edition of the British Poets." It also contains a memoir of the poet by Edward Bell. Consult: Masson, *Chatterton: A Biography* (New York, 1899); Watts-Dunton's essay in Ward, *English Poets*, iii (London and New York, 1880); Beers, *English Romanticism* (New York, 1898); Russell, *Thomas Chatterton, the Marvelous Boy* (New York, 1909); and Ingram, *The True Chatterton* (London, 1910).

CHATTI. See CATTI.

CHAUCER, chą'sẽr, GEOFFREY (c.1340–1400). The first great English poet. The son of John Chaucer, a London vintner, he was born in London about 1340, or possibly a few years earlier. Of the poet's life few trustworthy details have come down to us. The usual biography is a fabrication. But certain facts are contained in the official documents of the time, and, besides this, Chaucer sometimes speaks of himself. In 1357 he was in the service of the Countess of Ulster, wife of Lionel, the son of Edward III. His position was most likely that of a page. He was in the army of his King, who invaded France in 1359–60. He was taken prisoner, but was ransomed on March 1 of the latter year. Chaucer is not mentioned again until 1367, when he received from the King a pension of 20 marks under the title of "valet." From this time on Chaucer may be followed more closely, his name occurring frequently in public documents. From valet he rose to the rank of squire in the King's household. Chaucer was soon sent on several important foreign missions to Flanders, France, and Italy. His first Italian journey was in 1372–73, when he went to Genoa and Florence, and, as many believe, to Padua, where he learned from Petrarch the story of the Patient Griselda, the tale told by the Clerk of Oxford, one of the Canterbury pilgrims. In 1378 he again went to Italy, returning early the next year. In 1374 he was appointed comptroller of the customs for wool, skins, etc., at the port of London, and in 1382 comptroller of petty customs—of wine, candles, and other small articles. Both these positions he lost in 1386, but in that year he was elected to Parliament from Kent. Three years later he was appointed clerk of the King's works at Westminster, the Tower of London, and various royal manors, and in 1390 clerk of the works for St. George's Chapel, Windsor. During 1391 he lost these positions, probably because the repairs were completed. At about this time he became forester of North Petherton Park, Somersetshire. This appointment he held until his death. After 1386 Chaucer was at various times in financial trouble. It is not to be supposed that he was inefficient as an executive officer; he was rather a sufferer from the ups and downs of politics. During the reign of Richard II (1377–99) there were two parties, one led by John of Gaunt and the other by the Duke of Gloucester. Chaucer belonged to the first and shared in its reverses. When Henry Bolingbroke gained the throne as Henry

IV (1399), Chaucer was placed in better circumstances, but he did not live to enjoy his good fortune. He died on Oct. 25, 1400, and was buried in Westminster Abbey. Chaucer was married some time before 1374, probably as early as 1366. The surname of his wife is uncertain, but her Christian name was Philippa. She seems to have died in 1387. The fifth centenary of Chaucer's death was observed on Oct. 25, 1900, when the Poet Laureate unveiled a memorial window to him in St. Saviour's Cathedral, Southwark.

Chaucer was thus a man of affairs as well as a poet. The exact date of composition cannot be fixed for his various poems. In grouping them it has been customary to assign those that show a knowledge of Italian literature to a period following the first visit to Italy. But this procedure is not quite convincing. In the prologue to the "Legende of Good Women," written about 1385, Chaucer mentions his most important poems down to that date—"Troylus and Cryseyde," "The House of Fame," "Boke of the Duchesse," the "Assembly of Foules," "Palamon and Arcite," "Life of St. Cecile" (the last two were incorporated into the *Canterbury Tales*), and many ballades, roundels, and virelays. All these poems just mentioned by name are very beautiful. Of them, "Troylus and Cryseyde," founded on the mediæval Troy legend, is by far the longest. It was a favorite with Dante Rossetti; and Chaucer is indeed most subtle here in his psychology. In much of the work cited above, Chaucer was to some extent a translator. He did not, however, follow Boccaccio and his other originals slavishly, but rather made use of them in a broad and free way. His greatest work is the *Canterbury Tales*. Here Chaucer brings together at the Tabard Inn men and women of every degree, from the knight to the cook, and plans to have each tell stories on the way to Canterbury and on the return. Of this vast scheme he lived to carry out only a part. The stories were intended to represent the literary types current in his day, such as the romance of chivalry, the legend, and the *fabliau*, or poetic fable, and they were to be in harmony with the characters sketched so delightfully in the prologue. Of this prologue Dryden wrote the famous passage: "'Tis sufficient to say, according to the proverb, that here is God's plenty. We have our forefathers and great-grandames all before us, as they were in Chaucer's day; their general characters are still remaining in mankind, and even in England, though they are called by other names than those of monks, and friars, and canons, and lady abbesses, and nuns; for mankind is ever the same, and nothing lost out of nature, though everything is altered."

Chaucer wrote several minor poems, among which are the "Complaint to Pity" and the "Complaint to his Purse." While it is agreed that Chaucer translated "The Romance of the Rose," there is disagreement as to whether the extant version is wholly his. Indeed, it has been argued, though not very successfully, that it is throughout the work of another hand. "The Court of Love," "The Flower and the Leaf," and certain other poems that have been attributed to him critics no longer accept as his. Chaucer also translated the work of Boëthius entitled *De Consolatione Philosophiæ*, a favorite book of the Middle Ages, and one of which we have a version by King Alfred. No better than his contemporaries in prose, Chaucer rises far above them all in verse. At a time when English poetry was dull and without art, he wrought as a craftsman of the very first rank. He invented the seven-line stanza and the heroic couplet employed by Dryden, Pope, and a host of other poets. He was indeed the father of English poetry.

Bibliography. The first competent editor of Chaucer was Thomas Tyrwhitt, whose edition of the *Canterbury Tales* appeared in 1775, a glossary being added three years later. An admirable edition of the *Complete Works*, by Skeat, in 7 vols., was published at Oxford in 1894–97. A convenient edition in 1 vol. is the Globe (London and New York, 1898). The most exhaustive work on Chaucer is by T. R. Lounsbury: *Studies in Chaucer* (3 vols., New York, 1892). Indispensable to the Chaucer student are the publications of the Chaucer Society, founded in 1867 by F. J. Furnivall. Consult also: Ten Brink, *Chaucer: Studien zur Geschichte seiner Schriften* (Münster, 1870); *Chaucer: Sprache und Verskunst* (Leipzig, 1884); Skeat, *The Chaucer Canon* (Oxford, 1900). For a summary of all known facts and dates of Chaucer's life, see Kirk, *Life-Records of Chaucer* (London, 1900), part iv, published by the Chaucer Society. A most useful work, also, is Hammond, *Chaucer: A Bibliographical Manual* (London, 1909). MacKaye, *Complete Poetical Works of Chaucer: Now first Put into Modern English* (New York, 1912), is helpful to beginners in Chaucer; and John Koch, *A Detailed Comparison of the Eight Manuscripts of Chaucer's Canterbury Tales*, etc. (Heidelberg, 1913), a careful textual study.

CHAUCER'S DREAM. A title originally prefixed to that poem of Chaucer which is now known as *The Boke of the Duchesse*, or *The Deth of Blanche*. In all editions of Chaucer subsequent to that of Speght in 1597, however, it is given to a poem which had been hitherto unrecognized. Although little is known as to the origin or history of the latter piece, there is no reason to doubt the authenticity of the authorship. The earliest manuscript of it which has come down belongs to the year 1550.

CHAUCER SOCIETY, The. A society founded in 1867 in London, by F. J. Furnivall, for the purpose of facilitating Chaucerian research and opening a knowledge of the great poet's works to the public.

CHAUCHARD, shō'shär', Hippolyte François Alfred (1821–1909). A French merchant and art collector, born in Paris. He was first employed as a clerk, but in 1854 founded the Magasins du Louvre and through the introduction of methods now universal in modern department stores built up a great fortune, with which he retired in 1885. His art treasures, including "The Angelus" and six other Millets, 40 Corots, several Rousseaus and Meissoniers, bronze statues, and tapestries, were left as a gift to the French nation.

CHAUCI, ką'sī. An ancient German tribe which dwelt along the North Sea, between the Amisia (Ems) and the Albis (Elbe). The Romans often came into conflict with them, notably during the reign of Claudius (41–54). Tacitus (*Germ.* 35) records that they were conspicuous for their love of peace and justice, powerful but not ambitious, ready to resist aggression, but never provoking war. After the fifth century they disappear from history.

GEOFFREY CHAUCER

FROM AN ENGRAVING BY GEORGE VERTUE

AFTER THE MINIATURE IN A MANUSCRIPT OF THE WORKS OF THOMAS OCCLEVE

CHAUDESAIGUES, shō'dzāg' (Fr. trans. of Lat. *Calentes Aquæ*, hot springs). A watering place of France, in the Department of Cantal, about 12 miles south-southwest of Saint-Flour (Map: France, S., G 4). It is widely known for its five hot mineral springs with a maximum temperature of 177°, the waters of which are considered very efficacious in cases of rheumatism and are also used for domestic purposes, washing fleeces, etc. There are also three cold springs near by. Pop. (commune), 1901, 1645; 1911, 1675.

CHAUDET, shō'dâ', Antoine Denis (1763–1810). A French sculptor, painter, and draftsman. He was born in Paris, studied with J. B. Stouf and E. Gois, and won the Prix de Rome in 1784. He was the favorite sculptor of Napoleon I, of whom he modeled many busts and statues. The most imposing of these, a colossal statue for the Vendôme Column, was destroyed in 1814. Other well-known works are the stone relief "Devotion to the Fatherland" (Panthéon), "Sensibility," "Œdipus" (Louvre), a silver statue of "Peace" (Musée des Arts Decoratifs, Paris), "General Dugommier" (Versailles). His best painting is "Æneas Fleeing with his Family," in imitation of the style of David. He also furnished good illustrations for editions de luxe of the day, such as Didot's *Paul and Virginia* and Racine's dramas. Chaudet's art united classic severity of form with a certain pathos which at times becomes sentimentality. He was an imitator of Canova, to whom some of his works have been ascribed.

CHAUDIÈRE (shō'dyâr') **LAKE** (Fr., caldron). An expansion of Ottawa River in Canada, just above the city of Ottawa, at which place the Chaudière Falls occur (Map: Ontario, J 2).

CHAUDIÈRE RIVER. A river of Canada which rises near the northwest border of Maine, in small head streams which flow into Lake Megantic, from which the Chaudière River issues. It flows generally north-northwest to join the St. Lawrence, about 7 miles above Quebec. It is about 120 miles long. The falls of the same name are 2½ miles above its mouth. See Chaudière Lake.

CHAUFFEUR, shō'fẽr' (Fr., burner), or Garrotteur. A member of the bands of outlaws during the Reign of Terror in France who roamed over the northeastern part of the country, under the lead of John the Skinner, or Schinderhannes. They garroted men and women and roasted their feet to compel them to disclose hidden treasure. In 1803 vigorous measures were taken which resulted in their suppression. (See Brigandage.) With the increasing use of the automobile as a means of recreation and transportation, the term "chauffeur" was applied to the driver who operated the carriage and the mechanic who was carried to look after the machinery and fuel. The origin of this use of the term is found in France, where automobiling first won favor as a sport, the word "chauffeur" being there employed to designate a fireman or stoker. To-day the word has come to be used to signify a professional licensed driver of a self-propelled motor vehicle. See Motor Vehicle.

CHAULIAC, shō'lyȧk', Guy de (c.1300–c.80). A French surgeon. He first practiced in Lyons and was physician to three of the popes of Avignon. He was far in advance of the time, and his *Chirurgia Magna* (1363), written in the vernacular *langue d'oc*, was for three centuries an indispensable manual.

CHAULIEU, shō'lyẽ', Guillaume Amfrye (1639–1720). A French poet, born at Fontenay (le-Comte). He was one of the dissolute abbés of the period and was called "L'Anacréon du Temple." His verses have a grace and facility that makes them still read. His poems were not published during his life. They have usually been printed with those of his intimate companion, the Marquis de la Fare (1644–1712). The best edition is that by Fouquet (1774). Consult Sainte-Beuve, *Causeries du lundi*, vol. i, and Berenger's introduction to Chaulieu's *Lettres inédites* (1850).

CHAUMETTE, shō'mĕt', Pierre-Gaspard (1763–94). A notorious character of the French Revolution, born at Nevers. Through Camille Desmoulins he was made a member of the Club of Cordeliers, and he soon became connected with one of the revolutionary journals. He preached the downfall of property and religion and stood for the policy of anarchy, pillage, and atheism. He became the real dominating spirit of the Commune. After the events of August 10 he became procureur-syndic of Paris. He was guillotined, April 13, 1794, at the instance of Robespierre. Chaumette was one of the most extravagant revolutionists in an age that had gone mad on revolution. At one time, according to tradition, he proposed that the French people should be made to wear wooden shoes and to subsist on potatoes. With all this, he is entitled to a certain amount of commendation for his hospital reforms, public burial for the poor, the suppression of lotteries, houses of ill fame, and obscene literature. Perhaps his most important reform was the abolition of corporal punishment in the schools.

CHAUMIÈRE INDIENNE, shō'myâr' ăn'dê-ĕn', La. See Saint-Pierre, Jacques Henri Bernardin de.

CHAUMONOT, shō'mō'nō', Pierre Marie Joseph (1611–93). A French Jesuit missionary in North America. He was the son of a vine-dresser, but was brought up by his uncle, a priest, who lived at Châtillon, on the Seine. At the age of 10 he ran off, with a companion, to study music at Beaune, Burgundy, under the Fathers of the Oratory; but, having stolen 100 sols (about a dollar) from his uncle, and dreading to be disgraced therefor at his home, he made a pilgrimage to Rome, where he fell under the influence of the Jesuits, and in 1639 went to Canada as a missionary to the Indians. Soon after arriving at Quebec, he left for work among the Hurons and for a year was stationed at Ossossane. For some time he busied himself gathering information for a dictionary of the Huron language and dialects and in 1640 accompanied Brébeuf (q.v.) on a mission to the Neutral Nation, a tribe which then lived west of the Iroquois, between Lake Ontario and Lake Erie. This mission proving unsuccessful, he went to St. Michael, where he remained until 1648, when the Iroquois destroyed this settlement, together with nearly all the others in this vicinity, and almost exterminated the Hurons. Chaumonot accompanied the survivors first to St. Joseph's Island, in Lake Huron, and afterward to the Island of Orleans, where he was able to complete the work on his dictionary and prepare a grammar besides. From 1655 to 1658 he worked among the Iroquois at Onondaga and then

spent some time in Montreal, where in 1663 he founded the Society of the Holy Family. He finally returned to the Hurons, among whom he remained until his death. His life was full of hardship, persecution, and suffering, and, like that of the other Jesuit missionaries of the time, was remarkable for its self-abnegation and unobtrusive heroism. Chaumonot left a curious autobiography, *Vie de P. M. J. Chaumonot, écrite par lui-même* (1688), the original of which is in the Hôtel-Dieu, Quebec. It was published by J. G. Shea in New York in 1858. A continuation (to 1693), *Suite de la vie de P. M. J. Chaumonot par un père de la compagnie* (probably Rale), was also published in New York in the same year. For his missionary work and writings, consult Thwaites, *The Jesuit Relations* (72 vols., Cleveland, 1897–1901). The Index volume should be consulted, as accounts of him are found in many volumes.

CHAUMONT-EN-BASSIGNY, shō'mōN'-ôNg-ba'sē'nē' (Fr., bald hill). The capital of the Department of the Haute-Marne, France, situated on an elevation between the rivers Marne and Suize, about 140 miles southeast of Paris (Map: France, N., L 4). The railway viaduct across the Suize is a remarkable structure, 1960 feet long with 50 arches. The city is well built, with clean, spacious streets, and fine promenades around the upper part of the town. The church of St. Jean Baptiste exhibits fine examples of Flamboyant Gothic, of Renaissance, and transitional architecture of the thirteenth, fifteenth, and sixteenth centuries, and contains some good paintings and sculptures. Among the town's monuments is a bronze statue of Philippe Lebon, a native and the pioneer of gaslighting in France. There are many manufactures, including wax candles, hosiery, cotton, yarn, leather, kid gloves, etc. There is also a brisk trade in grain, ironware, and coal. The town traces its origin to a baronial castle erected in 940. At Chaumont, on March 1, 1814, the Allied Powers formulated a plan for the reconstruction of western Europe and bound themselves by treaty not to lay down arms till France had been reduced to its ancient boundaries. Pop. (commune), 1901, 14,622; 1911, 14,870. Consult E. Jolibois, *Histoire de la ville de Chaumont* (Chaumont, 1856).

CHAUNA, chou'nȧ. A bird. See SCREAMER.

CHAUNCEY, chän'sĭ *or* chạn'sĭ, ISAAC (1772–1840). An American naval officer. He was born at Black Rock, Conn., and at an early age began a seafaring life in the mercantile service, in which he was conspicuous for enterprise and energy. In 1799 he entered the newly organized navy as a lieutenant, and in 1802 he was made acting captain, commanding the *Chesapeake*, the flagship of the squadron sent against Tripoli. Throughout the War of 1812 he had command on the Great Lakes. In 1813 he participated in the capture of York (now Toronto) and of Fort George, thus helping to drive the enemy from the whole of the Niagara region, and on October 5 he captured five British vessels and a regiment of troops. At the close of the war he was placed in command of the Brooklyn Navy Yard and in 1816 commanded the Mediterranean squadron and, with William Shaler, Consul, negotiated the treaty of peace with Algiers.

CHAUNCY, or **CHAUNCEY,** CHARLES (1592–1672). An American clergyman and educator, the second president of Harvard College. He was born at Yardleybury, England; graduated in 1613 at Trinity College, Cambridge, of which he was for some time a fellow and where for several years he was professor of Greek. He was vicar of Ware from 1627 to 1633 and of Marston St. Lawrence, Northamptonshire, from 1633 to 1637, and in both pastorates came into frequent conflict with the ecclesiastical authorities. He was first called to account for his opposition to the *Book of Sports* and for his presumption in substituting catechetical exercises for the prohibited afternoon sermon, and in 1629 was brought before the Court of High Commission for having said that "idolatry was admitted into the Church," and that "there is much atheism, popery, Arminianism, and heresy crept into the Church." In 1635 he was again brought before the court, this time for objecting to a rail around the communion table, and to the act of kneeling at the communion service, and after trial publicly recanted. In 1638 he emigrated to America and for three years preached in Plymouth; but in 1641 he became the pastor at Scituate, where, says Mather, "he remained for three and three times three years, cultivating the vineyard of the Lord." In 1654 he planned to return to his old pastorate at Ware; but the overseers of Harvard had meantime chosen him to succeed President Dunster and "by their vehement importunity" induced him to remain. From this time until his death he was president of the college. He is the reputed ancestor of all those bearing the name of Chauncy or Chauncey in the United States. Besides a number of sermons he published: *The Doctrine of the Sacrament, with the Right Use Thereof* (1642); *The Plain Doctrine of the Justification of a Sinner in the Sight of God* (1659), a collection of 26 sermons; *Antisynodalia Scripta Americana* (1662). Consult the interesting sketch in Cotton Mather, *Magnalia* (London, 1702), and Fowler, *Memorials of the Chaunceys* (Boston, 1858).

CHAUNTER, chänt'ẽr (OF. *chantur*, It. *cantatore*, Lat. *cantator*, singer, from *cantare*, frequentative of *canere*, to sing). The highest pipe of the bagpipe (q.v.) on which the chaunt, or melody, is played.

CHAUS, kā'ŭs (Neo-Lat., from the native name). The Indian jungle cat (q.v.).

CHAUSSARD, shō'sär', PIERRE JEAN BAPTISTE (1766–1823). A French author. He was born in Paris and was educated at the Collège Saint-Jean de Beauvais. In 1792 he was sent as commissioner to Belgium to effect a union with that country and upon his return was appointed Secretary General of Public Instruction. His *Mémoires historiques et politiques sur la révolution de Belgique et du pays de Liége* (1793) is an important contribution to the history of that period. He wrote on the art of poetry, supplementing Boileau.

CHAUSSES, shōs (Fr., stockings). In the Middle Ages, defensive armor for the legs. Some were made of padded and quilted cloth, with metal studs; some of chain mail, some of riveted plates, and some of banded mail. It was not unusual to fasten them by lacing behind the leg.

CHAUSSON, shō'sôN', ERNEST (1855–99). A French composer, born at Paris. He studied under Massenet and César Franck at the Paris Conservatory. For several years he was secretary of the Société National de Musique. He died as the result of an accident with which he met

while wheeling. His works attracted more than ordinary attention because of their strong individuality and excellent workmanship. He wrote two operas, *Hélène* and *Le Roi Arthur*, which was produced in Brussels in 1903; a symphony in B flat; two symphonic poems, *Viviane* and *Les caprices de Marianne*, and several smaller pieces for orchestra; incidental music to Shakespeare's *Tempest* and Bouchor's *Légende de Ste. Cécile;* the vocal works with orchestra *Hymne Védique, Le poème de l'amour et de la mer, Chanson perpétuelle;* a concerto for piano and orchestra; a concerto for violin and piano with string quartet; a piano quartet; a string quartet, and a string trio.

CHAUTAUQUA, shâ-tą'kwâ. A town in Chautauqua Co., N. Y., popular as a summer resort, and noted for its educational facilities and its picturesque situation 1427 feet above sea level, 68 miles by rail from Buffalo, on the Chautauqua Traction and the Jamestown, Chautauqua, and Lake Erie railroads, and on the western shore of Chautauqua Lake (Map: New York, A 6). Steamboats ply on the lake, which is reached by several railroads. The town has a hotel and numerous cottages, and among features connected with the educational work of the Chautauqua Institution are an amphitheatre with a seating capacity of 5000, the "Hall in the Grove," three gymnasiums, and an athletic club, administration building, and buildings for lectures, recitations, etc. The New York State Summer Institute also is situated here. Pop., 1900, 3590; 1910, 3515.

CHAUTAUQUA INSTITUTION. A name adopted from a lake and a county in southwestern New York, which has during the past third of a century become associated with a system of popular education now generally known, but by many only vaguely understood. The fundamental principle of this system is that the higher education may and should be extended to all alike, and that education, best begun in academy, college, and university, is not confined to youth, but continues through the whole of life. Broadly speaking, the influence of the institution is twofold—it is exerted through the summer assembly and summer schools directly upon those in attendance; and, by means of reading circles upon self-educating readers and students in their own homes. Correspondence instruction, formerly undertaken by the institution, has been abandoned. These two plans may be successfully combined, for, by supplementing home study during the year with six weeks' residence at Chautauqua in the summer, a conscientious and persevering student may do work of a high grade and acquire valuable and broadening information. The function of the institution in the educational system of the United States is, therefore, compensatory and supplementary. While its methods cannot be by any means an adequate substitute for college training, they may stimulate personal development among ambitious persons denied college opportunities and among all classes may encourage habits of systematic reading and study.

The Summer Assembly. The first Chautauqua Assembly (known as the "Sunday-school Assembly") was in session Aug. 4–18, 1874, as the result of a plan formed by Lewis Miller, of Akron, Ohio, and the Rev. John H. Vincent, of New York. Both men were interested in the improvement and development of Sunday schools. To this end they devised a meeting which should be more than a mere conference of two or three days, and which should include courses of study in pedagogical principles, biblical analysis, and practical questions of Sunday-school organization and management, extending over a period of 10 days or two weeks. The plan also recognized the importance of recreative exercises and of certain lectures of a general character not strictly related to the main subject of Sunday schools. It was decided to hold this "assembly" in camp, to adopt the unquestionably good features of the so-called camp meeting, but to give prominence to the calm, earnest, careful study of important principles and methods. Although the plan originated with members of the Methodist Episcopal church, there was no thought of making the assembly denominational. At the first session all the leading Protestant bodies were represented, and there has never since been any attempt to make distinctions. The attendance in 1874 was gratifyingly large. In spite of primitive lodgings and many discomforts, there was a spirit of enthusiasm which promised well for the success of the experiment. The Sunday-school Normal Department provided means for daily study under experienced instructors; prominent speakers gave lectures of a popular character on biblical themes. A large model of Palestine (300 feet long) was laid out near the lake (which served as the Mediterranean), and students were conducted through this miniature land by Oriental travelers.

The assembly plans widened rapidly in successive years. The system which had succeeded in the case of Bible study was quickly extended to include science, language (the teaching of Hebrew began in 1875), and literature. Music of a better grade was introduced, and a large chorus was drilled daily. This expansion has continued, until now the staff of lecturers and instructors numbers more than 200 men and women prominent in all departments of educational life. Every year at least one well-known British scholar is invited to cross the Atlantic especially to lecture at Chautauqua. Gradually, progressive courses on some one topic have been substituted for miscellaneous addresses on a great variety of subjects. In 1876 the session was lengthened to three weeks and now covers 60 days of each year. Thus began the Chautauqua Assembly, based on the theory that change of occupation, not idleness, is true recreation, and that the summer vacation may be made a means of development and stimulus to those engaged during the year in the ordinary pursuits of life.

Summer Schools. In 1879 a school for teachers in secular subjects, called "The Teachers' Retreat," was opened, with a faculty of efficient instructors. This department has grown steadily in numbers and importance and is a leading summer school of methods. It is now the School of Pedagogy. In the same year (1879) the School of Languages (now the College of Liberal Arts) began, with courses in German, French, Latin, Greek, Hebrew, and Sanskrit. The development of this school has been marked by important changes, largely due to Dr. William R. Harper, late president of the University of Chicago, who became instructor in Hebrew in 1882 and principal from 1884 to 1898. In 1888 the School of the English Bible (now the School of Religious Teaching) was organized, also under the principalship of Dr. Harper. This department, designed to promote the study of the Bible as a great literary masterpiece as well as an inspired

volume, was received with immediate favor and has grown rapidly. In addition to these three schools many other subjects of study have been added, until there are now 14 distinct departments under the presidency of George E. Vincent, son of the founder of the institution. These various schools are as follows: (1) School of English Language and Literature; (2) School of Modern Languages; (3) School of Classical Languages; (4) School of Mathematics and Sciences; (5) School of Pedagogy; (6) School of Religious Teaching; (7) School of Library Training; (8) School of Domestic Science; (9) School of Music; (10) School of Arts and Crafts; (11) School of Expression; (12) School of Physical Education; (13) School of Practical Arts; (14) School of Agriculture, added in 1912 in coöperation with Cornell University. Many of these schools are under the direction, or command the services, of professors from the leading universities and colleges of the country. About 3000 students avail themselves each year of these facilities.

In addition to the instruction given in these schools, the public programme includes: (1) a variety of lecture courses on the university-extension model, in which a number of lectures are given by one professor and at which the attendance is large; (2) public lectures and addresses by men and women prominent in various departments of life; (3) recreative and æsthetic entertainments, such as concerts, dramatic recitals, stereopticon lectures, etc. The public programmes are divided into series, each extending over a week and many emphasizing in the discussions some great movement of the time. No additional fee is charged for these lectures and entertainments, and they form a most popular and most successful part of the assembly work.

The Chautauqua Literary and Scientific Circle. Probably Chautauqua is best known in connection with the plan of systematic home reading. In 1878 at Chautauqua this plan was proposed and explained. The announcement went out to the press, and the first year 7000 persons were enrolled. From that time, every autumn and winter, readers varying in number from 8000 to 25,000 have joined the circle. During this period more than 300,000 persons have taken this work. About 50 per cent of these have done continuous work for two years, and about 60,000 have completed the four years' course.

The system was founded in the belief that thousands of ambitious men and women were only waiting for definite suggestion and aid in reading. The plan consists of: 1. A four years' course of reading, including selections in English from the ancient classics, history, economics, literature, and art. Each year of the four is devoted especially to a great nation and is known as "The Modern European Year," "The Classical Year," "The English Year," or "The American Year." No attempt is made to study language or mathematics. The course is general and follows in a measure the subjects taught in the average college; it gives what has been called the "college outlook." 2. Certain books, many of them specially prepared by well-known authors, are designated each year by a council of six prominent men. 3. A weekly (monthly up to 1913) magazine, the *Chautauquan*, containing supplementary articles on the subjects of the course by the leading writers of the day; general miscellaneous matter on current affairs; several departments designed to aid the reader, such as apportionment of the course by the week or month, notes on the books, outlines of reading, word studies, etc. 4. A membership book, sent to each reader, including analyses of the required books, and question papers (memoranda), to be filled out and returned to the office. These papers are intended to aid the reader in reviewing and systematically arranging the facts and principles he has learned. They are not examinations, nor are they regarded as such. 5. Local circles, which may be formed in any community where three or more readers desire the benefit of comradeship. More than 10,000 such circles have been formed. 6. A certificate, granted at the end of the course to all who state in writing that they have faithfully read all the required literature. Such certificate has no significance beyond the fact stated, and, of course, has not the significance of a degree.

The readers enrolling each year are known as a "class" and assume the numeral of the year during which their course is completed, after the plan of American colleges. This device, with the thought that so many people in this country and in foreign lands are reading the same books at the same time, creates a certain spirit of fraternity and enthusiasm that contributes to the success of the plan. For those who have completed the four years' course, or for others, there are many special courses in history, literature, science, and art, which enable a reader who has found a congenial subject in the general course to pursue a specialty. There is also a plan by which these special courses may be directed by correspondence with one or another college professor. More than 75 such specialized courses are offered. The importance of continued reading is always emphasized.

In 1902 a new charter was granted to Chautauqua Institution in the nature of an amendment. It states that the purpose and object of the institution shall be to promote the intellectual, social, physical, moral, and religious welfare of the people. To this end it may hold meetings and provide for recreation, instruction, health, and comfort on its grounds at Chautauqua; conduct schools and classes; maintain libraries, museums, reading and study clubs, and other agencies for home education; publish books and serials, and do such other things as may further its general purpose.

Present Status. Architecturally the summer city of Chautauqua has kept pace with the progress of the plan. All the schools and classes are provided with suitable buildings; there are public lecture halls of capacity varying from 200 to 5000, and for other than collegiate purposes there are four clubhouses, three gymnasiums, an imposing colonial market place, and various other community buildings. A large organ and a chime of eight bells are among the possessions of the institution. The revenue is collected, like the customs dues of a foreign city, at the gates. No public "collections" are ever taken. A tax is levied upon all who enter and become members of the community. The institution carries the municipal idea beyond mere material matters to include public instruction and entertainment. All exercises, except class instruction in the college, are free to any one within the town limits, and a ticket giving all the educational privileges of the assembly may be had at a nominal price.

Local Assemblages. There are now throughout the United States and Canada over 550 local assemblies modeled after the original Chautauqua Institution. Most of these are local in their influence; but a few, such as the Champlain Assembly at Plattsburg, N. Y. (see CATHOLIC SUMMER SCHOOL), and the Jewish Chautauqua at Atlantic City, N. J. (see JEWISH CHAUTAUQUA SOCIETY), are doing work quite similar in character to that at Chautauqua. There is no organic relation between these local assemblies and the original, but most of them adopt as a part of their regular work the home reading courses of the mother institution.

Bibliography. Vincent, *The Chautauqua Movement*, with introduction by Miller (Boston, 1886); *The Chautauquan Magazine* (Chautauqua, N. Y., 1880–); *The Chautauqua Assembly Daily Herald; The United States Bureau of Education, Report* (Washington, 1891–92, 1894–95, 1899–1900); Martin, *Social Circles and how to Form them* (Boston, 1888); *Chautauqua Reading Circle Literature* (Meadville, Pa., 1896–97); Raymond, *About Chautauqua: As an Idea, as a Power, and as a Place* (Toledo, 1886); Bray, *A Reading Journey through Chautauqua* (Chautauqua, 1905).

CHAUTAUQUA LAKE (Seneca *t'kenchiata'kwen*, one has taken out fish there). In Chautauqua Co., western New York, 730 feet above the level of Lake Erie, and about 1300 feet above sea level (Map: New York, A 6). It is 18 miles long and about 2 miles wide, with an outlet into Conewango Creek and thence into Allegheny River. It drains only a small area, having no large feeding streams. The lake is in a country famed for its scenery, and on its banks is the celebrated Chautauqua Summer School. Mayville is at the head of the lake and Jamestown at the foot, on the outlet.

CHAUVEAU, shō'vō', PIERRE JOSEPH OLIVIER (1820–90). A Canadian statesman and writer, born and educated in Quebec. He was elected to the Provincial Legislature in 1844 and became Solicitor-General in 1851 and Provincial Secretary in 1853. In 1855 he was appointed superintendent of education for Lower Canada. On the organization of Confederation in 1867 he became Premier of the Province of Quebec and in 1873 was chosen Speaker of the Dominion Senate. He was appointed professor of Roman law in Laval University in 1878 and at one time was president of the Royal Society of Canada. Besides poems, he published: *Charles Guérin, roman de mœurs canadiennes* (1852); *L'Instruction publique au Canada* (1876); *François-Xavier Garneau, sa vie et ses œuvres* (1883); *Bertrand de la Tour* (1898).

CHAUVEAU-LAGARDE, shō'vō' là'gärd', CLAUDE FRANÇOIS (1756–1841). A French advocate, born at Chartres. He defended Marie Antoinette, the Princess Elizabeth, General Miranda, Brissot, and Charlotte Corday before the revolutionary tribunal. Apprehended and imprisoned, he escaped death through the fall of Robespierre. In 1828 he became a counselor of the Court of Cassation. He wrote a *Note historique sur le procès de Marie-Antoinette et de Madame Elisabeth* (1816).

CHAUVENET, shō've-nā', WILLIAM (1820–70). An American mathematician, one of the charter members of the National Academy of Sciences. He was born in Milford, Pa., graduated at Yale in 1840, was professor of mathematics in the navy from 1841 to 1859, and assisted in the establishment of the Naval Academy at Annapolis and of its observatory, of which he was made director. He became professor of mathematics and astronomy in 1859, and chancellor in 1861, in Washington University, at St. Louis, Mo. In 1870 he was president of the American Association for the Advancement of Science. Among his works are an excellent *Treatise on Plane and Spherical Trigonometry* (1850) and a *Manual of Spherical and Practical Astronomy* (1863). Consult "Memoir of William Chauvenet," in the *Biographical Memoirs of the National Academy of Sciences* (Washington, 1877).

CHAUVINISM, shō'vĭn-ĭz'm. The name given in France to a policy of excessive national self-glorification, accompanied by an attitude of aggressive hostility to everything foreign. Chauvin was the name of an old battle-scarred veteran of the Empire who adored the memory of Napoleon and who was continually talking of his achievements at Austerlitz and Jena, and his determination to take a brilliant revenge for Waterloo. The vaudevillists of the day—Scribe, Cognard, Bayard, and Dumanoir—seized upon him as a subject for the comic stage, and since then a *Chauvinist* has come to mean a man who has extravagant and narrow-minded notions of patriotism and enmity towards foreign people, equivalent to the English word "Jingo."

CHAUX-DE-FONDS, shō de-fôN', LA (Fr., deep line). A town in the Canton of Neuchâtel, Switzerland, 9 miles northwest of Neuchâtel (Map: Switzerland, A 1). It is situated in a dry, barren valley of the Jura, at an elevation of 3070 feet above sea level, and is regularly built, with broad, straight streets, and stone houses. The most notable structures are the aqueduct, 13 miles long; the Protestant church, with a fine, vaulted roof; the hospital; the college, which contains the municipal picture gallery; the historical museum; and the library. Among the educational institutions is a watchmaking and art-engraving school. Chaux-de-Fonds is the second largest watch and clock making centre in Switzerland and also manufactures articles in gold, silver, bronze, and enamels, lenses and scientific instruments. Watch and clock making was begun here in 1705 by Jean Richard. Pop., 1900, 36,015; 1910, 39,597.

CHAVANNES. See PUVIS DE CHAVANNES.

CHAVANTÉAN, chä'vàn-tā'àn. A South American tribe, whose language forms a distinct stock, situated in the region of the upper Paraná and lower Paranapanéma, about 20° S. lat., in the State of São Paulo, Brazil. These "Chavantés" are to be distinguished from the "Chavantés" (also known as Akua) of Goyaz and Matto Grosso, who belong to the Tapuyan stock. The independent character of their language was recognized by Von Ihering in 1905. Consult H. von Ihering, *The Anthropology of the State of S. Paulo, Brazil* (2d ed., S. Paulo, 1906), and Chamberlain, in *Journ. de la Soc. des Amér. de Paris*, N.S., vol. vii, p. 185 (1910), and in *Science*, N.S., vol. xxxvii, p. 344 (1913).

CHAVES, shä'vĕsh (Portug., key). A town and fortress of the second class in Portugal, in Tras-os-Montes, near the Spanish frontier, situated on a plain on the right bank of the Tamega, which is here crossed by an old Roman bridge of 12 arches (Map: Portugal, B 2). In the neighborhood are saline springs, which are much

frequented, and the remains of a Roman bath-house. Because of its position near the Spanish frontier it was long maintained as a strongly fortified place, and its name "Chaves" is due to its being one of the "keys" of the North. Its industries consist of silk and linen weaving. Pop., 1900, 6463.

CHAY (chā) **ROOT** (Tamil, *chaya*), CHOYA, or SAYAN (*Oldenlandia umbellata*). A perennial herbaceous plant of the family Rubiaceæ, said to be a native of India. It is cultivated on the coast of Coromandel for the sake of its long, orange-colored roots, the bark of which affords a beautiful red dye. The quality of the bark is said to be improved by keeping it for some years. It is the coloring matter obtained from chay root which is used to paint the red figures on chintz. Chay root is the Indian madder, and with it some tribes in Ceylon formerly paid their tribute.

CHEAP'SIDE (ME. *chepe*, AS. *cēap*, bargain, ultimately connected with Lat. *caupo*, innkeeper + *side*). A street in London extending from St. Paul's Churchyard east to the Mansion House. It is famous for its fine stores, especially of jewelers and mercers, and for its historical reminiscences. It was originally an open square crossed by Watling Street (q.v.), where fairs, markets, and the like were held during the Middle Ages. It is from its mediæval use that it received its name. The square was narrowed down into a street after the "Great Fire."

CHEAT (abbreviation of *escheat;* OF. *eschet*, ML. *excadere*, from Lat. *ex*, out + *cadere*, to fall). As a term of English criminal law, cheat has a narrower signification than in popular usage. For example, a man may be induced to sell goods on credit to another by the false representation of the latter concerning his financial responsibility and thus be defrauded; but such fraud by the purchaser does not amount to a common-law cheat. To constitute that offense, false weights and measures, or a false token, coin, or sign must be used, or there must be a *conspiracy* (q.v.) to defraud. It was punishable as an offense against public trade rather than against an individual. By statute, both in England and in the United States, many fraudulent acts are indictable which did not amount to common-law cheats. See FALSE PRETENSES.

CHEAT. See BROME GRASS.

CHEAT RIVER. A river of West Virginia, formed of four confluents, rising in the eastern part of the State in the Alleghany Mountains, and uniting in Tucker County (Map: West Virginia, E 2). It flows through a region rich in iron and coal and joins the Monongahela River in Pennsylvania, 4 miles from the State line. It is about 125 miles long, but drains a rather narrow area, owing to the conformation of its watershed. It furnishes abundant water power and in portions of its course flows through narrow gorges amid magnificent scenery.

CHEATS, THE. A comedy by John Wilson written in 1662, published in London, in quarto, in 1664, and performed by Killegrew's company at Vere Street, Clare Market, in 1663. It is a satirical farce in mockery of the Nonconformists and excited so much disapprobation that it was soon withdrawn.

CHEATS OF SCAPIN, skā'păn', THE. A farce by Otway, performed in February, 1677, and published in the same year, bound up with the author's *Titus and Berenice*, which had been first produced at the same performance. A second edition appeared in 1701. It is a close adaptation of Molière's *Les fourberies de Scapin* and was played as far down as the end of the eighteenth century. The first edition was dedicated to Lord Rochester.

CHEBEC'. The least flycatcher (*Empidonax minimus*), a small, olive-green garden bird, common in the eastern United States, so named from its sharply accented call note. See PEWEE, and Plate of EGGS.

CHEBOYGAN, shē-boi'gan. A city and the county seat of Cheboygan Co., Mich., 166 miles north by west of Bay City, on the Michigan Central and the Detroit and Mackinac railroads, and on Lake Huron, at the mouth of the Cheboygan River (Map: Michigan, E 3). It has a good harbor, connected with lake ports by regular steamship lines, and has some reputation as a summer resort. The lumber interests are important, and there are large tanneries, canning factories, shipyards, and saw and paper mills. Settled in 1849, Cheboygan was incorporated in 1877. It is governed by a mayor and a city council. The water works are owned by the city. Pop., 1900, 6489; 1910, 6859.

CHECHEN. See TCHETCHEN.

CHECK, or CHEQUE. A bill of exchange (q.v.) drawn on a banker payable on demand. Such is the definition given in the English Bills of Exchange Act, 1882 (45 and 46 Vict., c. 61, § 73), and in the Negotiable Instruments Law, which has been adopted by a number of the United States. (See Laws of New York, 1897, c. 612, § 321.) In a few States it has been held that an instrument drawn upon a printed blank-check form, and differing from an ordinary check only in that it was payable on a day subsequent to its date, is a check, as distinguished from a bill of exchange. Such was not the prevailing view, however, even before the statutes above referred to. It is not necessary that a check be drawn by a customer on his banker, nor that it be drawn against funds, although ordinarily it is so drawn; and a person who obtains money on a check which he knows is drawn by one not entitled to draw for the amount specified therein commits a fraud and may be liable to criminal punishment. A check is intended for prompt presentment, and not for use as a continuing security; and when presented it is to be paid by the banker and canceled, not accepted and returned to the holder. In the United States the usage of certifying checks prevails. The liability of a bank which certifies a check drawn upon it is the same as that of a drawee who accepts a bill. The effect of certification upon the drawer's liability depends upon whether it was procured by the holder or by the drawer. If the drawer procures it, he remains liable on the check as the drawer of an accepted bill of exchange, payable on demand. If the holder procures it, the drawer and indorsers are discharged from liability. In other words, the holder in the latter case chooses to substitute for payment by the bank its promise to pay. Mere delay in presenting a check does not discharge the drawer, unless loss is caused to him thereby. At common law, if the delay did result in loss, as where the bank failed during the period of delay, the drawer was discharged in toto. By the English Bills of Exchange Act and the American Negotiable Instruments Law this has been modified, and he is discharged only to the extent of the loss caused by the delay.

Crossing checks is an English usage which does not prevail in this country. It consists (1) in writing across the face of the check the words "and Company" between two parallel lines, or in simply drawing two parallel transverse lines across the face; or (2) in writing across the face the name of the banker. The first is called a general crossing, the latter a special crossing. A crossed check is payable only when presented through a bank, and one crossed specially is payable only through the bank specified. The usage was introduced as a protection and safeguard to the owner of the check, but it did not restrain the negotiability of the instrument. The Bills of Exchange Act provides that if the crossing is accompanied with the words "not negotiable," a person taking the check shall not have, and shall not be capable of giving, a better title than that of the person from whom he took it.

In most respects other than those mentioned above, checks are governed by the rules which apply to bills of exchange. Consult the authorities referred to under NEGOTIABLE INSTRUMENTS.

CHECK'ERBER'RY. See GAULTHERIA; PARTRIDGE BERRY.

CHECK'ERED BEETLE. A beetle of the serricorn pentamerous family Cleridæ, so named because of its variegated markings. Some of them are antlike in form and coloration. The adults are found on flowers, such as *Spiræa*, and on trunks of trees, where they subsist on nectar and sweet sap. The larvæ live under bark and feed on wood-boring larvæ, even penetrating into the burrows in search of them. Some infest the hives of bees, where they devour the young bees, burrowing their way from cell to cell, and still others feed on dead animal matter. A synopsis of the North American species, by J. L. Le Conte, will be found in the *Annals* of the Lyceum of Natural History of New York, vol. v (New York, 1849).

A CHECKERED BEETLE.

CHECK'ERS (OF. *eschequier*, from ML. *scacarium*, chessboard, from *scacci*, chess, from Pers. *shāh*, king), or DRAUGHTS (Dutch *dragt*, Ger. *Tracht*, burden, from AS. dragan, to draw, Ger. *tragen*, to carry). A game played with "men" on a checkered board, made square, divided into 64 equal square spaces, colored alternately black and white, or any two strongly contrasted colors. The draughts, or checkers, are circular and flat. There are many varieties of checkers—Chinese, English, Polish, Spanish, Italian, and Turkish. A similar game was played by the Egyptians as early as 1600 B.C., and a form of it was popular in ancient Greece. The game is also found among the native tribes of the interior of New Zealand. In France it is called *les dames*, from its having been a favorite game with ladies; in Scotland the draught-board is called the *dambrod*.

Two persons play this game, each having a set of 12 men—one set black, the other white. The men may be placed either on the black or white squares, but they must all be placed on one color only. In England it is usual to play upon the white squares, with a black square to the lower right, and in Scotland upon the black, with a white square to the lower right, The men may be moved diagonally only, and by one square at a time. If an enemy's man stands in the way, no move may take place unless there be a vacant square beyond into which the piece can be lifted. The man leaped over is then taken and removed from the board. The object of the game is to clear the board of the enemy's men, or to hem them in so that they cannot be moved, and whichever party does so first wins the game. As no piece can move more than one step diagonally at a time, there can be no taking till the antagonists come to close quarters, and the advancing of them cautiously into each other's neighborhood is the chief art of the game. When a man on either side has made his way, either by taking or by a clear open path, to the opposite side of the board, he is entitled to be "crowned," which is done by placing another man on the top of his man. Crowned men may move either backward or forward, but always diagonally and by one square at a time, as before, and this additional power gives a great advantage to the player who owns the greatest number of "kings," and usually decides the game in his favor. Joshua Sturges's work, entitled *The Guide to the Game of Draughts*, first printed in 1800, edited by Kean and last published in 1892, is the standard authority. The rules and many diagrams will be found in *Spalding's Home Library* (New York). Consult also *Foster's Complete Hoyle* (New York, 1909) for different forms of the game, openings, etc.

CHECK'ING. In arithmetic, one of the oldest and best methods of checking the results of operations in decimal arithmetic is known as *casting out nines*. It originated at an early date among the Hindus, and from them it passed to the Arabs. Proofs for this rule appear in the works of Avicenna in the tenth century. Luca Pacioli (1494) adds this check to his work on division, pointing out cases in which it fails. Its use in elementary schools has been neglected more on the continent of Europe than in England, and not until recently has the method been seriously urged by American teachers. The process may be best explained by an example.

Required to check the multiplication, $35 \times 34 = 1190$:

(1) Dividing 35 by 9, the remainder is 8;

(2) Dividing 34 by 9, the remainder is 7;

(3) Dividing 56 (the product of 7 and 8) by 9, the remainder is 2;

(4) Dividing 1190 by 9, the remainder is likewise 2.

Therefore the product, 1190, is probably correct.

According to a proposition in the theory of numbers, the remainder (called the *excess*) arising from dividing a number by 9 is the same as that arising from dividing the sum of its digits by 9. Hence the above remainders may be obtained thus: (1) $3 + 5 = 8$; (2) $3 + 4 = 7$; (3) $5 + 6 = 11 = 9 + 2$; (4) $1 + 1 + 9 + 0 = 9 + 2$ as before.

In the case of addition the excess in the sum is equal to the excess in the sum of the excesses of the addends. Thus, in $635 + 234 = 869$, $6 + 3 + 5 = 9 + 5$, $2 + 3 + 4 = 9 + 0$, $8 + 6 + 9 = 2 \times 9 + 5$, but $5 + 0 = 5$; therefore the sum 869 is correct.

From the identity of division, dividend = divisor $\times$ quotient + remainder, it appears that the excess in the first member must equal that in the second. Hence the check for division is made to depend upon that for addition and

multiplication. Thus, in $8765 = 42 \times 208 + 29$, $8 + 7 + 6 + 5 = 2 \times 9 + 8$; $4 + 2 = 6$, $2 + 0 + 8 = 9 + 1$, $2 + 9 = 9 + 2$; $6 \times 1 + 2 = 8$; but $8 = 8$, therefore the division is correct.

In practice the sum of the digits is rarely found. As soon as the addition produces 9, this is rejected, and so on. Thus, in 180136, $6 + 3 = 9$, $1 + 0 + 8 = 9$; hence 1 is the excess.

If the result obtained from any operation differs from the true result by a multiple of 9, the check evidently fails, as is also the case if the result differs from the true result by having certain digits interchanged. These cases, however, rarely occur. Any number could be chosen for the purpose of checking, but the excess for 9 is easier found than that for any other number not having more exceptions to its efficiency.

The method of casting out nines is only one of several important checks used in mathematical operations. In algebra one of the principal checks is that of arbitrary values. Thus, in the multiplication of $a^2 + 2ab + b^2$ by $a + b$, the product is $a^3 + 3a^2b + 3ab^2 + b^3$. This may be checked by substituting any arbitrary values for a and b, as $a = 2$, $b = 3$, giving $5 \times 25 = 125$. There is also the check of homogeneity, likewise illustrated by the above multiplication, where the product of two homogeneous functions of degrees 1 and 2 respectively is also homogeneous of degree $1 + 2$. Functions which are, as in the above case, symmetric with respect to certain letters, also give rise in general to functions symmetric with respect to those letters when one is operated upon by the other, thus suggesting a simple check. The use of checks characterizes the work of all who have to perform operations of various kinds in any of the branches of mathematics, and the importance of the subject can hardly be overestimated. Consult Beman and Smith, *Higher Arithmetic* (Boston, 1895).

CHECKY, chĕk′ĭ, or **CHEQUEE,** chĕk′ê (OF. *escheque*, from *eschequer*, to check). The name given in heraldry to a field or charge composed of small squares of different tinctures, generally metal and color. See Plate of Heraldry.

CHEDDAR (chĕd′dar) **CHEESE.** See Cheese; Cheese Making.

CHEDORLAOMER, kĕd′ôr-lâ-ō′mēr. A king of Elam, who, according to Gen. xiv, conquered Palestine, but 13 years later was forced to make an invasion in order to establish his authority. He was accompanied by Amraphel (q.v.) of Shinar, Arioch (q.v.) of Ellasar, and Tidal of Goyim. Having conquered the Rephaim, the Zuzim, the Emim, and the Horites, and proceeding as far as El Paran, he returned by way of En Mishpat, slew the Amalekites and the Amorites in Hazezon Tamar, and defeated in a pitched battle the five kings of Sodom, Gomorrah, Admah, Zeboiim, and Zoar, but was smitten near Dan by Abram, who rescued his nephew, Lot. Concerning the historical character of this narrative as a whole many scholars entertain grave doubts. Chedorlaomer is indeed a possible Elamitish name, as Kudur occurs in Kudur Nanchundi and Kudur Mabuk, and Lagamar is the name of an Elamitish goddess. Three cuneiform tablets have been found dating probably from the Achæmenian and the early Seleucid periods, in which some scholars have seen a reference to King *Kudur Lagamar*, but the name in the first is only *Kudur* KU KU *mal*, in the second *Kudur nuch* (?) *gu mal*, and in the third, *Kudur nuch* (?) *gu;* the first also has the names *Erim aku* and *Tudchula*, and the second *Eriekua*. When these men lived is not indicated in the inscriptions. Tudchul may be identical with Tidal, as the guttural *ch* may represent the letter *ayin*, and it has been suggested that Goyim is a textual error for Gutim. Eri Aku may be the same as Rim Sin, a son of Kudur Mabuk, who actually reigned in Larsa, Aku being the Elamitish equivalent of Sin, the name of the moon god. There can be little doubt that Amraphel represents Hammurapi (2124–2081 B.C.). An invasion of Palestine by an Elamitish king is not improbable. But there is as yet no direct evidence from the monuments of any of these kings. While it is thought by some scholars that the names were found by a Babylonian Jew and put into connection with the story of Abram, others regard it more probable that a Palestinian cuneiform source was used. The names of the kings of the submerged cities (see Sodom) are regarded by some as symbolical and fictitious, while others maintain that they are of a type that may be expected in Palestine at the time, and are drawn from the same document. This difference of opinion also applies to Melchizedek (q.v.). We have no means at present of determining whether Abram was mentioned in the original source. The whole chapter is supposed by some students to be a *midrash* written as late as in the fourth century B.C., and some late touches are generally admitted even by those who prefer in so delicate a matter to suspend judgment until more archæological evidence can be obtained. Consult, especially, King, *Letters and Inscriptions of Hammurabi I* (London, 1898); Clay, *Light on the Old Testament from Babel* (Philadelphia, 1906); Meinhold, *I Mose 14, Eine historisch-kritische Untersuchung* (Giessen, 1911); Dhorme, in *Revue Biblique Internationale* (1908); Pilter, "Some Amorite Personal Names in Gen. xiv," in *Proceedings of the Society for Biblical Archæology* (1913).

CHEDUBA, chê-dōō′bâ, or **MANAUNG.** An island off Arakan, Burma, in the Bay of Bengal, stretching from lat. 18° 40′ to 18° 56′ N., and from long. 93° 28′ to 93° 46′ E. Area, 308 square miles. Pop., 1901, 26,899; 1911, 30,197 (Map: Burma, B 3). The soil is fertile, yielding rice, tobacco, sugar, indigo, cotton, hemp, and large quantities of a vegetable oil, equally fitted for burning and for varnishing. The principal mineral is petroleum. The island is of volcanic origin and still contains an active volcano in the northwestern corner. The coast has earthy cones, which emit mud and gas. The town of Cheduba, or Manaung, in the northeast, has a population of 1540.

CHEE′CHA (native name). A gecko (*Hemidactylas frænatus*) of Ceylon, India, and the Orient, 4 or 5 inches long, which is semidomesticated. "It makes its appearance soon after sunset, about the walls of the Indian dwellings, in search of flies and other small insects. If some attention be shown it, however, it will present itself every evening at the accustomed place, . . . soon becoming very tame." See Gecko.

CHEE′LA, or **CHILA.** See Serpent Eagle.

CHEER PHEASANT, chēr fĕz′ant. A crested pheasant (*Catreus wallichi*), of the middle ranges of the Himalayas, which varies from the true pheasants in lacking the bright metallic plumage and in other details. It ranges from

Chamba on the west to Khatmandu in Nepal, being found between 4000 and 10,000 feet elevation according to the season. Flocks of 5 to 15 are found in the vicinity of steep mountain sides, where it scratches vigorously for edible roots and feeds also on berries, seeds, and insects. It breeds in May and lays 8 to 10 eggs. It is the only member of its genus.

CHEERYBLE (chēr'ī-b'l) **BROTHERS, THE.** Twin brothers, Charles and Edwin by name, who are benevolent friends to Nicholas and Kate in Dickens's *Nicholas Nickleby*. They are said to be drawn from the Grant brothers who were Manchester cotton spinners in Dickens's day.

CHEESE (AS. *cēse*, from Lat. *caseus*, cheese). A food product made from milk by separating the curd or casein and portions of the fat and other constituents from the whey, shaping the mass into different forms, and usually ripening or curing it. The product has been known since earliest times, the oldest mention of it dating back to about 1400 B.C. It was a common food material long before butter was known, the references to butter in the Bible being more correctly translated 'curdled milk.' The Greeks were familiar with cheese making at the time of Homer, and Aristotle refers to the renneting of milk with the sap of the fig. Hippocrates mentions cheese made from mare's milk and from goat's milk. Sheep's milk was employed for this purpose by the early Egyptians. The Romans used cheese as food quite extensively and were familiar with several kinds, one similar to Limburger, others flavored with spices and herbs, and some which were smoked in the process of making. Columella gives a very good description of the methods employed in cheese making, and Pliny describes the foreign cheeses to be had in Rome, some of which were quite celebrated.

At the present day more than 150 different kinds of cheese made in Europe and America have been described. These depend for their characteristics upon the kind and condition of the milk used, the process of making, the seasoning, and especially upon the conditions incident to the ripening or curing. (See CHEESE MAKING.) Cow's milk is, of course, mainly used, but in some parts of Europe the milk of goats and sheep is also employed. The milk may be sweet or sour; it may contain different amounts of fat, depending upon whether whole milk, skim milk, or milk to which cream is added is used, and the cheese may be hard or soft, according to the amount of water left in it and the character of the curing. The principal hard cheeses are the common Cheddar cheese, the English Cheshire and Stilton, the Dutch Edam and Gouda, the Schweitzer (Swiss) or Emmenthaler (French product, known also as Gruyère), and the Italian Parmesan and Gorgonzola. Among the soft cheeses are Brie (*Fromage de Brie*), Camembert, Neuchâtel, Limburger, "brick," Philadelphia cream, and cottage cheese, or "smierkäse." The famous Roquefort is a semisoft cheese. In addition to these there are many fancy brands of cheese made in the United States and Canada by mixing ground cheese with cream, or butter, or oils, and sometimes adding a flavoring material, such as Meadow-Sweet, Club-House, Canadian Club, etc. Pineapple cheese is ordinary cheese made very firm and pressed into the shape suggested by its name. In composition cheeses of the same general variety vary quite widely, owing to differences in the richness of the milk used, the amount of water left in the curd, and the age of the product. As cheese ripens and ages, it dries out considerably, losing from 8 to 15 per cent of its water. The water in ordinary factory cheese varies all the way from 15 to over 50 per cent, although in well-cured cheese it usually constitutes about one-third, or 35 per cent. The remainder is solid matter, composed mainly of fat, casein (protein), and a little sugar and ash (mostly salt). Fully one-half of the solids in a whole-milk cheese should be fat; in skim-milk cheese the proportion is considerably less. Van Slyke found the average composition of whole-milk cheese made in New York factories to be: water, 31.5; fat, 37; protein, 26.25; ash, sugar, etc., 5.25 per cent. The average of a large number of American analyses differs but little from this, and is as follows: water, 34.2; fat, 33.7; protein, 25.9; ash, sugar, etc., 6.2 per cent. The average percentage composition of a number of the more common kinds of cheese is shown by the accompanying table.

KIND	Water	Fat	Protein	Sugar, ash, etc.
Cheddar (American)	34.2	33.7	25.9	6.2
" made from partly skimmed milk	38.2	29.5	25.4	6.9
" made from skim milk	45.7	16.4	31.5	6.4
Pineapple	23.0	38.9	29.9	8.2
Schweitzer	32.7	32.6	29.5	5.2
Edam	34.0	27.4	30.9	7.7
Parmesan	32.7	25.1	36.8	5.4
Stilton (made from milk and cream)	29.1	35.6	27.4	7.9
Cheshire	34.8	29.5	28.6	7.1
Roquefort	38.8	31.5	23.4	6.3
Limburger	42.1	29.4	23.0	5.5
Neuchâtel	43.4	32.3	17.1	7.2
Fromage de Brie	51.4	25.7	17.9	5.0

Many of the foreign cheeses, such as Emmenthaler (Schweitzer), Edam, Neuchâtel, brick, and Limburger, are now successfully made in the United States; but more than nine-tenths of all the cheese made in this country is the familiar standard variety known as Cheddar. The grades of this cheese commonly recognized are: "full cream," made from whole (unskimmed) milk; "skims," made from skimmed or partly skimmed milk; and "filled" cheese, in which foreign fat is substituted for the natural fat of the milk. The latter is the most serious form of adulteration of cheese, and as the product is palmed off as "full-cream cheese," it is to be regarded and should be treated as a fraud. Its base is skim milk, which is very abundant and cheap in creamery districts. The fat added is usually oleo oil or neutral lard, and from these cheap materials it is said that filled cheese can be made for four or five cents a pound. It is not easily detected by ordinary sampling when fresh; but it has little flavor or aroma, and its quality is short-lived. The exportation of considerable quantities of this cheese under fraudulent names has unfavorably affected the export cheese trade of the United States. Several of the dairy States have prohibited its manufacture, and others have enacted laws requiring its proper labeling.

The general reputation of American cheese at home and abroad has also suffered from the extent of the manufacture of skim cheese, or half-skims. While these are regarded as legitimate products, and, if well made, are highly

nutritious, they should always be plainly marked and sold for exactly what they are. Unlike the ripe and finely flavored Parmesan cheese, which is made from skim milk, the American skims are generally flat in flavor, hard, and horny. Several of the dairy States, notably New York and Wisconsin, have passed laws authorizing the use of State brands on cheese made from whole milk, guaranteeing the quality of the cheese so branded. Canada has prohibited by law the manufacture of either skim-milk or filled cheese. It is one of the largest cheese-producing countries, exporting about 200,000,000 pounds a year.

The cheese production of the United States in the middle of the last century was about 100,000,000 pounds a year and at its close about 300,000,000 pounds, from 30,000,000 to 50,000,000 pounds being exported. The total production in 1910 was 320,530,000 pounds. New York and Wisconsin are the two principal cheese-making States, the former making about 50 per cent more than the latter, and both together producing three-fourths of the entire output of the country. Farm-made cheese has been almost entirely superseded by factory cheese. (See CHEESE FACTORY.) From 30,000,000 to 40,000,000 pounds of cheese are annually imported into the United States, nearly one-half coming from Italy (Parmesan and Gorgonzola), and 30 per cent from Switzerland (Schweitzer).

Food Value. In proportion to its bulk, cheese is a highly nutritive food, both as regards tissue-forming material (protein) and as a source of energy (fuel value). The few digestion experiments which have been made with cheese indicate that the protein and fat in it are quite thoroughly digested. Well-ripened cheese is more thoroughly digested than green cheese. As regards ease of digestion, it appears that fat cheese, thoroughly ripe cheese, or that which is porous, is more quickly digested than other sorts. The distress which some persons experience after eating cheese may be due to a variety of causes, such as overindulgence, especially at the end of a hearty meal, eating a concentrated food without proper dilution with other foods, or insufficient mastication. There are undoubtedly some persons who cannot eat cheese, owing to some personal idiosyncrasy not easily explained, just as there are those who cannot eat strawberries or some other food. In general, it may be said that cheese thoroughly deserves the reputation of being a nutritious and wholesome food which it has had for centuries. Cheese is eaten alone, or combined with other food materials. The more highly flavored kinds are most commonly served at dessert and eaten in small quantities, while the mild sorts often replace to a considerable extent meat or other animal food and constitute an important part of the meal. Occasionally cheese causes a severe, or even fatal, illness. This is due to the growth of peculiar microörganisms and the consequent production of poisonous substances called "ptomaines." But these are by no means confined to cheese and are likely to occur in many other highly nitrogenous foods.

For bean cheese, or bean curd, see SOY BEAN.

CHEESE CEMENT. See CEMENT.

CHEESE FACTORY. A place where cheese is made on a commercial scale. The first cheese factory in the United States was established at Rome, N. Y., in 1851, by Mr. Jesse Williams, a farmer and skillful cheese maker. The idea of bringing together the milk from several neighboring farms, to be made into cheese by a skillful operator, has spread extensively throughout the dairy States and has been adopted abroad. In 1869 the number of cheese factories in the United States had reached over 1000, and since that time this coöperative, or factory, system has practically superseded the making of cheese on farms. There are now said to be over 3500 factories in the United States. The advantages of the system are diminished cost of production, a more uniform and superior quality of cheese, a higher and more regular price, and a great reduction of labor at the farm. Cheese factories are operated on two plans—viz., the stock company or coöperative system, under which the farmers own and manage the factory, through proper officers; and the proprietary plan, in which an individual owns and operates the factory, making cheese for the patrons for a certain price, which in New York State is usually one dollar per hundredweight. The milk is hauled to the factory daily by the patrons, the distance being in many instances several miles. Payment for the milk is usually made on the basis of the weight, account being taken of the amount of milk required to make a pound of cheese. The demonstration that the fat content is a reliable index to the cheese-producing value of milk has led some progressive factories to adopt this basis, which is carried out as at creameries (q.v.). There is a wide difference in the size of cheese factories. Some make only 5 or 6 cheeses a day, while others make over 20 in the height of the season. An average-sized factory produces from 8 to 10 cheeses a day, requiring the milk of about 300 cows. The kind made is almost exclusively Cheddar cheese.

CHEESE INSECTS. Insects affecting cheese are as follows: *Cheese hopper*, or *cheese skipper*, the larva of *Piophila casei*, a small, black, shining, two-winged fly, which lays its eggs on cheese, smoked ham, and chipped beef. The white, slender eggs hatch in 24 to 36 hours, and the cylindrical, white, tapering larva feeds voraciously upon the cheese, ham, or beef, completing its growth in from seven to eight days, and remaining in the pupal condition 10 days longer. The name is derived from the fact that the larva will bring the two ends of the body together and suddenly release them, like a spring, jumping in this way for 3 or 4 inches. In the United States this insect plays a more important rôle as an enemy of smoked ham than of cheese. It seems to prefer the outer, fatty portions. The substances attacked should be kept in scrupulously clean, well-aired rooms; the windows should be screened through the summer, and all shelf cracks should be occasionally washed out with a kerosene emulsion. *Cheesemite*, a minute, whitish, gregarious mite (*Tyroglyphus siro*) of a genus destructive to flour, sugar, etc., which feeds upon cheese, leaving a brown, powdery mass of shed skins where it has worked. Cleanliness in the place where cheese is kept is the best preventive.

CHEESE MAKING. The making of Cheddar cheese, which is the common cheese made in the United States and Canada, and also extensively in England, may be taken as illustrating the general principles upon which the process depends. The milk used should be free from taint or smell, and of good quality as regards composition. While the casein of the milk is

the part which is curdled and gives the body to the cheese, the fat is an important constituent of the finished product, and it has been conclusively shown that the cheese-producing power of milk is measured by its percentage of fat. Hence the fat content of milk indicates its value for both cheese and butter making. The casein in milk exists in a state of semisolution, from which it is separated or curdled by acids, as in the case of sour milk, or by rennet extract prepared from the stomachs of young mammals. The latter is most commonly used in making Cheddar cheese. Pepsin, which is the active agent of rennet, may be used equally well. The fresh milk is first ripened to the proper degree—i.e., a certain amount of lactic acid is developed in it by keeping it for a short time at about 85° F. The acidity accelerates the action of the rennet. When the milk is sufficiently ripe, the rennet is added in diluted form and stirred in, the milk being held at from 82° to 86° F. Ten or fifteen minutes are required to carry the curdling to the proper stage, after which the curd is cut into small pieces with gangs of steel knives, in order to facilitate the contraction of the curd and the expulsion of the whey. The mass is then stirred gently for about five minutes, and subsequently heated to about 98° or 100°, the result being the formation of more acid and a further shrinkage of the curd. The object in these operations is to separate the whey from the curd with the least possible loss of fat. Most of the fat is inclosed in the curd mechanically, but some little goes into the whey, the amount depending upon the skill of the operator. When the curd has assumed the proper consistency (usually judged by its stringing out in little threads when touched with a hot iron), the whey is drawn off and the curd is allowed to mat together into a solid mass. This is cut up into blocks, which are turned so as to maintain a uniform heat throughout. The development of acid, which continues, changes the character of the curd, and when the hot-iron test shows threads 2 or 3 inches long, the curd is ground, or, more properly speaking, cut, and salted, the salt hardening the curd and checking the further development of acid. It is then pressed to bring it into suitable form and remove any surplus whey. After this it is ripened in cool rooms or cellars. This is an important part of the process and has much to do with determining the general quality and character of the cheese. In it the casein is peptonized and changed to forms which are digestible, and the characteristic flavors are developed. If the temperature of the curing room is too high, the cheese ripens rapidly, but gets off flavor and even spoils; and if the air is too moist, the cheese molds. Low temperature and slow curing are much the safest methods, from 45° to 50° F. being recommended, and even a freezing temperature is employed with success. Cold-cured cheese is smooth and mild, and there is less shrinkage in curing due to water evaporation. To avoid the latter, cheeses are often coated with paraffin.

The losses in cheese making occur in the whey and in drippings from the cheese press. The albumin, a milk constituent similar to casein, is not coagulated by the rennet and passes into the whey. This is true also of the milk sugar, only a little being carried into the curd. The fat of the milk is quite largely (all but 5 or 10 per cent) recovered in the cheese in careful making. The amount of cheese that can be made from 100 pounds of milk depends upon (1) the skill of the maker, (2) the amount of water left in the cheese, and (3) the composition of the milk. As mentioned above, the richer the milk is in fat, the greater the amount of cheese that can be made from it under skillful handling. In recent years successful experiments have been made in making Cheddar cheese from pasteurized milk to which hydrochloric acid is added. This gives a more uniform product, removes the difficulty from tainted milk, and places the process under better control.

In the manufacture of other kinds of cheese than Cheddar the details of the process are modified somewhat, or different kinds of milk are used, or the ripening process is different. In the case of a number of kinds special ferments are introduced into the curd to bring about desired characteristics and flavors. This is true of Roquefort cheese, which was originally made from sheep's milk, but in which some cow's milk is now often used. A mold cultivated upon bread is mixed with the curd, and this gradually permeates the whole mass, giving it a mottled bluish color and imparting a characteristic flavor. The characteristics of Limburger are also due to specific fermentations induced during ripening, which result in a putrefactive odor. This cheese is made from sweet milk, the curd being formed into cakes about 5 inches square and 2 inches thick, and not pressed. The main cause of the putrefactive fermentation during ripening is the extremely moist condition in which it is kept. Successful experiments in making Camembert cheese have been conducted at the Connecticut Experiment Station, which have shown the nature of the peculiar fermentation. Schweitzer cheese is made from perfectly fresh, sweet milk—i.e., without ripening—and is of waxy texture, with large "eyes" or holes distributed evenly through it. The curing covers two stages and is carried on in two cellars to secure the proper conditions. It requires a number of months, a fine Swiss cheese being at least 8 or 10 months old before it is eaten.

The spherical dark-red Edam cheese is made quite similarly to Cheddar cheese, the curd being placed in molds to give it its form. It is sometimes made of partly skimmed milk. The curing process is practically the same as for Cheddar cheese, being continued for at least 8 or 10 months. The color is due to the application of an alcoholic solution of carmine when the cheese is ready for market.

The rich Stilton cheese of England, which is very highly esteemed, is made of milk to which cream is added, and is ripened for two years. This ripening is sometimes assisted by mixing some old grated cheese with the curd. The Italian Parmesan cheese is made from skimmed or partly skimmed milk, much like Cheddar cheese, but is ripened for a much longer time. It is very hard and keeps almost indefinitely. Brie is a rennet cheese made in France for several centuries, using cow's milk to which a coloring matter is added. The familiar cottage cheese, Dutch cheese, or smierkäse, is made of sour milk, no rennet being used, and is eaten while fresh. Part skim milk is often used, or a little cream or butter may be added to the curd. The American Neuchâtel, which comes in little cakes wrapped in tinfoil, is likewise a soft, unripened cheese, to be eaten while fresh, but is made from sweet milk with the addition of

rennet. Buttermilk cheese, a new product devised by the Wisconsin Experiment Station, is made by heating slightly acid buttermilk at 130°–140°, when the curd separates out. It is a soft cheese and keeps only a few days. See also CHEESE; CHEESE FACTORY.

CHEESE RENNET. See BEDSTRAW.

CHEETA, chē'tȧ, **CHITA** (Hind. *cīta*, from Skt. *citra*, spotted), or HUNTING LEOPARD. A large tropical cat (*Cynælurus jubatus*). It forms an aberrant genus of the Felidæ, differing from *Felis* prominently by its greater comparative length and slenderness of limb, which enables it to run for a short distance with the greatest speed, probably, of any of the larger mammals, and also by the fact that its claws are short, blunt, and almost nonretractile. It therefore pursues its prey by chase rather than by stealth, and to these doglike characteristics adds a docility unusual among cats. It is about the length of the leopard, but stands much higher; in color it varies from tawny to bright rufous, lighter underneath, marked everywhere except on the throat with small, solid spots of black, which are neither rosettes nor arranged in lines; the length of the crisp, erectile hair ("hackles") on the neck and shoulders is another feature. See Plate of WILD CATS, under CAT.

The cheeta is distributed over nearly all Africa, but commonly only in the equatorial jungles and thence sparingly eastward to India. It is in southern India that it is best known, because there it is kept tame and trained by many wealthy natives for the chase of black buck, etc. The methods of training are described by J. L. Kipling (*Beast and Man in India*, London, 1891) and result often in producing a harmless household pet. When taken hunting, it is driven in a cart, leashed and hooded, so that the sport resembles falconry. As soon as the game is sighted, the attendant removes the hood, the cheeta, quivering with excitement, understanding perfectly the meaning of the movement; and then the freed animal, after a glance to find its prey, rushes forward, overtakes and drags it down; it will, however, use catlike stealth should circumstances suggest. The game is never brought back, but held by the cheeta, which must be found quickly and captured—an operation requiring skill, for its native ferocity has been aroused. Having been rewarded with a draft of blood, it is rehooded and confined. The sport (to which the caracal has occasionally been trained for the chase of birds) is of very ancient date, as appears from its depiction on early Assyrian and Egyptian monuments. It was introduced into Europe by returning Crusaders in the fourteenth century and flourished for two centuries in Italy and France. For particulars, consult article by J. E. Harting in the *Field* (London, Dec. 26, 1885). For general description, see *Royal Natural History*, vol. i (London, 1894); for wild habits in Africa, Drummond, *Large Game . . . of Southern Africa* (London, 1875); for habits and sport in India, Blanford, *Fauna of British India* [mammals] (London, 1888–91); Baker, *Wild Beasts and their Ways* (New York, 1890); Sanderson, *Wild Beasts of India* (London, 1893). Facts and illustrations relating to its use in sport in the Middle Ages may be found in La Croix, *Mœurs et usages des moyen âges* (6th ed., Paris, 1878).

CHEETAL, chē'tŭl, or **CHITAL** (Hind. *cītal*, from Skt. *citra* spotted). The axis deer.

CHEETHAM, chēt'am, HENRY (1827–99). An English clergyman and religious author. He was born at Nottingham, studied at Christ's College, Cambridge, and in 1856 was settled as curate of Saffron Walden, Essex. He held the vicarage of Quarndon, Derbyshire, from 1858 to 1870 and was consecrated Bishop of Sierra Leone in the latter year. In 1882 he resigned to become vicar of Rotherham, Yorkshire. His most important publications are *One Hundred Texts of Irish Church Missions* and a volume of *Sermons.*

CHEETHAM, SAMUEL (1827–1908). An English divine and theologian of the Established church, archdeacon and canon of Rochester. He was born at Hambleton, educated at Christ's College, Cambridge, and was fellow there in 1850 and assistant tutor in 1853–58. From 1863 to 1882 he was professor of pastoral theology at King's College, and from 1879 to 1882 archdeacon of Southwark. He was an editor of the *Dictionary of Christian Antiquities* (1875–80) and published: *A History of the Christian Church during the First Six Centuries* (1894); *The Mysteries, Pagan and Christian* (1897); *Mediæval Church History* (1899); *History of the Christian Church since the Reformation* (London, 1908).

CHEE'VER, EZEKIEL (1615–1708). An American educator. He was born in London, but came to New England in 1637 and assisted (1638) in founding New Haven, where he became prominent as a deacon, a minister, and especially as a teacher. He also taught in Ipswich (1650–60) and in Charlestown and was at the head of the Boston Latin School for 38 years. He prepared the *Accidence, a Short Introduction to the Latin Tongue*, which was used as a textbook for a hundred years. Consult Gould, *Ezekiel Cheever, Schoolmaster* (Boston, 1905).

CHEEVER, GEORGE BARRELL (1807–90). An American Congregational clergyman. He was born in Hallowell, Me., and graduated at Bowdoin College in 1825 and at the Andover Theological Seminary in 1830. Two years later he was installed as pastor of a Congregational church in Salem, Mass. The Unitarian controversy attracted his attention, and he was an earnest defender of the orthodox system. Temperance also became a leading idea, and in 1835 he published in a Salem newspaper "Deacon Giles's Distillery," a bitterly satirical allegory which had a wonderful popularity. The author

was prosecuted and imprisoned a month for libel. He then traveled for some time in Europe and, on his return in 1839, became pastor of the Allen Street Presbyterian Church in New York. He resigned in 1844, and from 1846 until his retirement in 1867 was pastor of the church of the Puritans, New York. During the fierce debate that preceded the Civil War he was an active and uncompromising antislavery advocate. At an early age he began to contribute to the *North American Review* and later wrote much for the *Independent* and the *Bibliotheca Sacra*. Among his published works are: *Studies in Poetry* (1830); *Lectures on the Pilgrim's Progress* (1843); *The True History of Deacon Giles's Distillery* (1844); *Wanderings of a Pilgrim* (1846); *Journal of the Pilgrims at Plymouth in 1620* (1848); *God Against Slavery* (1857); *Faith, Doubt, and Evidence* (1881).

CHEFOO. See CHIFU.

CHEHALIS, chē-hā'lĭs. A city and the county seat of Lewis Co., Wash., 33 miles south of Olympia, on the Great Northern, the Northern Pacific, and the Union Pacific railroads (Map: Washington, C 4). There are saw and shingle mills, and factories of furniture, building materials, etc. Pop., 1910, 4507.

CHEIRANTHUS, kī-răn'thŭs. See WALLFLOWER.

CHEIROLEPIS, kī-rŏl'ē-pĭs (Neo-Lat., from Gk. *χείρ, cheir,* hand + *λεπίς, lepis,* scale). The earliest-known ray-finned fish, found in the Devonian rocks of Europe and North America. The body was slender, about 20 inches in length, and was covered by the regular rhomboidal ganoid scales, which in this genus were very small and reënforced on their inner surfaces by vertical ridges. The skull had almost the normal development of external bones, and the jaws were strong and well provided with teeth. The fins, which had very finely divided rays, consisted of a pair of pectoral, a pair of pelvic, and an anal and dorsal fin, and the tail was heterocercal. *Cheirolepis* is a member of a heterogeneous family of fishes, the Palæoniscidæ. See STURGEON; PALÆONISCUS.

CHEIROMANCY. See CHIROMANCY.

CHEIROTHERIUM, kī'rō-thē'rĭ-ŭm (Neo-Lat., from Gk. *χείρ, cheir,* hand + *θηρίον, thērion,* dim. of *θήρ, thēr,* beast). The name given by Dr. Kaup to the animal which produced the peculiar handlike impressions on the Triassic rocks of this country and Germany. The remains of the animal having been found and its structure made out, this name has given place to the more characteristic one of *Labyrinthodon*. See STEGOCEPHALIA.

CHEKE, chēk, SIR JOHN (1514–57). An English scholar, one of the revivers of classical learning in England during the sixteenth century. He was born at Cambridge, and became a fellow of St. John's College in 1529. He devoted himself assiduously to Latin and Greek, particularly the latter language, then much neglected in England. When the regius professorship of Greek was founded in Cambridge by King Henry VIII, Cheke was appointed to the chair. In 1544 he became tutor to Prince Edward (afterward Edward VI). He became a member of Parliament in 1547, and again in 1552–53, provost of King's College in 1548, and was knighted in 1551.

When Mary came to the throne, Cheke, who was a Protestant and had been Secretary of State for Lady Jane Grey, was stripped of all his possessions and imprisoned. Later he was released and went to the Continent. In 1556 he was seized in Belgium by the agents of Philip II of Spain and brought back to England. Being now compelled to choose between the stake and the Catholic religion, he accepted the latter. Of his numerous writings the most remarkable is his translation of the *Gospel of St. Matthew*, ed. by Goodwin (1843). He lectured on Demosthenes and wrote *De Pronuntiatione Græcæ Linguæ* (1555); through this work he introduced into England a new method of pronouncing Greek. Consult Strype, *Life of Cheke* (Oxford, 1821).

CHEKH (chĕk) LANGUAGE AND LITERATURE. See CZECH LANGUAGE; CZECH LITERATURE.

CHEKHOV, chĕ'kŏf, ANTON PAVLOVITCH (1860–1904). A famous Russian writer of the younger school, which includes Gorky, Andreev, and Artsybashev. He was born at Taganrog (southern Russia), and although his parents were uneducated themselves—they were both liberated serfs—he himself received a good education. In 1884 he completed the medical course at Moscow University, but soon he decided to follow a literary career. His early work, dating from 1879, consisted chiefly of humorous sketches appearing in the more popular periodicals under the pseudonym "Chekhonte." Encouraged by the suggestion that he was capable of worthier things, Chekhov approached his work more seriously, and soon he was hailed by literary critics as the greatest figure in Russian literature since the days of Turgenev—a distinction which in a measure is still his. Chekhov died of tuberculosis at 44, but into his short life he crowded the writing of over 150 short stories, a number of plays, and at least one full novel. So popular did he become in Russia that it was no uncommon thing for a collection of his works to sell from 10 to 14 editions in a comparatively short time.

Most of his writings have been translated into German or French. In English only the following are available: "Philosophy at Home" (*Short Stories*, October, 1891); "Sorrow" and "The Biter Bit" (*Temple Bar*, May, 1897); "In Exile" (*Fortnightly Review*, September, 1903); "Street Scene in Russia" (*Canadian Magazine*, April, 1905); "Sleepy-Eye" (*Cosmopolitan Magazine*, June, 1906); "Darling" (*Fortnightly Review*, September, 1906); "Terrible Night" (*Current Literature*, January, 1907); and "Bad Conduct" (*New England Magazine*, January, 1909). There are also in English two collections of Chekhov's tales —*The Black Monk and Other Stories* (1903) and *The Kiss and Other Stories* (1908). His plays accessible in English are: *The Sea Gull* (1905); "The Cherry Garden" (*Yale Courant*, 1908); *The Swan Song* (1912); and "Uncle Vanya" and "Ivanhoff" (in *Plays by Anton Tchekhoff*, 1912).

Chekhov's distinguishing characteristics are extreme compression, strict realism and objectivism, complete aloofness, an unusual mastery of words, and a delicate sense of humor. He has been sometimes called a pessimist; but in view of his charming comedies, especially *The Cherry Garden* (his last and most inspiring play), this charge can hardly be sustained. He represents petty and aimless characters with the same intent that he depicts hypocrites and frauds. As a true realist, he could not avoid them.

CHE-KIANG, chĕ'kē-äng' (Chinese, crooked river). A maritime and eastern province of China, bounded by the Province of Kiang-su on the north, the Pacific on the east, Fu-kien on the south, and Kiang-si and An-hwei on the west. The Chusan Archipelago is also a part of the province. It is the smallest of the provinces and one of the oldest and most fertile parts of the Empire, 36,680 square miles in area. Drained by 14 large rivers (and the Yang-tze-kiang once had a mouth here) and many smaller streams, it produces abundantly tea, rice, cotton, silk, wheat, indigo, and other crops, while the forest and fruit trees comprise every species known in eastern China, so that the people have little need to import materials for food or clothing. Its capital is Hangchow, the centre of the silk district, and on the line of China's partly completed railway system. Ningpo is the chief seaport. Other important cities are Wenchow, a treaty port in the south, and Huchou, on the south shore of T'ai-hu Lake, in the north. In 1899 Italy attempted to gain part of this province, but failed. Pop. (est. in 1910), 17,000,000. Next to Shantung it is the most densely populated province of the Republic.

CHELAN, shē-lăn', Lake. A serpentine sheet of water in Chelan Co., Washington, situated amid picturesque mountain and glacier scenery (Map: Washington, E 1). It is over 40 miles long and from 2 to 3 miles wide. It is fed by the Stehekin or Pierce River, on which are the famous Rainbow Falls, 300 feet high, 3 miles above the entrance to the lake. The lake drains at Chelan Falls into the Columbia River. Stehekin, Moore, Lucerne, Lakeside, and Chelan on its banks are summer resorts. Steamers ply on its waters, and there are fine angling and shooting in the district.

CHELARD, she-lär', Hippolyte André Jean Baptiste (1789–1861). A French musician, born in Paris. He studied under Fétis and at the Paris Conservatory under Gossec and Dourlen. In 1811 he won the Grand Prix de Rome and became in Italy a pupil of Baini, Zingarelli, and Paisiello. His first opera, *La casa a vendere* (1815), was produced in Naples; but his second, *Macbeth* (book by Rouget de Lisle), was not brought out till 1827. Its failure discouraged Chelard, who retired to Munich and rewrote the entire work. In revised form it met with considerable success, and its composer was appointed court kapellmeister at Munich. In 1829 he returned to Paris and opened a music store, but upon its destruction in the revolution of 1830 he returned to Munich. He conducted German opera in London (1832–33), and in 1836 was called to Weimar as kapellmeister of the Grand Duke. His successful operas, *Der Student* (1831); *Mitternacht* (1831); *Die Hermannsschlacht* (1835), his best work; *Der Scheibentoni* (1842), and *Der Seekadett* (1844), were all produced in Germany. He died in Weimar. A posthumous opera, *L'Aquila romana,* was produced in 1864 in Milan.

CHELIDONIUS, kĕl'i-dō'ni-ŭs, Benedictus (?–1521). A Benedictine monk. His true name was Schwalbe ('a swallow'), of which the name by which he is better known is a Græco-Latin punning translation. While in the abbey of St. Egidius, in Nuremberg, built by the Emperor Conrad III in 1140 for the Scotch Benedictines, he wrote, in 1511, the Latin verses to Albert Dürer's cartoons on "The Apocalypse," the "Passion of Christ," and the "Life of the Virgin Mary," besides poems on his monastery and its abbots. His love of learning earned him the nickname "Musophilus." In 1515 he became abbot of the Scotch Benedictine monastery of the Virgin Mary in Vienna, and there he died, Sept. 8, 1521.

CHELIUS, kā'lĭ-o͝os, Maximilian Joseph von (1794–1876). A German physician, born in Mannheim and educated at the University of Heidelberg. He was professor of surgery in Heidelberg from 1817 to 1864, where he contributed greatly to the advancement of the science. His works include: *Ueber die Amputation im Fussgelenk* (1846); *Ueber das Staphyolm der Hornhaut* (1847); *Handbuch der Chirurgie* (8th ed., 1858); *Ueber die Heilung der Blasen-Scheidenfisteln durch Kauterisation* (1845); *Zur Lehre von den Staphylomen des Auges* (1858).

CHELLEAN, shĕl'ē-an. The designation applied by French archæologists to one of the oldest epochs of man in Europe, named from Chelles, in the Department of Seine-et-Marne. The climate of the Chellean epoch was warm and humid, and the flora of the Seine valley was that of the Mediterranean basin, and the fauna characterized by the hippopotamus, rhinoceros, and *Elephas antiquus.* The fact of man's existence there rests on the occurrence in vast numbers of the leaf-shaped, chipped flint implement called by the French Chelléan. Consult Mortillet, *Le préhistorique* (Paris, 1900). See Paleolithic Period.

CHELLES, shĕl, Jean de (?–c.1270). A French architect and sculptor, famous for having built and decorated the beautiful portal of the south transept of Notre Dame in Paris (begun in 1257), with its sculptured portal and rose window. The contemporary chapels of the nave are also probably by him, and he may have had a hand in the building of the original Louvre.

CHELMINSKI, chĕl-mĭn'skē, Jan (1851–). A Polish genre and battle painter. He was born at Brzostov, Russian Poland, and studied in Warsaw under Kossaks and at the Munich Academy under Wagners, Brandt, and Franz Adam. The years 1884–87 he spent in the United States. After that he passed much time in London and in Paris, where he took up his residence. His early works are principally military and hunting subjects. Attractive and lively in execution, they met with great success. Among them are: "Stag Hunt in the Time of Louis XV" (1876); "Morning in the Ukraine"; "Empress of Russia on a Fox Hunt" (1888). These were followed by a series of battle pictures from the wars of Napoleon, particularly the deeds of the Polish legion. More recent works are "The Outskirts of Soissons, 1814" (1907), "Reconnaissance in the Mountains" (1910), "Pursuit of a Courier, 1812" (1911).

CHELMSFORD, chĕmz'fērd. The county town of Essex, England, at the confluence of the Chelmer and the Cann, 30 miles east-northeast of London (Map: England, G 5). The town contains factories for making agricultural implements and electric appliances, iron foundries, breweries, and grain mills. Its chief trade is in agricultural produce. It has large and important corn and cattle markets. Pop., 1901, 15,572; 1911, 18,008. Chelmsford belonged to the Bishop of London from Anglo-Saxon times to 1545. It was a prosperous town under the Edwards.

CHELMSFORD. A town in Middlesex Co., Mass., 4 miles southwest of Lowell, on the New York, New Haven, and Hartford and the Boston and Maine railroads, and on the Merrimack River (Map: Massachusetts, E 2). It is the seat of the Middlesex County Training School and contains Adams Library, Silver Lake, and a number of old houses of historic interest. The town is in an agricultural and fruit-growing region and has woolen and worsted mills, machine shops, and cotton-scouring plants. It is governed by a board of three selectmen. Pop., 1900, 3984; 1910, 5010.

CHELONIA, kĕ-lō′nĭ-ȧ (Neo-Lat. nom. pl., from Gk. χελώνη, *chelōnē*, tortoise), or TESTUDINATA (Neo-Lat. nom. pl., from *testudo*, tortoise). An order of reptiles, having the body protected above and below by bony expansions forming shields usually covered with horny plates. It is the least variable of the reptilian group and comprises the turtles, tortoises, terrapins, carets, etc. See TORTOISE and TURTLE, under which heads a description of fossil forms will also be found.

CHELSEA, chĕl′sē (AS. *Celchyp*, Chalkport, from *celc*, chalk + *hyp*, port). Formerly a suburban village of London, England, on the north bank of the Thames, 4½ miles southwest of St. Paul's, and now a metropolitan and parliamentary borough of Greater London (q.v.) (Map: London and Vicinity, E 6). From the sixteenth to the eighteenth century it was a place of aristocratic habitation and is now the chief literary and artistic residential section of London. During the nineteenth century George Eliot, Rossetti, Whistler, and Carlyle, "the Sage of Chelsea" (whose house in Cheyne Row is preserved as a public memorial to him), were residents. The celebrated Ranelagh and Cremorne Gardens were situated here. Bridges connect Chelsea with Battersea, on the south bank of the river. Its features of note are the Chelsea Hospital (q.v.); the Royal Asylum for Soldiers' Children; military barracks; the old church of St. Luke's, built in 1307–27, one of the most interesting of metropolitan parish churches; the Sloane Botanic Gardens; the London Water Works of 1772, and the "Embankment," a favorite riverside promenade. Chelsea porcelain has been famous since the eighteenth century. Pop., of borough, 1891, 72,954; 1901, 73,856; 1911, 66,385. Consult: Martin, *Old Chelsea* (London, 1888); Beaver, *Memorials of Old Chelsea* (London, 1890); Davies, *Chelsea Old Church* (London, 1904).

CHELSEA. A city in Suffolk Co., Mass., and a suburb of Boston, from which it is 3 miles distant, on the Boston and Maine Railroad (Map: Massachusetts, E 3). It is connected with Charlestown by a bridge across the Mystic River, and with Boston by ferry and steam and electric railroads. The principal public buildings are the courthouse, city hall, United States naval and marine hospitals, Frost Hospital, soldiers' home, public library, State armory, and Ye Olde Pratt House. The city contains also Union Park and public playgrounds, and a soldiers' monument. Though Chelsea is principally a residential place, it has manufactures of rubber goods, woolens, foundry and machine-shop products, shoes, brass goods, wireless apparatus, boxes, lithographs, stoves and furnaces, tiles, pottery, etc. The city owns and operates its water works. The government is vested in a mayor, elected annually, and a board of aldermen, one elected from each of the five wards, and four at large. The board elects the city clerk, treasurer, solicitor, auditor, assessors, messenger, clerk of committees, and commissioners of sinking fund, and, upon nomination of the executive, all other municipal officials. The mayor's clerk alone is appointed by the mayor. The annual income of the city for 1913 was $274,637. The principal items of expenditure were: police department, $60,736; fire department, $73,534; schools, $199,230. Pop., 1890, 27,909; 1900, 34,072; 1910, 32,452; 1920, 43,184.

First settled in 1626 as Winnisimmet, Chelsea was part of Boston from 1634 to 1638, when it was incorporated as a town under its present name. Here, in May, 1775, occurred a sharp skirmish between a body of British troops and 1000 Americans under Stark and Putnam, the latter being victorious. Chelsea was incorporated as a city in 1857. Out of parts of Chelsea the present towns of Winthrop and Revere were created. In 1908 a great fire occurred in Chelsea, causing the destruction of 17,000,000 dollars' worth of property. The city recovered from this loss rapidly, however. Consult Winsor, *Memorial History of Boston* (4 vols., Boston, 1880–81).

CHELSEA. A town and the county seat of Orange Co., Vt., 22 miles south by east of the State capital, Montpelier (Map: Vermont, E 5). It has manufactures of lumber, bobbins, and dairy products. Pop., 1890, 1230; 1900, 1070; 1910, 1074.

CHELSEA CHINA. Chinaware made in Chelsea, London, between 1745 and 1784. Its leading marks are an anchor and triangle.

CHELSEA HOSPITAL. An asylum in Chelsea, London, for disabled and superannuated soldiers. It was founded by Charles II, who built the present building in 1682–92, on the site of the College for Religious Controversy (Protestant) founded by James I in 1609. Originally one day's pay per year and two in leap year were deducted from the pay of soldiers in service in order to defray the hospital expenses. This deduction, however, has long since ceased, and the asylum is maintained by parliamentary grant and governed by a board of commissioners appointed by the crown, who are charged also with the duty of awarding all pensions granted by the British government. The initial plan of giving all pensioners accommodation in the asylum has been necessarily abandoned. The in-pensioners in 1913 numbered 558, and the out-pensioners 84,393.

CHELSEA VILLAGE. A former village, now a part of New York City. In the early part of the nineteenth century it formed the farm of Clement C. Moore, author of "'Twas the Night before Christmas," who, when on the point of abandoning it on the ground of its distance from the city, was persuaded to sell it in building lots. The name is still in use by old residents and is preserved in Chelsea Square, between Twentieth and Twenty-first streets and Ninth and Tenth avenues, the site of the General Theological Seminary.

CHELTENHAM, chĕl′t'n-*ȧm* (village on the Chelt). A municipal and parliamentary borough and fashionable watering place in Gloucestershire, England, 8 miles northeast of the city of Gloucester (Map: England, D 5). It lies in a picturesque valley, on the Chelt, a small stream which rises in the adjacent hills and flows into the Severn. It is sheltered on the east and

southeast by a semicircle of the Cotswood Hills. The town is regularly laid out and well built and has fine public promenades, gardens, terraces, and squares. Among its numerous churches, the parish church of St. Mary's, dating from the fourteenth century, is a fine example of Gothic architecture. The town was incorporated in 1876. It returns one member to Parliament. Modern improvements include electric lighting, an excellent water supply, and a system of sewerage in connection with three large sewage farms. A public library, an art school, baths, a cattle market, and slaughterhouses are also maintained. Cheltenham has become famous for its colleges and schools, among which are the grammar school (founded in 1574), Cheltenham College, training colleges for schoolteachers, and many private schools. Its popularity, however, is chiefly due to its mineral springs, considered to be especially efficacious in cases of dyspepsia and affections of the liver. In consequence, such a large proportion of the resident population consists of Anglo-Indians that the town has been nicknamed "Asia Minor." The Cotswold Hunt holds its meets here and draws many visitors during the hunting season. Roman remains have been discovered on the site of the town. It is mentioned in *Domesday Book*, but it was not until the discovery of its mineral springs, in 1716, that it began to rise into importance. The visit of George III in 1788 set upon it the seal of fashion. Its growth in the nineteenth century was very rapid. Pop., 1901, 49,439; 1911, 50,035.

CHEMICAL NOTATION. See Chemistry, *Chemical Formulas.*

CHEMICAL SENSE IN ANIMALS. The capacity of an animal for particular mental processes conditioned upon the chemical constitution of the stimuli acting upon it. The criterion of the chemical sense is to be found, as are, indeed, the criteria of all the senses, in the specialized mode of behavior with which the animal responds to the particular class of objects concerned. Many of the lowest forms of animals (e.g., amœba) respond to the presence of chemicals in their environment in the same way that they respond to mechanical contact with a solid object; they cannot, however, be said to give evidence of a chemical sense, since the identity of response to mechanical and chemical stimuli shows no indication of a special experience concomitant with the one kind of stimulation and not with the other. A very little higher in the biological scale the specialized response is found; while still higher there seems to be a difference in the reaction of the animal to substances in solution and to those diffused in air—a difference which has led to the discrimination of two senses, taste and smell.

Among the cœlenterates we first find evidence of a separate chemical sense. Hydra responds to food by seizing it with its tentacles, a performance never elicited by mechanical stimulation. Sea anemones exhibit at least two responses to chemical substances. In the one, the positive reaction, a particle of food is seized by the outer tentacles and passed on by means of the inner tentacles to the mouth. In the other, the negative reaction, the tentacles withdraw in the presence of certain chemicals, such as quinine. In both of these animals the difference in the character of response to chemical and mechanical stimulation indicates an independent chemical sense. In other members of the group, however, the response to both sorts of excitation is the same, although the chemical stimulus seems to be more readily effective, or, as is the case in jellyfish, effective only in certain parts of the creature. In neither of these cases are we justified in assuming the existence of a separate chemical sense. (For form of behavior as sole index of mental processes, see Animal Psychology.)

As we progress higher in the evolutionary scale, the evidences of the chemical sense become more abundant and more striking. The flatworms show a fairly complex feeding reaction. One form of earthworm will burrow only in the presence of the juices from manure, which constitutes its usual environment. There is some evidence for both taste and smell in snails. Starfish perceive food at a distance, and may even be made to follow a bit of meat about an aquarium. Most of the Crustacea (crabs, crayfish, etc.) show a general restlessness when in the presence of food, and it is thought that in some forms chemical stimulation is effective in guiding the male to the female. Spiders give evidence of smell, in that they will move away from glass rods, dipped in certain oils, which are held behind them.

In insects there is a remarkable development in the sense of smell, both in respect to sensitivity and in respect to the number of discriminable smell qualities. Evidence of extreme olfactory sensitivity is seen in the mating of moths. A male moth, when liberated over a mile away, has been known to find the only female in the region within a very short time. A female of another species, hatched in a region where the species was practically unknown, was visited, within a few hours after she became mature, by 60 males. When the female was placed in a tightly sealed box, however, no males came.

Ants appear to be sensitive to a considerable number of different smell qualities, which play an important part in determining their complex behavior. Ants apparently distinguish the smell of food and of their larvæ and discriminate between nest mates and foreigners also in terms of smell. They are guided in the paths to and from the nest very largely, although not entirely, by smell, and it has been suggested that the ability of certain forms to recognize, upon coming at random across a path, the direction to the nest as distinct from the direction from it, is in some way due to an olfactory perception. The fact that the antennæ, which bear the organs of smell, are movable, makes it possible that ants may have an olfactory space perception not unlike tactual space perception in man.

Bees are, perhaps, no less well endowed for olfactory discrimination, although vision plays a more important rôle in their habits than it does with ants. One investigator finds evidence of a large number of specifically different smell qualities—the smell of the individual workers, of the queen, of the drones, of the larvæ, of food, of wax, and of honey.

There is no conclusive evidence for a chemical sense in fishes, amphibia, or reptiles, although

it is suspected in fishes. Most birds are probably without the power of smell.

In spite of the lack of experimental work upon mammals, there is no doubt that in general they possess the capacity for both taste and smell, aquatic animals, such as whales, porpoises, and seals, forming a probable exception as regards smell. In most other members of the group olfactory sensitivity is very great and the power of discrimination remarkable. Not only can they sense very faint odors, but those animals, like the dog, which are primarily dependent upon smell in their daily life, appear to be able to isolate a single smell component within a highly complex mixture.

For details of behavior of particular forms, see articles under those animals. For method of interpretation of observed data and for bibliography, see ANIMAL PSYCHOLOGY. See also CHEMOTAXIS; TROPISM, *Chemotropism*.

CHEMICAL SOCIETY, AMERICAN. A society founded in 1876 for the discussion of subjects connected with and allied to chemistry. The society holds annual meetings, frequently in conjunction with other scientific societies. The membership in 1913 was 6673, including 14 honorary members, 13 life members, and 64 corporation members. Two journals are published, the *Journal of the American Chemical Society* and the *Journal of Industrial and Engineering Chemistry*. The first is edited by W. A. Noyes, and the second by M. C. Whitaker. There is also published a series of *Chemical Abstracts* edited by A. M. Paterson.

CHEMICAL WARFARE. The organized use of chemical materials to do injury to the personnel or matèriel of an enemy, or to wreak destruction of crops, and permanent and temporary structures, or otherwise to render uninhabitable certain regions. The chief field of such effort has been in the use of asphyxiating or poisonous gases, but as shown in the World War the activity of the military chemist was by no means confined to such limits. The earliest recorded use of suffocating gases in military operations was at the siege of the cities of Platæa and Belium in the war between the Athenians and the Spartans about 431 B.C. Here sulphur was burnt and the fumes were employed to harass the enemy. In modern times the first serious proposal to use toxic gases was in August, 1855, when the British Admiral, Lord Dundonald, familiar with the deadly effects of sulphur fumes in Sicily, proposed to the British Government a detailed plan for the reduction of the fortress of Sebastopol by such a method. This proposal was officially disapproved on the ground that "the effects were so terrible that no honorable combatant could use the means required to produce them." From that time the discussion of poisonous gases in warfare was academic and with little thought of the actual use of such materials. However, it was in the minds of military men, as evinced in the introduction of the subject at the Hague Conference of 1899 (see PEACE MOVEMENT), when among the declarations adopted was one providing for the prohibition of the use of projectiles diffusing asphyxiating or deleterious gases. Several European and Asiatic nations acquiesced in this declaration at the time, but many did not sign the articles until later. Thus provision was signed and ratified by Germany on September 4, 1900, but the United States never signed the declaration, which furthermore was not to be binding in case of a war in which a non-signatory was or became a belligerent.

Again at the second Hague Peace Conference in 1907 rules for land warfare were adopted, and Article 23 of these rules stated that "It is expressly forbidden to employ poisons or poisonous weapons," while at the Washington Peace Conference of 1922 a treaty was signed by the powers there represented relative to abolishing the use of poisonous gases. See VOLUME XXIV.

The active beginning of the use of toxic gas in the World War dated from April 22, 1915, when chlorine was released by the Germans in an attack against the French and British lines in the northeastern portion of the upper Ypres salient (see VOLUME XXIV). This was indeed a momentous step for the Germans, as it introduced into civilized warfare a new weapon which led to new tactics of offense and defense.

The importance of the use of toxic gas in modern warfare is shown by the fact that during the year 1918, from 20 to 30 per cent of all the American battle casualties were due to it, but there was the compensating feature that where armies were supplied with masks and other defensive equipment only about 3 or 4 per cent of the gas casualties were fatal as compared with 20 to 25 per cent for those wounded by high explosive shell, shrapnel, bullets, etc. By far the greater part of the gas casualties resulted from the gas projectiles fired by field artillery, which in the British Army reached the great total of 170,000. In fact it was estimated that 90 per cent of the total gas casualties could be thus accounted for, notwithstanding the heavy losses at the first attacks in 1915 among troops quite unprepared when cloud gas was released from cylinders. But trusting to air currents to carry the gas was not satisfactory, and it was charged into projectiles which could be fired from guns, howitzers or mortars.

The use of lethal shells began in 1916 and these projectiles charged with deadly gases were used in addition to the lachrymatory gases. The three main killing gases used in chemical warfare were phosgene, diphosgene, and chlorpicrin. Their use made improved masks or respirators essential, and it was a constant contest between developing new toxic gases and finding adequate protection against them.

Chlorine (q.v.) was the first gas to be used and after it had been allowed to escape from cylinders, it was found that in its liquid form it could be filled into shells, which discharged from regular field pieces, would be detonated in the usual way by a fuse and booster charge and small bursting charge of high explosive. Chlorine is a greenish yellow gas of strong suffocating odor which commercially is used for bleaching and purification of water supplies. By cold and pressure it is liquefied for storage and transport. At Ypres the Germans permitted this gas to float out but they were insufficiently supplied with it, and also with means of protecting themselves so that they were afraid to advance through it.

Phosgene, a gas formed by the combination of chlorine and carbon monoxide in the presence of a catalyzer, is a colorless gas that liquefies at 8° C. It was one of the deadliest gases used during the war and was employed not merely to annoy or to compel the wearing of masks but to kill as many as possible. It was often used in an attack as it did not persist long in the air or on the ground after the explosion of the shell,

and as a result it would clear away by the time that the oncoming troops reached the place of gas concentration.

Chlorpicrin, a gas that is an active poison and in addition a lachrymator or tear producer, is made by the reaction between picric acid or calcium picrate and chlorine. It is a colorless liquid that boils at a temperature of approximately 112° C, and the gas while not so poisonous as some of the toxic gases nevertheless was quite efficient. This after chlorine was the first war gas to be made on a large scale in the United States.

Mustard Gas, Dichlorethyl Sulphide, was introduced by the Germans in July, 1917, at Ypres and immediately became a most effective agent in gas warfare. It also proved a boomerang for the Germans, as they never were able to improve their original facilities for manufacture which could not produce more than 6 tons per day at the end of the war. At that time France and England had improved methods and quantity production, while the United States had 10 times the German capacity at the time of the Armistice. This gas, it is interesting to note, was prepared by the Germans by the method originally described by Victor Meyer and later developed in Emil Fischer's laboratory. Mustard gas is a colorless, slightly oily liquid boiling at 220° C. with some decomposition and freezing at 14° C. or below, the former temperature applying to the pure liquid. Mustard Gas was not necessarily fatal except in sufficient amounts and it acted on the skin like a deep burn. It attacked the lungs, the eyes, the skin and even the intestines. It blistered the skin and produced nausea thus requiring the removal of the mask. It had a delayed action and often a man might be gassed even fatally before he was aware of it, and then he was beyond the reach of treatment. Ground soaked with mustard gas remains impregnated for days continually giving off the vapor.

Diphosgene, or Superpalite, Perchlormethyl formate, was extensively employed by the Germans as was *Diphenylchlorarsine,* their blue cross gas, which produced sneezing and a disagreeable temporary sickness. The latter gas was not considered by the Allies very efficient though made by the Germans in large amounts. *Diphenycyanarsine* and *Ethyl Dichlorarsine* were also employed by the Germans.

Lachrymatory or tear gases were extensively used during the World War by both sides in order to annoy and cut down the efficiency of the enemy and most of all to compel him to keep masked continually. This form of gassing was cheaper than the use of poison gas and even a trace of tear gas in the air would blind a man temporarily. In fact a single tear gas shell could distribute its charge so widely as to require the wearing of masks over an area so wide that from 500 to 1000 phosgene shells would be needed for the same effect. The tear gas was irritating to the membranes of the eye, and so far as it alone was concerned goggles might suffice for protection, but the usual practice was to mix it with deadlier gases. Most tear gases had bromine as a base, the bromine being derived from subterranean brines, and the gas could be used alone, but such combinations as brombenzyl cyanide were made, the one specified being extensively produced in the United States.

In addition to the gases mentioned others were employed and new toxic materials were developed during the war by organic and physiological chemists. Much was accomplished that was never revealed, and had the war continued another year the annihilation of the Central Powers by the discharge from aircraft of deadly gases produced in the United States and elsewhere was predicted.

Gas Masks. Naturally the use of gas immediately resulted in defensive measures. After the first attack by the German in 1915, extemporized masks and impregnated fabric helmets were rapidly developed in England and hurried to the Continent consisting merely of gauze pads soaked with neutralizing chemicals. Then came masks or helmets of the box respirator type first introduced by the British in August, 1916, where absorbing and neutralizing chemicals purified the air before it was inhaled by the wearer. An essential element of these respirators was the charcoal which had to be prepared with great care. Gradually the British and the Americans developed double protection masks which were efficient under all conditions. There were also protective suits and gloves to resist mustard gas.

Tactical Use of Gas. By 1917 the extensive and effective use of gas led to the development of special tactics both for attack and defence. Shells filled with gas and appropriately painted or striped to indicate the charge were issued along with shrapnel and high explosive. The kind of gas selected was determined by the nature of the plan or the military objective, all carefully considered especially with regard to the target and terrain. For example, in case of an advance, a gas that would disperse readily would be employed, or it might be that lanes would be left for the troops going up to seize or contest an objective. It must be remembered that while ordinary high explosive or shrapnel shell exerts its effect immediately after the burst, that of a chemical shell has just begun and may even persist in the case of some of the chemical charges for a week or ten days. Furthermore, a bomb-proof shelter, safe against flying fragments, is no protection against chemical shell whose fumes can pass around corners or sink into the ground.

The artillery during the war made a distinction between "lethal" and "neutralizing" projectiles and fire and this was the basis of the marking of the shell. The lethal shell is used to produce casualties and was employed against occupied positions for surprise effect, the object being to concentrate the greatest possible number of shell on the target in the smallest time, which should not exceed two or three minutes, as in that time gas masks can be adjusted and no further casualties should develop. In attacks of this kind phosgene is employed. With neutralizing shell or those filled with chemicals which are persistent and vaporize slowly, a slow searching fire is maintained scattered over the area to be neutralized. In other words the aim is to develop an atmosphere intolerable for unprotected troops, so that the artillerist seeks to find lines of communication, camps, rest billets, trench systems, cross roads, battery positions, and in short any point where troop are likely to be concentrated. The aim is to make them wear respirators, thus cutting down their efficiency in using field or machine guns, construction or supply work or the bringing up of transport.

Just as the Germans introduced the various types of chemical shell in the World War, so they also developed tactics for its effective use. Their first shell was fired over a considerable area with low concentration, but the results while not always considerable were encouraging so that when they had Mustard Gas and other lethal gases available they began to use a high explosive charge and greater concentration. When it was proposed to advance infantry they began by using mustard gas on the areas where the attack was contemplated, and then a shelling of the front areas was made with Green Cross (Phosgene) shell. The Germans developed detailed tactics using the various shell — "Yellow Cross," "Blue Cross," "Yellow Cross 1," "Green Lorraine Cross," and others as they fitted into the general plan. At the end of the World War, it was stated that 40 per cent of all shell issued to the artillery should be chemical shell divided as follows:

	Per Cent
Mustard Gas	24
Lethal Gas	10
Lachrymatory Gas	6

Incendiary projectiles, short and long range, hand grenades and drop bombs all found their place in the bitter warfare that was waged, and no substance capable of causing injury or destruction was overlooked. The incendiary projectiles usually contained a charge of phosphorous or thermit or a mixture of thermit and oil. For trench fighting flame projectors were developed but were never extensively employed.

CHEMISTRY. The science of the various material substances that are capable of existence, of their relations to one another, and of the laws governing their various transformations.

The Name. The origin of the word "chemistry" is uncertain. *Chemia* (or *Chemi*) is the old name of Egypt, and as the art of making gold and silver was first practiced in that country, the *science of chemeia* (*χημεία*) may have meant originally 'the science of Egypt.' Later, however, at the time of the Alexandrian alchemists, the word was used to denote some substance; and as, on the one hand, the word *chemi* means 'black,' and, on the other hand, the first step in the transmutation of metals is known to have been a process of blackening, we conclude that *chemeia* may at that time have denoted the 'philosopher's stone,' i.e., the substance employed in the process of blackening the metals. Similarly, in the form *al-kîmiyâ*, the term is used also by the early Arabic writers to denote, not their art, but a substance employed in that art. With them, however, the term was used in much the same sense as the word *al-iksîr*, and this suggests another possible derivation. The word *iksîr* is derived from the Greek *xēros* (*ξηρός*), which means 'dry.' Possibly, then, the word *kîmiyâ* may have been derived from the Greek *chymos* (*χυμός*), which means 'liquid'; and while at one time both *iksîr* and *kîmiyâ* were used to denote a substance, the words *chymeia* (*χυμεία*) and *alchymy* gradually came to denote the art in which that substance was employed, the substance itself (the philosopher's stone) retaining only the name *al-iksîr*.

The Branches of Chemistry. The facts of chemistry have been grouped in a variety of ways, either in the interests of research or according to their usefulness in connection with kindred sciences or with the arts. Hence such titles as Animal, Vegetable, Medical, Astronomical, Metallurgical Chemistry, etc., which in a general way explain themselves. Chemistry proper may be considered as comprising the following four branches: analytical, descriptive, general, and applied. *Analytical chemistry* may be defined as the art of determining the composition of substances; under the names of technical analysis, physiological analysis, etc., many of its methods form an important part of applied chemistry. *Descriptive chemistry* deals with the chemical and physical characteristics of substances; it forms a record of the properties of substances, which are arranged, for convenience of reference or for didactic purposes, in accordance with the principles of general chemistry. The two great subdivisions of descriptive chemistry are *inorganic* and *organic* chemistry, the latter dealing with the compounds of carbon, the former with those of all the other elements. *General chemistry* includes theoretical and physical chemistry, which are usually treated together; theoretical chemistry comprises the laws of the composition and chemical behavior of compounds; physical chemistry treats of the physical properties of compounds, of homogeneous mixtures, and of the physical phenomena (thermal, electrical, etc.) accompanying the transformations of substances in general. *Applied chemistry* comprises all the facts and methods of chemistry that find practical employment. The most important subdivisions of this branch are: (1) biological chemistry, including the chemical facts connected with physiological and pathological phenomena in animals and plants; (2) agricultural chemistry, which deals with problems of rural economy; and (3) industrial, technological, or practical chemistry, which deals with the uses of chemistry in the arts and manufactures.

The Methods of Chemical Philosophy. Like any other science, chemistry may use two different ways in discovering and demonstrating its general principles. On the one hand—and this is the surest way—a principle may be induced from a large number of experimental observations; it is then nothing but the statement of a general fact, and is termed an *empirical law*. Thus, the principle of the conservation of matter is an empirical law. Perhaps this law may suggest itself a priori; but as a law of science it has been induced from facts established by the balance. On the other hand, there are problems which cannot be attacked by experiment. Thus, the problem of the ultimate structure of matter lies far beyond our power of direct observation; yet it is intimately connected with the correlation of substances, and therefore chemistry is compelled to consider it for purely practical reasons. In cases of this nature chemistry, like any other science and like speculative philosophy, makes some plausible assumption, termed a *hypothesis*. Like speculative philosophy, it develops the hypothesis, combines it, if necessary, with other assumptions, and thus builds up a *theory*. But at this point, where speculative research reaches its ne plus ultra, the work of the scientist really begins. The general principles forming part of the theory are busily applied to phenomena capable of direct observation, and then, if their correctness is indicated by actual experiment, they become *theoretical laws*. A scientific theory has for its object, first, to correlate seemingly different facts, and, secondly, to throw light on the road of in-

vestigation and lead to the establishment of new facts. Thus, the atomic theory of chemistry has correlated the various chemical substances with regard to their composition and constitution, and it has revealed the possible existence of innumerable compounds many of which have since been actually prepared—an achievement not unlike the discovery of Neptune by theoretical astronomy.

SUBSTANCES

The Chemical Elements. Some 80-odd among the many thousand substances known to chemists have been classed together as the chemical "elements." They include the pure metals (gold, silver, iron, tin, zinc, etc., but not the alloys, like brass) and, on the other hand, a set of substances (carbon, sulphur, phosphorus, oxygen, nitrogen, hydrogen, etc.) called "the metalloids." A list of elements may be found in the article ATOMIC WEIGHTS.

A priori the mind almost refuses to accept the belief that the universe is built up of a number, like 80, of substances, each of which is ultimately simple and unrelated to the others. At all periods in the history of scientific thought men have rather inclined to the belief in the qualitative unity of matter, to the idea that the substances and materials found in nature or prepared artificially consist essentially and ultimately of one and the same thing, a *single* primordial matter. Towards the very end of the nineteenth century we find so keen a chemical thinker as Van't Hoff expressing the opinion that the elements may yet be decomposed when we have learned to produce high enough temperatures.

However, in spite of such philosophic views held by chemists as well as by scientists in general, the metals and metalloids continued to be regarded as elements and to be classed apart from other substances. For a positive science like chemistry is more securely founded on results of experience, even if such results are not philosophically plausible, than on attractive aprioristic speculation. And experiment had failed to establish any relationship between the substances in question. Thus, centuries of effort directed towards transmuting the baser metals into gold had yielded only negative results. Then, through the various innumerable processes, analytical and preparative, to which all sorts of substances were subjected by chemists in the course of the nineteenth century, the elements remained unchanged and undiminished in amount. Moreover, the spectroscope has shown that the heavenly bodies are made up of the same elements as the earth, which indicates that the highest temperatures prevailing anywhere in nature are still incapable of decomposing our terrestrial elements. While, therefore, the elements were defined, with formal scientific caution and for obvious philosophic reasons, as substances that have *not yet* been decomposed into something simpler and that are *not known* to be related or transmutable into one another, they were really assumed to be as good as absolutely undecomposable, and the name "elements" was retained notwithstanding the prevalent belief that they were ultimately derived from some one substance.

In 1869 Mendeléeff and Lothar Meyer made a discovery (see PERIODIC LAW) which indicated that the elements had very correctly been distinguished as a class of substances different from all others. When, viz., the elements are arranged in the order of their atomic weights, the group exhibits a periodicity of physical and chemical properties which could not possibly occur among a heterogeneous lot of compound substances that simply had not yet happened to be decomposed. But, on the other hand, this same discovery, this very periodicity of properties, also pointed to the existence of an essential family relationship between the elements themselves, and hence, possibly, to their common derivation from one and the same ultimate substance. However, the underlying cause of this periodicity is still not definitely known to-day.

The first decade of the twentieth century brought an even more important discovery: Sir William Ramsay found that the element radium was continually changing into the element helium, and shortly afterward Debierne discovered that the element actinium was likewise changing into helium! This was strong evidence—almost proof—of the essential sameness of the elements. True, the phenomenon was observed only in the exceptional cases of the newly discovered radio-active elements; but the view gained ground that radio-activity was by no means an exceptional property, that in some measure or other it is common to *all* the elements, and hence that *all* the elements are undergoing gradual decomposition—perhaps into electricity, the ultimate primordial material of the universe.

Radio-activity may thus appear to have introduced a profound revolution in chemical science: to have degraded the elements to the rank of decomposable substances and even to have brought back in its wake the ancient alchemist hope of transmuting base metals into gold. This is not the case. That the alchemical hope is not yet more justifiable now than in the past is clear if we consider that radio-active changes are as far beyond human control as the movements of the heavenly bodies: we can observe them as passive spectators; influence them we cannot. Granting even that some base metal might be turned into gold by a radio-active change, we can neither bring about nor control such a change. Nor has radio-activity (notwithstanding its great importance and still greater possibilities) in any sense revolutionized chemical science: the elements of 25 years ago are still listed as elements to-day and are still recognized as substances of an immeasurably high order of stability. The radio-active decomposition of an element is so exceedingly slow that its occurrence has no more significance for the activities of the chemist than the attraction of a distant fixed star has in computations of the orbit of a planet by the astronomer: it is a negligibly small quantity. This is why radium itself, in spite of its continually changing into helium, is unhesitatingly classed with the "elements."

Chemical Compounds. The conception of the almost absolute simplicity and stability of a chemical element defines clearly the distinction between elementary substances on the one hand and compounds and mixtures on the other. The distinction between a chemical compound and a mixture is not easy to define precisely and generally. But before we proceed to formulate this latter distinction, it may be well to consider two simple cases illustrating the formation of true chemical compounds.

First, when hydrogen and oxygen are mixed in certain proportions at ordinary temperatures, a gas is obtained which still exhibits the properties of the two constituents, each of which behaves just as if the other were not present. If the walls of the vessel containing them are porous, both diffuse out, but the hydrogen diffuses out more rapidly; and so it would be if the two gases were confined in porous vessels separately. Now, if we should apply to our mixture sufficient heat, a remarkable change would suddenly set in—an explosion would take place, the hydrogen as well as the oxygen would cease to exist as such, and a new substance (water) would be found in their place. By suitable methods (e.g., by the use of a galvanic current) water may be decomposed into hydrogen and oxygen; but while it exists as water, it has a set of properties all its own and does not exhibit any of the properties of either hydrogen or oxygen.

Secondly, if finely divided iron and finely divided sulphur should be carefully mixed in certain proportions and left at ordinary temperatures for any length of time, the two would continue alongside each other, iron as iron, sulphur as sulphur. A microscope would show two different kinds of particles. A magnet would separate out the iron and leave the sulphur. But again, if we should heat the mixture, a change would take place, accompanied by an evolution of heat and light, and, as a result, we would find a substance (sulphide of iron) which has none of the properties of either sulphur or iron, although these substances may be obtained from it by suitable methods of decomposition.

It is therefore clear that a chemical compound is an "individual" with properties peculiar to itself and different from those of its components; in a mixture each constituent retains its own individuality and may be recognized by its own properties. A compound is invariably found to be homogeneous, even if examined with a powerful microscope; a mixture may be homogeneous, as in the case of hydrogen and oxygen, or it may be heterogeneous, as in the case of iron and sulphur. In separating the constituents of a mixture advantage is taken of the differences in their properties—in the case of hydrogen and oxygen, the difference in diffusibility; in the case of iron and sulphur, the fact that iron possesses magnetic properties while sulphur does not. The properties oftenest taken advantage of for separating substances without destroying their individuality are *volatility* and *solubility;* and on these are based, respectively, the processes of distillation and crystallization.

When a sufficiently stable chemical compound is subjected to one of these processes and is thus gradually divided into two or more portions, the latter are qualitatively identical with one another and with the whole. Thus, when pure water is subjected to distillation, its composition remains unchanged while any portion of it is being removed. The successive portions of the escaping vapor, too, must have the same composition, viz., that of pure water. Similarly, in the case of pure alcohol, when part of a given amount is removed by distillation, the portion remaining undistilled, as well as the distillate, cannot be anything but pure alcohol, and hence cannot but have the same composition as the liquid before the distillation. Quite different is the case of mixtures. Let, e.g., a liquid made up of alcohol and water be subjected to distillation, and let the process be discontinued when a portion of the liquid has passed over. The liquor remaining behind undistilled will then be found to be much weaker, i.e., to contain a greater proportion of water, than the original liquor before the distillation. On the contrary, the escaping vapor will be found to contain a smaller proportion of water than the original liquor before the distillation. The reason is mainly in the fact that water and alcohol are not equally volatile in the mixture; and, of course, the more volatile constituent, viz., alcohol, distills over more rapidly than water, the less volatile constituent. The process of distillation is very often actually employed by chemists when it is required to ascertain whether a given liquid represents a single compound or a mixture. During crystallization, too, a single substance must obviously remain unchanged. Let, e.g., a given amount of magnesium sulphate (Epsom salt) be dissolved in water and allowed to crystallize; any portion of the crystalline matter separating out must obviously have the same composition as the given salt. On the contrary, if every crystal of a given substance contains two or more different compounds—say, magnesium sulphate and zinc sulphate—then any portion crystallizing out from the solution will be found to have a composition quite different from that of the given substance. The reason is mostly in the fact that the constituent substances of a mixture are not equally soluble in water; and, of course, the less soluble constituent will tend to crystallize out more rapidly than the constituent whose solubility is greater.

It must, however, be remembered that certain mixtures, too, retain their chemical composition unchanged when divided into two or more fractions by distillation or crystallization. Thus, alcohol containing about 2 per cent of water will remain absolutely unchanged if divided into fractions by distillation; each fraction will still contain the same percentage of water. A certain mixture of water and nitric acid, and mixtures of certain other substances, are known to behave in the same way. At one time these mixtures were actually taken to be chemical compounds. This view, however, was discarded as soon as it was shown that the composition of such mixtures can be readily changed by changing the conditions under which the distillation or crystallization takes place. If such a mixture is, viz., distilled in an apparatus connected with an air pump, the temperature at which the distillation takes place can be lowered by lowering the pressure, and then the composition will be found to have changed considerably if the liquid is examined after a part of it has passed over. No such thing can be observed in the case of a single chemical compound. Water, e.g., may, by varying the pressure with the aid of an air pump, be distilled at any ordinary temperature, yet its composition will of course remain unchanged. See DISTILLATION.

In accordance with the above considerations, a chemical compound may be defined as *a homogeneous substance which can, by suitable methods, be broken up into elements, but whose composition is not changed by fractional distillation or crystallization carried out under variable conditions of temperature.* This definition is sufficient for most purposes of theoretical and practical chemistry.

The Atomic Theory. Once we have made certain that we shall not, by insufficient definition

of our concepts, confound mixtures of substances with isolated chemical compounds, we are ready to undertake the investigation of compounds, their physical and physiological properties, their composition, and their constitution and reactions, i.e., their chemical properties. The physical properties, such as color, crystalline form, solubility in various solvents, the boiling or melting point, etc., serve the purpose of readily identifying known compounds. A knowledge of the physiological properties of compounds is desirable, because compounds are often capable of therapeutic action and may therefore be used in medicine. The theoretical chemist, however, is interested in all such properties only inasmuch as they are manifestations of the intimate nature of the compounds characterized by them, and his principal aim is to find a precise expression for the dependence of properties on chemical composition and constitution.

The composition of a compound is revealed by chemical analysis, which shows (1) what the constituent elements are (qualitative analysis) and (2) in what relative quantities those elements are contained in the compound (quantitative analysis). A remarkable law that governs the quantitative composition of compounds became known about the beginning of the nineteenth century. This law, called "the law of multiple proportions," may be enunciated in the following form: There is for every chemical element a characteristic number that represents its combining weight; and the composition of any chemical compound may be represented either by the combining weights of its elements or by simple multiples of those weights. Thus, using the combining weights as we know them at present, we may state the composition of a few compounds as follows: carbonic oxide is composed of 12 parts of carbon and 16 parts of oxygen; carbonic acid of 12 parts of carbon and 32 parts of oxygen; water of 2 parts of hydrogen and 16 parts of oxygen; marsh gas of 12 parts of carbon and 4 parts of hydrogen; olefiant gas (ethylene) of 24 parts of carbon and 4 parts of hydrogen, etc. The combining weights of the three elements mentioned are, approximately: carbon, 12; hydrogen, 1; oxygen, 16; and it is easy to see that in stating the composition of our compounds we have been able to use either these numbers or simple multiples of them. Dalton was led to the discovery of this law by the hypothesis according to which all matter is made up of "atoms," i.e., of minute particles incapable of further subdivision. The atomic theory, based on this hypothesis, comprises the following assumptions: The atoms of any given element are identical; the atoms of different elements are different and have different weights; by the force of chemical affinity several atoms may be held in combination, forming a particle, or "molecule," of a compound, and very large numbers of molecules are necessary to make up even the smallest amounts of compounds which we are actually capable of handling. In accordance with these assumptions, let M stand for the number of molecules making up a certain amount of some compound containing two elements; and let the amount of the first element in it be a, the amount of the second element, b. Let, further, A stand for the weight of a single atom of one of the elements, and n stand for the number of such atoms contained in a single molecule of the compound. Then, evidently, the weight a of the first element in the compound equals $M \times n \times A$. Similarly, if A' stand for the weight of a single atom of the second element, and n' for the number of its atoms contained in a single molecule of the compound, then, evidently, the total weight b of the second element in M molecules equals $M \times n' \times A'$. We therefore have

$$a : b : : MnA : Mn'A'$$

or,

$$a : b : : nA : n'A'.$$

In case a molecule of the compound should contain equal numbers of atoms of the two elements, then $n = n'$, and hence

$$a : b : : A : A'.$$

But these proportions tell us that the weights (a and b) of the elements in a compound are proportional either to the weights of single atoms (A and A'), or to multiples (nA and $n'A'$) of those weights. Thus the fundamental law of chemical composition follows as a direct consequence from, and is, hence, completely explained by, the atomic hypothesis, without which it would be a mystery. The "combining weights" mentioned above in connection with our statement of the law are seen, in the light of the hypothesis, to represent the relative weights of the atoms themselves and are therefore termed *atomic weights*.

But while the fundamental assumptions of the atomic theory thus establish a general relation between the quantitative composition of substances and the relative weights of atoms, they do not furnish a sufficient basis for determining these relative weights in an unequivocal manner. When we apply the above proportions to some given substance—say, water—for the purpose of determining the atomic weights of its elements, we find ourselves compelled to make some additional assumption. Indeed, chemical analysis shows that water contains 11.1 per cent of hydrogen and 88.9 per cent of oxygen. We therefore have

$$a : b = 11.1 : 88.9 = 1 : 8 \text{ (nearly)}$$

and hence

$$nA : n'A' : : 1 : 8,$$

where A and A' are, respectively, the weights of single atoms of hydrogen and oxygen, while n and n' are, respectively, the numbers of atoms of these elements in a molecule of water. What we are after is the ratio $A : A'$, i.e., the relative weights of single atoms; but this we evidently cannot find unless we assign some numerical value to the ratio $n : n'$. Dalton assumed that a molecule of water is made up of one atom of hydrogen and one of oxygen, i.e., $n = n' = 1$, and therefore he found

$$A : A' : : 1 : 8,$$

i.e., an atom of oxygen is 8 times as heavy as an atom of hydrogen. (In reality, Dalton thus obtained, for the atomic weight of oxygen, the figure 6; but this was due to his imperfect knowledge of the proportion of hydrogen and oxygen in water.)

Dalton's assumption was quite arbitrary. But in subsequent years, as the substances known grew numerous and complex, chemists began to feel the want of some general theoretical principle which would render arbitrary, and hence confusing, assumptions unnecessary. Then Gerhardt and Cannizzaro enriched Dalton's atomic theory by adding to it a principle which had

been enunciated by Avogadro as early as 1811, but which had remained unemployed as long as it was not urgently needed. According to Avogadro, equal volumes of different gases contain equal numbers of molecules if the temperatures and pressures of the gases are the same. This theoretical principle and its use in determining the atomic weights of the elements have been explained at some length under ATOMIC WEIGHTS and AVOGADRO'S RULE (qq.v.) and require no further discussion here. Suffice it to state that it forms part of the very foundation of the present atomic and molecular theory, and that it is involved in the discussion of most, if not all, problems of modern chemistry.

A still further addition was made to the fundamental hypothesis of the atomic theory before it attained its maximum of possibilities. This last addition, gradually incorporated during the second half of the nineteenth century, consists of certain assumptions concerning the combining forces of atoms, the number of such forces peculiar to the atom of each element, and the directions in which those forces act. (See below, under *Chemical Formulas;* and see the articles VALENCY; CARBON COMPOUNDS; STEREO-CHEMISTRY.) These assumptions, forming the so-called "doctrine of valency," were adopted mainly because of the necessity of explaining the isomerism of organic compounds, i.e., the fact that quite different compounds may have exactly the same composition. And it was mainly when fortified by these assumptions that the atomic theory enabled us to know compounds before they have actually been found in nature or in a chemical laboratory.

Chemical Formulas. In the notation based on the atomic theory, the atoms of the several elements and their relative weights are represented by symbols, such as H for hydrogen, O for oxygen, C for carbon, etc.; H standing for 1, O for 16, C for 12, etc. (A list of elements, with their symbols and atomic weights, may be found in the article ATOMIC WEIGHTS.) When two or more elements combine chemically, their atoms are assumed to become associated in groups (molecules) without being in any way changed. The assumption is based on the fact that the elements of a compound can be reobtained from it in the free state, though we do not know, of course, what really becomes of an element when it combines with other elements; for, as we have seen above, chemical combination usually causes the properties of the elements to disappear more or less completely. In accordance with the assumption, the formula of a compound is made up from the symbols of its elements. For example, the formula of carbonic oxide is CO; that of carbonic acid is CO_2, etc.; C denoting one atom of carbon, O_2 two atoms of oxygen, etc. The formulas at present used by chemists are of three different kinds, viz., empirical, molecular, and graphic.

An *empirical formula*, as the name suggests, may be considered as involving no hypothesis whatever; it is merely the simplest form in which the composition of a compound may be expressed in terms of the atomic weights of its elements. For example, analysis shows that acetic acid contains 6 parts of carbon, 1 part of hydrogen, and 8 parts of oxygen; or—what is the same—12 parts of carbon, 2 of hydrogen, and 16 of oxygen. Using the symbol C to represent 12 parts of carbon, the symbol H 1 part of hydrogen, and the symbol O 16 parts of oxygen, we may denote the composition of acetic acid by the empirical formula CH_2O, which is nothing but a symbolic expression of the results of analysis.

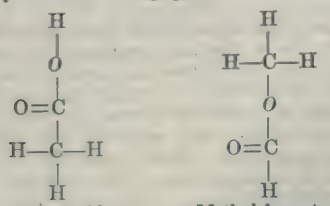
But analysis also shows that certain other substances have the same composition as acetic acid, e.g., the well-known formaldehyde. It is therefore clear that, in order to denote their compounds in a definite manner, chemists must employ formulas which express something else besides composition. Now, Avogadro's hypothesis leads to a knowledge of the relative weight of the molecule of a compound, that weight being, viz., twice as great as the vapor density of the compound referred to hydrogen. (See MOLECULES—MOLECULAR WEIGHTS.) So, to compare acetic acid and formaldehyde, we determine their vapor densities, and as the vapor of acetic acid is found, under proper conditions, to be 30 times as heavy as hydrogen, and formaldehyde vapor is found to be 15 times as heavy as hydrogen, we assign to the acid the "molecular weight" 60, and to the aldehyde the "molecular weight" 30. On the basis of this difference we represent the two compounds, respectively, by the formulas $C_2H_4O_2$ and CH_2O, which have the total weights 60 and 30, while the relative weights of the constituent elements are obviously the same in both. Formulas like these, which denote not only the relative composition of substances, but also their molecular weights, are termed *molecular formulas.* In the case of formaldehyde the molecular formula, CH_2O, happens to be identical with the empirical formula, CH_2O; in many other instances, however, this is not so. A thing exceedingly important to remember is, that *molecular formulas represent practically equal volumes of substances in the gaseous* (or dissolved) *state, under the same conditions of pressure and temperature.* See AVOGADRO'S RULE.

But even molecular formulas do not, in very many cases, suffice to characterize fully the compounds represented by them, for different compounds may have not only the same composition, but also the same molecular weight. Consider, e.g., the "ester" formed by the action of formic acid on wood alcohol. This compound, called methyl formate or methylformic ester, has precisely the same composition as formaldehyde and acetic acid, and precisely the same vapor density as the latter. It must therefore be represented by the same molecular formula as acetic acid:

$C_2H_4O_2$	$C_2H_4O_2$
Acetic acid	Methyl formate

To differentiate compounds like these, chemists use *graphic* or *structural formulas.* Such formulas represent compounds as different because the atoms are differently combined within their molecules, though the kind and number of atoms are the same. To exhibit these differences of combination, chemists employ the assumptions of the doctrine of valency. They assume an atom of hydrogen to be always "uni-valent" because as a rule it is incapable of holding in combination more than a single atom of another element; they assume an atom of carbon to be "quadri-valent" because in marsh gas, CH_4, they find it combined with *four* atoms of hydrogen, and for other reasons of the same nature; and they assume an atom of oxygen to be "di-valent" because in water, H_2O, they find it combined with *two* atoms of hydrogen. With the aid of these assumptions, symbolized by dashes

("bonds") linking together the atoms, they represent acetic acid and methyl formate, respectively, by the following graphic formulas:



Acetic acid Methyl formate

The differences between the two formulas are obvious; thus, the formula of methyl formate shows one of its oxygen atoms as linking together two carbon atoms, while in the formula of acetic acid the corresponding oxygen atom links a carbon atom to an atom of hydrogen. An explanation of the principles used in determining which of all graphic formulas possible in a given case should be assigned to the compound under consideration may be found in the article CARBON COMPOUNDS. To determine the "chemical constitution" of a compound means to determine its graphic formula; for the latter corresponds with, and is therefore a simple expression of, its most important chemical properties.

Graphic formulas often have an abbreviated form; the dashes are omitted, the atoms are combined into groups, and these are written so that their relative arrangement in the molecule may be evident. Such abbreviated expressions are usually employed, for convenience' sake, in preference to the full graphic formulas. Thus, acetic acid is represented by the formula $CH_3.CO.OH$ (or simply CH_3COOH, or CH_3CO_2H); methyl formate is represented by the formula $H.CO.OCH_3$; etc. Remembering the valencies peculiar to the constituent elements, the chemist has no difficulty in reconstructing the graphic formulas from abbreviations of this kind. There is, however, another kind of constitutional formulas, which may be described as incomplete, or imperfect, because they are made up of atomic groups which can be represented, not by only one, but by two or more different graphical schemes. Such formulas are assigned to compounds when we do not know enough about their chemical nature.

Mixtures. We have seen in a preceding paragraph that while the properties of a chemical compound are quite different from those of its constituent elements, the properties of a mixture are made up by the alligation of those of the components. This is very nearly true in the case of all gaseous mixtures, particularly under low pressures, and one of the general laws of gases is that the pressure in a vessel containing several gases is equal to the sum of the pressures that would be exerted by them if each were isolated in a similar vessel (Dalton's law). But in the case of homogeneous ("physical") mixtures in the solid or liquid state, or even of gaseous mixtures in a highly compressed state, the principle of the "additivity of properties" is only a rough approximation, for in such mixtures the properties of each component are often considerably affected by the presence of the other components. A class of mixtures whose theory forms one of the most important chapters of physical chemistry will be discussed in the article SOLUTION.

TRANSFORMATIONS

We have seen above that when heat is applied to a mixture of hydrogen and oxygen, or to a mixture of powdered iron and sulphur, changes set in which result in the formation of entirely new substances—water and sulphide of iron respectively. Changes of this kind are termed *chemical reactions*. On the other hand, there are changes of matter that are much less profound in their character and involve neither the disappearance of the given nor the formation of new chemical substances. Such changes (mostly changes of state) are termed physical transformations. Thus, e.g., the mere evaporation of water may be spoken of as a physical transformation, because liquid water and water vapor are chemically identical. The science of chemistry deals with physical as well as with chemical transformations, mainly because the former often influence and accompany the latter. Following are the laws governing the various transformations of matter:

1. **Conservation of Mass.** No transformation is known to involve gain or loss of the mass of matter. When, e.g., a candle burns up in the air, its material is not lost; it merely combines with the oxygen of the air to form two invisible products—water vapor and carbonic acid; but these, too, are matter, for they have weight, and their mass is precisely equal to the original mass of the candle, *plus* the mass of oxygen consumed. Hence the inductive principle known as the law of the indestructibility or conservation of mass. A strong argument in favor of this law is found in the fact that in spite of the violent processes undoubtedly taking place in the sun, its weight has not in the least changed within historical times; for an appreciable change in the mass of the sun would have involved a change in the length of the day, and such a change is positively known not to have taken place. Of course, the main evidence in favor of the principle of conservation is presented by the innumerable quantitative processes actually employed by chemists. Besides, accurate investigations have been instituted for the special purpose of testing the precision of the principle and have invariably failed to prove it incorrect. True, radio-active change may possibly, or even probably, involve loss of ponderable mass by the partial dissolution of matter into the imponderable substance of electricity. But radio-active change, as already observed (see above, under the side head *The Chemical Elements*), is too exceedingly slow to require consideration in connection with the processes forming the subject matter of chemical science proper.

2. **Conservation of the Elements.** No transformation, except those of radio-activity, is known to involve the transmutation of one chemical element into another. Combining this with the preceding principle, we get what is known as the law of conservation of the elements. According to this, no ordinary transformation involves gain or loss of the mass of each of the chemical elements, and hence, while an element may exist either free or in a state of chemical combination with other elements, its total mass in the universe may, for all purposes of chemical science, be considered as unchangeable.

3. **Combining Quantities.** While we can mix substances in any desired proportion, chemical combination can only take place between

certain definite relative quantities, which depend on the nature of the reacting substances. Thus, hydrogen and oxygen combine in the proportion of 1 part by weight of the former to 8 parts by weight of the latter; or, what is the same, they combine entirely when the volume of hydrogen is twice as great as the volume of oxygen (oxygen is 16 times as heavy as hydrogen). If, instead of these relative quantities, we should mix, say, 1 part by weight of hydrogen with 9 parts of oxygen, we should still find that only 8 parts of the latter have combined with all of the hydrogen into water, and that 1 part of oxygen has remained uncombined; the case would be analogous if, instead of an excess of oxygen, we employed an excess of hydrogen. Hence the conception of "combining quantities." Early in the nineteenth century Gay-Lussac discovered a remarkable fact, viz., that the relative combining volumes of gases can in all cases be expressed in the form of simple arithmetical ratios. We have just seen that hydrogen and oxygen combine in the ratio of 2 volumes of the former to 1 of the latter (the product is 2 volumes of water). In the case of the reacting pair, hydrogen and chlorine, the ratio is still simpler, 1 volume of hydrogen combining with 1 volume of chlorine (the product is 2 volumes of hydrochloric acid). It was this general fact that suggested to Avogadro his celebrated hypothesis, in accordance with which we explain the fact that 2 volumes of hydrogen react with 1 of oxygen, by saying that every 2 *molecules* of the former react with every 1 *molecule* of the latter.

Chemical Equations. The three principles just stated are expressed symbolically in those equations which chemists use to represent the various reactions of substances. Take, e.g., the equation representing the combustion of marsh gas, i.e., its combination with oxygen, viz.:

$$CH_4 + 2O_2 = CO_2 + 2H_2O.$$

The symbols CH_4, $2O_2$, CO_2, and $2H_2O$ represent, respectively, certain relative weights of marsh gas, oxygen, carbonic acid, and water; and the sign of equality denotes that the total mass of the carbonic acid and water yielded is precisely the same as the total mass of the marsh gas and oxygen that have disappeared as such. Similarly, the fact that the total number of C's, H's, and O's is respectively equal in the two members of the equation reminds us of the principle of conservation of the elements. Further, CH_4, O_2, CO_2, and H_2O represent equal volumes of the four substances, and hence the equation expresses that 2 volumes of oxygen are required to burn completely 1 volume of marsh gas, and that the products of the combustion are a volume of carbonic acid equal to that of the marsh gas burned and twice that volume of water vapor.

Reversible Reactions. In mathematics, the members of an equation can be transposed at pleasure, and $a = b$ may as well be written $b = a$. Not so in chemistry. A chemical equation represents not merely an equality of quantities, but an actual reaction of substances. And if, e.g., marsh gas and oxygen react to form carbonic acid and water, it does not by any means follow that carbonic acid and water will with equal readiness form marsh gas and oxygen, which would be expressed by the above equation if written in the form

$$CO_2 + 2H_2O = CH_4 + 2O_2.$$

There are, however, reactions that can actually be reversed. For instance, ordinary ethyl alcohol and acetic acid react to form ethyl-acetic ester and water. But ethyl-acetic ester and water also react to form ethyl alcohol and acetic acid. In this case we are, of course, justified in writing the equation in either of the following forms:

$$\underset{\text{Alcohol}}{C_2H_5OH} + \underset{\text{Acetic acid}}{CH_3CO_2H} = \underset{\text{Ester}}{CH_3CO_2C_2H_5} + \underset{\text{Water}}{H_2O}$$

$$\underset{\text{Ester}}{CH_3CO_2C_2H_5} + \underset{\text{Water}}{H_2O} = \underset{\text{Alcohol}}{C_2H_5OH} + \underset{\text{Acetic acid}}{CH_3CO_2H}$$

Reactions of this nature are termed *reversible reactions* and are now denoted by expressions in which the sign of equality is replaced by two arrows pointing in opposite directions. Thus, the reactions just mentioned would be represented as follows:

$$\underset{\text{Alcohol}}{C_2H_5OH} + \underset{\text{Acetic acid}}{CH_3CO_2H} \rightleftarrows \underset{\text{Ester}}{CH_3CO_2C_2H_5} + \underset{\text{Water}}{H_2O}$$

The investigation of reversible reactions has resulted in the establishment of the so-called law of mass action, which is at the basis of modern chemical statics and dynamics. In return the methods of chemical statics and dynamics have furnished positive proof that *all reactions are reversible*, i.e., that any reaction whatever may be set going backward, if only the proper physico-chemical conditions are established. In this manner, e.g., the decomposition of ammonia has been reversed, i.e., nitrogen and hydrogen gases have been caused to *form* ammonia, and thus a great new industry has been created under the guidance of the chemico-dynamic theory. See AMMONIA; REACTION.

Thermochemical Equations. Every given quantity of matter carries with it a certain quantity of energy. Heat being a form of energy, it is clear that the hotter the body the greater its energy. To cool it, we must abstract some of its heat by bringing it into contact with some cooler body; and then, by determining the rise of temperature in the latter, we can learn how much energy the hot body has lost. But while we can thus readily find out how much more energy a body contains at one temperature than at another, we have no way of telling how much energy it contains altogether, for we have no way of abstracting its energy entirely. Nevertheless, we know that different substances generally contain different amounts of energy, even if their temperatures are precisely the same. This is plainly shown by the fact that different substances have different "specific heats," i.e., that different amounts of heat are required to cause an equal rise of temperature in equal masses of them.

Now, since during chemical reactions the given substances disappear as such and new ones arise in their place, it is evident that chemical reactions must be accompanied by either evolution or absorption of heat. For, like the mass of matter, a quantity of energy can be neither destroyed nor created out of nothing, by a chemical or any other transformation. If the original reacting substances contain more energy than the products of the reaction, the reaction will cause some energy to be given off; thus, hydrogen gas and oxygen gas contain much more energy than the water vapor that may be formed from them, and hence their combination (the "burning") sets free much energy in the form of sensible heat. Precisely the same amount of energy would, on the contrary, be taken up if water were decomposed into its elements, hydrogen and oxygen. Reactions in which energy is

given off are called *exothermal reactions;* those in which energy is taken up are called *endothermal reactions.* It must not be thought, however, that transfers of energy are involved in chemical reactions alone. Thus, the evaporation of water is a purely physical transformation, and yet it involves the absorption of much heat. For this reason, if a chemist wishes to ascertain how much energy has been given off or taken up in a given chemical reaction, he must make a thorough study of the physical changes accompanying the reaction and of the transfers of energy caused by those changes. In this respect the most important form of physical change is the dissolution of solids in liquids, especially in water, because many important reactions take place in aqueous solutions.

The above considerations make it evident that the chemical equations discussed in preceding paragraphs are really incomplete; for they represent transformations of matter without stating what changes of energy accompany them. Whenever, therefore, questions of energy are of moment, whether in theoretical discussions or in problems dealing with foods, fuels, etc., chemists use a more complete form of equations, viz., "thermochemical equations." In writing these, Ostwald has adopted the following notation: Gases are denoted by their chemical formulas inclosed in parentheses; solids by their formulas inclosed in brackets; liquids simply by their formulas; substances dissolved in a great deal of water by the symbol Aq (i.e., *aqua,* water) affixed to their chemical formulas. Thus, (H_2O) denotes water vapor; $[H_2O]$ denotes ice; H_2O denotes liquid water; KClAq denotes potassium chloride in very dilute aqueous solution. Ostwald also proposes to denote the energy taken up or given off during reactions in terms of *kilojoules,* denoted by the symbol J. One kilojoule (= 10,000,000,000 ergs) is the same as 239.1 calories, a calorie being here the amount of heat required to raise by 1° C. the temperature of one gram of water of 18° C. For example, the neutralization of hydrochloric acid by potash in dilute solution, which is ordinarily represented by the equation

$$HCl + KOH = KCl + H_2O,$$

would be denoted thermochemically in the following form:

$$HClAq + KOHAq = KClAq + 57.3J.$$

The number of kilojoules represents the total amount of energy given off or taken up in the reaction. It is, however, important to observe that even the thermochemical equation does not give complete expression to all the important facts connected with the given reaction. Even leaving out of view questions concerning the atomic mechanism of the reaction and the catalytic influences involved in it (see CATALYSIS), the thermochemical equation fails to tell us how much *mechanical work* the reaction is capable of furnishing. The practical importance of knowing this need not be emphasized. But it should be remembered that this work is by no means equivalent to the heat given off. In fact, work can be furnished by a reaction even if, instead of cooling, it *absorbs* heat. See REACTION.

HISTORY

Ancient History. The history of ancient philosophy records certain theories of matter which have had a directing influence on chemical thought during later centuries. The most important ideas date from the fifth century B.C. Empedocles (c.490–430 B.C.), who may have derived his views from the ancient philosophers of the East, held that air, water, earth, and fire are four elements unrelated to one another and forming the basis of the universe. Aristotle (384–322 B.C.) added a fifth element, *ousia* (*οὐσία*), a purely spiritual substance pervading the infinity of space. During the Middle Ages not a little energy was lost in researches after this "fifth essence," which, by confusion of ideas, came to be regarded as a fifth elementary form of matter. To Aristotle the material elements were not altogether different from one another, but were forms of a primary substance differentiated by properties—as dry, moist, hot, cold—that were not essential to its nature. Hence, later, the alchemists' attempts to turn metals into one another, crowned by the belief that such transmutations cannot be effected by any known means. The atomic conception dates from Democritus (c.460–370 B.C.), who held that all bodies are made up of the atoms of one and the same substance, and that the differences exhibited by the various forms of matter are due entirely to differences in the size and shape of their atoms. It is hardly necessary to state that if this undeveloped idea of Democritus had not furnished a suggestion that led to the building up of a useful chemical doctrine, it would deserve no mention in the history of science. It is thus clear that the ancients did nothing directly towards the building up of a science of chemistry. Indeed, how much chemical knowledge can we expect to find in an age when a man like Aristotle did not hesitate to assert that a vessel will hold as much water if filled with ashes as when empty?

But while the intellectuals of the epoch were devoted to speculation concerning broad general questions of the philosophy of nature—with little result—artisans and craftsmen, priests and healers, gradually accumulated an empirical store of knowledge that was destined to serve as a crude foundation for a rational science of chemistry to be built up by experimenting philosophers in a remote future. Most of that empirical chemical knowledge was gained by the Egyptians and was by them communicated to the Jews and Phœnicians and later to the Greeks and Romans. The metallurgy of gold, silver, copper, iron, lead, tin, mercury, and perhaps zinc, and the preparation of certain alloys, were known at quite an early date. The Egyptians had highly developed the art of making glass and of coloring it by means of certain metallic oxides, and many extant specimens of Egyptian pottery are beautifully enameled in various colors. The art of dyeing fabrics with the aid of mordants had likewise been developed at an early date, and many mineral and organic coloring matters were known to the Egyptians, Phœnicians, and Jews. The Egyptians were also probably the first to employ substances for medicinal purposes.

Alchemy. Egypt was the birthplace of alchemy, the pretended art of making gold from base metals. Based on superficial observation and the erroneous interpretation of phenomena, this pseudo-art subsequently absorbed the attention of men for many centuries (see ALCHEMY) and rendered scientific progress, and hence the development of the useful arts,

impossible. Thus, the arts of metallurgy and of dyeing remained through the Middle Ages practically what they had been in Egypt long before the beginning of our era. Nevertheless, in their fantastic search after the philosopher's stone, the alchemists discovered methods of preparing many new substances, perfected many processes of manipulation, and thus slowly paved the way for the future investigator. Bismuth and antimony, sulphuric, hydrochloric, and nitric acids, the chloride and the carbonate of ammonium, the nitrates of potassium and silver, compounds of mercury, antimony, and arsenic—these and many other important substances were first prepared and their properties were first studied by the alchemists. Of course, the interpretation of known facts was absurd, based as it often was on the most groundless assumptions, e.g., the assumption that most substances and certainly all metals contain sulphur. As to the compounds of carbon, the alchemists did hardly anything towards laying a foundation for future organic chemistry, although they learned to concentrate aqueous acetic acid by distillation and to prepare a few metallic acetates and were familiar with certain reactions, such as the transformation of ordinary alcohol under the influence of sulphuric acid, the formation of certain esters, etc. A number of substances derived from the organic world were also used for medicinal purposes; but it was not until the beginning of the "iatrochemical" period that the art of preparing substances began to be looked upon as a handmaid of medicine. Alchemy proper had only one great object in view—to ennoble the base metals and to prolong life indefinitely—and this remained the principal aim of some of the best men even to the close of the era of iatrochemistry. The history of chemistry teaches here a remarkable lesson. Even in our own day the practical man is given to jeering at the uselessness of pure science; his attitude towards the activities of a scientific investigator is not unlike that of a busy adult towards a child's play. But the history of chemistry tells that while sixteen centuries of utilitarian search for gold and perpetual youth —the most utilitarian search imaginable— yielded nothing useful, the birth and activities in our own time of a pure, non-utilitarian science of chemistry have brought mankind incalculable wealth.

Iatrochemistry (Gk. *larpós, iatros*, physician). The first great iatrochemist was Paracelsus (1493–1541), who taught that the aim of chemistry was the preparation, not of gold, but of therapeutic agents. Adopting a view current among alchemists prior to his time, he held that, everything being composed of sulphur, mercury, and salt, if the amount of any of these happens to rise above or fall below the normal in the animal body, the result is a condition of disease. Hence disease must be combated by chemical means. Paracelsus therefore devoted himself to pharmacy and medical chemistry and soon became famous through the many happy cures that he actually succeeded in effecting. Unfortunately the adventurous life that he led, and his gross lack of modesty, aroused suspicion in many, and the bitterest opposition among the more conservative members of the medical profession, obscured his fame, and greatly diminished the sphere of his influence. Nevertheless, his great work was accomplished; pure alchemy had received at his hands the first powerful blow, pharmacy had been firmly linked to chemical science, and medicine had been aroused from the torpor of many centuries.

Following in the steps of Paracelsus came Turquet de Mayerne (1573–1655), Andreas Libavius (?–1616), Oswald Croll, Adrian van Mynsicht, and the great Van Helmont (1577–1644). Van Helmont not only realized that the processes of life, in health and disease, are largely dependent upon chemical changes, but he abandoned the arbitrary assumptions of Paracelsus concerning the chemical basis of the animal body, and his keen experimental researches imparted a powerful impulse to the development of scientific medicine. Equally, if not more, important was his recognition of the fact that there may be other gases than air, and that atmospheric air, carbonic acid, hydrogen, marsh gas, and sulphurous acid may be quite different from one another. In certain special cases he also succeeded in showing that substances are not lost, either qualitatively or quantitatively, when they enter into chemical combination, and that they may be reobtained entirely from the resulting compounds. Yet he believed in the possibility of making gold, and among the absurdities found in his writings is the assertion—strange to relate—that mice may be spontaneously produced in buckets filled with soiled linen and wheat flour! But if the spirit of the time permitted such beliefs, so much more wonderful must appear the scientific penetration of his genius, so much more deserved is his place among the best names of both chemistry and medicine. Other important names in connection with iatrochemistry are those of Sylvius (1614–72) and Tachenius. Sylvius was the first to grasp the similarity between the processes of respiration and combustion, and, recognizing the distinction between arterial and venous blood, he understood that the bright color of the former was due to the action of air. Digestion, too, he considered as a purely chemical process. His pupil, Tachenius, was the first clearly to recognize that salts are substances formed by the union of acids and bases; he studied the composition and properties of many substances, invented a number of interesting qualitative tests, and even subjected a few reactions to quantitative investigation, determining, e.g., the gain of weight involved in the oxidation of lead.

The age of iatrochemistry marks a great period in chemical history. During this period, for the first time, we find many thoughtful men making an endeavor to free themselves from the preconceived ideas of the past and to approach nature in a critical spirit and with a curiosity purely scientific. With iatrochemistry was thus born the possibility of chemical progress. But this is not the only thing for which mankind is indebted to that period. For, while the iatrochemists were preparing the first material for the very foundation of future chemistry, others were busy developing industries which have since become affiliated to our science. Foremost among these men were Agricola, Palissy, and Glauber. Georg Agricola (1490–1555) rendered great services to mining and metallurgy, introducing rational scientific methods into the former and perfecting many of the processes of the latter. His splendid treatise on metallurgy, in which these processes were described for the first time, long remained the standard work on its subject. Besides, he introduced a

practical system for the classification of minerals, based on their physical properties, such as color, hardness, etc. Bernard Palissy (c.1510–89), considering worthless and ridiculous the efforts of alchemy, devoted himself to experimental research in ceramic art and invented a number of valuable methods of coloring and enameling articles of pottery. Johann Rudolf Glauber (1604–68) improved many processes of dyeing and prepared a number of useful salts, including sodium sulphate ("Glauber's salt"), the chlorides of zinc, tin, arsenic, copper, lead, and iron, the nitrate of ammonium, tartar emetic, etc. He even succeeded in gaining some insight into the rationale of certain processes; but this did not prevent him from adhering to the most fantastic absurdities of alchemy to the very end of his life. In connection with the iatrochemical period reference must finally be made to the wonderful development of the art of making articles of glass, and to the rapid progress of the liquor industry, which had only been founded towards the end of the fifteenth century, i.e., a short time before the commencement of the period. As to scientific pharmacy, we have already stated that its beginning coincides with that of iatrochemistry, and it is hardly necessary to add that the latter enriched it with many new preparations and with a knowledge of the medicinal properties of substances already known.

About the middle of the seventeenth century iatrochemistry came to a sudden decline. That this had to happen sooner or later is clear, if we consider that a true medical chemistry could not possibly flourish before, on the one hand, chemistry itself was placed on a sound basis, and before, on the other hand, anatomy and physiology had attained a stage of serious development. The iatrochemists were still too utilitarian to accomplish much of really permanent practical value; even they had misdirected their efforts, and if we should in our present structure of chemistry mark the parts established by them, we would find that their lasting contributions were very few. The historical importance of the period is chiefly in the fact that with it came a revolution against traditional errors and a change in the direction of research.

The Forerunners of Chemistry. In the seventeenth century we find the Englishman Robert Boyle (1627–91) grasping truth with an insight unprecedented and in many respects not yet surpassed. Boyle understood that chemistry must be treated as an independent science, i.e., primarily without reference to applications of any sort, and that only in this manner could the relationships between chemical phenomena proper be discovered. He maintained that chemists should consider as an element only a substance which, in spite of exhaustive actual efforts, they have not succeeded in decomposing. And even this method, though necessary and sufficient for the purposes of science, he did not regard as proving the elementary nature of a substance absolutely beyond doubt. Still, he was inclined to consider the metals as elements, and, proving experimentally that the products of the destructive distillation of wood are compound, he refuted the opinion—then generally prevalent—that dry distillation breaks up substances into their elements. He further defined the distinction between a chemical compound and a mixture; the properties of a chemical compound, he maintained, are quite different from those of its components, while in a mixture each constituent retains its characteristic properties practically unaffected. Above all, he earnestly warned chemists against adopting hypotheses and general theories a priori. Theories are necessary; but unless they are generalizations cautiously made from observed facts, they may be dangerously misleading.

Boyle's views are now accepted universally. Had he grasped and succeeded in spreading abroad one more idea—viz., the absolute necessity of quantitative investigation—he would have doubtless become the founder of the science of chemistry—that is to say, with him would have commenced the epoch enlightened by truth and free from fundamental errors. This he did not accomplish; nor was it possible to accomplish it before the characteristics of gaseous matter came to be known better than they were in his day. And so it came about that chemists failed to appreciate his great warning against hypotheses that are not rigidly correlated with facts, adopted a belief in a fiery "phlogiston," and thus created a new period of darkness that lasted a century. It must be remembered that the important phenomena of what we now call oxidation engaged the attention of chemists towards the end of the seventeenth century and through the entire eighteenth century. These phenomena were explained by the supposed existence of phlogiston, a substance which may have been originally produced in the erring mind of some alchemist, but the first clear reference to which, under the name of *terra pinguis*, we find in the works of Becher (1635–82). Stahl (1660–1734) named it phlogiston, endowed it with certain imaginary properties, and used it as the basis of a doctrine which was soon accepted throughout the civilized world.

To give a clear and precise account of this, as of any other erroneous doctrine, is a matter of considerable difficulty. For when ingenious men are dominated by error, they will mold it into a variety of forms in their efforts to give it the appearance of truth and render it consistent with itself. The phlogistians handled their hypothesis with much dexterity. Yet their thought, lacking the character of quantitative precision, was weak; for quantitative conceptions, while already mastered by the physicist, were still in a state of confusion in the mind of the chemist. Distinguishing clearly between the absolute weight of bodies and their specific gravity, we have no difficulty in understanding that although water vapor is lighter than air, its addition to a given body must increase the weight of the latter, because water, whether liquid or vaporized, has weight. Stahl believed that the conversion of a "calx," i.e., a metallic oxide, into metal was caused by the addition of phlogiston. He *knew* that the conversion was accompanied by a diminution of weight; but from this fact he only deduced that phlogiston must be "lighter than air," failing to grasp that such an addition may make a body *lighter* in the sense of producing a system of lower specific gravity, but must necessarily make it *heavier* in the sense of increasing its absolute weight. It is more probable, however, that Stahl understood this in a general way, but thought that the metals had a lower specific gravity than their calces. At least Juncker, a pupil of Stahl's, asserts this about metals and calces as a matter of fact, although Boyle

had long before shown experimentally that the specific gravity of metals is really higher than that of their calces. Much more extraordinary is the conception that we find in the writings of Guyton de Morveau, Macquer, and others, who taught that phlogiston had *less than no weight!* Stahl conceived of phlogiston as a fiery principle, "*materia aut principium ignis, non ipse ignis.*" Seeing that charcoal burns up completely and is capable of producing metals by adding itself, as he thought, to their calces, he considered charcoal as made up almost entirely of phlogiston. Cavendish, knowing that "inflammable air" is given off when metals are dissolved in acids, adopted the view that that inflammable air (hydrogen) was phlogiston, with which metals part on coming into contact with acids. An inconvenient fact in connection with the phlogistic theory was that combustion, including the transformation of metals into calces, could only take place in the air. Stahl and his followers referred to this fact as if it were quite natural that if phlogiston was to be absorbed from metals there must be a medium capable of absorbing it. There were thoughtful men, however, who would not be satisfied with explanations of this kind. Boerhaave, whose *Elementa Chemiæ* (1732) served for many years as the standard textbook of chemistry, taught distinctly that the conversion of metals into calces involved the absorption of something from the air. This he deduced by combining the fact that the presence of air was necessary with the fact that the conversion involved increase in weight. The latter fact he even freed from an erroneous explanation attached to it by Boyle, who had thought that the increase in weight was due to absorption of heat during calcination; by the use of the balance Boerhaave showed that metals have precisely the same weight when glowing hot as when cold, and thus proved that heat has no weight. So near the truth were some. Yet none rose to combat the phlogistic theory, and all, even Boerhaave, were dominated by it more or less.

Two things were necessary to make away with phlogiston: first, a clear knowledge of some of the ordinary gases; secondly, a clear quantitative knowledge of some of the ordinary chemical transformations. The gases in question are carbonic acid, oxygen, and air. As to quantitative chemical knowledge, it can, of course, be acquired only by the use of the balance. Carbonic acid was known since the time of Van Helmont; yet chemists were not sure but that it might be impure air, until Joseph Black isolated it and demonstrated its properties in 1755. Bergman completed the study of this gas in 1774. The presence and properties of oxygen were suspected by Boyle, Mayow (1669), Boerhaave, and others; but it was first actually isolated by Priestley and Scheele in 1774. The nitrogen of the air was isolated by Rutherford in 1772. It must be remarked here that the apparatus and manipulations of "pneumatic chemistry" were gradually perfected by Boyle, Hales, Moitrel d'Element, Black, and Priestley, the latter having invented the method of collecting gases over mercury, which rendered possible the isolation of gases that are soluble in water. But the precise demonstration of the composition of gases, the introduction of the systematic use of the balance, are due to the founder of quantitative chemistry—the French physicist and chemist Lavoisier.

But before we proceed to narrate the further progress of chemical philosophy, it remains to enumerate briefly the most important achievements of chemical technology during the reign of phlogiston. In spite of its fundamental error, chemistry was making fairly rapid progress, and this naturally told on the industries. Boyle and Kunkel improved many metallurgical processes and the manufacture of glass. The manufacture of iron and steel owed valuable improvements to the researches of Bergman, Gahn, Rinman, and Réaumur. Stahl, Scheele, Hellot, Macquer, and others introduced new dyestuffs and improved many processes of dyeing. The preparation of zinc was improved by Marggraff, and its manufacture on a large scale was commenced at Bristol in 1743. The manufacture of sulphuric acid was commenced by Ward at Richmond; and in 1746 lead chambers were first introduced by Roebuck. In 1747 Marggraff discovered sugar in beets; however, the sugar industry was not born until the beginning of the nineteenth century. Early in the eighteenth century (1703) Böttger was accidentally led to the invention of porcelain, and its manufacture commenced at Meissen in 1710; but the processes were kept secret, and the manufacture was confined to Meissen until Réaumur rediscovered them by systematic research, and finally, in 1769, great porcelain works were established also at Sèvres, near Paris. In the course of the period many substances were introduced as therapeutic agents, and Scheele discovered a number of important compounds of carbon.

Modern Chemistry. If, after we have become accustomed to think of modern chemistry as founded in the latter part of the eighteenth century, we take up the writings of phlogistic chemists prior to that time, we may be greatly surprised to find that our general principles were not at all unknown to them. They certainly believed in the indestructibility of matter, and some of them described molecules and atoms in much the same way as we describe them at the present day. And yet their knowledge cannot be rightly considered as constituting a science. Their abstract speculations were very keen; their knowledge of chemical facts was quite extensive; but that mathematical correspondence between abstract principles and concrete phenomena which alone constitutes science did not exist. And so, even when the properties of gases were no longer unknown, all chemical knowledge remained in a state of confusion, and elements continued to be considered as compounds, compounds as elements, combinations as decompositions, and decompositions as combinations, until the work of establishing the scientific correspondence was begun by Lavoisier.

Endowed by nature with a keenly critical mind, Lavoisier acquired the habit of quantitative thinking by early training in mathematics and physics, and by subsequent association with some of the most brilliant mathematicians and physicists of his time. As early as 1770 we find him solving a problem of chemistry by a purely quantitative method. It was known, viz., that when water is kept boiling for some time in a glass vessel, there is formed in it an earthy deposit; it was therefore believed that water could be converted into "earth." Lavoisier heated water in a glass vessel, weighed the vessel before and after the operation, and found that the vessel *plus* the deposit after the opera-

tion weighed exactly as much as the vessel alone weighed before. He thus proved that the earthy deposit came, not from the water, but from the glass of the vessel. In 1772 he turned the same quantitative method of experimenting and reasoning to the conversion of metals into calces, and in 1774 published the following observation: When metallic tin is heated in a sealed retort full of air, it becomes transformed into its calx; the weight of the sealed retort with its contents is exactly the same after the reaction as before; if the retort is now opened, air rushes into it and the weight is increased; the increase is equal to the difference in weight between the calx formed and the mass of metallic tin employed. From this Lavoisier concluded that the transformation of tin into its calx involved the absorption of air, and that phlogiston had nothing to do with the phenomenon. It also became evident to him that the balance of precision could serve the chemist no less than the telescope served the astronomer, and that the principle of indestructibility, which could and should be established experimentally, ought to be at the basis of all chemical reasoning. When Priestley and Scheele discovered oxygen, they thought that it was this constituent of air that was capable of absorbing phlogiston from metals; Lavoisier demonstrated that it was this constituent of air that combined with metals to form calces. He recognized that the same gas combined with sulphur, phosphorus, charcoal, and other combustible substances, and as he regarded the resulting compounds as acids, he gave to the gas the name *oxygen* (from the Greek *ὀξύς, oxys*, acid, and *γενής, genēs*, producing), and adopted the view that it was an indispensable constituent of all acids (this view was discarded half a century later). Carbonic acid he recognized as a compound of carbon and oxygen, and when Cavendish found that the sole product of the combustion of hydrogen in oxygen was water, Lavoisier understood that water was not an element, but a compound of hydrogen and oxygen, and had no difficulty in determining its quantitative composition. Carbonic acid and water he also showed to be the products of the combustion of organic substances, and soon he recognized that respiration, too, was a process of organic combustion.

Logical and consistent as Lavoisier's method appears to the unprejudiced mind, it failed to appeal to some of the most eminent men of his time. Thoroughly accustomed to the inverted principles of the phlogistic doctrine, those men adhered to them as firmly as fanatics will adhere to an absurd creed, and some of them, including Priestley, himself the discoverer of oxygen, died believers in phlogiston. Nevertheless, Lavoisier lived to see the light of his system spread over the entire scientific world and turn chaos into order. He had established a rigid correspondence between the law of indestructibility and chemical transformations and had thus built the first bridge between an abstract principle and the world of chemical phenomena. The concept *element* was now correctly applied to oxygen, hydrogen, carbon, sulphur, phosphorus, and the metals then known in the free state; the concept *compound* was correctly applied to water and the oxides of the metals. True enough, in his list of elements (1787) Lavoisier included also light and heat and the compounds potash, soda, and lime; on the other hand, he considered the element chlorine as a compound containing oxygen. But this did not interfere with further progress. The first bridge of chemistry was firmly established, and the lingering errors were rectified (mainly by Sir Humphry Davy) early in the nineteenth century. The development of another correspondence—viz., that between the hypothesis of the atomic constitution of matter and the quantitative composition of substances—was already noted in a preceding section of this article. Here it may be observed that the law of multiple proportions was first discovered by Richter (1762–1807), and that Proust (1754–1826) continued Richter's researches and clearly demonstrated the law in course of a controversy with Berthollet. Dalton (1804) rediscovered the law deductively and then proved it experimentally; he was thus the first to establish a rational connection between the old atomic hypothesis and the facts of chemical composition.

After the relation between the known metals and their oxides was established, Lavoisier himself, and others, began to suspect the true nature even of oxides whose metals were not yet known in the free state, and attempts began to be made to decompose these oxides so as to isolate their metallic elements. About the beginning of the nineteenth century Sir Humphry Davy (1778–1829) undertook to investigate the effect of the galvanic current on chemical compounds. In 1807–08 he succeeded in decomposing caustic potash and caustic soda, obtaining from them the metals potassium and sodium. About the same time Seebeck similarly decomposed the oxides of calcium, barium, strontium, and magnesium, obtaining these metals in the form of their amalgams, i.e., combinations with mercury. From these amalgams Davy isolated the metals themselves and gave them their present names. From the metals Davy turned his genius to the nonmetallic elements. Chlorine, known since 1774, remained unrecognized as an element and was generally considered as the oxide of hydrochloric acid. In 1811 Davy clearly demonstrated its elementary nature; and when, soon afterward, Courtois discovered iodine, Davy showed that this substance, too, so similar to chlorine, must be considered as an element. Davy also was the first to demonstrate clearly the elementary nature of nitrogen and even of fluorine (from the similarity of hydrofluoric to hydrochloric acid, and of the fluorides to the chlorides), although the latter element was not yet known in the free state and remained unknown until 1887. The value of Davy's contributions can be readily appreciated if we remember that the substances he was dealing with are among the commonest in the entire range of chemistry, and if we imagine how much confusion would suddenly ensue in all departments of the science if we were to forget their existence or their true nature.

Dualism. On the basis of his electrolytic investigations, Davy also constructed an electrochemical theory which was subsequently modified and extended by Berzelius. According to Davy (1807), when the atoms of different elements come into contact, they become charged with the opposite forms of electricity, by whose attractive force they are held together, constituting chemical compounds. Berzelius' theory was as follows: The atom of each element does not *become* charged with electricity on coming in contact with other atoms, but *is* charged, whether combined with other atoms or not.

With respect to the electrical charges of their atoms, the elements form an "electro-chemical order," oxygen being the most electro-negative, potassium the most electro-positive, and hydrogen dividing the electro-negative from the electro-positive elements. All bases are produced by the combination of oxygen with electro-positive, all acids by the combination of oxygen with electro-negative elements. Yet bases and acids are not altogether neutral; in the former positive electricity, in the latter negative electricity, predominates. This is why bases and acids show no mutual chemical indifference, but combine to form salts. When the terminals of a sufficiently powerful galvanic battery are immersed in the solution of a salt, the base of the latter is attracted more strongly by the negative terminal than by the acid, and the acid is attracted more strongly by the positive terminal than by the base; hence electrolysis ensues, the base being deposited on the negative, the acid on the positive, terminal. In brief, Berzelius maintained (1) that oxygen is an indispensable constituent of bases, acids, and salts; (2) that bases, acids, and salts have a dual constitution, each being made up of an electro-positive and an electro-negative part; (3) that chemical affinity is nothing but the mutual attraction of opposite forms of electricity. In the first of these principles Berzelius followed Lavoisier, for years refusing to accept Davy's view that chlorine and nitrogen were elements, and that their compounds with hydrogen, viz., hydrochloric acid and ammonia, although respectively an acid and a base, contained no oxygen. The structure of the entire theory became somewhat shaky when the correctness of Davy's views was finally recognized by all, including Berzelius himself (1820). Nevertheless, Berzelius, and with him the entire chemical world, continued to adhere to the electro-chemical theory, and thus a strictly dualistic conception of compounds continued to reign in the science. The thirties, however, brought much new evidence against Berzelius' principles. First of all it was recognized that electrolysis breaks up a salt, primarily not into two oxides, but into a free metal and an acid radicle. For example, potassium sulphate is broken up, primarily not into K_2O and SO_3, but into K_2 and the radicle SO_4. This made it evident that sulphuric acid was not SO_3, but H_2SO_4 (i.e., SO_3 chemically combined with H_2O), because the SO_4 radicle was seen to be the true acidic component of potassium sulphate. Two important conclusions thus thrust themselves upon chemists: (1) an acid is not a binary compound of *oxygen* with an electro-negative element, but a combination of *hydrogen* with an electro-negative radicle; (2) a salt is not a compound of two oxides (e.g., $K_2O.SO_3$), but a combination of a metallic element with the electro-negative radicle (e.g., SO_4) of an acid. The first of these conclusions, together with Davy's discovery that hydrochloric acid contained hydrogen but no oxygen, indicated that not oxygen, but hydrogen, is an indispensable component of acids, and this view was further strengthened by Graham's and Liebig's classical studies of the so-called polybasic acids. But so profound was Berzelius' belief in dualism, and so great was his authority, that the electro-chemical theory still continued to stand, and the conclusions just pointed out were not generally accepted for some years. The final blow to dualism came from the young organic chemistry, in which the electric theory had been applied as generally as in the inorganic branch of the science. About the middle of the thirties Laurent and Dumas made a series of important discoveries showing that chlorine and other elements could be substituted for the hydrogen of organic compounds, and that the nature of the latter was thereby affected very little. But if part of the molecule of a compound can combine with either of such electrically different atoms as those of hydrogen and of chlorine, then there is no reason for believing that that part is essentially either electro-positive or electro-negative, and hence there is no reason for believing that every compound is made up of two electrically opposite parts. The more evidence to this effect was brought forward, the more bitterly old Berzelius adhered to the electro-chemical theory. But finally it became evident to all that, as Liebig wrote, "the wheel of time cannot stand still," and "Berzelius is fighting for a lost cause"; and thus, towards the end of the thirties, electro-chemical dualism was overthrown. As a result of their struggle against dualism, chemists then fell into the opposite extreme and adopted a purely unitary view of chemical combination. The molecule of a compound was conceived to be a composite unit somewhat like the solar system, in which the planets are held together by mutual attraction, but which does not by any means consist of two essentially different parts, endowed with two opposite forms of energy. Such unitary views of combination are still prevalent in chemistry to-day. But "the wheel of time cannot stand still," and recent years have forced upon us theories which make us feel that extreme unitarism is just as inadequate as extreme dualism. The elements certainly differ in their electrical properties, and chemists have even succeeded now in expressing those differences mathematically. Electricity, while not identical with the energy that causes the mutual attraction of atoms, is yet certainly one of the factors determining that attraction. At present, however, it is impossible to tell what compromise between chemical unitarism and electro-chemical dualism will ultimately be adopted.

Organic Chemistry. When the general principles of chemistry were established, and the atomic hypothesis had lent to the science a keen power of penetration, it became possible to approach the world of organic matter with the hope of shedding some light upon its mystery. Since then organic research occupied chemists almost exclusively during a greater part of the nineteenth century, and the result of that inquiry has been not only a vast store of empirical knowledge of organic compounds, but also a set of general principles that have strengthened the theoretical basis of the science and have led to some of the great industrial achievements of modern times.

Early in the nineteenth century it was universally believed that organic substances could not be produced without the agency of the "force of life." Whether there is such a distinct "force," and what its relations may be to the measurable forms of energy, we do not know as yet. But we do know that organic compounds can also be produced by chemical agencies alone, without the intervention of anything else. For chemists have actually succeeded in building up from their elements many

thousands of compounds that occur ready formed only in the organisms of animals and plants. The first of such compounds reproduced in the laboratory was urea, which Wöhler made artificially in 1828. The old belief, however, lingered, some chemists contending that urea could not be looked upon as a true organic compound. Gradually, however, less doubtful organic compounds were reproduced synthetically. Writing in 1839 of the synthesis of formic acid, Ure says: "The artificial formation of this animal secretion is one of the most remarkable triumphs of modern chemistry." When Kolbe synthesized acetic acid in 1845, and when other indisputably organic compounds were made from their elements, then all agreed that there was no essential difference between organic and inorganic compounds, and that the former were nothing but the compounds of carbon. At present many dyestuffs, drugs, and perfumes, which could once be obtained only from plants, are made artificially on a large scale, and so are many valuable carbon compounds that are not known to occur ready formed at all.

While the belief in an indispensable force of life thus delayed for a time the progress of synthesis, chemists early directed their attention to the problem of molecular constitution. Berzelius was led to this problem by his electrochemical theory. But in the twenties facts became known which made its study an imperative necessity also from a purely practical standpoint. Not small was the surprise of chemists when Gay-Lussac and Liebig found, in 1823, that silver fulminate had precisely the same composition as silver cyanate. Two years later, Faraday discovered a volatile liquid hydrocarbon that had precisely the same composition as ethylene gas. Berzelius first thought it unwise to abolish, on the evidence of a few facts, what had seemed an axiom, viz., that two different compounds cannot possibly have the same composition. But when he discovered that racemic and tartaric acids, too, had the same composition, he realized that the character of a substance must depend not only on its *composition*, but also on its *constitution*, i.e., not only on the kind and number, but also on the arrangement of the atoms in its molecule. Thus was born that great problem of modern chemistry—to determine the constitution of substances from the standpoint of the atomic hypothesis.

In 1832 Liebig and Wöhler made an important discovery: A series of compounds allied to benzoic acid were transformed by them into one another, and through all the transformations a group of atoms (made up of carbon, hydrogen, and oxygen), which they named "the benzoyl radicle," remained unchanged; the molecules of benzoic acid, benzaldehyde, benzamide, and benzoyl chloride contained that radicle in common, as if it were a single atom of some element. The discovery of benzoyl was followed by Liebig's discovery of ethyl, a radicle common to ordinary alcohol and ether, and by Bunsen's discovery of cacodyl, which is possessed in common by several compounds of arsenic. The discovery of radicles was obviously the first step towards a knowledge of the constitution of compounds. But almost from the beginning the idea of radicles became associated with certain other ideas that could not be maintained in the light of more knowledge. Berzelius subdivided organic radicles, like the elements, into electro-positive and electro-negative. On the other hand, it was generally expected that radicles would eventually be isolated and thus constitute a series of simple compounds whose molecules would bear the same relation to the substances of organic chemistry as the atoms of the elements bear to the compounds of inorganic chemistry. But when the electro-chemical theory was overthrown, while attempts to isolate radicles remained fruitless, the opinion began to spread that the theory of radicles had made of organic chemistry a science of imaginary substances, and, hence, the sooner the theory was abolished the better for the young science. But how, then, were organic compounds to be correlated? A solution of this problem was suggested by Dumas in 1839. Continuing his researches on the substitution of different elements for one another in organic compounds, Dumas found that in acetic acid hydrogen could be exchanged for chlorine, and that the resulting compound (trichlor-acetic acid) was very much like acetic acid itself. Similar facts had already been observed, since 1834, by himself as well as by Laurent. It now occurred to Dumas that in correlating their substances chemists could be guided solely by the phenomena of substitution. Acetic acid and its chlorine-substitution product obviously belong to the same "type," and similar relations exist between other substances as well. If, therefore, the phenomena of substitution were investigated in connection with organic compounds in general, the result would be a grouping of compounds free from all hypothesis, but based on and exhibiting clearly their natural relationship. Such were, *in nuce*, Dumas's views, on the basis of which the celebrated "theory of types" was gradually built up in course of the fourth and fifth decades. The most important contributions to the theory were made by Gerhardt, Wurtz, Hofmann, and Williamson. Gerhardt realized that Dumas's ideas were worthy of being developed, but he also realized that this could not be done without the aid of the idea of radicles. No objection could be raised against the latter idea, once it were freed from all unnecessary associations, especially from the belief that radicles were unalterable substances capable of independent existence. To say that benzoyl chloride, C_7H_5OCl; benzoic acid, $C_7H_6O_2$; and benzamide, C_7H_7ON, contain in common the benzoyl radicle, i.e., the group of atoms C_7H_5O, was only to express what was evident from their formulas. On the other hand, the recognition of radicles must obviously lead to the discovery of the relationship of compounds, and thus, together with the phenomena of substitution, guide in grouping compounds in accordance with the idea of types. In 1849 Wurtz and Hofmann discovered a series of compounds that bore an unmistakable resemblance to ordinary ammonia, and could be considered as ammonia in which one or more hydrogen atoms were replaced by radicles. They proposed to group them together as belonging to the "ammonia type." In 1850 Williamson showed that alcohols, ethers, and acids could be referred to the "water type." Ordinary alcohol, e.g., whose formula is C_2H_6O, could be considered as water, H_2O, in which one hydrogen atom has been replaced by the ethyl radicle, C_2H_5. Ordinary ether, $C_4H_{10}O$, could be considered as water, H_2O, in which two hydrogen atoms have been replaced by two ethyl radicles, ether being thus $(C_2H_5)_2O$. Acetic acid,

$C_2H_4O_2$, could be considered as water, H_2O, in which one hydrogen atom has been replaced by the radicle C_2H_3O. Now, ether, $(C_2H_5)_2O$, was obtained from alcohol, C_2H_5HO, by the use of dehydrating agents. Williamson therefore held, by analogy, that it ought to be possible to transform acetic acid, $C_2H_3O.HO$, into a compound, $(C_2H_3O)_2O$. When, in 1852, Frankland actually succeeded in effecting this transformation by the use of dehydrating agents, the usefulness of the type theory was demonstrated. For nothing is more striking proof of the value of a theory than its capacity for revealing unknown facts. To the types *ammonia* and *water* Gerhardt added the types *hydrogen* and *hydrochloric acid*, and for a time it seemed that all organic compounds could be grouped under these four simple types. It was soon found necessary, however, to introduce the ideas of "condensed types," like the condensed water type, $(H_2O)_2$, "mixed types," and the type *marsh gas*, CH_4. In course of the fifties the type theory thus gradually became less and less simple, and hence less and less valuable for the purpose of correlating organic compounds.

Meanwhile an idea of inestimable value had thrust itself upon chemists. Inspecting the typical formulas of compounds, they could not help noticing that certain radicles (e.g., methyl, CH_3, or ethyl, C_2H_5) were capable of replacing each a single atom of hydrogen; others were capable of replacing each two atoms of hydrogen, etc. In other words, some radicles were seen to be equivalent to an atom of hydrogen; others had double its combining capacity, etc. Hence the idea of the *valency* of radicles and atoms. Like most other general ideas, that of valency was not new. In a vague and more or less specialized form it may be found in the researches of Berzelius, Graham, Liebig, and others; and Frankland, who first clearly enunciated it, in 1852, justly points out that it was probably a vague recognition of the valency of radicles, as exhibited by the facts of substitution, that gave birth to the theory of types. Frankland's statements, however, attracted no attention. In 1858 Kekulé and Couper independently developed the same idea, the latter proposing to symbolize the combining capacity of different atoms by the dashes now generally employed in graphic formulas. Kekulé called attention to the quadrivalence of the carbon atom, as shown directly by compounds like the following: CH_4, CH_3Cl, CH_2Cl_2, $CHCl_3$, CCl_4; or indirectly by such compounds as CO_2, $COCl_2$. In the former compounds a single atom of carbon is seen to be equivalent to four atoms of hydrogen, and a single chlorine atom to a single atom of hydrogen, which is also shown by the formula of hydrochloric acid, HCl. In a compound like $COCl_2$, the oxygen atom must therefore be assumed to be divalent, and so it is directly shown to be by the formula H_2O. Kekulé soon came to the conclusion that in practically all organic compounds one carbon atom is combined with a quantity of other elements which is equivalent to four atoms of hydrogen. This gave rise to a lively controversy, the critic Kolbe especially maintaining that the valency of an element may not be the same in all of its compounds. Kekulé's view, however, was finally accepted by all, and in 1860 chemists the world over were busy determining the "structure" of organic compounds—a problem which has since occupied the attention of a majority of them almost exclusively. The theory of types, the mother of the structural theory, exhibited the radicles of compounds, and thus explained those cases of isomerism in which compounds are different because they contain different radicles. Those further cases in which the radicles themselves are differently constituted, it could not explain. The doctrine of valency, showing the different ways in which the atoms can be linked in the radicles, has furnished a satisfactory solution of the problem of molecular constitution and has completely explained the fact that the molecules of different compounds may be made up of the same atoms. At first Kekulé scarcely appreciated the full value of his own ideas. In the very memoir in which he states the doctrine of valency, he advances the view that this doctrine cannot by any means solve the problem of the constitution of compounds; the old problem, he thought, might possibly be solved some day by physical chemistry. Perhaps he was not altogether wrong. For now, after half a century of experience, organic chemists are beginning to complain of the inadequacy of the structural theory, even with its more recent development—stereochemistry (q.v.)—and to look forward to some broader idea, that would correlate a larger number of known phenomena and permit of foreseeing a larger number of as yet unknown facts. What that idea will be, no one can tell as yet. Chemists are energetically trying to attain it by way of inquiries into the *nature* of valency, and an increasing number of such inquiries are now published every year. The conception of valency has lost much of its original rigidity, and the idea that carbon, e.g., is not necessarily quadrivalent, but may in certain compounds act as a trivalent or even as a bivalent element, is no longer astonishing to anybody. Thus, in fulmimic acid carbon is very generally considered to be bivalent, and in triphenyl-methyl it is also generally admitted to be trivalent. Further, the existence of "additional valencies," "partial valencies," etc., is not infrequently assumed, for very practical purposes, by contemporary chemical investigators. See VALENCY.

General Chemistry. The doctrine of valency could not have come into existence if not for the fact that towards the end of the fifties chemists had learned the true atomic weights of the elements. Without a knowledge of the true relative weights of atoms, it would have been impossible to know their true number in molecules and, hence, impossible to know their true valencies. Atomic weights were determined, calculated, and recalculated ever since Dalton first established the atomic theory. Dalton himself, as stated in a previous section of this article, determined atomic weights on the basis of certain simple assumptions. Soon afterward Berzelius devoted himself to the problem with great assiduity. From the law of combining volumes, discovered by Gay-Lussac in 1808, Berzelius inferred that equal volumes of gaseous elements must contain equal numbers of particles. In 1819 Mitscherlich discovered the principle of isomorphism. (See ATOMIC WEIGHTS.) Berzelius had carried out about 2000 analyses, determining the relative quantities of the elements contained in a great variety of compounds. By combining the principle of isomorphism with that of equal gaseous volumes, he was now able to calculate the atomic weights of the elements. Now, his principle of equal volumes was not quite correct. To him the par-

ticles of a gaseous element in the uncombined state were isolated atoms. While he distinguished between the particles of compounds and the atoms of elements, he failed to distinguish between the free particles of elements and their atoms. That the particle of an element might be made up of two or more single atoms, it would have been impossible for him to admit; for, according to his electro-chemical theory, only unlike atoms could exist in combination with one another. Avogadro's memoir of 1811, in which more correct views on the subject had been advanced, therefore remained unnoticed, and Berzelius' atomic weights were for years employed by all. Nor were most of those figures wrong; for in many cases Berzelius' error eliminated itself, owing to the fact that the molecules of the ordinary gaseous elements are made up of equal numbers of atoms. Knowing the true atomic weights of the ordinary gaseous elements, Berzelius was able to obtain correct figures for many other elements, with the aid of the principle of isomorphism and certain other principles that need not be explained here. Thus, his figure for mercury was 200, that for phosphorus 31, that for sulphur 32—figures practically identical with those accepted at present. In 1827, however, Dumas invented his celebrated method of determining vapor densities and undertook to apply Berzelius' principle of equal volumes to elements which are not ordinarily gaseous. Finding that the vapor of mercury is 101 times as heavy as an equal volume of hydrogen, the vapor of phosphorus 62.8 times, and the vapor of sulphur 96 times, as heavy as hydrogen, Dumas concluded that the relative weights of their atoms must be, respectively, 101, 62.8, and 96, and not 200, 31, and 32, as Berzelius thought. The error of Berzelius' principle thus emerged in the results of Dumas. But instead of rectifying the error of his principle by introducing the concept of the *molecules* of elements, Berzelius only concluded that the principle was unreliable. The result was that chemists began to disagree as to the true values of the atomic weights, and many even abandoned the hope of ever knowing atomic weights altogether, and decided to use nothing but *equivalents*. These represented the weights of elements that were capable of combining with, or of being replaced by, unit weight of hydrogen. For example, Berzelius' view that an atom of oxygen was 16 times as heavy as an atom of hydrogen was abandoned, and as hydrogen combined with 8 times its weight of oxygen, the latter was represented by its equivalent 8. But the use of equivalents was not universal, many chemists using systems in which the figures were partly equivalents, partly atomic weights, and thus for years great confusion reigned in chemical notation, the true purpose of which is to avoid confusion by exhibiting the composition of substances in the simplest and clearest possible manner. In the forties Laurent and Gerhardt became convinced that the progress of knowledge in organic chemistry was seriously impeded by the lack of a consistent system of atomic weights. Their researches soon led them to distinguish clearly between the atoms and molecules of elements, and to grasp the full value of Avogadro's principle for determining the relative weights of molecules. With the aid of this principle Gerhardt found the true atomic weights of the elements; and in the latter part of the fifties his pupil Cannizzaro demonstrated clearly the consistency of the principle with all known facts. Thus was paved the way for the doctrine of valency. A few years later (in 1869) Mendeléeff and Lothar Meyer established a remarkable connection between the properties of the elements and their atomic weights (see PERIODIC LAW), and thus the correctness of the latter was confirmed in a very striking manner.

The further progress of general chemistry has been mainly in connection with the various subdivisions of physical chemistry, brief historical accounts of which may be found under REACTION; SOLUTION; DISSOCIATION; THERMOCHEMISTRY; ELECTROCHEMISTRY; CATALYSIS. (See also the article LABORATORY.) The epoch-making discovery of radium has resulted in the birth of what is really a new science—the science of radio-activity (q.v.), which has even already a history of its own.

LITERATURE

In a science whose progress is so phenomenally rapid as that of chemistry, even the best books are likely, within a few years of publication, to lose more or less of their original value. Nevertheless, it is safe to say that most of the following works will, in the ordinary course of events, retain their interest for a number of years to come. The list includes some of the best-known modern works on descriptive, theoretical, and technical chemistry. More specialized works are noted in the articles on various chemical topics.

Inorganic and Organic Chemistry. Ostwald, *Introduction to Chemistry* (New York, 1911); Remsen, *Introduction to the Study of Chemistry* (New York, 1895); id., *Inorganic Chemistry* (ib., 1895); Erdmann, *Lehrbuch der anorganischen Chemie* (Brunswick, 1900); Ostwald, *Grundlinien der anorganischen Chemie* (Leipzig, 1900); Mendeléeff, *The Principles of Chemistry*, trans. by Kamensky (2 vols., London, 1892); Mellor, *Modern Inorganic Chemistry* (New York, 1912); Stewart, *Recent Advances in Physical and Inorganic Chemistry* (London, 1909); Remsen, *An Introduction to the Study of the Compounds of Carbon* (Boston, 1895); Norris, *The Principles of Organic Chemistry* (New York, 1912); Perkin and Kipping, *Organic Chemistry* (London, 1894); Meyer (Victor) and Jacobson, *Lehrbuch der organischen Chemie* (2 vols., 1893–96); Richter, *Chemistry of the Carbon Compounds*, trans. by Smith (Philadelphia, 1891; new German ed., Bonn, 1900); Friedel, *Cours de chimie organique* (Paris, 1887); Béhal, *Traité de chimie organique* (2 vols., Paris, 1896–97); Stewart, *Recent Advances in Organic Chemistry* (London, 1908); Cohen, *Organic Chemistry for Advanced Students* (2 vols., New York, 1907 and 1913); Pope, *Modern Research in Organic Chemistry* (London, 1912); Henrich, *Theorien der organischen Chemie* (Braunschweig, 1912); Dammer, *Handbuch der anorganischen Chemie* (5 vols., Stuttgart, 1892–1902); Abegg and Auerbach, *Handbuch der anorganischen Chemie* (Leipzig, 1904–13); Beilstein, *Handbuch der organischen Chemie* (5 vols., Hamburg, 1893–1901, and 5 supplementary vols.); Roscoe and Schorlemmer, *A Treatise on Chemistry* (9 vols., New York, 1878–92).

Theoretical and Physical Chemistry. Van Deventer, *Physikalische Chemie für Anfänger* (Leipzig, 1897); Meyer (Lothar), *Modern Theories of Chemistry*, trans. by Bedson and Williams (London, 1888; new German ed., Leipzig, 1899); Ostwald, *Outlines of General Chemistry*,

trans. by Walker (London, 1890; new German ed., Leipzig, 1899); Walker, *Introduction to Physical Chemistry* (London, 1910); Nernst, *Theoretische Chemie* (ed. 7, Stuttgart, 1913); Van't Hoff, *Vorlesungen über theoretische und physikalische Chemie* (Brunswick, 1898–1901); Ostwald, *Lehrbuch der allgemeinen Chemie* (Leipzig, 1891–96); Arrhenius, *Theories of Chemistry* (London, 1907); Cannizzaro, *Abriss eines Lehrganges der theoretischen Chemie* (Leipzig, 1891); Smiles, *The Relation Between Chemical Constitution and Some Physical Properties* (London, 1910); Wurtz, *The Atomic Theory*, trans. by Cleminshaw (London, 1880); Noyes, *General Principles of Physical Science* (New York, 1902).

Teaching and Experimentation. Arendt, *Didaktik und Methodik des Chemie-Unterrichts* (Munich, 1895); Arendt, *Technik der Experimentalchemie* (Hamburg, 1900); Stähler, *Handbuch der Arbeitsmethoden in der anorganischen Chemie* (Leipzig, 1913); Vanino, *Handbuch der präparativen Chemie* (Stuttgart, 1913); Chandler, *The Construction of Chemical Laboratories* (Washington, 1893); Beckmann, E. O., *Das Laboratorium für angewandte Chemie der Universitat Leipzig* (Leipzig, 1908).

Industrial Chemistry. Wagner, *Manual of Chemical Technology*, trans. by Crookes (London, 1894); Ost, *Lehrbuch der technischen Chemie* (Hanover, 1900); Lunge and Berl (editors), *Chemisch-technische Untersuchungs-Methoden* (4 vols. Berlin, 1910–11); Sadtler, *A Handbook of Industrial Organic Chemistry* (Philadelphia, 1900); Dammer, *Handbuch der chemischen Technologie* (5 vols., Stuttgart, 1895–98); Dammer, *Chemische Technologie der Neuzeit* (Stuttgart, 1910–11); Engler (editor), *Neues Handbuch der chemischen Technologie* (Braunschweig, 1912–13); Kremann, *The Application of Physico-chemical Theory to Technical Processes and Manufacturing Methods* (London, 1913).

Household Chemistry. Richards (Mrs. E. H.), *The Chemistry of Cooking and Cleaning* (Boston, 1882); Lassar-Cohn, *Die Chemie im täglichen Leben* (Hamburg, 1900; English trans., Philadelphia, 1913).

Dictionaries. Watts, *A Dictionary of Chemistry*, ed. by Morley and Muir (4 vols., London, 1890–94); Wurtz, *Dictionnaire de chimie pure et appliquée* (5 vols., 1867–70, and supplement; 2d supplement, vol. i, ed. by Friedel, 1891–94; vol. ii in progress); Ladenburg, *Handwörterbuch der Chemie* (13 vols., Breslau, 1883–95); Richter, *Lexikon der Kohlenstoffverbindungen* (2 vols., Hamburg, 1900); Stohmann and Kerl (editors), *Muspratt's Encyklopädisches Handbuch der technischen Chemie* (8 vols., Brunswick, 1886–1900); Thorpe, *A Dictionary of Applied Chemistry* (ed. 2, London, 1912–13).

History. Kopp, *Sonst und Jetzt in der Chemie*, a popular lecture (Brunswick, 1867); Wurtz, *Histoire des doctrines chimiques* (Paris, 1869); Meyer (Ernst), *A History of Chemistry*, trans. by M'Gowan (New York, 1891; new German ed., Leipzig, 1894); Kopp, *Geschichte der Chemie* (Brunswick, 1843–47); id., *Beiträge zur Geschichte der Chemie* (ib., 1869–75); Berthelot, *La chimie au moyen âge* (Paris, 1893); Berthelot, *La révolution chimique* (ib., 1890); Tilden, *Short History of the Progress of Scientific Chemistry in our own Time* (London, 1899); Ladenburg, *Die Entwickelung der Chemie in den letzten 20 Jahren* (Stuttgart, 1900); Ladenburg, *Vorträge über die Entwickelungsgeschichte der Chemie von Lavoisier bis zur Gegenwart* (Braunschweig, 1902); Ostwald, *Der Werdegang einer Wissenschaft, Sieben gemeinverständliche Vorträge aus der Geschichte der Chemie* (Leipzig, 1908); Thorpe, *Essays in Historical Chemistry* (London, 1911); Schorlemmer, *The Rise and Development of Organic Chemistry* (London, 1894); Roscoe and Harden, *A New View of the Origin of Dalton's Atomic Theory* (New York, 1896); Dalton, Gay-Lussac, Avogadro, *Papers on the Foundation of the Molecular Theory* (reprinted, Edinburgh, 1893). Ostwald's *Klassiker der exakten Wissenschaften* (Leipzig) includes edited reprints of many important papers. Consult also the excellent volume *Chemie*, edited by Ernst von Meyer and forming a part of "*Kultur der Gegenwart*" (Leipzig, 1913).

Periodicals. *Berichte der deutschen chemischen Gesellschaft* (Berlin); *Transactions and Proceedings of the Chemical Society of London* (London); *Bulletin de la Société chimique de Paris* (Paris); *Journal of the American Chemical Society* (Easton, Pa. In 1914 the *American Chemical Journal*, which had been founded and edited by Ira Remsen, was consolidated with the *Journal of the American Chemical Society*); *Zeitschrift für physikalische Chemie* (Leipzig); *Journal de Chimie physique* (Geneva); *Chemisches Centralblatt* (Hamburg); *Jahrbuch der Chemie* (Brunswick); Chemical Society of London: *Annual Reports of the Progress of Chemistry* (London); *Zeitschrift für den physikalischen und chemischen Unterricht* (Berlin).

Bibliography. Bolton, *A Select Bibliography of Chemistry, 1492–1892* (Washington, 1893; 1st supplement, for 1492–1897, Washington, 1899; 2d supplement, Washington, 1904).

CHEMISTRY, Agricultural. The branch of chemical science which deals with the problems of the soil, the nutrition of plants and animals, the composition of their products, and their value as food for man and animals. Its field borders on those of vegetable and animal physiology on the one hand, and of physics and geology on the other; and in working out problems in agriculture, the agricultural chemist has frequently been led into these adjoining branches of science. His work has, however, been essentially chemical, and thus a quite distinct and well-defined branch of chemical science has been built up.

History. The first attempt to bring together in a systematic manner the teachings of chemistry as applied to agriculture was made by Sir Humphry Davy, in a series of lectures before the British Board of Agriculture, early in the nineteenth century (*Elements of Agricultural Chemistry*, 1814). Davy regarded the soil as the source of all nourishment of plants, and he announced the general principle that plant food must be practically dissolved before it can enter the organism of the plant. But while he and his predecessors knew the value of certain materials for plant food, they did not know the constituents which gave them this value. Oil, e.g., was long supposed to be one of the most valuable fertilizing constituents, and Davy supposed sugar to be also. One of the reasons for this error was undoubtedly the belief that the carbon of plants was derived through the roots from the humus—i.e., the partially decomposed organic matter of the soil. The errors of this "humus theory" were pointed out, about 1840, by Justus von Liebig, who in his generalizations drew heavily upon the works of De Saussure and Boussingault. Liebig showed the carbonic acid of the air to be the source from which plants

derive their carbon, and the leaves to be the medium through which this assimilation takes place. He thus laid down a fundamental principle of physiological botany. He established the interdependence of plants and animals with relation to carbonic acid, which is a vitalizing principle of the one and an excretory product of the other. In place of the "humus theory" he advanced his famous "mineral theory," according to which the soil furnishes to plants their ash or mineral constituents; and this led him to suggest the employment of artificial fertilizers for keeping up the supply of the mineral constituents of the soil and thus maintaining its fertility. Liebig's views, with some modifications, form the basis of our present theories; but, on the other hand, we have learned much regarding the true value of humus and its functions in the soil. See MANURES.

In the field of animal nutrition, or the utilization of plants and their products in feeding animals, agricultural chemistry has likewise led to the establishment of the underlying principles and the methods of research. The earlier ideas regarding the valuable food constituents of plants were equally as crude as those regarding the fertilizing constituents. There was a prevalent belief in a subtle, undefined property of forage plants, upon which their nutritive properties largely depended, and it was a long time before the connection between nutritive value and chemical composition was traced. Boussingault, in France, attempted to classify feeding stuffs on the basis of their nitrogenous constituents; and Thaer, in Germany, compared them with hay and prepared his tables of "hay values." At length Henneberg worked out a classification of the nutritive constituents of feeding stuffs, and a method of analysis known as the Weende method. His classification and method have been extensively employed, having served as the basis in most of the investigations since. These studies in animal nutrition have led the agricultural chemist into a field of inquiry intimately connected with physiology proper; and in the development of the theories, as well as in their application in practice, agricultural chemistry has until recently contributed much more than physiology itself and has usually been the leader. See FEEDING FARM ANIMALS.

Agricultural chemistry laid the foundation for a science of agriculture, and one of the most important and far-reaching influences of the early agricultural chemists was that which led to the establishment of the agricultural experiment station. The teaching of agriculture in agricultural schools and colleges preceded it in most countries, but the investigation and experimentation was for the most part in the hands of the agricultural chemists. Their work led them into agricultural experiments of various kinds, as a matter of necessity, and Liebig, Boussingault, Lawes and Gilbert, and others, laid out experimental fields for carrying on their studies and testing their theories. As the practice of fertilizing the soil became introduced in the Old World, farmers found themselves confronted by a variety of problems relating to their soils and fertilizing materials which they were unable to answer, and they quite naturally turned for advice and guidance to the agricultural chemists who had developed these theories. Thus experiment stations came to be established, first by agricultural societies of private individuals and later with government aid. (See AGRICULTURAL EXPERIMENT STATIONS.) In the United States the researches and writings of S. W. Johnson (*How Crops Grow*, 1869; *How Crops Feed*, 1870), C. A. Goessmann, E. W. Hilgard, G. C. Caldwell, W. O. Atwater, and other chemists, prepared the way for the establishment of experiment stations as State institutions; and out of these has grown a system of stations under government aid and supervision, embracing every State and Territory in the Union, and providing incidentally the most munificent endowment for agricultural-chemical research to be found in any country.

Agricultural Analysis. The chemical substances with which agricultural chemistry is primarily concerned are those comprising the ash, or mineral constituents, and the food constituents of plants. As the soil is the source of the mineral constituents of plants, and usually of the nitrogen also, those elements of the soil which serve as food for plants—i.e., which enter into their composition—are embraced in the field of agricultural chemistry; and, on the other hand, as farm animals derive their nourishment from plants, agricultural chemistry is naturally concerned with the food constituents of these plants. The plant is thus a link between the soil and the animal, as regards the mineral elements; but the plant gets its carbon from the air and develops from it a series of carbon-containing compounds, which in turn are the source of carbon to the animal.

In the analysis of the plant we find first that the tissue contains a very large percentage of water—up to 90 per cent—which is indispensable to its growth and circulatory system. This water is expelled by heating the plant in a drying oven at about 212° F. for several hours. The residue, or *dry matter*, consists of organic constituents and a relatively small proportion of ash. The former are combustible, and hence the ash is determined by burning the sample. The ash consists chiefly of lime, magnesia, potash, soda, iron, silica, chlorine, and carbonic, sulphuric, and phosphoric acids. In plant analysis determinations are made of all these constituents. In analyzing fertilizers, only the potash, phosphoric acid, and nitrogen are commonly considered, these three being often spoken of as the fertilizing constituents. Latterly lime and sulphur are often included, and in special cases the other ash constituents, soda, magnesia, iron, etc. In fertilizer analysis it is customary to carry out separate determinations of the phosphoric acid soluble in water (mono-calcium phosphate), of "reverted" phosphoric acid—i.e., that soluble in a standard solution of ammonium citrate (di-calcium phosphate), and of the insoluble form (tri-calcium phosphate). The soluble and reverted forms are more readily available to plants than the insoluble form and are valued at a higher price. In complete analysis of soils other mineral ingredients besides the potash and phosphoric acid are determined, such as magnesium, calcium, sodium, manganese, iron, alumina, and silica, and also the humus. The latter is a very important constituent of soil in determining its fertility, ability to retain moisture, and to support biological changes which render the soil constituents available to plants. Mechanical analysis of the soil is also made, in which the sample is separated into particles of different sizes by means of water, and the percentage of each grade ascertained. The value of an agricultural soil depends to a considerable

extent upon its mechanical condition, as shown by this analysis, since this largely governs its capacity for moisture, capillarity, suitability for certain crops, and other qualities. In the examination of soils there have been many attempts to estimate the amount of the fertilizing ingredients present in forms available to plants. This is done by extracting the soil with weak acids and analyzing the extract, or by growing plants in pots of the soil and analyzing the crop. Important as this matter is in determining the fertilizers needed by soils, no method has yet been devised which is entirely reliable and satisfactory.

Of the organic constituents of plants those of most concern to the agricultural chemist are the so-called food constituents, which determine the value of the plant as food for animals or man. These may be divided into the nitrogenous, or those containing nitrogen, and the non-nitrogenous substances. The nitrogenous are grouped under the name of protein and include albuminoids, containing about 15 to 18 per cent of nitrogen, the amides, and a variety of other bodies. Of the non-nitrogenous constituents, the most important are (1) the fats and oils and (2) the carbohydrates, including starch, sugars, pentoses, cellulose, fibre, etc. The protein of plants is estimated by determining the nitrogen and multiplying the result by 6¼, on the assumption that the protein constituents average about 16 per cent of nitrogen. As this does not always hold true, the result is subject to slight error. In determining the fats the material is extracted with ether, in a special extraction apparatus, the ether expelled, and the residue weighed. This is not pure fat, but contains also the waxes, chlorophyll, lecithin, and some other bodies in small quantities. The fibre or cellulose is usually determined separately from the other carbohydrates. This is done by dissolving out the other constituents of the plant with dilute alkali and acid and weighing the residue, a correction being often made for the remaining traces of nitrogen and ash. As a large variety of other carbohydrates are usually present, which are of similar feeding value, they are not determined individually, except for special purposes, but are grouped with the organic acids and some other substances about which little is known, under the general head of nitrogen-free extract. This is done on the supposition that everything else has been accounted for in the water, ash, fat, protein, and fibre determined separately; and hence the difference between the sum of the percentage amounts of these and 100 represents the nitrogen-free extract. Accurate methods have been worked out for determining the sugars, starches, pentoses, galactose, etc., separately, and these are used for special analysis. For example, in studying sugar-producing plants, the sugar is determined very exactly. The principal organic acids in plants are oxalic, malic, citric, and tartaric, and these are determined on occasion, as in analysis of fruits, beverages, and some vegetables.

In the analysis of dairy products, which comes within the scope of the agricultural chemist, the principal subjects are milk, butter, and cheese. In milk analysis the specific gravity (by lactometer), water, total solids (dry matter), fat, casein, sugar, and ash are determined, the fat being the constituent considered especially, as showing the richness of the milk and its value for butter and cheese making. (See MILK; BUTTER MAKING; CHEESE MAKING.) Butter is analyzed mainly with a view to detecting adulteration with oleomargarine, renovated butter, excess of water, etc. Cheese is examined for water, fat, nitrogen, and ash, the principal objects being to determine its food value and to detect adulteration. There is a long list of other substances which come within the scope of the agricultural chemist for analysis, such as fungicides and insecticides, human foods and beverages, tanning materials, etc., which can only be referred to here.

In dairying the investigations of agricultural chemistry have been far-reaching in their results, largely modifying dairy practice in a number of respects. For example, Babcock has worked out a rapid, simple, and accurate method of testing milk and cream as to their fat content. This test has come into very general use and has not only changed the method of paying for milk at creameries and cheese factories, but led to the selection of cows giving richer milk. The same chemist, with Russell, a bacteriologist, has made elaborate studies of the ripening of cheese, which, supplemented by those of Van Slyke and Hart, have shown the causes and nature of the chemical changes during ripening.

The inspection or control work, which is now carried on in nearly every country, has afforded agriculturists needed protection in the purchase of fertilizers, feeding stuffs, and the like, and reduced the traffic to a business basis. The percentages of essential constituents in these materials is now guaranteed by the sellers, and the goods inspected to see that they meet the guarantee. Dairy products of various kinds have been subjected to systematic inspection, and of late this has been extended to materials used for insecticides and fungicides, the consumption of which is assuming large proportions.

The earliest treatise on methods of agricultural analysis in the United States was published by Prof. G. C. Caldwell in 1869. Since 1884 the Association of Official Agricultural Chemists has been a potent factor in testing and developing methods of analysis. It holds an annual meeting and publishes a volume of proceedings and papers. Similar associations exist in Germany, Holland, and Belgium, and a number of other European countries.

Feeding and Metabolism Experiments. The analysis of plants as above shows the total amount of the constituents present; but as these are not all in form to be digested by the animal, digestion experiments are made by the chemist on live subjects. In these experiments the amount and composition of the feed consumed by the animal, and of the corresponding excreta voided, are definitely determined for a short period, and by calculation the percentages of protein, fat, fibre, and nitrogen-free extract actually digested are ascertained. These percentages are called the *coefficients of digestibility* and have to be determined for each feeding stuff separately. A method of artificial digestion has been worked out, in which the feed is treated with pepsin and hydrochloric acid and with pancreas solution, but it is not generally considered to be as reliable as the natural method. In recent years the bomb calorimeter has come into quite extensive use in the study of feeding stuffs, for measuring the fuel value, or the capacity of the feed for furnishing heat and energy for work. In this apparatus a sample of the material is ignited with oxygen in a platinum-lined bomb,

and the heat evolved is measured by means of very accurate thermometers, suspended in a water jacket surrounding the bomb. For further details regarding fuel value and the subject of animal nutrition in general, see FEEDING STUFFS; FEEDING FARM ANIMALS.

Very refined and delicate methods and apparatus have also been elaborated for studying the functions of the different nutrients in animal feeding, and the way in which they are used in the animal body in producing animal heat and energy for work, repairing the waste of the body, and making growth or meat or milk. In the ordinary feeding experiment with cattle, or sheep, or pigs, the herd is divided into equal lots and fed in periods varying from a few weeks' to several months' duration, account being kept of the amounts of food of known composition which each lot or individual eats and of the changes in weight. At the conclusion the animals are often slaughtered and the composition of the carcass determined. In this way the feeding value of nearly every available feeding stuff, and of a great variety of compound rations, has been studied, and the specific effect of nutrients from different sources on the quality of the beef, pork, butter, etc. Much of this feeding work has also been directed towards the relation of live stock to the problem of maintenance of soil fertility and the development of a rational system of agriculture. It has been shown that by feeding the crops largely on the farm where they are produced, and applying the manure to the soil, the fertility of the latter can be conserved, the supply of humus kept up, and the expense for commercial fertilizers reduced to a minimum. The reason of this is that when crops are fed to growing stock or milch cows, from 60 to 90 per cent of their fertilizing ingredients, voided in the solid and liquid manure, are retained upon the farm.

In studying the fundamental principles of nutrition, and the function of the different nutrients, the total income and outgo of the body during the experimental period must be determined. This includes the carbonic acid and other gases given off, as well as the excreta. For measuring these gases a respiration apparatus is employed, which usually consists of a closed chamber in which the animal or person is placed, with means for measuring and sampling automatically the air as it enters and leaves the chamber. With such a respiration apparatus Henneberg, Kühn, Kellner, and others have worked out the functions and relative values of the different nutrients and many of the underlying principles of nutrition. Atwater and Rosa have combined a calorimeter with the respiration apparatus and made many improvements in the accuracy of the latter. In their apparatus the chamber in which the subject is placed is a calorimeter, with very delicate arrangements for registering the heat given off by the subject. With the aid of this highly sensitive respiration calorimeter, it has been possible to demonstrate the absolute conservation of matter and energy in the body. A similar apparatus for use with animals has been constructed by Armsby.

Fertilizer Experiments. The investigations of the agricultural chemist in studying the fertilizer requirements of different crops, the value of different forms of plant food and their effect on the quality of the crop, and a wide range of similar problems, are conducted either in pots or cylinders, or in plats in the field. The preliminary studies are often made in pots or boxes, filled with sterile sand, to which definite amounts of humus and fertilizers have been added. The conditions are under complete control, and every part of the plants can be saved for analysis. These pots are usually mounted on trucks, so that they can be placed under cover at night or during a rain. The plat work is especially for testing theories under field conditions, studying fertilizer requirements, the draft of different kinds of crops, the changes in humus content and fertility of the soil under various systems of treatment, and the like. The plats are most commonly about one-tenth of an acre in area, selected with much attention to uniformity of the soil, and often underdrained and provided with basins for collecting the drainage water from each plat. Great care is exercised in preparing the land, applying the fertilizers, cultivating the crops, and harvesting them, so as to have the treatment of all uniform except as regards the special experimental feature. For studying soils in the field, samples are taken at intervals with a tube specially made for the purpose, which is driven into the ground to the depth required, removing a core of the soil. These samples are taken to the laboratory and tested or analyzed. These studies of plant production and soil fertility have been accompanied by a gradual refinement of methods, and a great deal of investigation has had purely that aim. The field covered has been very broad and has not always been strictly chemical. For example, the discovery of the ability of leguminous plants (clovers, peas, and the like) to appropriate to their use the free nitrogen of the atmosphere, and thus, under certain conditions, to enrich the soil with nitrogen from the air, was made by a German agricultural chemist, who also demonstrated the agency of bacteria in bringing about this assimilation. See GREEN MANURING; ROTATION OF CROPS.

Of late years the biological relations of soils, nitrification and denitrification, the water requirements of plants, poisonous principles of feeds and plants, the nature of the protein and other constituents of plant and animal products, the ripening of fruits, and allied topics have received the attention of agricultural chemists. The development of biological and physiological chemistry has differentiated the field of agricultural chemistry to some extent, and the more detailed classification of agriculture has tended to split up the subject among numerous departments.

Bibliography. Among the more important treatises on agricultural chemistry, the following may be mentioned: Johnston, *Lectures on the Application of Chemistry and Geology to Agriculture* (New York, 1850); Johnson, *How Crops Grow* (New York, 1900); Storer, *Agriculture in some of its Relations with Chemistry* (New York, 1897); Wiley, *Principles and Practice of Agricultural Analysis* (3 vols., Easton, Pa., 1906–13); Dehérain, *Traité de chimie agricole* (Paris, 1892); Sachsse, *Lehrbuch der Agriculturchemie* (Leipzig, 1888); Mayer, *Lehrbuch der Agriculturchemie* (Heidelberg, 1895); Snyder, *Chemistry of Plant and Animal Life* (New York, 1913). See FOOD, and the special articles upon the principal crops.

CHEMISTRY, ANALYTICAL. (See ANALYSIS, CHEMICAL.) Many special processes of analytical chemistry may be found described under the

names of the substances in connection with which they are usually employed.

CHEMISTRY, INDUSTRIAL. In no department of manufacture has the progress been so great in recent years as in Industrial Chemistry.

Chemistry is naturally divided into two great divisions, known respectively as inorganic and organic chemistry. The former may also be termed mineral chemistry, and that branch of chemistry which treats of the extraction of metals from their ores is called metallurgy; therefore the industrial processes used in metallurgy will find proper treatment under that title or perhaps under the special metal concerning which information is sought, such as gold, iron, silver, tin, etc. In addition it may be said that many of the processes used for the manufacture of special products will be found under the name of the product, as cement, lime, potash, soda, etc.

The most prolific development in industrial chemistry is perhaps that which pertains to organic chemistry. So long ago as 1828 the great German chemist Wöhler by his synthesis of urea established the fact that it was possible to produce from inorganic substances, such as coal tar, compounds previously supposed to derive their origin from organic or natural sources. Since that time many artificial products have been manufactured, such as alizarin, indigo, and camphor, which have in some cases entirely removed the industry from a natural local environment to a chemical center. This was the case with artificial alizarin, which was synthesized in Germany and there manufactured at a cheaper rate than it was possible to grow the natural madder in Turkey and elsewhere. Thus have the conditions in recent years entirely changed owing to the manufacture of many substances from coal tar. Also must be mentioned the fact that the fuel question has had much to do with the development of industrial chemistry, especially where those products that are of organic origin are concerned. Formerly coal was the common fuel used, but again with the rapid development of the uses of electricity, that force generated in regions where water power was cheaply available has led to the establishment of chemical industries in localities, such as Niagara Falls in the United States. The cheaper the fuel, it naturally follows that the power is cheaper with a corresponding possibility of making the product at a reduced price.

The World War has had a remarkable influence upon chemical manufactures. With rare skill and great ability, large chemical plants had been developed in Germany until these concerns controlled many branches of chemical industry. The whole world seemed, therefore, dependent upon Germany for many of their essential chemicals. The methods followed were quite simple. Control was obtained of raw products and these were then manufactured into useful products which were sold more reasonably than by other concerns in other countries. Typical of this situation was the potash industry, leading up to the manufacture of commercial fertilizers, which was completely under German domination. The coal tar products, including the aniline dyes (originally an English invention), the synthetic medicines, and many artificial products could be purchased in Germany of better quality and at cheaper prices than elsewhere in the world. The stopping of all exports from Central Europe made it impossible for the Allied countries to obtain these products, and accordingly at once Great Britain, the United States, and Japan began to manufacture their own chemicals. In Great Britain under government subsidies, the manufacture of dyestuffs, certain chemicals, and certain varieties of glass was undertaken. In Japan large plants were established and the natural camphor industry renewed, as was also the indigo industry in India. The conditions in the United States were in many respects most favorable. Large industrial corporations, some of which were manufacturing high explosives, saw their opportunity and found it possible to undertake the manufacture of artificial dyes and succeeded. (See DYESTUFFS below.) The production of potash so essential for the farmer was undertaken and also succeeded. In 1922 the newer chemical industries in England had somewhat lapsed, and those in Japan had failed to realize expectations, but in the United States the results had been most successful, until this country was not only practically independent in the dyestuff industry but was succeeding in the making of potash, a success which promised to continue if proper tariff legislation were enacted. One other chemical deserves a word. It is the manufacture of nitrogen compounds from the air and this will be discussed under *Nitrogen*. Had not Germany been able to manufacture nitrates from the air during the World War she would have been obliged to succumb much sooner, owing to the impossibility of procuring nitrates from Chile.

Metals. In recent years the conditions regarding these important substances have changed materially. Ever since the perfection of the valuable reduction process announced by Castner, followed by the electrolytic production of *aluminum*, resulting in a great reduction in the price of that metal, there has been a growing demand for it as a substitute for tin, notably in the production of household utensils and in the manufacture of alloys. Aluminum has also found extensive use in the manufacture of white metallic paints and is used to take oxygen from iron oxides in the manufacture of steel. Important improvements have been made in the processes used for its reduction and in the methods of soldering it. During the World War its production in the United States greatly increased. Uses for the rare metal *cerium* have been found, and both it and *magnesium* are now manufactured in this country. The former is a by-product of the gas mantle industry. *Molybdenum* deposits in Canada and Southern China have been worked advantageously especially since Germany ceased to be the source for that metal. It finds its chief use in connection with steel. *Radium*, formerly extracted from ores mined in Colorado, is now largely manufactured near Pittsburgh in the United States, and the production of this valuable remedial agent is increasing with a corresponding reduction of the cost. The great source of supply for *Platinum* has always been the Ural Mountains but as these deposits are no longer available, the world has been searched for that precious metal. Small quantities have been found in Spain and in Western United States and Alaska. It is largely used as a catalizer. *Thorium* and *Mezothorium* are growing in importance, especially for use in mantles for artificial lighting. *Tin* is growing scarce, although new

deposits have been found in Bolivia and improved processes for its extraction are reported. *Titanium*, formerly entirely disregarded, is now coming into use as a valuable constituent of steel rails. *Tungsten*, until lately an exclusive German product, is now obtained in California, Chile, Burma, and China, and was largely derived from these sources during recent years. *Uranium* ores as a source for radium have been in demand and *Vanadium*, once a curiosity almost, is now a valuable constituent of certain steels. *Zirconium* is also being studied as an alloying element in steel.

Alloys. Improved alloys showing lightness and increased strength are of frequent invention. Concerning aluminum alloys it has been found by adding aluminum to copper an immediate increase, both in the strength and ductility is obtained. The ductility attains a maximum with 7.35 per cent of aluminum. Beyond that it falls and when 11 per cent is reached the alloy becomes too brittle to be of any commercial value. Heat treatment has little effect upon alloys containing less than 7.35 per cent of aluminum. Beyond that they are stiffened by heat treatment at 800° C. Alloys containing less than 7.5 per cent aluminum are not amenable to cold working, though they are improved by hot rolling, while higher alloys are much improved by either hot or cold rolling. Of the recent aluminum alloys "Liege metal" and "Vanalium" are compounds that are useful for machine parts where lightness and strength are desired. When the scarcity of platinum became conspicuously evident a series of substitute alloys were prepared for commercial use. Among these was "palau," a gold palladium alloy which consists of 80° gold and 20° palladium. In resistance to most chemical reagents to the action of which such ware is ordinarily exposed, palau compares favorably with ordinary platinum ware. "Rhotanium" is an alloy with a gold content of 60 to 90 per cent, which is said to be superior to pure platinum for use in jewelry. It is harder and stronger and takes a better finish. Jewelry made from it passes the common jewellers' and platinum buyers' test. An alloy of chromium, cobalt, and iron is a Canadian invention, which is recommended for the finest forms of cutlery.

Gases. Two very important gases have in recent years come into conspicuous notice. Of these *Helium*, discovered in the middle of the nineties of the last century by Sir William Ramsay, was until 1917, without any practical value. It is not inflammable, and next to hydrogen is the lightest substance known, and in consequence, owing also to the fact that in a balloon it is capable of exerting an ascensional power of 92.6 as compared with hydrogen, helium has become of the utmost value for aëronautical purposes. It is a constituent of natural gas from which it is separated by fractional distillation through compression which induces heat and subsequent expansion which promotes refrigeration, the gases that liquify at higher temperatures precipitating from the mixture sooner than those that require lower temperature to bring about this action. The progressive cooling causes liquifaction of all the gases in natural gas except helium, the one having the lowest boiling point. The helium content, therefore, of the natural gas retains its gaseous condition, and in this state can be readily separated from its liquified associates. The richest sources of helium are in Texas, Oklahoma, and Kansas, while others of less importance are in California, Montana, and Ohio. In 1917, the cost of its production was from $700 to $2,000 a cubic foot while today it may be produced at $56 a 1,000 cubic feet and even $20 a 1,000 cubic feet is believed possible. The U. S. Navy has established a plant at Fort Worth, Texas, for the production of helium for its dirigible balloons.

Nitrogen. When Sir William Crookes made his celebrated presidential address before the British Association for the Advancement of Science, in which he predicted the exhaustion of the soil with consequent diminution of food supplies unless means were found for an increased supply of nitrogen compounds, he little thought of the thousands of British lives that would be sacrificed because Germany, recognizing the value of his predictions, was able at the beginning of the World War to successfully extract nitrogen from the air and convert it into nitrates. As early as 1915 the commercial production in the United States of nitric acid from the air was announced with its application to the manufacture of artificial fertilizers, but when the World War came it was more and more obvious that no adequate plants existed in this country for the manufacture of nitrates in sufficient quantities to furnish the needed supply of explosives. In response to a resolution of the Naval Consulting Board Congress appropriated $20,000,000 in 1915, for the erection of a plant somewhere between the Alleghany Mountains and the Sierra Nevadas so as to be situated at a safe distance from either sea coast. In 1916 the matter having been thoroughly considered, Congress appropriated a very large sum of money and plants were built at Muscle Shoals, Ala., and near Toledo and near Cincinnati, Ohio. It was believed with this equipment that the United States would be independent of all foreign sources for its supply of nitrates for use in the manufacture of explosives, while in times of peace these plants could be used for the manufacture of fertilizers. At the close of the war after an expenditure of over $60,000,000 by the United States work at these plants ceased and has not as yet been resumed. It is pertinent to add that at the close of the war an announcement was made of an organization of a syndicate of all the German nitrogen plants under the direction of the Minister of Finance.

Potassium. Closely allied to the production of nitrogen is the question of potassium salts. The natural deposits of these salts in Central Europe were, until the return of the deposits in Alsace to France, under the control of the German Potash Syndicate and careful search was made throughout the world for other sources. In the United States the Geological Survey reported that "every clew that might yield valuable results has been followed up in a country-wide investigation extending from New York to California." Nevertheless, it resulted in the development of deposits at Searles Lake in California, where a plant was erected in 1915, and also of deposits of alunite, a mineral containing potassium salts, in Utah, which was developed, but the output from both of these deposits was relatively small. Other sources were therefore considered, and among them are several which are of practical value. The most important, perhaps, is the large quantities of seaweed and rockweed found in the shallow

waters of the Pacific Coast. This kelp is dried and then distilled, yielding a charred residue from which potash salts can be extracted by leaching and evaporation. The great masses of seaweed known as the Sargossa Sea were considered, but these were not so rich in either nitrogen or potash as the California kelp. Other sources were the gases from cement works and blast furnaces. It was found that by adding a small proportion of sodium chloride to the charge of a blast furnace, the potash in the ore is released and volatilized with the outpouring gases as potassium chloride, when it may easily be recovered as a by-product. A similar process was announced of recovering potash by decomposing feldspar, resulting in the salvage of potassium carbonate and aluminum. This process was successfully carried on in Durham, Ontario, where it was said the cost of production was less than the freight charges paid on a ton of the imported German product before the war. In 1915, only 1,000 tons of potash were produced in the United States, while three years later the estimated production was over 60,000 tons.

Fuel. The enormous consumption of coal with the prophesied disappearance of natural gas and petroleum would seem to indicate that within a comparatively short time these valuable natural sources of heat will be exhausted, and therefore chemical engineers are studying the sources of power that will in the future be available for heat and light. Electricity derived from water power seems to be the coming agent, but it is hoped that some means will be found to utilize the heat of the sun and perhaps collect the power generated by the action of the waves.

In the United States the use of natural oil and also of electricity has been largely substituted for coal in motors and engines and also in locomotives and steamers. Under the auspices of the Geological Survey the peat and other deposits of inferior coals have been made the subject of careful and exhaustive reports. In Europe in recent years the trend has been in favor of natural products such as peat and refuse carbonaceous materials, and even before the war a gas made from peat was recommended and wood made from straw, especially for such uses as match stems, was favorably considered. The distillation of peat was actually undertaken in Great Britain and the oil thus obtained was used in the British Navy in place of foreign oils. In Sweden, where again the subject was thoroughly investigated, condensed peat was used in the form of briquettes, while in Holland an illuminating gas was made from peat, that had the merit of having no by-products, the peat being entirely consumed in the process of manufacture. In Sweden experiments with peat powder as a fuel for locomotives were made and the product was found to compare with coal as 2 to 3. Its use for this purpose has extended to Norway, Denmark, and even to Switzerland until during the war its cost was one-sixth that of coal. In England, household refuse, such as ashes, cinders, paper, straw, and vegetable fibers, has been converted into briquettes so as to conserve the supply of coal. It is safe to say that in Ireland and northern Europe an industry has been created for the manufacture of fuel from peat deposits, and in Germany the great shale deposit, bog and peat fields have been carefully examined by experts for the same purpose. In England the very latest reports mentions a so-called "colloidal fuel" composed of pulverized coal and oil which is said to give ships a wider cruising radius with increased boiler efficiency.

Dyestuffs. The story of the coal tar colors is the romance of chemistry. At the inspired touch in 1856 of Sir William H. Perkin, the beautiful aniline violet came out of the discarded refuse of gas works and a new industry was created. For a time it grew and flourished in England, where color after color were released from their prison of darkness by the magic of chemistry. Then it went to Germany where great corporations with every facility that science could afford were established and the industry became practically a monopoly of Central Europe. This condition continued until the blockading of the seaports of the Central Powers of Europe made further exports impossible and with the exhaustion of existing stocks in other countries prices naturally rose. Great Britain, France, Italy, Russia, and the United States at once undertook to manufacture their own dyestuffs and to bring again into use such natural dyes as were available. In Great Britain the conditions were met by the organization of "British Dyes (Ltd.)" with a capital of £2,000,000 which the government increased by £1,500,000 at 4 per cent to be paid in 25 years. The largest existing plant in England for the manufacture of aniline dyes in Huddersfield was secured and actual manufacturing begun in May, 1915. In France, Italy, and Russia schemes were considered and attempts made to establish new plants but with uncertain success. In Switzerland the conditions were peculiar. Factories there had long depended upon Germany for their crude materials, but that country declined to continue that practice unless the Swiss factories would refuse to sell the finished dyestuffs to countries not at war with the Central Powers. This they declined to do, and arrangements were made with the United States manufacturers to supply the crude materials and accept in payment the finished products. In the United States the outlook was most favorable. The annual consumption of dyestuffs had a value in 1914 of over $15,000,000, of which $12,000,000 represented importations. The textile industries, the paint, varnish, and ink trades, the paper industry, the feather and leather trades, and other minor industries were threatened with disaster unless means were found to furnish them with the needed coloring materials. Congress promptly directed the Bureau of Foreign and Domestic Commerce to prepare a report on the subject, which was promptly done, so that with the facts carefully presented by the well-known chemist, Dr. Thomas H. Norton, the conditions required for the establishment of the industry were well known. The most important element was to obtain sufficient crude materials from which to manufacture aniline oil, the source of the aniline colors, and to meet this demand many coke ovens were equipped with appliances for the recovery of coal tar bases, from which the dyes were manufactured. This was accomplished so quickly that within a year the supply of aniline oil was sufficient to meet the demands of the dyestuff makers in the United States. New and improved processes were invented and it was not very long before the domestic product exceeded in value that previously imported and even large exportations were made. In 1917,

the 7 establishments had increased to 46, from which the annual production was over 60,000,000 pounds. In that year the statement was made that "American colors are made from practically the same chemical formulas as those of Europe and are practically the same product in every way." In a summary of the condition of the dyestuff industry in the United States published in 1921, it was said that the exports of aniline dyes had increased to a value of $17,130,397 in 1920, and the comment was made "that with the return of peace it is evident that whatever the demand for dyes made in Germany may be, that country will never regain its lost supremacy n the world trade in dyestuffs." In England the production is constantly increasing and it is estimated that the domestic output is about 80 per cent of the dyes actually consumed in the United Kingdom. France, Italy, and Japan are producing some dyestuffs, but due to lack of raw materials and to other difficulties, these countries cannot yet supply their own textile factories with the quantity and variety of colors required. Switzerland is the only country other than the United States now making aniline colors sufficient to meet its own requirements and to export on a large scale, but the Swiss are dependent on other countries for the raw materials.

Paper. The persistent demand by man for wood for many purposes has largely reduced in recent years the supply of wood pulp for paper, and the attention of the industrial chemist has been directed to other sources for substitutes. During the war there was an actual scarcity of stock for newspaper and in Australia the condition was so acute that many newspapers were forced to suspend publication when the price of paper stock went from $45 to $185 a ton. Many varieties of grass have been experimented with, such as the tall millet of Manchuria, the sparto grass of Spain and northern Africa, the papyrus of Egypt and borders of the Nile, while in the United States studies have been made with corn stalks, pineapple leaves and pulp, and with various fibrous plants and grasses, both without and in combination with ranges. These experiments have resulted in the production of excellent qualities of wrapping paper and strawboard, and there has been reported a paper made from hemp which has been described as "of good body, clear white cream texture, and very satisfactory calendered finish"; also the Bureau of Standards announced the possibility of making a high grade white paper from cotton linters although the question of cost might have to be considered. It was announced that in England a successful filter paper had been made to take the place of the Swedish and German filter papers. During the war Germany made extensive use of paper for clothing, especially in connection with fibrous materials. It was such that prisoner's uniforms were found to consist of a union of cotton, shoddy, and paper.

Artificial Silk. The artificial production of a natural fiber seems at first blush an impossibility, but chemistry can accomplish wonders, and so by the skilful treatment of cotton with the addition of certain chemical preparations to make it brilliant or incombustible, a compound is obtained that can only be distinguished from silk by the most expert. Certain varieties of artificial silk consist of spun glass, the filaments of which are one-eighteenth of a hair's diameter, and these are said to be stronger and more solid than any other variety. The process for manufacturing artificial silk has been extended to the production of artificial velvets which are said to present all the brilliancy and softness of silk velvet. In recent years the scarcity and high prices of silk and other textiles has resulted in a greater development in the manufacture of chemically produced textile materials and at present it is possible to procure any one of the following five varieties of artificial silk, namely, nitrated silks, collodion silks, viscose siks, acetate silks, and gelatin silks. The great center of the industry was in France but it has now extended both to England and Italy, and even to Poland, where a large factory was established prior to the World War.

Rubber. At a meeting of the Eighth International Congress of Chemistry, held in New York City in 1912, specimens of artificial rubber were exhibited that were fully equal to the original product, but more convincing, perhaps, was the statement made by Chancellor Bethmann-Hollweg before the Reichstag in 1915 that "German inventors had discovered a method of producing synthetic rubber." There is no reasonable doubt but the production of artificial rubber has been accomplished; but for the present the cost of the production of the artificial compound is too great to allow of its manufacture in competition with the natural product. Meanwhile many plants, such as the guayule of Mexico and the bulia of the Fiji Islands, have been proposed as desirable sources of juices that possess qualities similar to those of the rubber plant. In 1916 a Russian chemist announced that an artificial rubber had been produced by him from certain vegetable oils, such as hempseed oil and rapeseed oil, with alcohol. An experimental plant was erected for the continuation of his experiments. Among the interesting war products was "sonjatin," a substitute for rubber tubing, made out of masses of solidified glue. That many chemists are devoting their energies to the solution of the interesting proposition of how to produce a synthetic rubber is shown by the extensive list of references to the subject found in the journals on chemistry.

Motor Fuels. The increased and increasing price of gasoline has naturally received much attention from the chemist, whose researches for a cheaper motor fuel have very largely led him to a study of original sources, although mixtures of gasoline have been considered. In England, where the subject has been very thoroughly investigated, a mixture of benzol and alcohol was successfully employed in motor busses. It was also in England that the recommendation was made that steps be taken to increase the production of power alcohol by the extended use of the vegetable matter from which it may be obtained, such as: (1) Sugar-containing products, as molasses, makua flours, sugar beets, and mangolds; (2) Starch or inulin-containing products, as maize and other cereals, potatoes, and artichokes; and (3) Cellulose-containing products, as peat, sulphite wood-pulp lyes, and wood. In Sweden alcohol is now made from white moss, of which large quantities are available, and in the United States straw was found to yield satisfactory results. In South Africa a compound called "natalite" has been found useful. It is a by-product of the Natal sugar industry and is said to be a mixture of

alcohol and ether. "Acetol" is a similar mixture that is made in Africa and may be manufactured at a much lower price than gasoline can be bought. Coal gas in large bulky containers has been used in England with much success, but the general trend seems to be in favor of cheaper alcohol or mixtures of alcohol obtained from some local source as in the case of natalite, noted above as a by-product of a sugar industry, and gasoline or other derivative of petroleum. Both in Cuba and Brazil such preparations have been found very useful and are largely employed.

Petroleum Products. In connection with the foregoing paragraph mention must be made of the introduction of the so-called "cracking" principle applied to petroleum for an increased yield of the lower products of distillation. It was found that by treating the vapor of petroleum instead of the liquid itself greater pressure could be applied than by the use of a still. In a still pressures of 100 pounds are high and an undue increase of heat after that pressure is reached is usually dangerous. Gas on the other hand is compressible to a much greater degree than 100 pounds without danger of explosion and it was found possible to work with a pressure greater than 500 pounds. With such pressures and with a degree of heat perfectly controllable by the means used, it becomes possible to deliver gasoline to the amount of from 50 to 75 per cent and also to obtain benzene and toluene, both valuable by-products useful in the manufacture of aniline oil. By this method 200 per cent more gasoline can be obtained from a given quantity of petroleum than was formerly possible. This process is called "cracking" and methods for its application were invented by W. F. Rittman, W. O. Snelling, W. A. Hall, C. S. Palmer, and others. The first named was connected with the U. S. Bureau of Mines and his patent was assigned to the Government from which it may be leased with the understanding that those who use it agree if they discover any improvements to it will give them to the United States instead of patenting them for themselves. Of the great value of this process it was said of it that: "By its aid vast quantities of petroleum waste, hitherto available for little beyond fuel purposes, can be transformed at will either into gasoline for use in motor engines or into benzene and toluene, also susceptible of the same utilization, but constituting likewise the crude material for the manufacture of the two coal tar high explosives— picric acid and trinitrotoluene — and forming also the starting point for the synthesis of an almost endless variety of dyestuffs, medicinals, photographic chemicals, artificial flavors, and perfumes."

Artificial Gems. Synthetic gems have been sought for during many years and the successful production of such gems has been found possible, largely through the high temperatures resulting from experiments made in France. The successful production of diamonds would solve the problem for other gems and while satisfactory results have been obtained, the processes have thus far been found to be too expensive to yield gems that are economically satisfactory. With the return of peace comes a report from Germany that the firm of Alfred Nobel, formerly makers of dynamite and other high explosives, have succeeded in manufacturing synthetic diamonds. Not only have many diamonds of good size been produced, but it is also claimed that it will be possible to make them profitably. In quality the artificial stones are said to be equal to those which come from natural sources.

Glassware. Formerly the best qualities of optical glass were made in Germany and from that source the world was supplied. The Bureau of Standards after long and persistent investigation of this subject achieved results that were so satisfactory that in May, 1917, Secretary Redfield announced concerning optical glass "that henceforth the United States would be independent of any foreign supply of this important element of warfare." In Great Britain similar successes were reported and the British Government in 1918 entered into contracts with recognized firms to furnish crown glass that was equal in quality "to the well-known German Jena glass that formerly was universally used." The condition was similar in connection with glassware used in laboratory work for the chief sources of this glass were formerly factories in Germany and Austria. In July, 1919, the American Chemical Society began a campaign against importing scientific apparatus from Germany, especially glassware, and within a year it was possible to announce that American glassware was being made that would compare favorably with that from abroad. A similar experience was had in England. A department of glass technology was inaugurated in Sheffield University with the support of the British Government and soon it was reported that chemical glassware was being made to "equal anything Germany ever produced." The manufacture of lenses, especially designed for photography from the air, was started in England during the war and the products obtained satisfied the most searching tests and the claim was made that the "lenses were superior to those hitherto made in Germany." Thus again the expert chemist showed himself capable in difficult situations to meet the emergency and produce technical products considered impossible to duplicate.

Sugar. The removal of the tariff placed on sugar caused the sugar planters in the United States to discontinue their raising of that important food product. This condition was naturally followed by increased importation, but with the advent of the World War all exports, as of beet sugar, ceased from the Central Powers of Europe; and as supplies soon greatly diminished, the price rose and for a time only a limited amount could be purchased by any one person. Under these circumstances, sugar-producing countries, such as Cuba and the Philippines, greatly increased their production, which was sold at very high prices. Whether the sugar planters in Louisiana and the beet-sugar growers in the west will be protected by a new tariff sufficiently high to permit them to resume operations and make the United States independent of foreign sources remains to be seen. Meanwhile other varieties of sugar are being continuously sought and exploited, notably the nipa palm of the Orient, from which the Bureau of Science in Manila reports that there would be at least 12 per cent of recoverable sugar in the sap, and the average annual yield of 4,000 gallons of sap an acre would yield about 4,000 pounds of sugar. A recent improvement in the manufacture of sugar consists in the use of dry or superheated steam for water in the final process of washing sugar in

the drums in which the sugar is dried. By this means over 99 per cent of the avid molds and bacteria are destroyed and it is estimated that fully 1 per cent of the Cuban crop, or about 70,000,000 pounds of sugar a year, worth at least $1,500,000, can be saved by the employment of this improved process invented by an American.

War Products. Two very interesting series of products have grown out of the World War and were the results of the demands made upon the chemist by the extraordinary conditions that prevailed during that period.

Substitutes. Among these are the following which are of passing interest. A *beer* substitute consisting of beet root, hops, yeast, and water which was patented in Germany, but its use was forbidden, as it was essentially a beer, being produced by the fermentation of sugar contained in the beet root. Beet roots were extensively used in the dilution of jam supplies and in the manufacture of coffee substitutes. A *butter* substitute was made in Norway from fish oils and it was accepted as being as good as any of the best kinds of margarines. A substitute for absorbent *cotton* was made in Sweden from wood pulp. After sterilization it found extensive use as a surgical dressing. Seaweeds have been found in Japan to yield a practical substitute for *cotton* and this substitute is found to be in every respect superior to vegetable *cotton*. Numerous *fiber* substitutes such as "cellulon," which is a cellulose yarn made from wood and "textilite," the result of a paper thread and a fiber thread being twisted together, were exhibited in Dresden in 1918, where also were shown fabrics made from various fiber plants, such as the cat-tail, the cotton grass, and the broom, and of certain animals, particularly the hair of the Angora rabbit. Heather ground to form a sort of flour and mixed with blood from slaughter houses was used as a substitute for *fodder*. Sawdust, strawdust, and nutshell dust were sold in Germany at incredible prices as *food* adulterants. Carpenter's glue was used in the manufacture of pudding powder, and flour sweepings in the baking of bread. Foreign substitutes found in the bread included flax fabrics, cotton, wood pulp, straw, and sand. Raw bones were made into a substitute for *glue* by treatment with sulphur dioxide, the fat being removed by benzene and the mass boiled in water under pressure. The juices from the stems of certain creeping plants and from certain kinds of bulbs, if properly evaporated and treated, yielded a very suitable *gum* substitute for certain purposes. As a substitute for *jute* "cellulon" was extensively used in Germany, and in Italy the stray fibers from barley, wheat, or rice were used for a similar purpose, according to the strength of the material wanted. A product from cellulose yarn without any dressing was used as a *leather* substitute, and shoes were made from it in Germany. As a substitute for *opium* benzyle benzolate was announced. It was taken internally as benzyle acetate and relaxed the muscles, giving the patient the same beneficial effects as opium without its ill effects. The *oils* from mustard seeds and from sunflower seeds as well as other plants found extensive use in northern Europe during the days of scarcity as substitutes for illuminating and lubricating oils. *Wood* was largely replaced in Sweden and Denmark by the fiber obtained from the peat bogs that occur in northern Europe, and when mixed with 10 per cent of animal hair served as a substitute for felt soles in footwear.

Asphyxiating Gases. The world was startled and horrified when in May, 1915, a gas of a greenish color with a strong odor and great density came from the German lines towards the Allies. Its properties were those of chlorine and the symptoms of the soldiers who inhaled this poison gas tended to confirm this opinion. Later it was claimed that not only chlorine but also bromine, and nitrogen peroxide had been added to this new and cruel method of modern warfare. Measures were at once taken to meet this terrible weapon of offense and these assumed the form of gas masks, at first quite primitive, but as the war progressed they became more elaborate and were provided with materials impregnated with counteracting chemicals that neutralized the effect of the poison gas. (See Chemical Warfare.) Finally in 1918 it was asserted by high authority that "there was not a single case on record of an American soldier falling victim to a gas attack when protected by the gas mask" adopted by the United States. Equally to the credit of the United States may it be said that the American poisonous gases were stronger and more effective than those used by the Germans. With the coming of peace and the turning of swords into ploughshares the poisonous chlorine gas has been directed into almost universal use for purifying the water supply of cities, and the other and more deadly gases in the destruction of rodents, as rats around wharves, breakwaters, etc., and insect pests, such as those that infest the citrus groves of California or the cotton fields of the South, while the frightful phosgene yields a violet scent more delicate and lasting than that of the woodland flower.

Organizations. Besides many special organizations, such as the American Ceramic Society and the American Petroleum Institute in the United States and the Institute of Petroleum Technologists and the Society of Dyers and Colourists in Great Britain, there is the American Chemical Society with a membership of over 15,000, which publishes "Chemical Abstracts" and the "Journal of Industrial and Engineering Chemistry," both of which periodicals contain abstracts of important papers and digests of current information on industrial chemistry. In Great Britain there is the London Chemical Society with a membership of over 3800 and the Society of Chemical Industry with a membership of over 5600. The last named publishes fortnightly a "Journal" and annually an "Annual Report," giving the progress of the science during the year. In the United States there is also the American Electrochemical Society and the American Institute of Chemical Engineers, both of which publish proceedings.

Bibliography. The literature of chemistry is enormous. In fact not only does every special branch of chemistry possess its own text books and treatises, but every important product has now many volumes devoted to its history and treatment. Therefore, in order to acquire a knowledge of any particular subject such works must be examined and studied. The great reference book in the English language on chemistry is Watts' *Dictionary of Chemistry*, revised and entirely rewritten in recent years by M. M. Pattison Muir and H. Foster Morley. Added to this is *A Dictionary of Applied Chem-*

istry by Sir Edward Thorpe, also in four volumes, which is now in its third revised edition.

CHEMISTRY, ORGANIC. See CHEMISTRY; VALENCY; CARBON COMPOUNDS; STEREO-CHEMISTRY; HYDROCARBONS; ALCOHOLS; ALDEHYDES; KETONES; ETHERS; ESTERS; AMINES; AMIDES; PHENOLS; DIAZO-COMPOUNDS; CARBOHYDRATES; SUGARS; ALKALOIDS; ETC. All the more important organic compounds may be found described under their special names.

CHEMISTRY, PHYSICAL. See AVOGADRO'S RULE; MOLECULES—MOLECULAR WEIGHTS; REACTION; CATALYSIS; SOLUTION; DISSOCIATION; THERMO-CHEMISTRY; ELECTRO-CHEMISTRY; PHOTO-CHEMISTRY; EVAPORATION; DISTILLATION; BOILING POINT; MELTING POINT; CRITICAL POINT; ACIDS; ETC.

CHEMISTRY, PHYSIOLOGICAL. One of the biological sciences, having for its object the study and investigation of the manifold chemical processes taking place in living organisms, both animal and vegetable. Physical, or mechanical, physiology deals with those functions of living organisms explainable by physical laws and studied by physical methods. Chemical physiology, or physiological chemistry, deals with those functions explainable by chemical laws and studied by chemical methods. In the study of physiological chemistry, therefore, the facts to be collected and the methods pursued are almost wholly chemical, while the application is purely physiological.

In the early days of physiological chemistry, energy was devoted mainly to the simple study of chemical composition. The various tissues and organs, especially of the higher animals, were analyzed, their chemical composition examined, and the chemical nature of the various proximate principles occurring in these tissues ascertained. It was found that 12 chemical elements enter into the composition of all living organisms—viz., carbon, nitrogen, hydrogen, oxygen, sulphur, phosphorus, chlorine, sodium, potassium, calcium, magnesium, and iron—while more recently iodine has been found widely distributed in organic combination. The first six of the above elements enter mainly into the make-up of the organic substances of the living body, while the last six occur chiefly as inorganic or mineral compounds. Sulphur and phosphorus, however, are especially characterized by the fact that they are widely distributed in organic combination—i.e., as an integral part of complex organic compounds, as proteids, nucleo-proteids, and various crystalline substances—while at the same time in oxidized form as sulphates and phosphates of the alkalies and alkali earths, they are ever present as part of the inorganic salts, or mineral matter, so abundant in animal and vegetable tissues. Iron likewise occurs both in organic combination, as in ferruginous nucleo-proteids and in the pigment of the red blood corpuscles, and in the form of simple iron salts. The ideas of physiologists were revolutionized, and physiological chemistry took on new dignity, when it was seen that the various chemical substances—both simple and complex—formed in the tissues of living organisms could be constructed in the laboratory by comparatively simple methods. (See CHEMISTRY.) As a result, there rapidly developed great activity in the study of the chemical nature and chemical relationship of the organic compounds occurring in the body; methods were devised for producing them artificially; their genetic relationships were traced out; and much light was thrown upon the conditions attending their formation in the body. To-day the study of the chemical constitution of the various end products of catabolism formed in and excreted from the body has given most useful information regarding a host of chemical processes occurring in the organism, and has enabled the physiologist to trace out many of the individual steps in the breaking down of complex organic material. In other words, chemical methods and simple chemical principles are quite sufficient to explain the nature of the many processes going on in living organisms by which the life and activity of the organism are maintained.

The various chemical processes characteristic of living organisms may be divided into two main groups, viz., synthetic and analytic; i.e., building up and breaking down. Synthetical processes are most prominent in the vegetable kingdom. The plant cell alone has the power of building up complex organic compounds out of simple elementary substances. The most striking illustration of this constructive power is seen in the formation of proteid or albuminous material. This important constituent of every living cell, in part the chemical basis of protoplasm, is formed in the plant cell from simple inorganic substances. The carbonic acid of the atmosphere furnishes the carbon, hydrogen is drawn from the moisture, nitrogen from ammonia or nitrates in the air and water, oxygen from the air, sulphur and phosphorus from the sulphates and phosphates of the soil. From these elements proteid, the most complex organic substance known in nature, is constructed. As indicative of its chemical composition, we ascribe to it various formulas according to its exact nature, for there are many different proteids in both the animal and vegetable kingdoms. Egg albumin is represented by the formula $C_{201}H_{322}N_{52}O_{66}S_2$; vegetable globulin, by the formula $C_{292}H_{451}N_{80}O_{89}S_2$. Investigations in recent years have shown that there exist very subtle, though quite distinct, differences between proteids, which as yet cannot be detected by purely chemical methods. By means of a biological test (the precipitin test) it was demonstrated that proteids of the tissues of an animal of one species differ from those of another, and on the other hand that all proteids of one animal or of animals of the same species possess a certain degree of similiarity. This necessitates a change in our view of the difference between the function of animal and of plant cells. According to the older view the animal cell does not possess the power to synthesize proteid. At present it is evident that proteids of the foodstuffs are totally reconstructed before they are assimilated and transformed into body proteid. It is nevertheless true that in the animal kingdom synthetical processes are limited. An example of the most frequent type of synthetic reactions in the animal is presented by the formation of hippuric acid. Glycocoll and any benzoyl-containing compound, on passing through the kidney, are, under the influence of the epithelial cells of the kidney and the ever-present blood, made to combine, and hippuric acid results. This reaction may be formulated as follows:

$$\underset{\text{Glycocoll}}{CH_2(NH_2)COOH} + \underset{\text{Benzoic acid}}{C_6H_5COOH} =$$

$$\underset{\text{Hippuric acid}}{C_6H_5CO.NH.CH_2COOH} + \underset{\text{Water}}{H_2O}$$

In the animal body, however, analytical processes are most conspicuous. These analytical or destructive changes are of various kinds, such as *hydrolysis*, *oxidation*, *reduction*, etc. Examples of hydrolytic decomposition or change are perhaps best observed in connection with the digestive processes. Here the various classes of foodstuffs, under the influence of the digestive juices, are gradually transformed into more or less soluble and diffusible products well fitted for absorption. Proteid, e.g., is converted into a series of soluble proteoses and peptones —a transformation brought about by certain enzymes or ferments, such as pepsin and trypsin. The change, little understood, is termed "catalytic," since it is assumed to occur through mere contact of the enzyme; but what really happens is the taking on by the proteid of one or more molecules of water (hydrolysis) with subsequent splitting or cleavage of the molecule, and formation of a number of simpler products. Hence the products are frequently termed "hydrolytic cleavage products." A like transformation occurs in the digestion of starch with saliva or pancreatic juice, whereby soluble dextrins and sugars result, under the influence of the enzymes contained in the above secretions. Further, cane sugar, under the influence of the invert ferment secreted by the intestinal cells, is split into two molecules of a simpler sugar during digestion, as a result of simple hydration. The reaction which takes place may be represented as follows:

$$\underset{\text{Cane sugar}}{C_{12}H_{22}O_{11}} + H_2O = \underset{\text{Dextrose}}{C_6H_{12}O_6} + \underset{\text{Levulose}}{C_6H_{12}O_6}$$

Oxidation, another analytical process, serves a different purpose. Oxidation is the principal method by which the organic material of the tissues is broken down. Naturally this oxidation is brought about in some measure by the oxygen coming to the tissues in the arterial blood; but oxygen itself does not possess the power of oxidizing tissue constituents, and as yet the exact process by which the oxygen of the blood is caused to act on tissue components remains a subject of speculation. There are present in tissues of the animal body, as well as in vegetable tissues, peculiar ferments such as the oxidases which are capable of inciting oxidation. Many of the oxidation processes going on in the animal body seem to be connected with the life of the cell of the tissue or organ involved, but it is quite probable that in most, if not in all, such cases there are really oxidizing enzymes present, generated no doubt by the activity of the cell. The process of oxidation is the means by which the organism is furnished with that energy which is required to maintain its vital functions. The potential energy of the foodstuffs, the fuel of the animal body, is derived from the sun. As Bunge has stated it, "all the potential energy of vegetable substances is converted sunlight." The foodstuffs, whether animal or vegetable, are rendered capable of absorption by the several digestive processes. After passing into the blood or lymph, they are carried to the various organs and tissues of the body, where they are assimilated, and, by processes of anabolism, are built up, in part, into the tissues of the body, in part directly burned with liberation of their energy. This energy shows itself either in the form of heat or as work—i.e., muscular movements, or organized movements by which we perform work. The sum of the work performed by an animal, and of the heat which it gives out, is the exact equivalent of the potential energy contained in the food taken in, or in the material of the tissues burned up. This energy is liberated as the result of oxidation, and the energy is essentially the same in amount, whether the oxidation is carried on in the body or by combustion outside of the body. In other words, the amount of energy liberated is the same whether the foodstuff or its equivalent is burned directly to carbonic acid and water, or whether it is broken down gradually, step by step, until the final stage in the oxidation is reached. A man of average body weight, doing an average amount of work, must consume food material sufficient to yield 3000 kilogram-degree units of heat, or 3000 large calories, if he is to keep himself in equilibrium. The amount of heat required to keep the body continuously at 38° C., no matter what the temperature of the surrounding air, is by no means small, and, in addition, it is to be remembered that all the involuntary muscular movements, such as the beating of the heart, the muscular movements involved in respiration, and the constant movements of the intestinal walls, involve a large expenditure of energy which is quite independent of the energy required for muscular contraction when some task is to be performed. Consequently, in the case of an active man, the amount of chemical activity involved in the various processes incidental to the liberation of the required energy is large. The rôle of the process of reduction in furnishing the organism with the required heat and energy is as yet not known, but that the process does occur in the animal body is evidenced by the formation of the pigments of the urine and of the fæces from that of the bile.

The efficient and economical liberation of this energy in the body is dependent not only upon the completeness of digestion, the readiness of absorption and assimilation, and the efficiency of the circulation, but much depends also upon the proper working of the excretory apparatus. Waste products formed in oxidation must be removed, otherwise the physiological rhythm is interfered with. The ashes and clinkers must be taken from the human furnace if the fires are to be kept burning freely. For this purpose the skin, lungs, and kidneys are efficient channels, and the study of the excretions poured out through these several emunctories throws much light upon the extent and character of the oxidation going on in the body. It is a truism that the chemical study of the urine throws light especially upon the extent and character of the proteid metabolism going on in the body. The nitrogenous waste products—those which come from the breaking down of proteid material—find their outlet through the urine, and abnormalities in this excretion have a significance easy of interpretation.

It must not be overlooked, in considering the domain of physiological chemistry, that its scope is a broad one. The chemical processes going on in the animal body, e.g., are multitudinous. There are few functions in which physiological chemistry does not play some part, and the light which its study throws upon physiology as a whole can hardly be estimated. The phenomenon of muscular contraction is in great part chemical. Until the discovery of muscle plasma and the contained myosinogen by Kühne,

physiologists were in the dark regarding what took place inside the muscle fibre during contraction and after the death of the fibre. The discovery of glycogen in the liver by Claude Bernard, and the relationship of glycogen to the sugar of the blood, opened up the whole subject of the glycogenic function of the liver and thereby paved the way for a clearer understanding of the function of carbohydrate material in the body. The subject of secretion and the mode of formation of the digestive enzymes from their precursors, the zymogens, inside the cells of the secreting glands, was unraveled in great part through the application of chemical methods by such eminent physiologists as Corvisart, Kühne, Heidenhain, and Langley.

The study of lymph formation was rendered possible through the use of chemical methods, and the same methods of study have taught physiologists all that is known regarding the chemical nature of the blood, its various chemical constituents, and the various parts played by the serum, plasma, and corpuscles in the coagulation of the blood and in many normal and abnormal processes.

Metabolism in the liver—aside from glycogen formation—has had much light thrown upon it by chemical methods of study, and the whole broad subject of internal secretion and the ductless glands has been helped forward at a rapid pace by the work of physiological chemists, who have unraveled in part the chemical nature of the specific substances responsible for the physiological action of the various secretions.

Lastly, mention may be made of the part which physiological chemistry is now playing in the development of our knowledge concerning bacteriology and the infectious diseases. The microörganisms which are responsible for the various infectious diseases now preying on mankind owe their action in great part to specific chemical poisons which they produce. The chemical nature and physiological action of these poisons is being carefully studied, and, with fuller knowledge of their properties, ready methods for combating these diseases will be available. Even to-day our knowledge of these toxins is considerable, and more than one antitoxin has been discovered by which immunity can be secured or a logical method of treatment devised. Here is a large and practical field for the application of the principles and methods of physiological chemistry, and we may hope in the near future for such an extension of our knowledge of bacterial poisons as will enable us to cope successfully with these destroyers of health and life. A study of physiological chemistry promises expansion of knowledge concerning the normal changes occurring in the organism, and also affords a means of recognizing the approach of abnormal conditions, the forerunners of disease and death.

Bibliography. The substances forming the chemical basis of the organisms of animals and plants may be found described under their special names. See also FOOD.

CHEMISTS AND DRUGGISTS, LAWS RELATING TO. In the United States the terms "apothecaries," "druggists," "pharmacists," and sometimes "chemists," are used with little or no distinction as names of those licensed to compound and sell drugs and medicines upon prescriptions of physicians or otherwise; in Great Britain, however, a legal distinction exists between the three classes—apothecaries, chemists and druggists, and pharmaceutical chemists.

The Law of 1868, designed especially to restrict the sale of poisons, made the classification just referred to for the sake of public convenience. Under this law apothecaries are from practically a lower branch of the medical profession, having the right to practice in certain classes of cases; chemists and druggists are those who have passed an examination at the pharmacy college and have received a license to sell and compound drugs and poisons; pharmaceutical chemists are those who have passed a second, "major," examination, and who constitute a higher branch of the profession. Laws relating to the business of selling and compounding drugs and medicines, under whatever name the business is carried on and whether in the United States or in England, are either laws limiting and defining the qualifications of those who may carry on the business, or restricting the sale of poisons or intoxicating liquors, or defining the liability for injuries caused by carelessness or ignorance. Generally speaking, the statutes of the States in the United States require a person wishing to adopt the profession of druggist either to pass an examination before a board appointed for that purpose, or to produce a diploma from a college of pharmacy recognized as having authority and weight. Either State or city ordinances prescribe the conditions under which poisons may be sold, directing, e.g., that certain kinds of labels be used on bottles containing the poisons, and that the names of persons purchasing be entered in a book open for public inspection. Druggists are sometimes also forbidden to sell certain drugs or liquors except on physicians' certificates. Gross carelessness on the part of a druggist in compounding a prescription, if it leads to death or serious injury, is a penal offense; if death ensue, the offense usually amounts to manslaughter.

CHEM'ITYPE. A process invented by C. Pül, of Copenhagen, in 1843, for producing on a metal plate an engraving in relief. A design is etched or engraved on a polished plate of zinc, and the depressions filled with a melted metal, the composition of which is secret, which is then reduced to the exact level of the zinc, so that the design appears as if inlaid. An acid is then applied to the surface, which dissolves the zinc, leaving the inlaid metal in relief, and from which an electrotype may be made, or the orig-

inal may be used directly on the printing press. The process was formerly employed for printing maps, but is now seldom used. The term "chemitype" has also been applied to several processes for obtaining drawings or impressions from an engraved plate in relief, suitable for printing on an ordinary press.

CHEMNITIUS, MARTIN. See CHEMNITZ, MARTIN.

CHEMNITZ, kĕm'nĭts (from OCh. Slav. *kamenĭ*, Lith. *akmu*, stone, Gk. ἄκμων, *akmōn*, anvil, Skt. *aśman*, stone). One of the foremost manufacturing towns in Germany, and the third in population, in the Kingdom of Saxony, situated in a fertile valley at the base of the Erzgebirge, on the river Chemnitz, about 38 miles west-southwest of Dresden (Map: Germany, E 3). The city consists of an older inner town, almost circular in form, intersected by narrow streets, completely surrounded by modern suburbs. Among its numerous squares and public places are the Hauptmarkt, which contains the Old Rathaus, a handsome late Gothic structure; the Neumarkt; the Königs-Platz, with the church of St. Peter and the Royal Technical Schools; the Stadtpark, and the gardens surrounding the castle pond. Its notable public buildings include the church of St. James, of the fifteenth century, restored in 1880; the New Rathaus, post office, Imperial bank, law courts, Central Railway station, the city theatre, King Albert Museum, the large cattle market, and the castle. The city owns its water, gas, and electric works, maintains a municipal pawnshop, and is the seat of government of the district. Its educational institutions include a gymnasium, numerous schools for the technical branches, including schools of agriculture, commerce, engineering, and the various crafts, in addition to several elementary schools. There is also a municipal library of over 35,000 volumes. Chemnitz has grown from a small city to be called "the Saxon Manchester." Its locomotive and machinery construction shops employ over 20,000 men; ranking with them is the manufacture of textiles which are largely exported to the United States. It also has large manufactories of carpets, dyestuffs, chemicals, leather, vehicles, and beer. Its growth during the past 20 years has been phenomenal. Pop., 1900, 207,000; 1910, 287,340.

Chemnitz was originally a settlement of the Wends; but the present town grew up around a Benedictine monastery which Emperor Lothair founded in 1125. By 1300 it had a fully organized communal government and in 1414 it received municipal rights. It possesses, as do few other German cities, an unbroken history as an industrial city from the thirteenth century, when bleacheries were first established, to the present. In the Thirty Years' War Chemnitz was laid waste; but later in the century the introduction of cotton manufacturing revived its prosperity. Consult Zöllner, *History of the Manufacturing and Commercial City of Chemnitz* (Chemnitz, 1891).

CHEMNITZ, kĕm'nĭts, **KEMNITZ, CHEMNITIUS,** MARTIN (1522–86). Next to Luther and Melanchthon the most distinguished German Protestant theologian of the sixteenth century. He was born at Treuenbrietzen, in Brandenburg, Nov. 9, 1522; studied at Frankfort-on-the-Oder and Wittenberg; and in 1548 became rector of the cathedral school of Königsberg. About 1550 he began to devote himself seriously to theology, and in 1553 went back to Wittenberg, where he became familiar with Melanchthon and delivered prelections on *Loci Communes*, whence sprang his own *Loci Theologici*, which for method and learning excels all similar books of the same age. In 1554 he was made a preacher in Brunswick, where he wrote his *Repetitio Sanæ Doctrinæ de Vera Præsentia Corporis et Sanguinis Domini in Cœna Sacra* (1561), in which he defended Luther's view of the Lord's Supper against that of the Swiss reformers; the *Theologiæ Jesuitorum Præcipua Capita* (1562); and the *Examen Concilii Tridentini* (4 vols., 1565–73), a work in which he argued with remarkable acuteness and learning against the dogmas of the Church of Rome. His *Corpus Doctrinæ Prutenicum* (1567), written in conjunction with Joachim Mörlin, became a standard work of divinity among the Prussian Protestants. But his greatest ecclesiastical achievement was inducing the Saxon and Swabian churches to adopt as their confession of faith the *Concordienformel*, and thus extending and consolidating the creed of Luther. He died in Brunswick, April 8, 1586. For his life, consult C. G. H. Lentz (Gotha, 1866). Consult also R. Mumm, *Die Polemik des M. Chemnitz gegen das Konzil von Trent* (Leipzig, 1905).

CHEMNITZ, MATTHÄUS FRIEDRICH (1815–70). A German poet, born in Barmstedt, Holstein. For a number of years he was editor of the *Hamburger Nachrichten*. He is best known as the author of *Schleswig-Holstein meerumschlungen*, which, as set to music by Bellmann, was extremely popular throughout Germany, particularly in 1848–49 and 1863–64.

CHEMNITZER, or **KHEMNITZER,** kĕm'nĭt-sĕr, IVAN IVANOVITCH (1745–84). A Russian fabulist, born at Yenotayevsk, Astrakhan, the son of a German physician of Chemnitz, who had served in the Russian army under Peter the Great. He participated in the campaigns of the Seven Years' War and afterward devoted himself to mining engineering and subsequently visited Germany, Holland, and France. Upon his return he accepted a position as Consul to Smyrna, where an attack of melancholia hastened his death. In contradistinction to Sumarokov and others among the earliest fabulists of Russia, whose works are essentially satires, Chemnitzer was the first to introduce the genuine fable into Russian literature. He was thus one of the predecessors of Krylov (q.v.), having brought the Russian fable to its greatest perfection. Although to some extent translations or imitations of La Fontaine and Gellert, his works show considerable originality. Their good humor, vivacity of dialogue, simplicity, and distinctively national character have greatly endeared them to the Russian people. Among his best original fables are *The Metaphysician*, *The Tree*, *The Peasant and his Load*, and *The Rich Man and the Poor Man*. The latest and best edition of his works is that of Grot (St. Petersburg, 1873).

CHEMOSH, kē'mŏsh. The national god of the Moabites, mentioned as such in the Bible (Num. xxi. 29; Jer. xlviii. 46) and on the Moabite Stone. He bears the same relation to the Moabites as the national deity Yahwe does to the Hebrews. Little is known of the worship of Chemosh; the Moabite Stone tells that Mesha, King of Moab, built a high place for the worship of his god; and when Solomon, as a political symbol of his control over surrounding na-

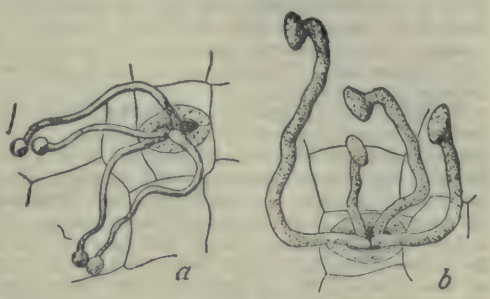
tions, introduced the official cults of other deities by the side of the national Yahwe, he also built a high place in Chemosh's honor. From the fact that the King of the Moabites offered up his son to the god (2 Kings iii. 27), it has been conjectured that human sacrifices formed part of the worship of Chemosh. The Ammonites are apparently said to have worshiped Chemosh (Judg. xi. 24), but the passage (Judg. xi. 12–28) in which this statement occurs is probably an interpolation and should refer to Moab. Chemosh was formerly variously identified with Saturn or Mars, but these identifications have no value. The etymology of the name is not known. Consult E. Renan, *Mission de Phénicie* (Paris, 1864); G. A. Barton, *A Sketch of Semitic Origins* (New York, 1902).

CHEM'OSYN'THESIS. See PHOTOSYNTHESIS.

CHEM'OTAX'IS (Neo-Lat., from Gk. χημεία, *chēmeia*, alchemy + τάξις, *taxis*, arrangement, from τάσσειν, *tassein*, to arrange). The sensitiveness of free-swimming organisms to certain chemical substances, by virtue of which they approach or recede from the source of the substance. Chemotaxis seems to be fundamentally the same as chemotropism (q.v.), though the reaction is unlike. It has been held that in many organisms the unequal stimulation of different parts of the creature by the diffusing chemical substance causes the motor organs on one side to act more strongly than those on the other. Thus the body is swung around in the medium until it is so placed that all sides are equally stimulated. This condition occurs only when the axis of the organism coincides with some of the lines of diffusion of the stimulating chemical compound. Since the motor organs still act, but now equally on all sides, swimming must take place either towards or away from the source of diffusion. More recent study, however, has shown that with certain substances the organisms, swimming in all directions, accidentally pass into the constantly increasing sphere of influence of the diffusing substance; but as they swim through it, reach the limit, and are about to pass out into the pure solvent again, a reaction occurs which reverses the movement of the motor organs. The creatures thus seem to rebound from the invisible limit whenever they reach it. The region occupied by the diffusing substance therefore acts as a trap into which they may pass but from which they cannot escape. Other substances repel a given organism. In this case the reversal of motion occurs as soon as they reach the boundary of the region occupied by the diffusing particles.

Chemotactic sensitiveness is observed, among plants, in zoöspores of various algæ and fungi, in sperms of mosses and ferns, and in many bacteria. Fern sperms are attracted by malic acid and its salts, as well as by many salts of the common mineral acids. Sperms of mosses are attracted by cane sugar. Such reactions may be demonstrated as follows: Very fine capillary glass tubes are prepared, of such diameter that the sperms can swim easily into them. These are cut into lengths of about 1 centimeter, and one end of each is sealed in the flame. These tubes are submerged in the solution to be tested, and the whole is exhausted of air under an air pump. Air is then allowed to reënter the receiver, and the fluid is forced into the tubes, leaving only a small bubble of air at the closed end. A drop of water containing the sperms is now mounted on a microscopic slide in the ordinary way. The tubes just described are placed under the edges of the cover glass, their open ends inside. After a short time the sperms may be observed swimming towards and into the tubes or away from them. The mode of response of an organism is profoundly influenced by the concentration of the substance. See TROPISM.

CHEMOT'ROPISM (from Gk. χημεία, *chēmeia*, alchemy + τροπή, *tropē*, a turning, from τρέπειν, *trepein*, to turn). The sensitiveness of certain plant organs by virtue of which they change the direction of their growth when acted upon by chemical substances. If an organ bends so as to grow towards the source of a substance, it is said to be positively chemotropic



CHEMOTROPISM.

Positive chemotropism. *a*, hyphæ of a fungus, *Mucor*, entering stoma of leaf of *Tradescantia* which has been injected with ammonium chloride; *b*, pollen tubes of *Digitalis* entering stoma of same, injected with 4 per cent solution of cane sugar. (After Miyoshi.)

to that substance; if it turns away from it, it is negatively chemotropic. The organ tends to place itself so that it shall be equally stimulated on all sides by the diffusing chemical substance. In elongating organs, such as roots, fungous filaments, etc., the reaction is one of growth; the curvature is brought about either by the retardation of growth on one side or by its acceleration on the other, or by both together. Of course the side on which retardation occurs becomes concave; the opposite side convex. If a root is positively chemotropic towards a substance, that side which comes in contact with the most of the substance—as the latter diffuses through the medium in which the root is growing—will be retarded in growth and become concave. If the root is negatively chemotropic, acceleration of growth will take the place of this retardation, and that side will become convex. Thus the root tip is turned either towards or away from the source of the diffusing compound, and the bending continues until all sides are equally stimulated. The reaction is seen in case of many gases, liquids, and solids when dissolved in water. The term "aërotropism" (q.v.) has been applied to the power of responding to gases in this way. An example of chemotropism is the following: If fungi be grown in a plate of moist gelatin, and an excess of sugar be added to a certain part of the gelatin plate, the filaments will bend and grow from all parts of the medium towards the part which is richer in sugar. The diffusion of the sugar from this region into the surrounding material is the occasion of the response. For chemotropism in animals, see TROPISM, *Chemotropism*.

CHEMULPO, chĕ-mŭl'pō. The most important treaty port of Korea, situated on the west coast, at the mouth of the Han River, about 25

miles southwest of Seoul, whose port it is (Map: Korea, G 4). There are native, Chinese, Japanese, and European quarters. The port was opened to Japanese commerce in 1881 and to that of the world in 1883. In 1911 the imports amounted to over $7,227,000, consisting chiefly of textiles, silk, metals, railroad material, and petroleum; the exports amounted to over $1,948,000, consisting mostly of rice, beans, ginseng, hides, wheat, and paper. In 1900 a railroad connection was established with Seoul. Improvements by the Japanese have made the river navigable. Pop., 1900, about 27,000 (4200 Japanese, 1260 Chinese, and 86 Europeans and Americans); 1909, 25,167. In October, 1906, there were 13,603 Japanese. At the outbreak of the Russo-Japanese War a Japanese force landed in Chemulpo, Feb. 8, 1904. On the following day a Japanese squadron under Admiral Uriu destroyed a Russian cruiser and gunboat outside the harbor.

CHEMUNG (shē-mŭng′) **FORMATION.** A series of sandstones and shales of marine origin, constituting the uppermost member of the Devonian system in southern and western New York and eastern Pennsylvania, and deriving its name from the Chemung Narrows, near Elmira, N. Y., where the formation was first described. The Chemung strata formed the top of the "New York system" of the early New York State Geological Survey. It succeeds the Portage formation, which it conformably overlies, and which it resembles in the shallow-water character of most of its deposits. The rocks are mostly shales, though sandstones are frequent. In the vicinity of its original locality, near Elmira, the Chemung formation has a thickness of about 1500 feet; it thins westward towards the Pennsylvania-Ohio line, where it disappears. Towards the east it changes its character, the marine deposits giving way to the estuarine and brackish-water deposits of its littoral facies, the Catskill formation (q.v.). Southward, through eastern Pennsylvania, the thickness of the marine deposits increases, and along the northern Appalachian Mountains the formation is from 3500 to 5000 feet thick.

The Chemung rocks, as a rule, abound in fossil contents. Brachiopods are most abundant, in places forming whole layers of rock, where the shells were washed together by currents and strewn over the shallow bottoms. They include forms belonging to the genera *Spirifer*, *Rhynconella*, *Atrypa*, and *Productella*. Land plants, prophetic of the forms seen in the later coal measures, are common in the more easterly portions of the formation, especially in the estuarine beds of the Catskill series, where a large fern, *Archæopteris* (q.v.), is often found. At several localities in western New York have been found large numbers of Dictyospongidæ (q.v.), allies of, and probably when alive just as beautiful as, the modern glass sponge (*Euplectella*). Some phyllocarid crustacea have been found, and in a few localities "fish beds" have yielded good examples of *Holoptychius*, *Bothriolepis*, etc. The economic products of the Chemung consist of building stone, and oil and gas in the western counties of New York.

Williams, "On the Fossil Faunas of the Upper Devonian, etc.," in *Bulletin No. 3 of the United States Geological Survey* (Washington, 1884); "On the Fossil Faunas of the Upper Devonian: The Genesee Section," in *Bulletin No. 4 of the United States Geological Survey* (Washington, 1887); Prosser, "The Classification and Distribution of the Hamilton and Chemung Series of Central and Eastern New York," part i, in *Forty-ninth Annual Report New York State Museum*, vol. ii (Albany, 1898); part ii, op. cit., 51st, vol. ii (Albany, 1899); Stevenson, "The Chemung and Catskill on the Eastern Side of the Appalachian Basin," in *Proceedings American Association Advancement of Science*, vol. xl (Salem, 1891); "Middle and Upper Devonian," in *Maryland Geological Survey Reports* (Baltimore, 1913). See also Devonian System; Catskill Group; Clay; Brick; Oil; Gas; Petroleum.

CHENA, chē′nä (Hind.). The Hindu name of the most common and widespread species (*Ophiocephalus striatus*) of the "walking" or serpent-headed fishes. See Walking Fishes.

CHENAB, chē-näb′ (Pers., gathering of waters). The largest of the five rivers which give name to the Punjab (q.v.), British India (Map: India, B 2). It rises at an altitude of 14,000 feet above sea level in the western Himalayas, flows through the Ritanka Pass, and after a southwest direction enters the plains of the Panjab at Riasi. It receives from the right the Jhelam, and from the left the Ravi and the Ghara, with its affluents, the Sutlej and the Beas. After its junction with the Ghara, near Uchh, it is called the Panjnad ('five rivers') and flows into the Indus near Mithankot. Its length is about 750 miles. It is navigable by rafts 50 miles below Riasi.

CHENAVARD, shâ′nà′vär′, Paul Joseph (1807–95). A French painter. He was born in Lyons, studied at the Ecole des Beaux-Arts, Paris, under Hersent, Ingres, and Delacroix, and passed two years in Italy copying the old masters. A student also of philosophy and æsthetics, he dreamed of reforming painting and making it play a political and social rôle. He was called the "orator in painting," and by his witty and learned conversation exercised a great influence over his contemporaries. After the revolution of 1848 he began a series of mural decorations in grisaille representing the history of humanity, but, owing to political conditions, he was forced to abandon this long-cherished project at the end of three years. Some of the cartoons for this work have been preserved in the museum at Lyons, which also possesses a number of his paintings, such as "Hell," "Purgatory," "Paradise," "The Deluge," and the "Death of Socrates." Another important work is the "Divina Tragedia," or "End of all Religions," in the French Senate. His drawing is excellent, but his contempt for color often makes his work appear cold and heavy. Consult Germain, *Les artistes lyonnais* (Lyons, 1910).

CHE'NERY, Thomas (1826–84). An English journalist and Arabic scholar. He was born in Barbados, was educated at Eton College and Caius College, Cambridge, and became correspondent for the London *Times* in the Crimean War. Afterward he became a writer of editorials and in 1877 succeeded John T. Delane as editor of the *Times*. He was an excellent Arabic and Hebrew scholar, was professor of Arabic at Oxford from 1868 to 1877, and was a member of the company of the Old Testament revisers. He served for several years as secretary to the Royal Asiatic Society and published a translation of the *Six Assemblies* of Hariri (1867) and an edition of the *Machberoth Ithiel* of Harizi (1872).

CHE'NEY, Charles Edward (1836–1916). A bishop of the Reformed Episcopal church in America. He was born in Canandaigua, N. Y., and graduated at Hobart College in 1857 and two years later at the Theological Seminary of Virginia. He was ordained to the Protestant Episcopal priesthood and in 1860 became rector of Christ Church, Chicago. For refusing to use the word "regenerate" in the baptismal offices, he was tried and suspended by an ecclesiastical court, and when he refused to yield was deposed from the priesthood. Soon afterward (in December, 1873) he was chosen Assistant Bishop, and afterward Bishop, of the Reformed Episcopal church, then newly organized, and became again rector of Christ Church, Chicago, the parish following its pastor into the new communion. His published works include: *Twenty-eight Sermons* (Chicago, 1880); *A Word to Old-Fashioned Episcopalians* (Philadelphia, 1884); *What do Reformed Episcopalians Believe?* (1888); *A King of France Unnamed in History* (1903); *The Enlistment of the Christian Soldier* (Chicago, 1893); and *The Second Norman Conquest of England* (1907).

CHENEY, Edna Dow. See Cheney, Seth W.

CHENEY, John. See Cheney, Seth W.

CHENEY, John Vance (1848–1922). An American librarian, poet, and essayist, born in Groveland, N. Y. After practicing law for a year in New York, he removed to San Francisco (1876), and became librarian of the Free Public Library from 1887 to 1894. From 1894 to 1899 he was librarian of the Newberry Library in Chicago. His publications comprise several volumes of poems, including: *Thistle Drift* (1887); *Queen Helen and Other Poems* (1895); *Out of the Silence* (1897); *For Thinking Hearts* (1901); and two volumes of essays: *The Golden Guess* (1893), *That Dome in Air* (1895); *At the Silver Gate* (1911). He edited the *Caxton Club Scrap-Book* (1904).

CHENEY, Seth Wells (1810–56). An American draftsman and engraver. He was born in South Manchester, Conn., and, together with his brother John, studied painting under Isabey and Delaroche in Paris. They both practiced engraving also in Paris, and Seth Cheney's work, though not extensive, is noted for its charm of expression. In 1841 he opened a studio in Boston and soon obtained prominence through his portraits in crayon, being the first to practice this art on a large scale in the United States. He excelled especially in his ability to express character in individual heads. Among his best-known sitters are James Russell Lowell, Theodore Parker, and William Cullen Bryant. His widow, Ednah Dow Cheney (1824–1904), was a well-known author. She took an active part in the Freedmen's Aid movement, and was later a prominent advocate of woman suffrage.—John Cheney (1801–85) was probably the best American engraver of his day for illustrated holiday books. His heads of young girls, especially, are finely executed and very charming.

CHENG-TU, cheng-to͞o'. A Chinese city, capital of the Province of Sze-chuan, situated on the river Min, in the midst of a fertile plain (one of the largest in the Empire) and a rich mining region (Map: China, B 5). Famous in Marco Polo's time, it is still one of the richest cities in China, with clean streets and canals, carrying on a flourishing trade with the cities of the Yangtze River valley. It has telegraphic and postal connection with many other places in the province, and railways to K'ui-chou-fu and farther east are under construction. Better-class overland roads connect the city with Ichang and the Yang-tze ports. In the arsenal, which has machinery of German and British make, rifles and cartridges of the Mauser pattern are turned out. It has a population estimated by some as nearly 1,000,000.

CHÉNIER, shā'nyā', André Marie de (1762–94). A French poet. He was born in Constantinople, where his father, Louis de Chénier, a historian of some note, was Consul General. André was sent in infancy to France and studied in Paris. His mother was Greek, and he had a strong predilection for Greek poets, from whom he adapted verses as early as 1779. In 1782 he entered the army, but resigned that year and gave himself up to study and poetry, writing idyls and planning longer works. His health failed from overstudy, and he passed 1785–86 in travel. On his return he conceived a passion for Madame de Bonneuil that inspired many of his elegies, remarkable for their classic purity of language and their restrained vigor of thought, and showing him an apt, probably the aptest, pupil of the Greek anthologists. He wrote also at this time, in imitation of Ovid, a poem on the "Art of Love"; a poetic theory of æsthetics, "L'Invention"; and a Lucretian philosophic poem, "Hermes," which remains a noble fragment; but "Susanne," a Miltonic treatment of the biblical legend, is little more than a preliminary sketch. None of this work was then published. In 1787 Chénier went as Secretary of Legation to London. This uncongenial post he resigned in 1790, and entered with patriotic zeal into the revolutionary movement, joining the moderate party as a lover of liberty and a hater of anarchy. He wrote a manifesto in this spirit for the Society of '89, which brought him a medal from Stanislas Poniatowski of Poland and fierce denunciation from Camille Desmoulins, in *Les révolutions de France et de Brabant.* In 1791 he wrote the *Jeu de Paume*, a superb Pindaric ode on the meeting of the Third Estate. The same year he was defeated in the election for the National Assembly. In 1792 his anti-Jacobin attitude involved him in sharp controversy, and the fall of the monarchy made him resolve to retire from politics and devote himself to study and art.

But the trial of the King brought him again to the front. He offered to share in the preparation of the King's defense and in the responsibility for it. Then, broken in spirit, he withdrew to Rouen and Versailles, whence he wrote the striking poems, "A Versailles" and "A Fanny." He could not resign himself to be a passive spectator of the Terror. On March 7, 1794, seized by agents of the Committee of Public Safety at the house of M. Piscatory, at Passy, he remained in Saint-Lazare prison till his execution, July 25. Here he wrote his most famous poems, an iambic denunciation of the Convention, and the exquisite "Jeune Captive," dedicated to his fellow prisoner, Mademoiselle de Coigny (later Duchess of Fleury). It is said that on his way to execution he recited to his fellow condemned, the poet Roucher, the opening lines of Racine's *Andromaque.* His last words are reported as: "I have done nothing for posterity, and yet I had something in me." He had indeed published only the "Jeu de Paume" and "Ode à Charlotte Corday," the

self-appointed executioner of Marat. His other poems were first edited in 1819 by Latouche. He became at once a restraining and chastening force in the new romantic poetry. He still stands among French poets as an envied model of formal purity, stately yet vigorous diction, and a lyric style that is warmly passionate, yet never obtrusively personal. The best edition —2 vols., *Poésies* and *Œuvres en prose*—of Chénier is that of 1872, ed. by Becq de Fouquières, not the earlier of 1862 of the same editor. Becq de Fouquières also edited *Documents nouveaux sur André Chénier* (1875). There is also a later edition of Chénier's *Prose* (1879) and *Poésie* (1889) by L. Moland. In 1899 appeared the two-volume edition, ed. by R. Guillard, and in 1908 the *Œuvres complètes* (2 vols.), ed. by Paul Dimoff. Consult: Becq de Fouquières, *Lettres critiques sur Chénier* (Paris, 1881); Valée, *Chénier et les Jacobins* (Paris, 1881); Rouquet, *Les Chénier, portraits, lettres, et fragments inédits* (Paris, 1891); Bertheleroy, *Eloge de Chénier* (1901); Haraszti, *La poésie d'André Chénier* (Paris, 1892); Morillot, *André Chénier* (Paris, 1894); Heller, *André Chénier* (New York, 1895); Faguet, *André Chénier* (Paris, 1902).

CHÉNIER, Marie Joseph Blaise de (1764–1811). A French poet and dramatist, the younger brother of André Marie de Chénier. He was born in Constantinople, was educated in France, and entered the army at 17, but soon left it, and at 20 produced *Azémire* (1784), a rather feeble tragedy. His *Charles IX*, however, excited in 1789 intense enthusiasm, its intrinsic merit being supplemented both by the occasion of the eve of the Revolution and by the genius of the great actor Talma, who achieved in it his first renown. This play is still acted. Other dramas, now forgotten, followed—*Henri VIII* and *Jean Calas* in 1791, *Caius Gracchus* in 1792. This last was proscribed for its anti-Jacobin phrase, "Laws and not blood," as was his *Timoléon* in the following year. He now became, as member of the Jacobin Club, a literary politician and political poet. He was successively member of the Convention, the Council of Five Hundred, the Tribunate, and of the Committees of Public Instruction, General Security, and Public Safety. Under Napoleon he was member of the Educational Jury of the Seine, and member of the Committee of Public Instruction (1803–06). He lectured on literature under Imperial patronage, and wrote, at Napoleon's command, a good *Tableau historique des progrès de la littérature française* (1808) that has been often reprinted. His most noteworthy poems are the national song, the *Chant du départ; Sur la mort de Mirabeau;* and *Sur l'oligarchie de Robespierre.* His best satires are the *Lettre à Voltaire* (1806) and the well-named *Epître sur la calomnie* (1797), which may seem to illustrate the vice it denounces. Chénier also deserves remembrance for his work as translator, not only from the Latin and Greek poets, but from the German Lessing and the English Gray. Chénier's *Works* (*Œuvres complètes*) were collected in 8 vols. (1823–26). This edition contains notices of the author by Arnault and Daunou. Consult: C. Labitte, *Etudes littéraires* (1846); H. Welschinger, *Théâtre Révolutionnaire* (1881); A. Lieby, *Etude sur le Théâtre de Marie-Joseph Chénier* (1902); Ernst Peters, *Marie-Joseph Chénier als Kritiker und satirischer Dichter* (Leipzig, 1911).

CHENILLE, shê-nēl′ (Fr., caterpillar). A thick, velvety, tufted cord of silk, wool, or worsted, having short fibres or threads standing out at right angles from a central core of thread or wire and so bearing some resemblance to a woolly caterpillar. It is made by weaving four warp threads, or crossing three warp threads about filling threads that are afterward cut, and is used in trimming and bordering dresses, in ornamental sewing, and in manufactured trimmings, hangings, curtains, etc. In certain carpets chenille is used instead of yarn to form the filling. In embroidery also chenille is employed, being either laid on the surface of the stuff or drawn through with a needle. Chenille is used also in combination with wool or cotton in the manufacture of a cloth known as *chenille cloth.*

CHEN KIANG FU. See Chinkiang.

CHENNEVIÈRES-POINTEL, shâ-nĕv′yâr′ pwăN′tĕl′, Philippe, Marquis de (1820–99). A French administrator and art critic, born at Falaise. In 1851 he received the title of inspector of museums of the provinces, and in 1855 was chosen inspector general of exhibitions of art and was further given charge of the organization of the Salon at the Palais des Champs Elysée. He was also made manager of the Luxembourg Museum and in 1873 director of fine arts. His official capacity gave him the choice of artists and subjects for the decoration of the Panthéon. In 1874 he instituted a *prix du Salon,* whose recipient was given the opportunity to spend three years in study in Rome. He caused to be compiled a general inventory of the artistic treasures of France and made the teaching of drawing obligatory in the common schools. Among his numerous works on art and kindred subjects are: *Lettres sur l'art français* (1851); *Portraits inédits d'artistes français* (1853); *Les derniers contes de Jean de Falaise,* his own nom de plume (1860); *Essais sur l'histoire de la peinture française* (1894); *Les dessins du Louvre* (4 vols., 1882–84).

CHENONCEAUX, shê-nôN′sô′. A celebrated castle in the Department of Indre-et-Loire, France, built on piles in the river Cher, 4 miles east of Bléré. Its foundations were laid in 1515. It became crown property in 1535 and was a favorite occasional residence of Francis I. Henry II presented it to the celebrated Diana of Poitiers, who lavished much money on its embellishment, as did also Catharine de' Medici, after she had dispossessed Diana. Among the curiosities shown to the visitor is the mirror used by Mary Stuart, Queen of Scots, during her honeymoon spent at Chenonceaux with Francis II in 1559. The castle became private property in the eighteenth century and was long an attractive resort for the distinguished literary and scientific men of that period, including Montesquieu, Voltaire, Fontenelle, Buffon, Bolingbroke, and Rousseau. It escaped the ravages of the revolutionary period and is in a fine state of preservation.

CHENOPODIACEÆ, kē′nō-pō′dĭ-ā′sē-ē (Neo-Lat. nom. pl., from Gk. *χήν, chēn,* goose + *πούς, pous,* foot). A family of dicotyledonous plants, consisting of herbs and half shrubs, with entire or divided leaves that are destitute of stipules. The flowers are inconspicuous, bisporangiate or monosporangiate; the perianth deeply divided, persistent; the stamens inserted into its base, opposite to its segments, and equal to them in number, or fewer; the ovary single,

free, or occasionally adhering to the tube of the perianth, with a single ovule attached to the base of the cavity; the style generally with two to four divisions. The fruit is membranous, inclosed in the perianth, which sometimes becomes fleshy. The seed has a curved or spiral embryo. There are about 75 genera and 550 known species, most of which have a weedlike appearance and grow in waste places. They are widely diffused over the world, but are particularly abundant in the northern parts of Europe and Asia. Beet and spinach are among the best-known and most useful plants of the family. Many are occasionally used as potherbs, as some species of *Chenopodium* and of *Orache*. See CHENOPODIUM.

As most of the species of this family frequent situations where the soil abounds in salt, necessitating a reduction of transpiration by the plant, many curious devices to prevent too abundant giving off of water are shown. In *Salicornia* the leaves are wholly suppressed, and the stem is curiously jointed. In many others the leaves are covered with peculiar scales or hairs, giving to the plant a mealy appearance, and structural differences are also present by which water is kept within the plant, so that there is not such a draining of the soil and consequent absorption of salt as would be expected in plants growing in salt marshes, etc. Two great groups are formed of the genera —the *Cyclolobeæ*, in which the embryo is ring-shaped or horseshoe-shaped, and *Spirolobeæ*, in which the embryo is spirally coiled. *Beta*, *Chenopodium*, *Spinacia*, *Atriplex*, *Kochia*, *Corispermum*, and *Salicornia* belong to the first group, and *Sarcobatus*, *Suæda*, and *Salsola* to the last.

CHENOPODIUM, kē'nō-pō'dĭ-ŭm (Neo-Lat., from Gk. χήν, *chēn*, goose + πούς, *pous*, foot). A genus of plants, comprising about 50 species, of the family Chenopodiaceæ, some species of which are well known by the name of goosefoot, as weeds in gardens, on heaps of rubbish, and in waste places. The species are mostly annuals, with entire or toothed leaves, which in some cases have a sort of mealy hoariness. They are mostly natives of Europe and of the temperate parts of Asia; but some are natives of America, into which, however, some of the common European species have found their way and are naturalized as weeds. The genus has perfect flowers with perianth of five small green scales, five stamens, and solitary flat seeds. The leaves of many species are used as a substitute for spinach, particularly those of the good-Henry, wild spinach, or English mercury (*Chenopodium bonus-henricus*), a perennial plant, native of Great Britain and other parts of Europe, often found growing by waysides, with stem more than a foot high, powdered with minute, transparent globules, and large, alternate, triangular, arrow-shaped, entire leaves. It is cultivated in some places, particularly in Lincolnshire, chiefly for the leaves, but the young shoots are also used as asparagus. *Chenopodium urbicum*, *Chenopodium album*, etc., annuals common in waste places, are also excellent substitutes for spinach. *Chenopodium olidum* and *Chenopodium vulvaria* (stinking goosefoot), annuals with an extremely nauseous odor, growing in waste places in Great Britain and elsewhere, especially near the sea, are popular medicines, in much repute as antispasmodics and emmenagogues. *Chenopodium botrys*, a native of the south of Europe, with pinnatifid leaves resembling those of the oak, and hence called Jerusalem oak, is in use as an expectorant and anthelmintic. It is not fetid like the species last named, but agreeably fragrant. *Chenopodium ambrosioides* has a strong aromatic odor, is used in Mexico instead of tea, and is much cultivated in France, an infusion of it being deemed useful in nervous disorders. A variety, known in the United States as wormseed, has a strong and somewhat aromatic odor, and enjoys a high reputation as a vermifuge. Its seeds are chiefly used, or the essential oil extracted from them, called oil of wormseed. More important than any of these species, as affording an important article of food in the countries of South America, of which it is a native, is quinoa (*Chenopodium quinoa*) (q.v.), the seeds of which are large and abundant and are extensively used. The coast blite (*Chenopodium rubrum*) and the strawberry blite (*Chenopodium capitatum*) are indigenous species along the seacoast, about the Great Lakes and westward. See QUINOA.

CHEN'OWETH, ALEXANDER CRAWFORD (1849–1922). An American engineer, born at Baltimore. He was educated at Dickinson College (A.B., 1868; LL.D., 1908) and Rensselaer Polytechnic Institute. He engaged in engineering in connection with the public works of Brooklyn and Washington and also for various railroads. In 1884 he prepared the foundation for the Bartholdi Statue of Liberty, Bedloe's Island, N. Y. In the following year he became assistant engineer to the Croton Aqueduct Commission, New York, and he was resident engineer in charge of Croton Aqueduct from 1885 until he was called (1895) to take charge of construction work for the United States Government at Sandy Hook. He invented the Chenoweth steel-concrete pile and the Chenoweth reënforced concrete revetment. He came to be regarded as an authority on foundation work and was awarded several medals and prizes.

CHENSTOCHOW, chĕn'stô-kôv'. A town of Russian Poland in the Government of Piotrkow, situated near the left bank of the Warthe, on the Warsaw-Vienna Railway, 135 miles southwest of Warsaw (Map: Russia, A 4). It consists of the old and the new town and is of considerable industrial importance. There are a number of large cotton mills, iron foundries, paper mills, breweries, flour mills, etc. Chenstochow owes its fame to the adjacent monastery of the Order of St. Paul the Hermit, situated on the Warthe and visited annually by over 400,000 pilgrims. The chief attraction is the picture of the Virgin, made of dark wood and known among the Catholics of Poland and Russia as the Black Virgin. It is supposed to be by St. Luke the Evangelist and to have been brought to the monastery at the end of the fourteenth century. The monastery was formerly fortified and in 1655 withstood a siege of 38 days by the Swedish troops. Pop., 1900, 53,650; 1910 (est.), 69,525. Its manufactures are of cotton and woolen goods, and paper. Trade is carried on in lithographs, printing, and religious emblems. It is also a cattle market.

CHENTUNG, LIANG-CHENG, SIR. A Chinese diplomat. He graduated at Phillips Academy, Andover, Mass., served as attaché of the Chinese Legation to the United States from 1886 to 1889, and was secretary to the Chinese special mission to Japan in 1895. In 1897 he was secretary of the embassy to the Diamond Jubilee in London,

and afterward served as secretary of embassies to Berlin (1901) and to London (1902). From 1903 to 1908 he was Chinese Envoy and Minister to the United States, Peru, Cuba, and Mexico.

CHENU, shẽ-nụ′, JEAN CHARLES (1808–79). A French naturalist and army physician. He was born in Metz and was educated in Paris. In 1829 he entered the sanitary corps of the army, and was in the Crimean War. During the Franco-Prussian War he was at the head of the ambulance corps. He published several valuable works on the medico-surgical statistics of modern French campaigns, edited the *Encyclopédie d'histoire naturelle* (31 vols., 1850–61), and wrote on shells.

CHEOPS, kē′ŏps. The name under which the second King of the fourth Egyptian dynasty, who probably lived about 2900 B.C. (Meyers' dating), and who built the greatest of the pyramids, is generally known. In that form the name is given by Herodotus. He is called Chembes by Diodorus, Saophis by Eratosthenes, and Souphis by Manetho; the hieroglyphic form is Khufu. He carried on successful wars against the Bedouins of the Sinai Peninsula. Herodotus' account, in which Cheops was made out to be an oppressive ruler and one who even sacrificed the honor of his daughter to obtain funds to complete his pyramid, is probably without foundation. So far as can be made out the Egyptians considered him a wise and powerful ruler, and to him the foundation of many temples was ascribed. In later times, in the twenty-sixth dynasty, together with Chephren, he was honored by a funerary cult. Various monuments bearing his name have survived; outside of Egypt there have been discovered only the inscriptions at Wady Magharah, near Sinai, where the old copper mines were worked under him. See EGYPT; PYRAMID.

CHEPHREN, or **KHEFREN**, kĕf′rĕn. A king of Egypt, the builder of the pyramid near Ghizeh, second in size of the great pyramids. The usual form of his name is taken from Herodotus; other Greek writers call him Chabyras (Diodorus). In Egyptian his name is Kha'-f-re'. The Greeks, misled by the similarity of the two names, commonly call him the brother of Cheops; but, according to Egyptian tradition, he was his son. The famous Sphinx near the pyramids was attributed to Chephren as early as about 1450 B.C., but whether correctly is much disputed.

CHEP'STER. A name used in England to designate the starling (q.v.).

CHEPSTOW, chĕp′stō. A market town and river port of Monmouthshire, England, on the Wye, about 15 miles east-northeast of Newport (Map: England, D 5). It lies between bold cliffs on a slope rising from the river. Its castle, dating from the eleventh century, but almost entirely rebuilt in the thirteenth, is well preserved. The river is notable for its high tides, which reach at times the height of 50 feet. In the neighborhood are the fine ruins of Tintern Abbey and Caldicot Castle. Pop., 1901, 3000; 1911, 2953. Consult Wakeman, "The Town and Castle of Chepstow," in *British Archæological Journal*, vol. x (London, 1855); Marsh, *Annals of Chepstow Castle* (Exeter, 1883).

CHEQUE, chĕk. See CHECK.

CHER, shâr (Gall. *Carus*, connected with Bret. *quer*, Lat. *carus*, dear). A tributary of the Loire, rising near Crocq, in the Department of Creuse, France (Map: France, S., G 2). It flows in a tortuous course for 200 miles, in a general northwest direction, until it joins the Loire below Tours. It is navigable to Vierzon, 47 miles from its mouth.

CHER. A central department of France, to which the river Cher gives its name (Map: France, N., H 6). Over 500 square miles is forest land; the rest, being mainly agricultural, furnishes abundant harvests of wheat, oats, hemp, vegetables, fruit, and pasturage for horses and cattle. It has many iron mines, saw mills, manufactories of porcelain, glass, linen, and faïence. The surface is mostly level. Climate is mild and pleasant. Area, 2819 square miles. Pop., 1896, 347,725; 1901, 345,543; 1906, 343,484; 1911, 337,810. Capital, Bourges. Consult Frémont, *Le département du Cher* (Bourges, 1862); Ménault, *Monographie agricole du Cher* (Paris, 1891).

CHERASCO, kâ-räs′kō. A city in the Province of Cuneo, north Italy, 36 miles south of Turin, near the confluence of the Stura and the Tanaro (Map: Italy, B 3). It has a domed church, two triumphal arches, a gymnasium, and a technical school; markets grain, wine, and truffles, and manufactures silk. The Peace of Cherasco in 1631 ended the Franco-Austrian War, and in 1796 the armistice of Cherasco was followed by the treaty in which the King of Sardinia ceded Savoy and Nice to France. Pop., 1901, 9054; 1911, 9312.

CHERASKOV, kâ-räs′kôv, MIKHAÏL MATVEYEVITCH. See KHERASKOFF.

CHERAW, chê-rą′. A town in Chesterfield Co., S. C., 88 miles northeast of Columbia, on the Seaboard Air Line, the Atlantic Coast Line, and the Chesterfield and Lancaster railroads, and on the Pee Dee River (Map: South Carolina, E 2). The most important industries are planing and veneering mills, lumber plants, novelty works, cottonseed-oil mills, box factories, and sash and door factory. The water works and sewage system are owned by the town. During the Civil War Cheraw was for a time a depot of supplies for the Confederates. General Sherman captured it on March 3, 1865, and destroyed an immense amount of stores, including 3600 barrels of gunpowder. Pop., 1900, 1151; 1910, 2873.

CHERBOURG, shâr′bo͝or′. A fortified seaport town and arsenal of France, in the Department of Manche, at the mouth of the Divette River and at the head of a deep bay at the north extremity of the peninsula of Cotentin, on the English Channel (Map: France, N., D 3). Among its prominent buildings are the church of La Sainte Trinité (fifteenth century), lately restored, in front of which is a bronze statue of Napoleon I; that of St. Clement; the hôtel de ville; the marine library, containing 25,000 volumes; the museum and theatre. It owes its importance to its naval and commercial harbors. Napoleon I began to build the great defenses of this northern stronghold of France. His nephew, Napoleon III, developed his plans, but not with the original view of an invasion of England. Occupying a prominent position on the French coast, only some 60 miles removed from the southern shore of England, the harbor works have been extended, strengthened, fortified, and provided with cannon, the dockyards improved, and facilities for embarkation afforded. The vast breakwater of Cherbourg incloses a space of 3700 acres. In connection with its fortifications this breakwater assumes an importance that attaches to no other work of the kind in existence. At the apex of the angle formed by

the meeting of the two branches of the breakwater, or *digue*, there is a central fort or battery, measuring 509 feet on the inner line of the parapet, which forms a flat semiellipse. The circular forts at the extremities of the breakwater are remarkably well placed for purposes of defense. Behind the centre battery there is an elliptical tower, measuring 225 feet on the major and 123 feet on the minor axis. The entrances to the harbor are around the end of the mole; and the passages are further defended by the fortifications of the Île Pélée and by the batteries of La Roche Chavaignac and Fort Querqueville. A series of coast redoubts, and the two large fortifications of Les Roches des Flamands and du Homet, are situated behind this outer zone of defense. Besides batteries on the mole, Cherbourg is defended by many regular forts and redoubts. The town itself is commanded by the towering fort and mountain of La Roule and Fort d'Octeville, on the heights behind. The military port of Cherbourg comprises a small outer harbor, the entrance to which is 206 feet wide at its narrowest point. This harbor communicates by means of a lock with a floating basin, 957 feet long by 712 feet wide. The outer harbor has four building slips for first-class ships, besides some smaller slips and a fine graving dock. In August, 1858, an inner floating harbor was opened. This harbor, entirely cut out of solid rock, has a length of about 930 yards and a breadth of 437 yards and is surrounded by building slips and capacious graving docks. Cherbourg has a safe and commodious commercial port quite distinct from the other, situated on the southeast. Among its numerous industries are shipbuilding, sugar refining, lace making, tanning, and dyeing. The United States is represented by a consular agent. Communal pop. (census of March 5, 1911), 43,731.

Cherbourg is a town of Gallic origin, and is identified with the Roman Coriallum. In the Hundred Years' War it was captured by the English (1418) after a siege of four months, but was regained by Charles VII in 1450, after which it remained in the hands of the French. Louis XIV attempted to make it a military fort, but the works were dismantled in 1689. In 1758 the English inflicted severe damage upon the fortifications. On June 19, 1864, the Confederate cruiser *Alabama* steamed out of Cherbourg harbor to meet the Federal warship *Kearsarge*, and during the historic fight that ensued was destroyed about 9 miles from the harbor.

CHERBULIEZ, shâr'bụ'lyâ', Antoine Elisée (1797–1869). A Swiss political economist and jurist, professor of economics in Geneva and afterward in the National Polytechnic School in Zurich. He was a contributor to cyclopædias and periodicals, and the author of *L'Utilitaire* (1828–30); *Théorie des garanties constitutionnelles* (1838); *Riche ou pauvre* (1840); *De la démocratie en Suisse* (1843); *Le socialisme c'est la barbarie* (1848); *Précis de la science économique* (1862).

CHERBULIEZ, shâr'bụ'lyâ', Charles Victor (1829–99). A cosmopolitan French novelist and miscellanist, son of a professor in Geneva, where he was born and where he studied history and philosophy, as well as in Paris, Bonn, and Berlin. He taught, and then traveled widely, gathering material that he afterward used in social and political essays and also in his novels. Of his writings the first, *Apropos d'un cheval* (1860), was archæological; others were scientific. He first caught popular favor by *Le comte Kostia* (1863). The best of a multitude that followed in quick succession are: *Prosper Randoce* (1868); *L'Aventure de Ladislas Bolski* (1869); *Miss Rovel* (1870); *Meta Holdenis* (1873); *Samuel Brohl et Cie* (1877); *Noirs et rouges* (1881); *Jacquine Vanesse* (1898). He is best in cosmopolitan characterizations of Russians, Poles, English, Germans, or Jews—persons of exaggerated independence, incoherent and improbable as the plots in which they figure. Cherbuliez's descriptions are varied and clever, but superficial; his psychology is weak and conventional; the story may be interesting, but the ending is apt to be trivial. He grazes burning questions of sociology or science, deftly adapting his treatment to currents of popular interest, and with a sharp, cynical, and rather narrow irony. Cherbuliez became an Academician in 1881. Several of his novels have been popular in English translations. His essays, under the assumed name of G. Valbert, are in part collected under various titles and deal with politics, literature, and art. Consult the *Eloge*, by E. Faguet, on his succession to Cherbuliez's seat in the French Academy (1900).

CHÉRET, shâ'râ', Jules (1836–). A French lithographer and mural painter. He was born in Paris, was early apprenticed to a lithographer, but as a draftsman was self-taught. He was the first to convert poster designing into a real art, opening up an entirely new field with his posters in color. His work is original and charming, his drawing skillful, his color pleasing and harmonious. Among his best posters are "Bal de Valentino," "Le petit Faust," "Pan," "Scaramouche," "Loie Fuller," "Vin Mariani," "Jardin de Paris." Cheret shows extraordinary talent as a mural painter in such decorations as the dance scenes entitled "Life's Joys," in the Hôtel de Ville, Paris, in which the grace of the rococo is combined with modern French elegance. Consult Alexandre, *Jules Cheret, Catalogue de ses œuvres, etc.* (Paris); Kahn, in *Art et decoration* (ib., 1902).

CHERETHITES AND PELETHITES, kĕr'ê-thīts, pĕl'ê-thīts. Two peoples settled in the south of Palestine and furnishing a bodyguard for David. They are mentioned together in 2 Sam. viii. 18; xv. 18; xx. 7, 23; 1 Kings i. 38, 44; 1 Chron. xviii. 17. In all these passages the troops are referred to. The Cherethites alone are mentioned in 1 Sam. xxx. 14; Zeph. ii. 5; Ezek. xxv. 16; and probably Ezek. xxx. 5. The Greek and Syriac versions translate Cherethim as "Cretans," and they are evidently regarded as belonging to the Philistines. The Pelethites are probably only a dialectical pronunciation of Philistines. There is nothing improbable in David's having a bodyguard made up of Philistines. Consult R. Kittel, *History of the Hebrews* (London, 1896); S. R. Driver, *Notes on the Hebrew Text of Samuel* (London, 1890).

CHERIBON, shĕr'ī-bŏn. The capital of the residency of that name, situated on the northern coast of Java, at the mouth of the Cheribon River, about 125 miles southeast of Batavia (Map: East India Islands, C 6). It has a good harbor, and, although it has lost to a great extent its commercial importance, it still has a considerable trade in coffee, indigo, and teakwood. It is the seat of one of the sultans. Pop., 1896, 20,792.

CHERIMOYER, chĕr'ĭ-moi'ĕr (Fr. *chérimolier*, corruption of Peruv. *cherimoles*), or CHIRIMOYA (*Anona cherimolia*). One of the most esteemed fruits of Brazil and Peru, now common and even naturalized in some parts of the East Indies and generally throughout tropical countries and cultivated upon the Keys of Florida and in California. The tree is from 15 to 30 feet in height, with drooping branches and oblong leaves which are velvety beneath. The fruit is of most delicious flavor, is sometimes described as the finest of all fruits, and sometimes as inferior only to the mangosteen. It belongs to the same genus with the custard apple (q.v.). Both flowers and fruit emit a pleasant fragrance, but when the tree is covered with bloom the odor is so strong as to be almost overpowering. The fruit varies from the size of an orange to 16 pounds or upward in weight. It is roundish or heart-shaped. Externally it is nearly smooth, greenish or brownish yellow when ripe, and often with a reddish cheek. The skin is rather thick and tough and marked off into pentagonal or hexagonal areas. Internally the fruit is snow-white and juicy and contains a number of small brown seeds.

CHERKES'SIANS. See CIRCASSIANS.

CHER'NIGOV. See TCHERNIGOV.

CHERNOZEM, chĕr'nō-zĕm (Russ. *chernozemŭ*, from *chernuiĭ*, black + *zemlya*, earth). The Russian name for a very fertile black or dark-colored soil covering almost the entire southern half of European Russia and extending beyond the Ural Mountains into Asiatic Russia, where it occupies isolated areas of varying extent. Soils similar to chernozem are found in Galicia, Hungary, Rumania, northern Bulgaria, and Germany (in the region of Magdeburg and Hildesheim), as well as on the prairies of the western United States and the pampas of Argentina. Typical chernozem is formed by the admixture of humus with loess (qq.v.). It is characterized by high contents of fine particles and humus and high water capacity. The proportion of humus usually varies from 6 to 10 per cent, but is sometimes less than 4 per cent or higher than 20 per cent. The humus usually contains somewhat less than 5 per cent of nitrogen, the latter varying from .2 to .5 per cent in the soil. The soil also contains from .12 to .25 per cent of phosphoric acid and from .4 to 1 per cent of potash. Chernozem is therefore rich in plant food, and it is of great depth, so that it bears continuous culture with the same crops without deterioration; but its physical properties, due to its very fine particles, are such that under unfavorable weather conditions it loses its normal granular structure, dries out, and becomes so compact as to result in crop failures. Consult P. Kossowitsch, *Die Schwarzerde* (Vienna, Berlin, and London, 1912).

CHERNYSHEV, chĕr'nĭ-shĕf', ALEXANDER IVANOVITCH, PRINCE (1786–1857). A Russian general. He served against the French at Austerlitz and Friedland and on the side of Napoleon at Aspern and Wagram. He bore an important part in the campaigns of 1813–14; was made a count in 1825 and Minister of War in 1828. Nicholas I created him a prince in 1841. In 1848 he was made chairman of the Imperial Council.

CHERNYSHEVSKY, chĕr'nĭ-shĕf'skĕ, NIKOLAI GAVRILOVITCH (1828–89). A famous Russian author and publicist. He was born at Saratov (southern Russia) and received his early education at home under the supervision of his father, a distinguished priest. Later, at St. Petersburg University, his unusual ability soon attracted attention. Within three years after his graduation (having done teaching in the meantime) he had decided to devote himself entirely to literary work. In 1855 he appeared at the university for his master's degree with a dissertation entitled "The Æsthetic Relation of Art to Reality"; although this was well received and ably defended, the degree was denied —and the thesis confiscated. Such sensational procedure, however, served only to bring into greater prominence Chernyshevsky's brilliant work, with the result that the columns of the *Sovreménik* (the 'Contemporary'), a most influential Russian periodical at the time, were placed at his disposal. In two years (1855–57) the *Sovreménik*, with its leading essays and reviews by Chernyshevsky and Dobrolúbov (another famous publicist), became the greatest literary and intellectual force of progressive Russia.

Chernyshevsky's articles were rapidly transforming the views of thousands, when the Russian government, becoming alarmed at his influence, suppressed the epoch-making periodical and imprisoned its guiding spirit. This was in 1862. A year later, while still awaiting his fate at the Fortress of Paul and Peter, Chernyshevsky wrote *What's to be Done?*, a problem novel and the only work by which its author is known to non-Russian readers. Thereafter, on one pretext or another, he was kept in exile in Siberia for nearly 20 years, and when at last he was allowed to return to Russia health and courage were no longer equal to the task of resuming all his former activity. In 1889, within a few months of receiving leave again to live in his native town, he died.

Save the important but not very literary novel already mentioned, which exercised a tremendous influence in Russia, Chernyshevsky's creative work was all journalistic. He did, however, considerable translating and editing, of which the most important specimen is his scholarly translation, with illuminating notes and practical illustrations, of Mill's *Political Economy*. In a similar way he treated Schlosser's *Universal History* and Weber's voluminous *History of the World*. His original writings were gathered in 4 vols.—*Studies in Russian Literature in the Days of Gogol* (1890), *Æsthetics and Poetry* (1893), *Notes on Contemporary Literature* (1894), and *Critical Essays* (1895). A fuller collection of his articles appeared in 1906 in 10 vols. As a realist and materialist, Chernyshevsky helped to rid Russian thought of metaphysical speculation and to popularize science; as an exponent of the "Art for Life's Sake" principle, he gave æsthetics a utilitarian basis which won for it new favor in his generation; and as an exponent of French Socialism —especially that of Fourier—he did much to rouse the social conscience of Russia and to furnish truly scientific grounds for the unrest that characterized that country in the latter half of the nineteenth century.

CHER'OKEE. A city and the county seat of Cherokee Co., Iowa, 59 miles by rail northeast of Sioux City, on the Illinois Central Railroad and on the Little Sioux River (Map: Iowa, B 2). It is the seat of a State hospital for the insane and has a Carnegie library. Farming is the principal industry of the surrounding region.

Butter, mill machinery, and novelties are manufactured in the city, and there are railroad repair shops. Cherokee was settled in 1850 and was incorporated in 1872. The government is administered by a mayor, elected biennially, and a unicameral council. The water works are the property of the city. Pop., 1900, 3865; 1910, 4884.

CHER'OKEE (N. Amer. Indian, upland field). The largest and most important native tribe of the eastern United States. They are of remote Iroquoian affinity and formerly occupied the mountain region of the Carolinas, Tennessee, Georgia, and Alabama, in numerous permanent villages of substantially built log houses. They depended chiefly upon agriculture and raised large crops of corn, pumpkins, and beans. De Soto passed through their country in 1540, and for three centuries later they were prominent in the history of the South. They espoused the British cause during the Revolution, but in 1785 made a treaty of peace with the United States and at once took up the road to civilization, attaining in a very short time a high degree of prosperity and advancement. This was largely due to the work of devoted missionaries and to the presence of a respectable mixed-blood element, the descendants of former British traders. In 1820 they adopted the regular civilized form of government and seven years later formulated a constitution under the style of the "Cherokee nation." In the interval Sequoya (q.v.), known also as George Guess, had devised for the language an alphabet, which was officially adopted by the Cherokee government.

Meanwhile, however, gold had been discovered in the Cherokee country, and at once strong pressure was brought to bear to compel the removal of the Indians. Notwithstanding a decision of the Supreme Court upholding the autonomy of the Cherokee nation, the State of Georgia extended her laws over their country, and President Andrew Jackson refused to interfere in their behalf. Despite the repeated and energetic protests of more than nine-tenths of the Cherokee nation, a treaty was negotiated with a small faction which bound the tribe to remove within three years beyond the Mississippi, whither a small portion of them had removed some years before. The Cherokees repudiated the instrument, and in 1838 they were removed by military force, several thousands dying on the march or from hardships incident to the removal. Throughout this crisis the great leader of the patriot party was the chief John Ross (q.v.), who served as principal chief of the Cherokee nation from his first election in 1828 to his death in 1866. On their arrival in the Indian Territory they reëstablished their government, with Tahlequah as the capital. The outbreak of the Civil War in 1861 brought division to their councils, calamity and misery to their people, the tribe being about equally divided in sentiment and furnishing large contingents to both the Federal and Confederate forces. At the close of the war they entered into a new treaty with the United States, by which they agreed to free their negro slaves and admit them to full Cherokee citizenship. In 1892 they sold their western territorial extension, known as the "Cherokee Outlet." Under their former national government they had an elective principal chief, a Senate, a House of Representatives, and a complete system of public schools, but in 1906 they disbanded as a tribe and became citizens of the United States. The Cherokees of pure and mixed blood may number perhaps 20,000, besides whom some 1400 more, known as the Eastern Band, reside on or adjoining a reservation in western North Carolina, being descendants of those who escaped and fled to the mountains at the time of the removal. Consult Royce, "Cherokee Nation," in *Fifth Report of Bureau of American Ethnology* (1887); Mooney, "Myths of the Cherokee," in *Nineteenth Report of Bureau of American Ethnology* (Washington, 1887).

CHÉRON, shâ'rôn', Elisabeth Sophie (1648–1711). A French painter, engraver, and poet. She was born in Paris, studied first with her father, and at the age of 20 became a member of the Royal Academy of Painting and Sculpture, then presided over by Le Brun. In 1692 she married the engineer Jacques Le Hay. Her principal works are miniature portraits in pastel and water color. Some genre and biblical oil paintings also survive. Among her engravings a series of antique reliefs and gems are worthy of mention. She was the author of a book on the *Principles of Drawing* (1706), and her reputation as a poet was such that she was made a member of the Academia dei Ricovrati.

CHEROOT. See Tobacco.

CHERRIE, George Kruck (1865–). An American field naturalist, born at Knoxville, Iowa. He was educated at Iowa State Agricultural College. In 1889 he became taxidermist and curator of birds, mammals, and reptiles in the National Museum of Costa Rica, and in 1894–97 he was assistant curator of ornithology in the Field Museum of Natural History, Chicago. He spent the following two years in explorations of the valley of the Orinoco for Lord Rothschild. From 1899 to 1911 he was curator of ornithology and mammalogy in the Brooklyn Institute of Arts and Sciences. Besides his articles in the *Auk*, his writings include "The Ornithology of Santo Domingo," in *Publications of the Field Museum of Natural History, Chicago* (1896), and *New Birds of the Orinoco Region and of Trinidad* (1909).

CHER'RY (AS. *ciris*, Ger. *Kirsche*, from Lat. *cerasus*, Gk. κερασός, *kerasos*, cherry tree, from κέρας, *keras*, horn). Cultivated cherries have sprung almost entirely from two parent species —*Prunus cerasus* and *Prunus avium*—both of European origin. (For illustration, see Plate of Drupes.) Besides these species, the cherry is represented in Europe, America, Japan, and China by indigenous species, none of which have attained economic importance save the Japanese ornamental forms (*Prunus pseudocerasus*), in honor of which the famous Cherry Festival is given every year, and the Japanese weeping rose-flowered cherry (*Prunus pendula*). In America the chokecherry (*Prunus virginiana*) has sometimes been cultivated. The bird cherry (*Prunus pennsylvanica*) is grown for ornament, while *Prunus besseyi* and *Prunus pumila*, two dwarf forms native to the prairie region of the Northwest, have lately come into notice because of their fruit. The garden cherries are varieties of either *Prunus cerasus* or *Prunus avium*. To *Prunus cerasus* belong the Morellos and Amarelles—two of the three groups of *sour cherries*, in which the tree characteristics are spreading habit and willowy, drooping branches; to *Prunus avium* belong the Hearts, Bigarreaux, and Mazzards, the *sweet cherries*, and the Dukes, the third group of sour cherries, characterized by tall, robust, upright trees. The cherry is usually

propagated by budding the desired variety on Mazzard or Mahaleb stocks. Mazzard stocks are now counted best for both the sweet and sour cherries; but, because buds take more readily on the Mahaleb, this is extensively used as a stock for the sour cherries. Cherries prefer a well-drained gravelly loam, well enriched with plant food. Sour cherries require more moisture and will grow on heavier land than sweet cherries, but they will not tolerate a wet location. The fruit is grown commercially in Europe and the United States. In the eastern United States the sour cherries form an important item in the canning business, while on the Pacific coast the sweet-cherry industry reaches its highest development. The fruit of the cherry is much valued as an article of food. It is extensively used for dessert, pies, puddings, wines, etc. In 1909 the yield of cherries in the United States was 4,126,099 bushels, valued at $7,231,160. It ripens in Norway as far north as lat. 63°. In some parts of Germany the public roads are lined for many miles together with avenues of cherry trees. The wild black cherry (*Prunus serotina*) is a splendid timber tree, the wood being highly prized for finishing and furniture, while the bark is used in medicine and the fruit is used for making brandy.

Cherry Diseases. The cherry is subject to a number of fungus diseases, most of which are also common to other fruits, as brown rot (see PEACH), leaf spot (see PLUM), and black knot (see PLUM). A common disease of the cherry, known as mildew, is caused by the fungus *Podosphæra oxyacanthæ*, which is found upon the apple also, especially upon nursery stock. The affected leaves are gray with the fungus, and they soon dry and fall from the tree. Ammoniacal copper carbonate has been found a very efficient fungicide for preventing it. Leaf curl, due to the fungus *Exoascus cerasi*, and scab (*Cladosporium carpophilum*), are rather common diseases, but they usually yield to spraying. There is a very common leaf scorch in Europe, due to *Gnomonia erythrostoma*, that has not yet appeared in America. When attacked by this disease, the leaves wither suddenly, but remain on the trees all winter. The fruit ripens unevenly, cracks, and rots. In Germany relief was secured by collecting and burning all the leaves for two seasons. To be successful, this would have to be practiced over a considerable area, as the winds can spread the disease to quite a distance.

CHERRY BIRD, or **CEDAR BIRD.** See WAXWING.

CHERRY LAUREL, or LAUREL CHERRY. A popular name for certain evergreen species of the genus *Prunus*. They bear racemes of small, usually white, flowers and small nauseous fruits, the kernels of which somewhat resemble in flavor the kernels of almonds. The kernels and leaves of the cherry laurel are poisonous, although they are used to some extent for flavoring purposes. The leaves particularly are rich in the oil of bitter almonds, which is obtained by aqueous maceration and distillation. The product is known as cherry-laurel water and was formerly used in medicine. The common or English cherry laurel (*Prunus laurocerasus*), to which the foregoing remarks chiefly apply, is a native of southeastern Europe and adjacent Asia. It is a shrub which sometimes attains a height of 10 feet and which bears ovate-lanceolate, convex, smooth, shining, yellowish-green leaves and rather short terminal racemes. In Europe it is one of the most popular ornamental shrubs. It is rarely met with in the northern United States except in greenhouses; but in California and in the States south of Virginia it is becoming fairly common. Another European species is the Portugal cherry laurel (*Prunus lusitanica*), which often reaches a height of 20 feet. It does not grow so well in the shade as the other species. The wild orange (*Prunus caroliniana*), termed in the South the mock orange, is the best-known American representative of the cherry laurels. It is prized for ornamental planting because of its shining, dark-green leaves and short racemes of cream-colored flowers which appear in March.

CHER'RYVALE. A city in Montgomery Co., Kans., 156 miles south-southwest of Kansas City, on the Atchison, Topeka, and Santa Fe, and the St. Louis and San Francisco railroads (Map: Kansas, G 8). It contains a Carnegie library and a park. The principal industries are zinc smelting, brickmaking, oil refining, and the manufacture of glass. There are also ironworks and deposits of oil and gas. Cherryvale was settled in 1870 and was incorporated in 1879. The city has adopted the commission form of government. It owns its water works. Pop., 1900, 3472; 1910, 4304.

CHERRY VALLEY. A village in Otsego Co., N. Y., 68 miles west of Albany, on the Delaware and Hudson Railroad (Map: New York, F 3). Pop., in 1900, 772; in 1905, 746; in 1910, 792. It was the scene of a massacre during the Revolutionary War, 600 Indians under Joseph Brant and 200 Tories and English under Walter Butler attacking it on Nov. 11, 1778, killing 16 of the small garrison stationed here and 30 of the inhabitants, including women and children, burning nearly all the buildings, and carrying off 71 prisoners, whom they treated with great cruelty. Consult Halsey, *The Old New York Frontier* (New York, 1901).

CHERSIPHRON, kĕr'sĭ-frŏn (Lat., from Gk. Χερσίφρων). A famous Cretan architect, born at Cnossus. He planned, and in part constructed, the older temple of Artemis at Ephesus, being assisted in the work by his son Matagenes. He died, apparently, before the completion of the sculpture of the columns—i.e., before 546 B.C.

CHERSO, kĕr'sō. A long, narrow island of Austria, in the Adriatic, 12 miles south-southwest of Fiume (Map: Austria, D 4). It has an area of about 105 square miles. Its surface is generally hilly and rugged, with forests in the north. The vine and olive are cultivated to some extent. Vrana Lake, in the centre of the island, 40 feet above sea level, has no visible inlet or outlet, but is fed with water from the mainland by subterranean and submarine channels. Administratively it belongs to the District of Lussin, Istria. Its inhabitants are chiefly engaged in maritime industries. Its population, principally Serbo-Croat, was 8803 in 1900, including over 3000 Italians, and 10,200 in 1910. The chief town, Cherso, on the west coast, had in 1900 a population of about 5000.

CHERSON, kĕr-sōn'. See KHERSON.

CHERSONESUS, kĕr'sō-nē'sŭs (Lat., from Gk. Χερσόνησος, from *χέρσος, chersos*, dry land + *νῆσος, nēsos, island*, land island, i.e., peninsula). A name applied by the ancient Greeks to several peninsulas and promontories. Three of the most frequently mentioned are: (1) the Thracian Chersonese, northwest of the Hellespont (see THRACE; GALLIPOLI, PENINSULA OF); (2) the

Tauric Chersonese, in the Black Sea, the modern Crimea; and (3) the Cimbrian Chersonese, the modern Jutland.

CHERT, chĕrt (akin to Ir. *ceart,* pebble, Welsh *careg,* stone, Gael. *carr,* shelf of rock). An amorphous mineral substance, composed of a mixture of hydrated and anhydrous silica, which has the hardness of quartz and a splintery or conchoidal fracture. The color varies from white to black, but is commonly a neutral gray or brown. Chert is commonly associated with carbonate rocks, particularly limestone, where it forms nodules and irregular masses within the rock matrix, and is believed to be due partly to chemical deposition from water at the time of the deposition of the carbonate rocks, and perhaps in part to a concentration or segregation of the siliceous impurities subsequent to the formation of such rocks. Chert was formerly called "hornstone." See QUARTZ; SILICEOUS ROCKS.

CHERTKOV, VLADIMIR. See TCHERTKOV.

CHERTSY, chĕrt'sĭ, *colloq.,* chĕs'ĭ (AS. *Ceortes ēg,* Ceort's island). A market town of Surrey, England, on the Thames, 22 miles west-southwest of London (Map: England, F 5). It is irregularly built and is surrounded by villas. The chief trade is in malt and flour. Many vegetables are raised for the London market. Pop., 1901, 12,760; 1911, 13,816. Chertsey arose from a Benedictine monastery founded in 666 and rebuilt in 964 by Edgar. Charles James Fox lived on St. Anne's Hill, about a mile from the town, and the poet Cowley lived and died here.

CHER'UB (LL., Heb. *Kerub,* pl. *Kerubim,* Eng. pl. cherubim, or cherubs). The Hebrew name for a winged creature which is represented as in attendance upon Yahwe, and as belonging to the court of heavenly beings around his throne. In Babylonian inscriptions found at Susa the colossal winged bulls are called *karibati* (Zimmern, in Gesenius, *Hebräisches Wörterbuch,* 14th ed.), and the Semitic root *karab,* 'to plow' (Neo-Heb., Aram., Ar.), suggests that *karib,* or *karub,* may be an early name for "ox," attaching itself as a technical term to the figure of a bull symbolizing the protecting genius of a shrine or palace. It is probable that already in Babylonian and Assyrian thought the hurrying storm cloud in the sky corresponded to this representation on earth of the swift messenger and carrier of a celestial divinity. Whether the term applied to other winged monsters, combining features of man, beast, and bird, cannot yet be determined. Cherubim are spoken of in Gen. iii. 24 as guarding the way to the tree of life. In addition to the cherubs "the flame of the turning sword" is mentioned, probably suggesting the presence of a seraph. Some scholars hold that two classes of heavenly beings, cherubim and seraphim, are referred to; others think of clouds and lightnings. The author may have had the natural phenomena in mind as manifestations of the presence of the protecting spirits. According to Ex. xxv. 18–22; xxxvi. 7–9, there were two cherubs made of gold on top of the covering of the ark (see ARK OF THE COVENANT), and pictures of cherubs were woven into the veil and elsewhere (Ex. xxvi. 31; xxxvi. 35). There is no intimation as to the form or size of these cherubs. We do not even know whether they were winged bulls, as is perhaps most probable, or winged men. In the innermost sanctuary of Solomon's temple there were also two cherubs, but they were each 10 cubits high, with wings 5 cubits in length, and were made of olive wood overlaid with gold; and there were carved cherubs, palm trees, and open flowers on all the walls of the house (1 Kings vi. 23–30). Again we have no information concerning the body of the cherubs, and cannot be sure, therefore, that they were winged bulls, though the prominence of the ox symbol, e.g., under the brazen sea, renders this very probable. In Ps. xviii. 11, it is said of Yahwe, "he rode on the cherub and did fly." Here the storm cloud seems to be represented as Yahwe's celestial carrier, his animal on which he rides, probably the bull. In Ezek. i, four cherubs, represented as animals with the legs and feet of oxen, two pairs of wings, and different faces—one that of a man, another that of a lion, another that of an ox, and another that of an eagle—carry the vault of heaven on which rests the throne of Yahwe. It is generally recognized that the text has suffered much in transmission; a later hand seems to have given four heads to each of the cherubs. (Consult Winckler, *Altorientalische Forschungen,* 1896, vol. iv, pp. 347 ff.) In Ezek. x. 14, the original text also appears to have assigned only one face to each cherub, but, characteristically enough, substitutes for "the face of an ox" "the face of the cherub"; in xxviii. 14, Yahwe says to the Prince of Tyre, "Thou wast with the cherub, I set thee in the holy mountain of the gods," and verse 16: "The cherub cast thee out of the midst of the stones of fire." The author of Ezek. xl.–xlviii. has no ark in his temple and therefore no free standing figures of cherubs; but alternate cherubs and palm trees are carved on the walls (xli. 18–20, 25), the former with two faces—one of a man and one of a lion. As a reason for this alternation of cherubs and palm trees, it has been suggested that the cherubs were perhaps thought of as winds carrying pollen; the relation of guardian to a sacred tree is also obvious. Not essentially different from Ezekiel's view is that found in Rev. iv. 6 ff. Four cherubs covered with eyes surround the throne of God; the first has the face of a lion, the second that of an ox, the third that of a man, and the fourth that of an eagle; but they have six wings, and not four. This gave rise at an early period of the Church to the symbolical figures of the four evangelists—the human countenance being associated with Matthew, that of the lion with Mark, that of the ox with Luke, and that of the eagle with John. In the developed system of Hebrew angelology the cherubs form one of the 10 highest classes of angels. They are mentioned in Eth. Enoch, xiv. 11, 18; in xx. 7, Gabriel is said to be "over paradise, the serpents, and the cherubim." Cherubim, seraphim, and ophannim (wheels) are mentioned in the Parables of Enoch (Eth. Enoch lxi. 10). Slavonic Enoch represents the cherubs as living in the sixth and seventh heavens (xix. 6; xx. 1). Their function becomes more and more that of offering praise to the Most High. Dwelling so near to the source of all knowledge, they also become examples of most perfect knowledge. This is emphasized already by Philo and then by many Christian teachers. In the hierarchical gradations established by these theologians the cherubim rank next to the seraphim as the second order of angels. Consult Barton, *Semitic Origins,* pp. 90 ff. (1903); Zimmern, in the 3d ed. of Schrader, *Die Keilinschriften und das Alte Testament,* pp. 631 ff. (1902); Bousset, *Die Religion des Judentums,* pp. 320 f.

(1903); Driver, *Genesis*, pp. 60 f. (1904); Dibelius, *Die Lade Jahves* (1906); Benzinger, *Hebräische Archäologie*, pp. 221 al. (1907); Pinches, *The Old Testament in the Light of the Historical Records of Assyrians and Babylonians*, pp. 80–82, 533 (1908); Gunkel, *Genesis*, pp. 24 f. (3d ed., 1910); Moss, "Cherubim," in Hastings, *Encyclopædia of Religion and Ethics*, iii (1911).

CHÉRUBIN. An opera by Massenet (q.v.), first produced in Monte Carlo, Feb. 14, 1905.

CHERUBINI, kā'rōō-bē'nē, Maria Luigi Carlo Zenobio Salvatore (1760–1842). An Italian composer. He was born in Florence and began to study music at the age of six, under his father, a musician in the Pergola Theatre, and composition when nine years of age, under the brothers Felici and Bizarri and Castrucci. His earliest work was a Mass and Credo in D, and by 1776 his list included a Te Deum and an oratorio. Granted an allowance by the Grand Duke, he went to Bologna in 1778, spending there and in Milan four years under Sarti, from whom he acquired his remarkable knowledge of counterpoint and fugue. In 1780 his first opera, *Quinto Fabio*, was produced and was followed quickly by other dramatic works. In 1784 he went to London and held the post of composer to the King for one year. Here two operas, *La finta principessa* and *Giulio Sabino*, were brought out. In 1785 he visited Paris, and later Turin, and produced *Ifigenia in Aulide* (1787), returning in 1788 to make Paris his home. *Démophon* (1788) indicated that he was adopting a new style, and *Lodoïska* (1791) proved that he had abandoned the light Neapolitan style of his earlier works. Among later operas were: *Elisa* (1794); *Médée* (1797); *L'Hôtellerie portugaise* (1798); *Les deux journées*, in German called *Der Wasserträger*, and considered his operatic masterpiece (1800); and *Anacréon* (1803).

In 1795 Cherubini was appointed one of the *inspecteurs des études* in the new Conservatory of Music. In 1805 he went to Vienna to write an opera for the Imperial Opera House. Here he made the acquaintance of Haydn and Beethoven, both of whom considered the opera *Faniska* (1806) a masterpiece. He returned to France, but finding little favor with Napoleon went to the estate of the Prince de Chimay to recuperate. At the latter's request he wrote a church composition, the famous Mass in F (1809), and after that date wrote almost exclusively sacred music. In 1814 he was made a knight of the Legion of Honor by Louis XVIII. In 1815 Cherubini visited London, where he composed a symphony and overtures for the Philharmonic Society. In 1816 he was appointed, with Lesueur, musician and superintendent of the King's chapel, and in 1821–41 he was director of the Paris Conservatory, which he advanced to the high standard it still preserves. Cherubini has been called "the link between classic idealism and modern romanticism." "His sacred compositions, notably the requiems in C and D (1817 and 1836), are distinguished by a severe grandeur, and his dramatic work by brilliant and original instrumental effects." His work on counterpoint (1835) is still a standard. It was revised in 1896 by G. Jensen. For his life, consult: Berlioz, *Mémoires* (Paris, 1878); E. Bellasis, *Memorials of Cherubini* (London, 1905), with catalogue of compositions; Crowest, *Cherubini* (London and New York, 1890); M. E. Wittmann, *Cherubini* (Leipzig, 1895).

CHÉRUEL, shā'rụ'ĕl', Pierre Adolphe (1809–91). A French historian. He was born in Rouen, was educated at the Ecole Normale of Paris, became an instructor there in 1849, and in 1866 was appointed inspector general of public education and rector of the Academy of Strassburg. From 1870 to 1874 he was rector of the Poitiers Academy. He wrote a number of accurate, thorough, and readable works, including the *Dictionnaire historique des institutions, mœurs et coutumes de la France* (2 vols., 1855; 6th ed., 1884), the *Histoire de France sous le ministère de Mazarin* (3 vols., 1882–83), and a masterly edition of Saint-Simon (1856–58; 2d ed., 1878–81) and two studies of the Duc de Saint-Simon (1865, 1876). His earliest work was on the history of Rouen.

CHERUSCI, kē-rūs'sī. A German tribe, first mentioned by Cæsar. They dwelt in the region of the Weser, their country lying to the northeast of that of the Chatti (q.v.). They are chiefly memorable in connection with their great leader, Arminius. After the death of Arminius internal strifes broke out among the Cherusci, and Tacitus says that they were subjugated by the Chatti. Notwithstanding this, they again appear as the chief tribe in the military league of the Saxons about the end of the third century. In the beginning of the fourth century they are included among the peoples who had leagued against Constantine and towards the close of the same century are still mentioned distinctively by Claudian.

CHER'VIL (AS. *cerfille*, Ger. *Kerbel*, from Lat. *cærefolium*, from Gk. *χαιρέφυλλον, chairephyllon*, from *χαίρειν, chairein*, to rejoice + *φύλλον, phyllon*, leaf) (*Anthriscus cerefolium*). An umbelliferous plant which has long been cultivated as a potherb, used in soups and for a garnish, in the same manner as parsley. It is much more used in some parts of the continent of Europe than in Great Britain or in the United States. It is a native of Europe, naturalized in some parts of England and in a few localities in the United States. The leaves have a peculiar, somewhat sweetish, pleasantly aromatic smell and taste, by which the plant may be known from its congener *Anthriscus vulgaris*, a weed whose leaves have a disagreeable smell and which is also distinguished by its hispid fruit. The umbelliferous plant called Venus's comb, or shepherd's-needle (*Scandix pecten-veneris*), a native of Europe, often found in grainfields and remarkable for the appearance and large size of its fruit, and another species, *Scandix australis*, which grows in the south of Europe, have a taste and smell resembling chervil and are used in the same way on the Continent. Sweet chervil, or sweet cicely (*Myrrhis odorata*, the *Scandix odorata* of the older botanists), a native of the south of Europe and of some parts of Asia, common in the neighborhood of houses in Great Britain, although probably not a true native, is frequently cultivated in Germany under the name of Spanish chervil, or anise chervil. In Scotland the plant is commonly called myrrh by the peasantry. Its smell is peculiarly attractive to bees, and the insides of empty hives are sometimes rubbed with its leaves, to induce swarms to enter. *Chærophyllum bulbosum*, of southern Europe, sometimes called "turnip-rooted chervil," is cultivated for the sake of its carrot-shaped roots, which are used in the same manner as carrots. The seed is said to lose its vitality quickly and

should be stratified or sown in the fall soon after ripening. The quality of the root is said to be improved by keeping.

CHERVILLE, shĕr'vĕl', GASPARD GEORGES PESCOW, MARQUIS DE (1821–98). A French author. He was born in Chartres and for some time collaborated with the elder Dumas. Subsequently he became known as a writer on the chase, angling, and animal life, his works including: *Les aventures d'un chien-de-chasse* (1862; 2d ed., 1882); *Histoire d'un trop bon chien* (1867; an illustrated ed., 1884); *Les éléphants* (1895).

CHERWELL, chär'wĕl. A stream which falls into the Isis, or Thames, near Oxford, England. It rises in the southwest of Northamptonshire and forms the western boundary of Oxfordshire for a considerable distance (Map: England, E 5).

CHESAPEAKE, chĕs'â-pēk, THE. A 38-gun vessel famous in the history of the American navy. Early in 1807, after undergoing partial repairs in the Washington Navy Yard, she proceeded to Hampton Roads, where Commodore James Barron (q.v.) assumed command. On June 22, poorly equipped, insufficiently manned by an untrained crew, and wholly unfit for immediate action, she started across the Atlantic on a training cruise; but when well out to sea was overtaken and stopped by the British frigate *Leopard*, 50 guns, whose commander demanded the restitution of British deserters alleged to form a part of the *Chesapeake's* crew. On Barron's refusal to return the sailors demanded, or to permit search for them the British attacked with vigor, soon killing 3 and wounding 18 of the Americans and seriously crippling their vessel. From the *Chesapeake* only one gun was fired, and that with great difficulty and without effect. Barron finally struck his colors, and the British reclaimed four deserters, three of whom, though they had been formerly impressed into the British service, were native-born Americans. The affair caused intense excitement throughout the United States, anti-British feeling ran high, and the people everywhere demanded "reparation or war." President Jefferson immediately (July 2) issued a proclamation, which proved futile, ordering British cruisers to depart from American ports and forbidding all aid and intercourse with them: and, through Monroe, indignantly demanded redress, but without avail, from the British government. The incident was one of the chief occurrences that led up to the War of 1812 and is famous in American history as "The *Chesapeake* Affair," or "The *Chesapeake* Outrage." On June 1, 1813, the *Chesapeake*, then commanded by Captain Lawrence and carrying 50 guns, fought a battle in Massachusetts Bay with the British 38-gun vessel the *Shannon*, Captain Broke, then carrying 52 guns. The two vessels were almost evenly matched, except that the *Chesapeake* had an untrained crew and had only recently changed captains. After an engagement lasting fifteen minutes the *Chesapeake*, rendered unmanageable by the terrible fire of the *Shannon*, was forced to surrender after Captain Lawrence had received a mortal wound. This gallant commander exhorted his men to the end with the words, "Don't give up the ship!" Out of a crew of 379, the *Chesapeake* lost 61 killed or mortally wounded and 85 severely and slightly wounded; while out of a crew of 330, the *Shannon* lost 33 killed and 50 wounded. The *Chesapeake* was taken as a prize to Halifax, was afterward used as a British war vessel, and in 1820 was sold as old timber. Consult: Henry Adams, *History of the United States*, vol. iv (9 vols., New York, 1889–91); McMaster, *History of the People of the United States*, vols. iii and iv (New York, 1883–1900); Cooper, *History of the Navy of the United States* (2 vols., London, 1839); Roosevelt, *The Naval War of 1812* (New York, 1882); Barnes, *Naval Actions of the War of 1812* (New York, 1896).

CHES'APEAKE BAY (Algonquian *K'chesepi-ack*, country on a great river). The largest inlet on the Atlantic coast of the United States (Map: United States, L 3; Maryland, M 5). It penetrates Virginia and Maryland and is 200 miles long, having a maximum width of nearly 40 miles, but an average width of less than 20 miles. Its entrance, 12 miles wide, has on the north Cape Charles (q.v.) and on the south Cape Henry (q.v.). This bay has numerous arms, many of which are the estuaries of navigable rivers, such as the Susquehanna, Gunpowder, Patapsco, Patuxent, Potomac, Rappahannock, York, and James rivers on the west shore, and the Elk, Chester, Choptank, Nanticoke, and Pocomoke rivers on the east shore. Unlike the shallow sounds in North and South Carolina, this network of gulfs and estuaries, with an average depth of from 30 to 60 feet, affords navigation for the largest vessels. In consequence, Baltimore and Norfolk are extensive shipping ports, the latter being a naval base. Chesapeake Bay is noted for its extensive oyster beds, and the vast numbers of waterfowl which frequent its waters. The shore lands of the bay produce a great amount of garden stuff, which is sent to Baltimore and the Northern markets. Chesapeake Bay is connected with Delaware Bay by canal.

CHESAPEAKE BAY DOG. See FIELD DOG.

CHESAPEAKE FORMATION. The geological designation for an assemblage of sands, clays, and marls that outcrops within the Atlantic coastal plain of the United States and that comprises the entire Miocene series of that region. It is exposed as a broad continuous belt from northern New Jersey to North Carolina, but farther south appears in disconnected areas which continue as far as northern Florida. The famous Gay Head cliffs of Martha's Vineyard represent a northern outlier of the main belt. The formation has a thickness of 700 feet in New Jersey and 400 feet in Maryland. In the latter State, as well as in Virginia, it contains deposits of diatomaceous earth which have considerable economic importance. See TERTIARY SYSTEM.

CHESELDEN, chĕs'el-den, WILLIAM (1688–1752). An English surgeon and anatomist, born at Somerby, Leicestershire. He commenced his medical studies in 1703, established himself as a lecturer on anatomy in 1711, and in the following year was elected a fellow of the Royal Society. In 1718 he was appointed surgeon to St. Thomas's, St. George's, and Westminster hospitals, where he acquired a great reputation for his "lateral operation for the stone." His principal works are: *Anatomy of the Human Body* (1713), long a textbook on the subject in England; a *Treatise on the High Operation for the Stone* (1723); and *Osteology, or Anatomy of the Bones* (1733).

CHESHIRE, chĕsh'ĕr (for *Chestershire*, from *Chester*, the capital of the county + *shire*). A

maritime county in the west of England, bounded north by the river Mersey and partly by the Irish Sea (Map: England, D 3). Its area is 1027 square miles. The surface forms an extensive, nearly level plain between the Derbyshire and Welsh mountains, chiefly occupied by grazing and dairy tracts, which are among the most important in England. Dairy farming and cheese making are the principal agricultural industries. Cheshire is also an important manufacturing county. The chief mineral products are rock salt and coal. The chief towns are Chester (the county town), Macclesfield, Stockport, Congleton, Knutsford, and Birkenhead. Pop., 1901, 593,885; 1911, 676,356.

CHESHIRE, Joseph Blount (1850–). An American Protestant Episcopal clergyman, Bishop of North Carolina. He was born at Tarboro, N. C., graduated at Trinity College (Hartford, Conn.) in 1869, and practiced law from 1872 to 1878. He was ordained priest in 1880, was consecrated Bishop Coadjutor in 1893, and Bishop in the same year. His publications include *The Early Conventions of the Episcopal Church in North Carolina* (1882) and various pamphlets and addresses. He has edited *Sketches of Church History in North Carolina* (1892) and wrote a *History of the Protestant Episcopal Church in the Confederate States* (1911).

CHESHIRE CHEESE. See Cheese; Cheese Making.

CHESHUNT, chĕs″nt. A town of Hertfordshire, England, on the Lea, about 7 miles south of Hertford and 14 miles north of London (Map: England, F 5). The Cheshunt (theological) College, established here in 1792, was removed to Cambridge in 1905. Pop., 1901, 12,300; 1911, 12,954. Consult *Cheshunt College* (London, 1868).

CHESLEY, Mary Russell (1847–). A Canadian social reformer, born and educated at Dartmouth, Nova Scotia. She early became interested in matters of social reform, especially the legal prohibition of the liquor traffic; and was elected president of the Women's Christian Temperance Union. That body about 1891 petitioned the Nova Scotia Legislature for the political enfranchisement of women, and the refusal of the petition caused Miss Chesley to become an active supporter of the movement. To the address of James Wilberforce Longley (q.v.), then Attorney-General of Nova Scotia, against a bill for woman suffrage which had been introduced in the Legislature, she made a notable reply. Her publications include *The Mission of Women* (1895), *The Delusion of Militarism* (1909), and papers on the subject of woman suffrage.

CHESNEY, chĕs′nĭ, Charles Cornwallis (1826–76). A British military engineer and writer. He was a brevet colonel in the British Royal Engineers, and for many years was professor of military history at the Staff College at Sandhurst. He first attracted general attention by *A Military View of Recent Campaigns in Virginia and Maryland* (1863) and in 1868 published his *Waterloo Lectures*, perhaps his ablest work. He also published *The Military Resources of Prussia and France* (1870) and *Essays in Modern Military Biography* (1874). The latter contains valuable critical estimates of the military careers of Generals U. S. Grant and R. E. Lee and of "Chinese" Gordon.

CHESNEY, Francis Rawdon (1789–1872). A British soldier and explorer, was born at Annalong, County of Down, Ireland. In 1829 he inspected the route of the Suez Canal and proved the undertaking to be feasible, so that De Lesseps 40 years afterward styled him the "Father of the Suez Canal." He is especially known, however, as the explorer of the Euphrates, and the founder of the overland route to India by way of that river. He wrote *Expedition for the Survey of the Euphrates and Tigris* (1850) and *Narrative of the Euphrates Expedition* (1868). Consult his *Life*, by his wife and daughter, ed. by Stanley Lane-Poole (London, 1885).

CHESNIUS. See Duchesne.

CHESNUT, Victor King (1867–). An American chemist and botanist, born at Nevada City, Cal. He was educated at the University of California, where in 1890–93 he was assistant in chemistry. From 1894 to 1904 he served as assistant botanist, having charge of poisonous-plant investigations, in the Bureau of Plant Industry, United States Department of Agriculture. For the following three years he was chemist of the Montana Experiment Station. In 1907 he became assistant chemist in the Division of Drugs, Bureau of Chemistry, United States Department of Agriculture. His publications include: *Principal Poisonous Plants of the United States* (1898); *Preliminary Catalogue of Plants Poisonous to Stock* (1898); *Plants Used by the Indians of Mendocino County, California* (1902).

CHESS (OF. *esches*, Fr. pl. *échecs*, from It. *scacchi*, ML. *scacci*, from Pers. *shāh*, king). The origin of this, the most intellectual of all games of skill, has been much disputed; but it is safe to say that under the Sanskrit name of *chaturanga*, consisting of four members, a game essentially the same as modern chess was played in Hindustan in very remote ages. Marked traces of its early Asiatic origin may still be discerned in its nomenclature and other characteristics. From Hindustan chess spread into Persia and thence into Arabia. The Arabs, it would appear, introduced it into Spain in the eighth century, though it may have been imported still earlier into Constantinople and probably some other cities of eastern Europe. An interesting reference to it occurs in the French poem of "Huon de Bordeaux" (c.1450), which supplied Shakespeare with some of the *dramatis personæ* of his *Midsummer Night's Dream*. This connection is especially noteworthy because of the probability that it also suggested to him the introduction of Ferdinand and Miranda playing at chess in the *Tempest*, although it is likely that he was acquainted with the fact that during his own lifetime Naples, the country of Ferdinand, was the centre of European chess playing, and skill in the game temporarily reached a height which it never attained again until the middle of the eighteenth century, when Philidor (F. A. Danican) became famous all over Europe.

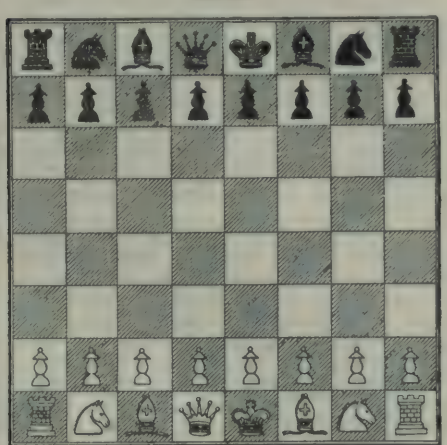
Benjamin Franklin was the first American to bring the game into prominence, both as a player and a writer; but its practice was confined to a few until the early part of the nineteenth century. By 1857 there were sufficient chess clubs to justify a national congress, at which Paul Morphy of New Orleans won the championship. He was such a phenomenal player that next year he was sent to Europe, and there he carried off all the honors. From that time chess has had a settled place among our pas-

times, and Americans, in all the phases of the game, in international contests have held a high place.

The original Hindu game was played on a board of 64 squares, as now, but by *four persons*, two being allied against two, as in whist. Hence the name *chaturanga*, from *chatur*, 'four,' and *anga*, 'a member,' or 'component part.' The name *shatranj*, used by the Persians and Arabs, is a corruption of the Sanskrit. The English, French, and other European names are derived from the Persian term *shah*, 'king.' *Check*, the warning when the king is in danger, is but another form of *shah;* in fact, "king" is sometimes used for "check," and in German *schach* is both the name of the game and the term of warning. The term *rook* is from the Sanskrit *roka*, Persian *rukh*, meaning a 'ship' or 'chariot'; *pawn* is said to be from *peon*, an 'attendant' or 'foot soldier.'

The chessboard is marked out into 64 square divisions, which are colored alternately black and white, in order the more clearly to determine and denote the respective movements of the several pieces. In placing the 32 pieces with which the game is played upon the board, each player must always have a *white* corner square at his right hand. There are two sets of pieces, of opposite colors, of 16 men each, and of various powers according to their rank. These sets of men are arrayed opposite to each other and attack, defend, and capture, like hostile armies. The accompanying diagram will best explain the name, form, and place of each man at the commencement of the game.

BLACK.



Rook. Knight. Bishop. Queen. King. Bishop. Knight. Rook.

WHITE.

The superior officers occupying the first row on each side are called *pieces;* the inferior men, all alike, standing on the row immediately in front of the pieces, are called *pawns*. Their moves and powers, along with the peculiar terms used in chess, may be briefly described as follows:

A *pawn*, at his *first* move, may advance either one or two squares straight forward; but after having once moved, he can advance only a single square at a time. In capturing an adverse piece, however, a pawn moves one square diagonally, either right or left; but the pawn never moves backward. On arriving at an eighth square, or the extreme line of the board, a pawn may be exchanged for any piece his owner chooses to call for, except a king, so that a player may have several queens on the board at once. If, on moving two squares, a pawn pass by an adverse pawn which has arrived at the fifth line, the advanced adverse pawn may take the other *in passing* in exactly the same manner as if the latter had moved but one square.

A bishop moves any number of squares diagonally, but diagonally only; therefore a bishop can never change the color of his square.

A knight moves two squares, so as always to change color—i.e., one square forward, backward, or sidewise, and one diagonally. On account of this crooked movement he can leap over or between any surrounding pieces; and therefore a knight's check, unless he can be taken, always compels the king to move.

The rook, or castle, moves any number of squares forward, backward, or sidewise, but not diagonally.

The queen is by far the most powerful of the pieces and moves over any number of squares, either in straight lines or diagonals, forward, backward, or sidewise; so that her action is a union of that of the rook and bishop. At starting the queen always stands on a square of her own color.

The king is the most important piece on the board, as the game depends upon his safety. He moves only one square at once, in any direction, except when he *castles*—a term to be explained presently. The king cannot be taken; but when any other piece attacks him, he is said to be in *check* and must either move out of check or interpose some one of his subjects, unless the checking piece can be captured. When there is no means of rescuing the king from check, he is said to be checkmated, and the game is over. Of course, the two kings can never meet, as they would be in check to each other. *Double check* is when a piece, by being moved, not only gives check itself, but also discovers a previously masked attack from another.

Castling is a privilege allowed to the king once in a game. The move is performed either with the king's rook or queen's rook; in the former case the king is moved to the king's knight's square, and the king's rook is placed on the king's bishop's square; in the latter case the king is played to the queen's bishop's square, and the queen's rook played to the queen's square. But the king cannot castle after having once moved, nor at a moment when he is actually in check, nor with a rook that has moved, nor when he passes over a square attacked or checked by an adverse piece, nor when any piece stands between him and the rook with which he would castle, nor when in the act of castling either the king or rook would have to capture an adverse piece.

A *drawn* game results from neither player being able to checkmate the other; thus, a king left alone on each side must of course produce a draw, as does also a king with a bishop, or a knight, against a king.

Stalemate, or the not being able to move either the king or any other piece, also constitutes a drawn game.

Odds is a term applied to the advantage which a stronger player should give to a weaker; thus, the removal of a rook or knight from the better player's forces may be fair odds; or, if the

players are more nearly matched, the one may give a pawn. When the odds of a pawn are given, it is always understood to be the king's bishop's pawn.

Gambit is a technical word implying the sacrifice of a pawn early in the game, for the purpose of taking up an attacking position with the pieces.

Supposing the worth of a pawn to be represented by unity, the following is a tolerable average estimate of the comparative value of the pieces: pawn, 1; bishop, 3; knight, 3; rook, 5; queen, 9.

The rows of squares running straight up and down the board are called *files*, those running from side to side are called *lines*, and those running obliquely across are termed *diagonals*.

The playing over the following short game will serve the learner as a little initiatory practice:

WHITE.	BLACK.
1. Pawn to K 4.	1. Pawn to K 4.
2. King's bishop to queen's bishop 4th.	2. King's Bishop to queen's bishop's 4th.
3. Queen to king's rook's 5th.	3. King's knight to king's bishop's 3d.
4. Queen takes [1] king's bishop's pawn, giving black checkmate.	

[1] Taking is always performed by lifting the captured man from the board and placing the captor on his square. The pawn is the only man whose mode of taking differs from his ordinary move.

The foregoing brief mode of giving a checkmate is called the *scholar's mate* and is often practiced upon young and unwary players. Any contractions used, such as "K" for king, "B" for bishop, etc., will readily be understood by the use of the diagrams.

In the conduct of the game and in the practice of chess the following rules, precepts, and hints will be found very generally useful: Play forth your minor pieces early, and castle your king in good time. You may sometimes delay castling with advantage, but not often. Do not expect to be able to establish an enduring attack with half your forces at home. Seek to let your style of play be attacking, and remember the gaining or losing of time in your measures is the element of winning or losing the game. Never touch a piece without moving it, nor suffer yourself or your opponent to infringe any other of the laws of the game.

You will find, when first player, that the opening, springing from your playing first king's pawn two, and then your king's knight to the bishop's third, is one of the best that you can adopt; but do not adhere to any one opening only. If you wish to adopt a purely defensive opening, you may play Pawn to K 3, and follow up with Pawn to Q 4, and Pawn to Q B 4. Next to playing with good players, nothing will conduce to improvement more than looking on at two expert players while they play. Wanting these advantages, it is best to play over openings and actual games from books or journals. To prevent blunders and oversights, always endeavor to perceive the motive of your adversary's move before you play; and look often round the board to see that you are not losing sight of any better move than the one you intended, or that you are not suffering yourself to be tempted by a bait.

The most elaborate and complete code of rules is to be found in Staunton, *Chess Praxis* (London, 1860). In that code every law of the game is fully explained, filling 66 pages of the book. For the antiquities of the subject, consult Forbes, *History of Chess* (London, 1860). Modern practical works are: Morphy, *Games at Chess*, ed. by Lowenthal (New York, 1860); Staunton, *Chess: Theory and Practice* (London, 1876); Gossip, *Chess Player's Manual* (London, 1875); Morgan, *Chess Digest* (4 vols., Philadelphia, 1905).

CHESS, or **CHEAT.** A common name of the *Bromus secalinus*. See Brome Grass.

CHEST (palatalization of AS. *cist*, *cest*, from Lat. *cista*, Gk. *κίστη*, *kistē*, chest, box), or Thorax. In anatomy, the part of the body between the neck and abdomen, constituting the uppermost of the two divisions of the trunk. It contains the heart and lungs and is bounded externally by the ribs. The chest is somewhat conical in form, the broad or lower end of the cone being closed by the diaphragm, a large muscular partition which projects upward from the lower ribs, being convex towards the chest and concave towards the abdomen. In respiration the diaphragm descends by its own muscular contraction, while at the same time the ribs are drawn upward and outward by the accessory muscles of inspiration. The cavity of the chest is thus enlarged, the lungs are expanded, and air is drawn into them through the trachea, or windpipe, and the bronchial tubes. The combination of bone, cartilage, muscle, and tendon entering into the composition of the chest is such as to permit of expansile movement to the extent required and yet to guard against overexpansion, which would be fatal to the delicate structures within. The bones of the chest are at the same time a powerful protection against external injury.

The structures forming the walls of the chest are: 1. The backbone, or spinal column, divided into 24 true vertebræ, 12 of which, called the "dorsal vertebræ," form the thoracic portion. 2. Twelve ribs on either side, attached behind to the dorsal vertebræ, and ending in front in the costal cartilages. 3. The sternum, or breastbone, which occupies the middle line in front, and to which the costal cartilages are attached on either side. 4. The diaphragm (q.v.). See also Skeleton.

The contents of the chest are the heart, the great arteries and veins, the lungs, the trachea, or windpipe, the bronchi, or branches of the trachea, leading to the lungs, the œsophagus, or gullet, certain important nerve trunks, and the thoracic duct, or general terminus of the lymphatic system of vessels, by which the chyle and lymph are discharged into the blood. The importance of these parts to life, and their great liability to deranged action, render the chest the seat of a large proportion of the diseases which afflict humanity, and especially of those which end in death. Of the three organs which Bichat called the "tripod of life" —viz., the brain, heart, and lungs—the chest contains two; hence its condition in almost all diseases, and especially in fatal diseases, is an object of the utmost solicitude to the physician.

The diseases of the chest depend in some cases on alterations in its form, as by rickets (q.v.) and other conditions affecting the bones in early childhood or in youth, or by too tight lacing in girls. The lungs are subject to a great variety of diseases, among which the principal are consumption, or pulmonary tuberculosis (q.v.), pneumonia (q.v.), pleurisy (q.v.), and bronchitis (q.v.). The heart is subject to pericarditis, endocarditis, enlargement (hyper-

trophy), dilatation, and degeneration of its muscular texture. The aorta is often affected with degeneration of its walls and occasionally with aneurism. The great veins are liable to overdistension and to obstruction by tumors or by coagulation of the contained blood. The thoracic duct is sometimes obstructed by external pressure, and the œsophagus has a number of diseases usually described in connection with the alimentary canal. Most of the diseases here referred to are described either in special articles or under HEART, DISEASES OF. See also AUSCULTATION; PERCUSSION.

CHEST, NAVAL. The name "chest" has been given to certain funds maintained for the benefit of seamen belonging to the English navy. A fund, called the *Chest at Chatham,* was suggested so long ago as the days of Drake and Hawkins for the relief of superannuated and wounded seamen. In 1590 all seafaring men in Queen Elizabeth's service consented to a stoppage out of their pay of two shillings to six shillings per month to support this fund. The money was not in those days, as it would be now, put out to interest; it was kept in a chest, and hence the name given to the fund itself. During the eighteenth century the system became organized in a better manner; but still the fund retained the name "chest," insomuch that when the office was removed from Chatham to Greenwich in 1803, it became the *Chest at Greenwich.* The chest is managed ex officio, and the accounts are annually laid before Parliament. Handsome gifts are occasionally made to the fund by individuals. Disabled sailors receive a present sum of money, if not deprived of the power of earning a living; but if their injuries are more permanent, they receive a pension from the Chest for one year or for several years or for life, paid half-yearly.

CHES'TER (AS. *ceaster,* from Lat. *castra,* camp). An ancient episcopal city, municipal and parliamentary borough, and river port, the capital of Cheshire, England, on the right bank of the Dee, 22 miles from its estuary, and 16 miles southeast of Liverpool (Map: England, D 3). It stands on a rocky sandstone height, the greater part being inclosed by ancient walls 7 or 8 feet thick, nearly 2 miles in circuit, pierced by four gates, and now forming a promenade from which excellent views of the city and vicinity are obtained. It is the only city in England that still has its walls intact. The two main streets cross at right angles and were cut out of the rock by the Romans 4 to 10 feet below the level of the houses. The houses in these streets are curiously arranged; the front parts of their second stories, as far back as 16 feet, form a continuous paved promenade or covered gallery, open in front, and reached by flights of steps from the street below, with private houses above, inferior shops and warehouses below, and the chief shops of the town within. These arcades, called the "Rows," together with the walls and the half-timbered construction of many of the houses, with ornamental gables of the sixteenth century, render Chester perhaps the most picturesque city in England. The cathedral is a massive structure of sandstone, with a tower of 127 feet. It was formerly the church of the Benedictine Abbey of St. Werburgh, which for 650 years was one of the richest in England. Charles Kingsley held his canonry in the cathedral of Chester. The cathedral grammar school was founded by Henry VIII. St. John's Church, long in ruins, but partially restored since 1868, is supposed to have been of early Saxon origin. Among other noted buildings are Cæsar's Tower, a remnant of the castle built by William the Conqueror, now used as barracks, the town hall, linen hall, and music hall. There are also many quaint private houses, such as God's Providence House, so called from the inscription on it; Bishop Lloyd's House, and Stanley House. The Dee is crossed by three bridges—an old stone one of seven arches, a suspension bridge, and Grosvenor Bridge, consisting of one superb stone arch of 200 feet span. Chester sends one member to Parliament. Many modern improvements have been made in the city, but with due regard to the quaint architectural features. Electric lighting has been installed; a modern sewerage system, including precipitation works, has been introduced; public baths, markets, a free library, a museum, and a hospital are maintained by the municipality. There are two public parks, and on the Roodee, outside the walls, there is a large race track. Chester has manufactures of lead, iron foundries, chemical works, and a shipbuilding yard. It manufactures boots and shoes for export. Its principal trade, however, is in cheese, for which it is a famous market. The improvement of the Dee is bringing back to Chester some of its former position as a port; there is an increasing importation of ores and timber and an export of manufactured iron. Chester is the terminus of several railway lines, and the union railway station is one of the finest in Great Britain. About 3½ miles from the city is Eaton Hall, the magnificent seat of the Duke of Westminster. Pop., 1891, 37,105; 1901, 38,309; 1911, 39,028.

Chester was the Deva of the Romans, the British Caer Lleonvawr, and the Saxon Legancester or Laegeceaster. It was devastated by Ethelfrid, King of Northumbria, early in the seventh century, after the massacre of 1200 monks of Bangor Yscoed, who had assembled to pray for the success of their compatriots. In 828 it was taken by the Saxons and in 894 by the Danes. Ethelred retook it in 904 and rebuilt the walls. From the Norman Conquest to the time of Henry III the earls of Chester had their own courts and parliaments at Chester, with eight subfeudatories and the superiors of the great religious houses, Chester being then a county palatine. Henry III made his eldest son Earl of Chester, a title held since by the Prince of Wales. In 1128 the town received its first charter. After a long siege (1643–46) the parliamentary forces took the city.

Bibliography. Howson, "Chester Cathedral," in *Cathedrals of England* (Philadelphia, 1895); Freeman, "Early History of Chester," in *Archæological Journal,* vol. xliii (London, 1886); Lach-Szyrma, "The Rows of Chester," Picton, "The Walls of Chester," Smith, "The Walls of Chester," in *Archæological Journal,* vol. xliv (ib., 1888).

CHESTER. A town and port of entry on Mahone Bay, Lunenburg Co., Nova Scotia, Canada, 34 miles (direct) south by west of Halifax, and on the Halifax and Southwestern Railroad (Map: Nova Scotia, E 4). The town was founded by New Englanders in 1760 and has manufacturing and fishing industries. Pop., 1910, 1096. The village of Chester Basin, 5 miles distant, is a popular summer resort.

CHESTER. A city and the county seat of Randolph Co., Ill., on the Mississippi River, 69

miles by rail south of St. Louis, and on the St. Louis, Iron Mountain, and Southern, the Illinois Southern, the Cape Girardeau and Northern, the St. Louis Southwestern, and the Wabash, Chester, and Western railroads (Map: Illinois, C 6). It has a public library, and contains the Southern Illinois Penitentiary and the Illinois Asylum for the Criminal Insane. The city carries on a considerable trade and has manufactures of flour, furniture, hose, shoes, knit goods, foundry products, wagons, etc. Pop., 1900, 2832; 1910, 2747.

CHESTER. A city in Delaware Co., Pa., 13 miles southwest of Philadelphia, on the Delaware River, and on the Baltimore and Ohio, the Pennsylvania, the Philadelphia and Reading, and the Southern Pennsylvania Traction Co. railroads (Map: Pennsylvania, K 8). It has two free libraries, two hospitals, a high school building, and three parks, and the Deshong Memorial grounds and art buildings; and is the seat of the Pennsylvania Military College. The Crozier Theological Seminary (Baptist) is at Upland, a part of Chester. Of historic interest are the city hall, built in 1724, and the house of William Penn. Chester has large manufactories of silk, cotton, and woolen goods, dyestuffs, steel castings, locomotives, boilers and engines, lumber, fire bricks, paper, cigars, plaster, boards, ice, etc.; and is noted for its former shipbuilding. Chester adopted the commission form of government in 1913. Pop., 1890, 20,226; 1900, 33,988; 1910, 38,537; 1920, 58,030.

Chester, the oldest town in Pennsylvania, settled by Swedes in 1644, was called Upland until 1682, when Penn arrived and gave it its present name. It was laid out in 1700, was incorporated as a borough in 1701, and was chartered as a city in 1866. The first Pennsylvania Assembly convened here in 1682. During the Revolution it was alternately occupied by the British and the Americans, and after the battle of Brandywine, in 1777, Washington reassembled his troops here. Consult Ashmead, *Historical Sketch of Chester* (Chester, 1883).

CHESTER. A city and the county seat of Chester Co., S. C., 65 miles north by west of Columbia, on the Southern, the Seaboard Air Line, the Carolina and Northwestern, and the Lancaster and Chester railroads (Map: South Carolina, C 2). It is in a cotton-growing and agricultural country, and has cotton mills, cotton gins, a cottonseed-oil mill, flour and lumber mills, iron works, an ice plant, overall, fertilizer, and canning factories, and railway shops. The city contains also a public library, courthouse, and hospital, and owns its water works. Pop., 1900, 4075; 1910, 4754.

CHESTER, Colby Mitchell (1844–). An American naval officer. He was born in New London, Conn., graduated at the United States Naval Academy in 1863, and in 1864 participated in the operations against Mobile. Having held several important commands and risen in rank, he was commandant at Annapolis in 1891–94 and commander in chief of the South Atlantic squadron in 1897–98; commanded the *Cincinnati*, the flagship of the North Atlantic squadron, during the Spanish-American war; took command of the battleship *Kentucky* in 1900; became superintendent of the Naval Observatory in 1902, and was advanced to rear admiral in 1903. He was retired on Feb. 28, 1906.

CHESTER, George Randolph (1869–). An American writer, born in Ohio. He left home at an early age and after engaging in various occupations began newspaper work as a reporter on the Detroit *News*. He was later connected with the Cincinnati *Enquirer*, of which he became Sunday editor. He began writing for newspaper syndicates and later for magazines, especially for the *Saturday Evening Post*, and became known as an author of popular appeal. Several of his stories have been dramatized and produced with success. His writings include: *Get-Rich-Quick Wallingford* (1908); *A Cash Intrigue* (1909); *The Making of Bobby Burnit* (1909); *The Art of Short-Story Writing* (1910); *The Jingo: A Tale of Red Roses* (1912); *Wallingford in his Prime* (1913).

CHESTER, Joseph Lemuel (1821–82). An American antiquary. He was born in Norwich, Conn., and until 1852 was a merchant's clerk in Philadelphia. He was afterward clerk in the House of Representatives and aid-de-camp to the Governor of Pennsylvania. After 1858 he resided in London, where he spent 10 years in the compilation of an annotated abstract of the registers of Westminster Abbey (1876). This work was published by the Harleian Society, of which in 1869 he had been a founder. At the time of his death he was regarded as perhaps the most learned genealogist in England or America. He also published: *Greenwood Cemetery and Other Poems* (1843); *Educational Laws of Virginia* (1854); *John Rodgers, the Compiler of the First Authorized English Bible* (1861); *The Reiester Booke of Saynte De'nis Backchurch* (1878).

CHESTERFIELD. A municipal borough and market town in Derbyshire, England, at the confluence of the Hipper and Rother, about 12 miles south of Sheffield (Map: England, E 3). There are manufactures of cotton, silk, earthenware, and machinery; the metals and minerals in the neighborhood include coal, iron, potters' and brick clay, slate, and lead. Trade is facilitated by a canal connecting Chesterfield with the Trent and by the main line of the Midland Railway. Owing to the rapid growth of its manufactures and the increase of its population, it has become a flourishing municipality. The electricity, gas, and water supplies are managed by a special board; tramways, parks, public baths, a cemetery, markets, and slaughterhouses are maintained by the municipality. It also operates its street railways. The town has an excellent system of sewerage and in connection therewith maintains a sewage farm. Its educational institutions include an ancient grammar school and technical school, and a public library maintained by the town. The town is of great antiquity. Its first charter was received in the reign of King John. George Stephenson is buried in Trinity Church. Pop., 1901, 27,200; 1911, 39,038. Consult Yeatman, *The Records of Chesterfield* (Chesterfield, 1884).

CHESTERFIELD, Philip Dormer Stanhope, Earl of (1694–1773). An English statesman and author, eldest son of the third Earl of Chesterfield. He was born in London, Sept. 22, 1694. He studied for about a year at Trinity Hall, Cambridge, and then left to travel in Flanders (1714). The next year he was appointed a gentleman of the bedchamber to the Prince of Wales and entered the House of Commons as a Whig. On the death of his father (1726) he succeeded to the earldom and

took his seat in the House of Lords. Two years later, he was appointed Ambassador to The Hague; in 1730 he was made a knight of the Garter and Lord Steward of the Household. Dismissed from office (1733), he became a bitter opponent of Walpole. Particularly brilliant was his speech against the Licensing Act (1737). In 1744 he joined the Pelham ministry, and in the next year was appointed Lord Lieutenant of Ireland, a post for which he was admirably qualified. In 1746 he became Secretary of State and was offered a dukedom. In 1748 he resigned office and passed the rest of his life in leisure. Distinguished for wit and graceful manners, he was for a time on terms of intimacy with Pope, Swift, Bolingbroke, and other eminent contemporaries. At an inopportune time he thrust himself forward as a patron of Dr. Johnson and was repudiated in a celebrated letter (Feb. 7, 1735). (See JOHNSON, SAMUEL.) Chesterfield's literary fame rests upon his *Letters* (published 1744) to his natural son, Philip Dormer, written for the improvement of his manners and inculcating the general standards of a man of the world rather than those of a moralist. Consult: *Letters of Chesterfield*, ed. by Lord Mahon (London, 1845–53) and by J. Bradshaw (London, 1892); also Browning, *Wit and Wisdom of Lord Chesterfield* (London, 1875); Hill, *Worldly Wisdom of Lord Chesterfield* (New York, 1891); Ernst's biography, including many letters not before published (London, 1893); Collins, *Essays and Studies* (London, 1895); Birrell, *Lord Chesterfield* (New York, 1905), and the *Life* by Craig (London, 1907). In 1912 there were published in London some hitherto uncollected letters of Lord Chesterfield's ed. by R. M. Louden and appearing as "Some Unpublished Letters of Lord C." in *Nineteenth Century and After*.

CHESTERFIELD INLET. An inlet of Hudson Bay, which extends westward for a distance of over 200 miles from the northwest corner of the bay (Map: Canada, M 4). It has a variable width, which does not exceed 25 miles, and is in water connection, near its head, with the string of large lakes lying to the southwest. It contains a number of islands, and at its western extremity it widens into Baker Lake.

CHESTER PLAYS, THE. A group of mystery plays on scriptural subjects, 24 in all, played by the guilds of Chester during three days at Whitsuntide. A sixteenth-century proclamation concerning them ascribes them, in obscure phrase, to either Sir Henry Francis, a monk, or to Sir John Arnway, mayor of Chester in 1327–28. The only complete edition of them was made by Mr. Thomas Wright, for the Shakespeare Society, London (2 vols., London, 1843–47).

CHES'TERTON, GILBERT KEITH (1874–). An English author, born in London and educated at St. Paul's School. After studying art for a while, he began at an early age to write for various periodicals and newspapers in London, attracting prompt attention by his brilliant and vigorous prose style and by the originality of his opinions (or of his way of expressing his opinions) on every sort of subject. A certain unexpectedness gave piquancy to his writing and especially to his criticism. If not always taken seriously, at least he came to be widely read, and his books, which represent poetry, fiction, miscellaneous essays, biography, and criticism, firmly established him as one of the most attractive of the English writers of his day. So nimble is he that in some of his essays the reader's mind, though fascinated, wearies in following his intellectual pyrotechnics. Mr. Chesterton has published two books of verse, *The Wild Knight* and *Greybeards at Play* (both in 1900); a collection of miscellaneous writings, *The Defendant* (1901); and two somewhat erratic stories, *The Napoleon of Notting Hill* (1904) and *The Club of Queer Trades* (1905). Of his biographies, the following deserve especial mention: *Robert Browning* (1903); *G. F. Watts* (1904); *Charles Dickens* (1906); *George Bernard Shaw* (1909). Other and even more characteristic works by Chesterton are *Heretics* (1905); *Orthodoxy* (1908); *Tremendous Trifles* (1909); *The Ball and The Cross* (1910); *What is Wrong with the World?* (1910); *Alarms and Discursions* (1911); *Man Alive* (1912); *The Victorian Age in Literature* (1913); *Magic* (1913); *The Flying Inn* (1914). Consult the anonymous *G. K. Chesterton: A Criticism* (London, 1908).

CHES'TERTOWN. A town and the county seat of Kent Co., Md., 30 miles (direct) east of Baltimore, on the Chester River, and on the Pennsylvania Railroad (Map: Maryland, N 4). It has planing and strawboard mills and phosphate and basket factories. Washington College, organized in 1773, is situated here. Pop., 1900, 3008; 1910, 2735.

CHESTNUT, chĕs'nŭt (formerly *chesten-nut*, a contamination of AS. *cisten*, OHG. *chestinna*, *kestinna*, Ger. *Kastanie*, chestnut, and OF. *chastaine*, It. *castagna*, Lat. *castanea*, chestnut, from Gk. *καστανέα*, *kastanea*, Arm. *kask*, chestnut; connected with Gk. Κάστανα, *Kastana*, or Καστανάια, *Kastanaia*, a city of Pontus noted for chestnuts). (*Castanea.*) A genus of plants of the family Fagaceæ, closely allied to the beech (*Fagus*), but botanically distinguished from it by long male catkins, set with groups of flowers, a five to eight celled ovary (bur), and one to three compressed, rounded nuts. Three species are of horticultural and commercial importance for their nuts and wood—the European of Spanish chestnut (*Castanea vulgaris*), the Japanese (*Castanea japonica*, or *Castanea crenata*), and the American (*Castanea dentata*). The European chestnut grows wild in extensive forests in the south of Europe, west of Asia, and north of Africa, and is a large, stately tree. The nuts are usually two in each bur, very large, and of a dark mahogany color. The American chestnut is taller and more spreading. In forests it reaches a height of 100 feet, with a trunk 3 to 4 feet in diameter. It is native from Maine to Michigan and southward to Louisiana and is generally found on high, sandy land, gravel ridges, or mountain slopes comparatively free from limestone. The Japanese chestnut is a smaller tree than either the Europeon or American and has a compact, symmetrical habit. Its large nuts, early and heavy bearing propensities, comparative freedom from blights, and complete union on either its own American-grown or on native American seedlings have brought it into extended use in the United States within recent years as an orchard tree and in grafting over native chestnut forests. Chestnuts are usually propagated from seed, and the seedlings are later grafted or budded with improved varieties. Chestnut timber is coarse-grained, light, and durable, and it finds

extensive use in furniture making and for posts and fence timbers.

In addition to the three species noted above, there are a number of dwarf forms known as chinquapins. The common, or tree, chinquapin (*Castanea pumila*) and the bush chinquapin (*Castanea nana*) are natives of the States south and west of Pennsylvania as far as Texas. The former is a shrub 4 to 5 feet high, though occasionally reaching a height of 30 or 40 feet; the latter rarely exceeds 3 feet. The nuts are smaller than chestnuts, but ripen earlier, are edible, and to some extent marketed. A number of other species are native to the East. *Castanea argentea* and *Castanea tungurrut* of Java are large trees with edible nuts. *Castanopsis chrysophylla* is a California evergreen, the small fruit or nuts of which are eaten. The horse-chestnut (q.v.) is entirely different from the true chestnut.

Chestnut trees in the eastern part of the United States are suffering from a very serious blight. First noticed in a park in Brooklyn, N. Y., in 1904, it has spread until in 10 years it was known to occur from New Hampshire to Virginia and westward to western New York and West Virginia. In parts of the country practically all the native chestnut trees have been destroyed. The cause of the disease is the fungus *Endothia parasitica*, and what is believed to be the same species occurs in China, indicating that the disease was introduced from the Orient. No remedy is known for the trouble. Japanese chestnuts seem less subject to injury than the American species.

Food Value.—Chestnuts when fresh contain 84 per cent of edible portion and 16 per cent of refuse (shell). The edible portion has the following percentage composition: water, 45.0; protein, 6.2; fat, 5.4; total carbohydrates, 42.1; and ash, 1.3. The fuel value is 1125 calories per pound. Unlike most nuts, the chestnut is rich in carbohydrates (largely starch) rather than fat or protein. In Europe steamed chestnuts are eaten with either salt or milk. They are also boiled and roasted, or are used combined with other food materials, and in the manufacture of confectionery. In the form of cakes, called in Italy *necci*, they are a common food. In the United States they are eaten raw or roasted, and are also used for making desert, for stuffing poultry, and in other ways. The candied chestnuts, or *marrons glacés*, are also well known. According to recent investigation, cooked chestnuts are quite thoroughly digested. Chestnuts are dried, and are sometimes ground to a flour used for making a bread or cake.

CHESUN'COOK LAKES (N. Amer. Indian, great discharge place). A group of lakes in Piscataquis Co., Me., the chief being Chesuncook Lake, 18 miles long and from 1 to 2 miles wide, and Ripogenus Lake, 2 miles long and 1 mile wide, which are but expansions of the Penobscot River (Map: Maine, C 3). Lake Chesuncook has the following feeding lakes or ponds: Longeley Pond, Umbazooksus Lake, Cuxabexis, Duck and Moose ponds, Mud Pond, Ragged Lake, and Caribou Lake, 7 miles long and 1½ miles wide. Lake Ripogenus has as a feeder Harrington Lake, 3 miles long and 1 mile wide. Lobster Pond, 5 miles long and 1½ miles wide, between Ragged Lake and North Bay of Moosehead Lake, may also be included in the Chesuncook system. Lying to the northwest of this section and directly connected with it by the Cauquomgomoc River, 12 miles long, are Lake Cauquomgomoc, about 7 miles long and nearly 2 miles wide, and its feeding lakes—Lone Lake, Poland Pond, Round Pond, and Shallow Lake.

CHETIMACHES, shĕt'ĭ-măsh', LAKE. See GRAND LAKE.

CHET'TLE, HENRY (?–c.1607). An English dramatist. Of the 13 or more plays of which he was the sole author, only one has survived, the lurid *Tragedy of Hoffman, or a Revenge for a Father* (performed 1602, printed 1631; ed. by H. B. Leonard, 1851). Of 36 plays on which he collaborated, only four were printed. Very attractive is *The Pleasant Comedie of Patient Grissil* (printed, 1603; ed. by J. P. Collier, 1841). Chettle's name is forever linked with Shakespeare's. He edited Greene's *Groatesworth of Wit* (1592), in which Shakespeare was attacked; apologized in a memorable passage in a pamphlet entitled *Kind Heart's Dream* (1592 or 1593; reprinted by C. H. Ingleby in *Shakespeare Allusion Books*, 1874); and apparently alluded to Shakespeare in "Silver-tongued Melicert," in *England's Mourning Garment* (1603; reprinted with *Kind Heart's Dream*, as above). There are two careful editions of Hoffman—one by H. B. L[ennard] (London, 1852); the other by Richard Ackermann (Bamberg, 1894). Consult also Ward, *History of English Dramatic Literature* (London and New York, 1899), and *Cambridge History of English Literature* (Cambridge and New York, 1907–13).

CHEVALIER, shĕv'ȧ-lēr' (Fr., variant of *cavalier*, It. *cavaliere*, from ML. *caballarius*, horseman, from Lat. *caballus*, horse). In heraldry, a horseman armed at all points. In the more general acceptation it signifies a knight (q.v.). See BANNERET; CHIVALRY.

CHEVALIER, THE YOUNG. The popular title of the grandson of James II of England, otherwise known as the Young Pretender (q.v.). See STUART, CHARLES EDWARD.

CHEVALIER, shə-vȧ'lyȧ', ALBERT (1861–). An English music-hall singer, and composer of "coster" songs. He made his first public appearance in 1877, at the Prince of Wales's Theatre, during the Bancroft management, in *An Unequal Match*. For some years he continued as a regular actor at the Court Theatre, with John Hare, and elsewhere, till in February, 1891, he made a great hit at the Pavilion Music Hall, developing his special gift of mimicking the traits of the London costermonger, as in the song *My Old Dutch*. His talents as composer and singer have brought him great popularity. In 1896 he spent some time in the United States, repeating his favorite performance. In 1911 he played at the Savoy Theatre, London. He is also the author of dramatic pieces, notably *Tommy Dodd*, which he produced at the Globe Theatre, London, in 1898, and of a volume of reminiscences called *Before I Forget*.

CHEVALIER, MICHEL (1806–79). A French economist. He was born in Limoges, Jan. 13, 1806, and was at the age of 18 admitted as a pupil of the Polytechnic School. Thence he went to the School of Mines, and some days before the revolution of July he was appointed engineer to the Département du Nord. In early life he accepted the doctrines of Saint-Simon and collaborated with the latter in the publication of the *Organisateur* and the *Globe*. In 1834 he was commissioned by the government

CHESTNUT TREE AND FLOWER SPRAY (Castanea Americana)

to visit North America and to prepare a report on the canals, roads, and railways of that continent. He traveled for two years in the United States, Mexico, and Cuba, and published the results of his experiences in a series of letters in the *Journal des Débats*. In 1840 he was appointed professor of economics in the Collège de France, and in 1845 he was elected a deputy, but served only till next year, his championship of free trade preventing his re-election. He lost his professorship during the provisional government, but later won the favor of Louis Napoleon and was reinstated. In 1860 he became senator. He died in Montpellier in 1879. The most important work with which Chevalier's name is associated was the commercial treaty of 1860 between France and England, negotiated by Chevalier and Richard Cobden. This treaty inaugurated a new era in the commercial policy of western Europe. Of his works, that most frequently quoted is his *Probable Fall in the Price of Gold* (1854). Other works are: *Letters from North America* (1836); *Material Interests in France: Public Works, Roads, Canals, Railways* (1838); *Letters on the Organization of Labor and the Question of the Laborers* (1848).

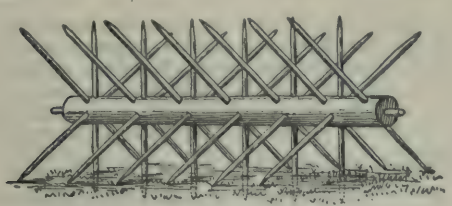
CHEVALIER AU CYGNE, ô sē'ny' (Fr., knight of the swan). A character also known as Helias, occurring in the Icelandic sagas, the legends of Germany and Flanders, and the early French romances. In the latter he is made grandfather to Godfrey de Bouillon. His name is more especially familiar as the title of a set of *chansons* composed shortly after the Crusades, among the individual titles of which are *Antioche*, *Les Chétifs*, and *Les Enfances de Godefroy*.

CHEVALIER DE SAINT GEORGE, de săN zhôrzh (Fr., knight of St. George). A title assumed by the "Old Pretender," James Stuart.

CHEVALIER D'INDUSTRIE, dăN'dụ'strē' (Fr., knight of industry). A man who lives by expedients and trickery. The term is derived from Alexandre Duval's five-act comedy in verse of that name, which was presented at the Théâtre Français on April 3, 1809. The hero, Saint-Remi, is a *chevalier d'industrie*, who palms himself off as a gentleman of quality. The scene is laid in the home of a rich merchant, where, after a number of diverting escapades, Saint-Remi's roguery is finally exposed. It is one of the weakest of Duval's plays.

CHEVALIER SANS PEUR ET SANS REPROCHE, săN pẽr â săN re-prôsh'. See Bayard, Pierre du Terrail.

CHEVAUX-DE-FRISE, she-vô'de-frēz' (Fr., horses of Friesland). An array of sharp or ragged points placed in a position towards the



CHEVAUX-DE-FRISE.

enemy and designed to stay his advance. They are usually made of wood or iron and are, as a rule, a substitute for regular abatis. See Abatis; Fortification.

CHEVECHE, she-vĕsh', or **CIVETTA,** chē-vĕt'tà. The common names in France and Italy, respectively, of the "little owl" (*Carine noctua*)—the bird of Pallas Athene and hence the emblem of Athens and associated with Minerva and the idea of Wisdom. See Owl, and Plate of Owls.

CHEVERNY, she-vâr'nē', Philippe Hurault, Count de (1528–99). A French statesman and author. He was born at Cheverny, in Brittany, and was appointed Chancellor to the Duke of Anjou, in 1562, through the influence of Catharine de' Medici. Under her son, Henry III, he became Guard of the Seals (1578) and Chancellor of France (1581), but fell into disgrace by supporting the League and was deprived of his post in 1588. In 1590 he was restored to favor by Henry IV, whom he served until his death. Count de Cheverny was the author of *Mémoires d'estat* (1636).

CHEVERT, she-vâr', François de (1695–1769). A French general. He was born at Verdun and took part in nearly all of the important campaigns fought during the reign of Louis XV. Marshal Saxe placed him in command of the grenadiers at the battle of Prague, and Chevert and his sergeant, Pascal, were the first to mount the walls of the city. In December, 1742, he heroically defended the same city with a handful of men. His skillful manœuvre decided the battle of Hastenbeck. He became lieutenant general in 1748.

CHEVES, chēvz, Langdon (1776–1857). An American lawyer and statesman, sometimes called "the Hercules of the United States Bank." He was born in Abbeville Co., S. C.; was self-educated; was admitted to the Charleston bar in 1797 and rapidly rose to eminence as a lawyer. In 1808 he became Attorney-General of his State, and, after serving three terms in the South Carolina Legislature, was elected to Congress by the Young Republican party in 1811. In Congress he was closely associated with William Lowndes, Henry Clay, and John C. Calhoun, and formed with them the celebrated "War Mess." He served as Speaker in 1814, and by his casting vote defeated the Dallas Bill for rechartering the United States Bank. In 1815 he resumed the practice of law in South Carolina, and from 1816 to 1819 was one of the associate justices of the State. In January, 1819, he was elected one of the directors of the United States Bank and in the following March was chosen to succeed Jones as president of that institution. The bank was then in a deplorable condition, and insolvency seemed almost inevitable; but Cheves set about restoring its credit, and, by continuing a previous policy of curtailing the note issues, by enforcing a rigid collection of all balances due from local banks, and by securing a loan of $2,000,000 in Europe, he fully accomplished his purpose within three years. In December, 1822, he resigned, and was succeeded by Nicholas Biddle (q.v.). Subsequently, until his death, he lived in retirement, first in Philadelphia, then in Lancaster, Pa., and finally in Charleston, S. C.; but in 1850 he went as a delegate to the celebrated Nashville Conference, where he expressed himself in favor of a Southern Confederacy, but strongly deprecated any independent action by separate Southern States. A brief account of his services to the United States Bank is given in the *Annual Report of the American Historical Association for 1896* (Washington, 1897).

CHEVILLARD, shĕ-vē'yȧr', CAMILLE (1859–). A French composer and conductor. He was born in Paris, Oct. 14, 1859, a son of the famous 'cellist Pierre Chevillard. He studied piano under G. Mathias, while in composition he was almost entirely self-taught. For several years he acted as assistant conductor to his father-in-law Lamoureux, whom, on the latter's death in 1899, he succeeded. Under Chevillard the *Concerts Lamoureux* have maintained their high standard of excellence and progressiveness. In 1903 he received the Prix Chartier for chamber music, and was in 1913 president of the Société Française de Musique de Chambre. His compositions comprise a symphonic ballad, a symphonic fantasy, a string quartet, a piano quintet, a piano trio, a sonata for violin and piano, and a sonata for 'cello and piano.

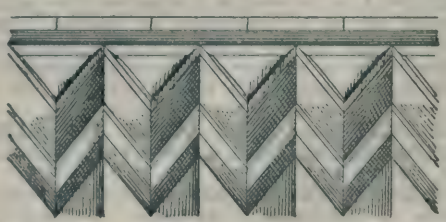
CHEVIOT HILLS, chĕv'ĭ-ŭt *or* chē'vĭ-ŭt. A mountain range in the counties of Northumberland and Roxburgh, on the English and Scotch borders, extending 35 miles, from near the junction of the Till and Tweed in the northeast, to the sources of the Liddel in the southwest (Map: England, D 1). The highest point is Cheviot Peak, 2658 feet high. The hills are noted for a valuable breed of sheep and for their connection with the border warfare of earlier history.

CHEVREAU, she-vrō', HENRI (1823–1903). A French legislator. He was born in Belleville, Seine. He was one of the strongest supporters of the coup d'état of 1851. In 1870 he superseded Baron Haussmann as Prefect of the Seine and, after the first defeat sustained by the French army in that year, was appointed Minister of the Interior. In this capacity he energetically promoted the organization of the Garde Mobile throughout the country, encouraging the formation of bodies of *francs-tireurs* (sharpshooters), and completing in Paris the equipment of 60 new battalions of the Garde Nationale. After the disaster at Sedan and the revolution of September 4, he fled to Brussels and subsequently rejoined the Empress Eugénie in England. He was elected a member of the Chamber of Deputies in 1885.

CHEVREUL, she-vrēl', MICHEL EUGÈNE (1786–1889). A French chemist, born at Angers, in the Department of Maine-et-Loire. He studied chemistry in Paris, became assistant to Vauquelin, and in 1813 was appointed professor of the physical sciences at the Lycée Charlemagne. In 1820 he was made examiner in the Ecole Polytechnique and in 1824 director of the dyeing department in the Gobelin manufactory. In 1830 he became professor of applied chemistry in the Museum of Natural History and in 1879 retired from active service. In recognition of his important services to science many honors were conferred upon him; he was made a member of the Institute, a fellow of the Royal Society of London, a commander of the Legion of Honor, etc. In 1886 the centenary of his birth was celebrated with great enthusiasm; and in the same year Harvard University, on the two hundred and fiftieth anniversary of its foundation, conferred upon him the degree of LL.D. A monument to his memory was erected at Angers in 1893. Another statue of Chevreul may be seen in the Museum of Natural History in Paris. Among his researches may be mentioned his successful investigation of the chemical nature of fats, which has led to the achievement of industrial results of the greatest importance. He was the first to demonstrate that the various fats are mixtures of glycerides, or compounds of glycerin with oleic, stearic, and palmitic acids. (See FATS.) He recognized that the stearic acid (or usually rather a mixture of stearic and palmitic acids) that may be obtained from solid fats would make an excellent material for candles. He was, however, unable to "break the grain" of the stearic acid (i.e., to prevent it from solidifying in the form of large crystals), and this was at least one of the reasons of the failure of his attempt to found the "stearin-candle" (or, as it should be called, the "stearic-acid candle") industry. Nevertheless it was on the basis of the discoveries of Chevreul that this important industry was subsequently established in 1851. He wrote: *Recherches chimiques sur les corps gras d'origine animale* (1823); *Considérations générales sur l'analyse organique et sur ses applications* (1824); *Leçons de chimie appliquée à la teinture* (2 vols., 1831); *De la loi du contraste simultané des couleurs et de l'assortiment des objets coloriés* (1839); *Théorie des effets optiques que présentent les étoffes de soie* (1846); *Des couleurs et de leur application aux arts industriels* (1864); *Résumé d'une histoire de la matière* (1878); etc. Consult Malloizel, *Œuvres scientifiques de Chevreul* (1887); also Hofmann, "Nekrolog auf Chevreul," in the *Berichte der deutschen chemischen Gesellschaft*, for 1887.

CHEVREUSE, she-vrēz', MARIE DE ROHAN, DUCHESSE DE (1600–79). One of the foremost opponents at the court of France to Richelieu, who banished her to England. After the death of Louis XIII she returned and participated in the Fronde (q.v.), defending Condé. She was a patron of La Rochefoucauld (q.v.). She was the widow of the first Duke of Luynes when she married Claude of Lorraine, Duc de Chevreuse. Consult the biography by Cousin (7th ed., Paris, 1886).

CHEVRON, shĕv'rŭn (Fr., ML. *capro*, rafter, from Lat. *caper*, goat). Any ornament in the form of a V, whether isolated, arranged in rows with the points in the same straight line, or in rows, side by side. In the latter case the ornament is more generally called a zigzag. Chevrons



CHEVRONS.

play an important part in Assyrian ornament; and, in the form of molded zigzags, in the French Norman and Anglo-Norman architecture of the eleventh and twelfth centuries, especially in the decoration of arch moldings. In heraldry (q.v.), one of the charges known as ordinaries.

CHEVRONS, shĕv'rŭnz (Fr. *chèvre*, a goat). Badges or insignia of rank consisting of stripes meeting at an angle and worn on both sleeves of the coat by noncommissioned officers. *Sleeve insignia* for rated enlisted men, not noncommissioned officers, are sometimes called *chevrons*. In the United States army such badges of rank are worn by all noncommissioned

officers and are of cloth corresponding in colors and pipings to the patterns laid down for stripes on trousers. (See UNIFORMS, MILITARY.) The chevrons are worn with the points up and midway between the elbow and top of sleeve. They are worn on the sleeves of the overcoat and all coats; also on the sleeves of the sweater in the field and on the sleeves of the olive-drab shirt when worn without the coat or sweater. The word *chevrons* is often improperly used to designate the *service stripes* worn by all enlisted men who have served faithfully for a period of three years. A *stripe* is added for each such period. They are worn diagonally on both sleeves of the dress coat below the elbow, and are of the color of the facings of the arm in which the service was rendered. To indicate *service in war* half chevrons, or stripes of white, were *formerly* worn on the sleeve. These have been replaced by *campaign badges* worn on the left breast. Previous to 1902 chevrons were worn with the points down, except by the cadet officers of the United States Military Academy and the noncommissioned officers of the United States Marine Corps.

Chevrons worn by noncommissioned officers of the line, according to their rank, are as follows: *regimental sergeant major*, three bars and an arc of three bars; *regimental quartermaster sergeant*, three bars and a tie of three bars; *regimental commissary sergeant*, three bars and a tie of three bars, having a crescent (points rear); *squadron* or *battalion sergeant major*, three bars and an arc of two bars; *chief musician*, three bars and an arc of two bars, with a bugle in the centre; *chief trumpeter*, three bars and an arc of one bar, with a bugle in the centre; *principal musician*, three bars and a bugle; *drum major*, three bars and two embroidered cross batons; *first sergeant*, three bars and a lozenge; *troop, battery,* or *company quartermaster sergeants*, three bars and a tie of one bar; *sergeant*, three bars; *color sergeant*, three bars and a star; *corporal*, two bars; *lance corporal*, one bar; *stable sergeant, field artillery*, three bars and a horse's head. Post permanent staff, engineer, hospital, ordnance, and signal corps noncommissioned officers wear chevrons in which the stripes are accompanied usually by a cloth device designating the corps or department of the service to which they belong. (See MILITARY INSIGNIA; for conditions under which campaign badges are worn, see UNIFORMS, MILITARY.) The service stripes to indicate enlistment periods, if more than one, are worn one above the other, in the order in which they were earned, one-quarter of an inch distance between them.

Chevrons of varying number and design are worn for the same reason and purpose in practically every civilized army, the English and French systems more closely approaching the United States than do the other nations of continental Europe. Chevrons as badges of distinction were first introduced in the Prussian cavalry in 1889 and are worn by expert swordsmen. In France veterans and noncommissioned officers promoted for long service are called *chevronnés*. In England warrant and noncommissioned officers wear the badges similarly to the French, on the left sleeve of the coat, between the elbow and the shoulder. Four chevrons denote the rank of quartermaster sergeant, three a sergeant, two a corporal, and one a lance corporal of infantry, a bombardier of artillery, and a second corporal of engineers. They are worn point downward. Warrant officers (i.e., regimental sergeant major or bandmaster) are distinguished, the former by a gold crown worn over the left cuff, and the latter by a gold lyre similarly worn. Chevrons for long service are worn by private soldiers on the right forearm, points upward. Chevrons for long service in the case of enlisted men or for rank in the case of noncommissioned officers below the rank of full sergeant are of cotton braid, the color of which is determined by the arm of the service to which the wearer belongs. Noncommissioned officers of sergeant's rank and upward wear gold chevrons.

CHEVROTAIN, shĕv'rō-tān' (Fr., from OF. *chevrot*, dim. of *chevre*, from Lat. *caper*, goat). A group (Tragulina) of diminutive, hornless, deerlike animals, the smallest-known ungulates, which are intermediate in structure between pigs, camels, and deer, but resemble agoutis in form, standing only about 12 inches high. Several species inhabit southern India, Ceylon, and the Malayan region, and one inhabits the Philippines. These belong to the genus *Tragulus*, and the best known are the kanchil (*Tragulus kanchil*) of the Malayan Islands and the Indian chevrotain, or mouse deer (*Tragulus meminna*), which differs from the others in being spotted with white. Usually the fur has some soft and beautiful hue of rufous, tawny, or mouse gray. In West Africa is a related species, the "biche cochon," or "water deer" (*Dorcatherium aquaticum*), which is rich brown, with the back and sides spotted and striped. All are shy little creatures, walking with a queer, stiff-legged, tiptoeing gait and hiding in thickets and rocky jungles, but capable of becoming gentle pets. These constitute the family Tragulidæ, which seems to be a scant survival of a group of forms widely distributed throughout all the temperate zone in Middle Tertiary times, and traceable to the same ancestry as the deer. See Plate of FALLOW DEER, MUSK, ETC., with DEER.

CHEVY (chĕv'ĭ) **CHASE** (probably a corruption of Fr. *chevauchée*, raid; scarcely connected with Eng. *chevy, chivy*, to drive, from Gypsy *chiv*, goad). The name of perhaps the most famous of British ballads. It has been preserved in two forms, known severally as the Scotch version and the English version, of which the former is the older and the more imaginative. To the Scotch ballad there is a reference in *The Complaynt of Scotland* (1549), and apparently in Sidney's *Apologie for Poetrie* (1595). The English poem, best known in England, was praised by Addison for its naturalness and simplicity (*Spectator*, Nos. 70, 74, 85) and continues to be a favorite poem. It is impossible to reconcile its incidents with history, but the event which is meant to be commemorated appears to have been the battle of Otterburn, in August, 1388—a fight which Froissart declares to have been the bravest and most chivalrous which was fought in his day. According to the ballad, Percy, surnamed Hotspur, vowed that he would enter Scotland and take his pleasure for three days in the woods of his rival and slay the deer therein at will. Douglas sent back word that he would prevent the sport. Accordingly, at the time of the hay harvest, Percy, with staghounds and archers, passed into the domains of his foe and slew 100 fat bucks. After the English had hastily cooked their game, Douglas, clad in armor and heading his Scot-

tish spears, came on the scene. Haughty challenge and defiance passed between the captains, and the battle joined. In the centre of the fray the two leaders met, and during the fierce combat an English arrow struck Douglas to the heart. "Fight on, my merry men all!" cried he, and died. Percy, with all the chivalrous feeling of his race, took the dead man by the hand and vowed that he would have given all his lands to save him, for a braver knight never fell by such a chance. Sir Hugh Montgomery, having seen the fall of Douglas, clapped spurs to his horse, dashed on Percy, and struck his spear through his body a long cloth yard and more. When the battle ended, representatives of every noble family on either side of the border lay on the bloody greensward. Consult "The Hunting of the Cheviot," in Child, *English and Scottish Ballads*, vol. iii (Boston, 1878; last ed., with memoir by Kittredge, 1898); Gummere, *The Popular Ballad* (New York, 1907); and see BALLAD.

CHEW, BENJAMIN (1722–1810). An American jurist, born at West River, Md. He studied law in the office of Andrew Hamilton (q.v.) in Philadelphia, Pa., and afterward in London; returned to Philadelphia in 1754 and was successively Register of Wills, Attorney-General, and Chief Justice of Pennsylvania. After the adoption of the Declaration of Independence he joined the ranks of the Loyalists, or Tories, resigned the chief-justiceship, and retired to private life. Stubbornly refusing to sign a parole, he was imprisoned at Fredericksburg, Va., in 1777. In the same year his elegant mansion (still known as the "Chew House") in Germantown was badly damaged by the cannonading to which it was subjected during the battle of Germantown, its occupation early in the engagement by the British, and the unwise attempt of the Americans to capture it, probably turning the fortunes of the day. (See GERMANTOWN.) Chew was President of the High Court of Errors and Appeals from 1790 until the abolition of this court in 1806.

CHEW, NG POON (1866–). A Chinese-American editor, born at Sun Ning, China. He was educated in the Occident School, San Francisco, and in the San Francisco Theological Seminary. His Chinese parents intended him for the Taoist priesthood, but he became converted to Christianity and entered the Christian ministry. He resigned his ministerial work in 1899 and began the publication of the first Chinese illustrated weekly and of *Chung Sai Yat Po*, the first Chinese daily newspaper in the United States. He became adviser to the Chinese consulate general in 1906. Chew came to be regarded as an authority on matters of Chinese exclusion and of American-Chinese relations. He published *Non-Exclusion* (1905) and *Treatment of Exempt Classes of Chinese in America* (1908).

CHEW'ING GUM. A preparation of some form of gum resin, to which a flavoring matter is often added. The gum resin of black spruce (*Abies nigra*), in its original state, was probably first used for this purpose; but the demand is now supplied by various manufactured preparations, and spruce gum occurs less frequently than formerly. The gum resins of sweet gum (*Liquid-ambar styraciflua*), tamarack (*Larix americana*), and certain other forest trees are also used. The substance most extensively employed in the manufacture of chewing gum is chicle gum (13,758,592 pounds, valued at $5,282,722, having been imported into the United States in 1913), an elastic gum from the naseberry (*Achras sapota*), a tree found in Central and tropical South America, somewhat similar to the India-rubber tree. Balsam of tolu, also found in South America, is a constituent of certain kinds of gum, while paraffin has also been employed. The gum of the white sap of the South and Central American trees is usually first allowed to oxidize and then melted in a crude oven and the resulting product flavored with brown sugar and colored with appropriate stains and flavoring matters. This may be done before export, but in the United States the product is carefully worked up in large factories. The practice of chewing gum is probably harmless, and in mild cases of indigestion it may even be somewhat beneficial, by mechanically stimulating the flow of saliva. Pepsin and similar substances are often mixed in with the gum; but it is safe to say that the success of any particular brand depends more upon its sweetness and flavor than upon any beneficial properties.

CHEWINK, chē-wĭnk' (imitation of its cry), or TOWHEE. A large terrestrial finch of the genus *Pipilo*, represented by several species in North America, of which the common Eastern species, the red-eyed towhee (*Pipilo erythrophthalmus*), is best known. It is about 8 inches in length, of which the tail is nearly half. The male is black, with a white belly and chestnut sides and with prominent white markings on the tail. The female is grayish brown where the male is black. It is a migratory bird, wintering in the Southern States and breeding from Georgia northward. The nest is built on or near the ground, of bark and leaves, lined with grass, and usually most cleverly hidden by an apparently accidental roof of twigs, leaves, etc. Eggs, four or five, white, spotted with rufous. The chewink is an active bird, spending its time mostly on the ground in woods and thickets, scratching about in the leaves in search of its insect prey, and now and then flying to some low branch or convenient fence rail to utter his melodious "chewink," or, in the spring, to pour forth a short but most musical song. The various names "chewink, towhee, joree," etc., are in imitation of its sharp call note, while "ground robin" refers to its colors, suggesting those of the American robin. See Plate of SPARROWS, and Plate of EGGS OF SONG BIRDS.

CHEYENNE, shī-ĕn', *local pron.*, shī-ăn'. The capital of Wyoming and the county seat of Laramie County, 105 miles by rail north of Denver, Colo., on the Union Pacific, the Burlington and Missouri River, and the Colorado and Southern railroads (Map: Wyoming, G 4). Among the prominent buildings are the State Capitol and Governor's mansion, the High School, Carnegie Library, Federal Building, Elks' Home, County Hospital, Catholic Convent, Opera House, and the stone depot of the Union Pacific Railroad. There are three attractive parts. Fort D. A. Russell, a well-equipped military post, is 3 miles distant from the city. The annual celebration of Frontier Days at Cheyenne attracts thousands of visitors. The city is an important stock-raising centre, with large stock-feeding yards and an independent packing establishment, and has railway shops of the Union Pacific, pressed-brick works, and an ice plant. Iron is mined in the vicinity. The place was first settled in 1867,

when the Union Pacific Railroad reached that point, and in 1869 was chosen as the territorial capital of Wyoming. In the same year a large portion of the town was destroyed by fire. Cheyenne has adopted the commission form of government. Its water works are owned by the municipality. Pop., 1900, 14,087; 1905, 13,656; 1910, 11,320; 1920, 13,829.

CHEYENNE, shē-ĕn′. A brave and warlike Plains tribe of Algonquin stock. They lived at one time on the Cheyenne River, a tributary of the Red River of the North, and according to tradition were friends of the Ojibway and the Dakota while these two powerful tribes were at war with each other. At last the Ojibway became suspicious, set upon the Cheyenne, and drove them down into the Dakota country. After this they roamed about the headwaters of the Platte, finally dividing into two bands, one of which became affiliated with the Kiowa of the South and the other with the Dakota of the North. These groups are, respectively, the Southern and Northern Cheyenne. They number 3055 and are confined to reservations in Montana and Oklahoma. In culture they are typical Plains Indians, living in tepee, observing the Sun Dance, and maintaining a complex social organization. Their ceremonies have been described by Dorsey, *Field Columbian Museum Publications* (Chicago, 1905).

CHEYNE, chā′nē, George (1671–1743). An English physician. He was born in Methlick, Aberdeenshire, studied in Edinburgh, and in 1702 went to London, where he was elected fellow of the Royal Society. He became enormously corpulent and, having secured relief by a milk and vegetable diet, recommended this treatment in all his subsequent treatises. His works, eminently argumentative in tone, were widely popular and were translated into foreign languages. They include: *Essay on Health and Long Life* (1724; 7th ed., 1726); *The English Malady* (1733; 6th ed., 1739); and *Essay on Regimen* (1740). His correspondence with Richardson, the novelist, appeared in 1817, as *Original Letters, edited by Rebecca Warner.*

CHEYNE, Thomas Kelly (1841–1915). An English biblical critic. He was born in London, Sept. 18, 1841; took the degree of B.A. at Oxford, 1862; was fellow of Balliol College there, 1868–82; became Oriel professor of the interpretation of Holy Scripture, 1885; and canon of Rochester, 1885. He was rector of Tendring, Essex, 1880–85; a member of the Old Testament Revision Company, and Bampton lecturer, 1889. His publications include: *Commentaries* on Isaiah (1880–81; 3d ed., 1884), Jeremiah (1883–84), Hosea (1884), Micah (1882); a new translation of the Psalms (1884); and critical works, such as *Job and Solomon* (1887); *Jeremiah: His Life and Times* (1888); *The Hallowing of Criticism* (1888); *The Origin and Religious Contents of the Psalter* (Bampton lectures, 1891); *Aids to the Devout Study of Criticism* (1892); *Founders of Old Testament Criticism* (1894); *Introduction to the Book of Isaiah* (1895); *The Christian Use of the Psalms* (1899); *Jewish Religious Life after the Exile* (1898); *Critica Biblica* (1904); *Bible Problems and the New Material for their Solution* (1904); *Traditions and Beliefs of Ancient Israel* (1907); *Decline and Fall of the Kingdom of Judah* (1908); *The Two Religions of Israel* (1910); *Mines of Israel Re-explored* (1912); and *The Veil of Hebrew History* (1913). With J. S. Black he edited the *Encyclopædia Biblica* (1899 et seq.).

CHEYNE-STOKES RESPIRATION. A type of breathing occurring in severe cases of disease of the brain, heart, kidneys, or severe general infections, and usually presaging death. The respirations occur in a regular cycle or rhythm; they gradually become accelerated and deeper up to a certain point, when they grow progressively shallower until breathing has apparently ceased; then, after a long pause, another cycle begins.

CHEYNEY, chā′nĭ, Edward Potts (1861–). An American historical and economic writer, born at Wallingford, Pa. The University of Pennsylvania, from which he graduated in 1883, and where he later became professor of history, conferred the degree of LL.D. upon him in 1911. He spent the years 1884, 1894, and 1904–05 in foreign travel, visiting German universities and studying at the British Museum. His writings, of widely recognized value as college textbooks, include: *Social Changes in England in the Sixteenth Century* (1896); *Social and Industrial History of England* (1901); *Short History of England* (1904); *European Background of American History* (1904); *Readings in English History* (1908); *A History of England, from the Defeat of the Armada to the Death of Elizabeth* (2 vols.; vol. i, 1914). He contributed to the first edition of the New International Encyclopædia.

CHÉZY, shā′zē′, Antoine Léonard de (1773–1832). A French Orientalist, born at Neuilly. He was the son of Antoine de Chézy (1718–98), a well-known engineer. After studying engineering, in 1799 he entered the Bibliothèque Nationale as librarian in the department of manuscripts, and published *Les amours de Medjnoun et Leïla* (1806), a translation from the Persian of Jami. He devoted himself to Sanskrit also, and a chair of that language was created for him at the Collège de France (1814). Among his works are an analysis of the *Meghaduta* of Kalidasa (1817); *La mort de Yadjnadatta* (1826); *La reconnaissance de Sacountala* (1830, trans. and text); and *L'anthologie érotique d'Amarou* (1831).

CHHATISGARH, chŭt′ēs-gär′. A division of the Central Provinces, British India (q.v.), comprising formerly the districts of Raipur, Bilaspur, and Sambalpur, and several small feudatory states. In 1906 Sambalpur was given to Bengal, and the district of Drug constituted out of parts of Raipur and Bilaspur. These three districts now form the division. The name "Chhatisgarh" means the 'Thirty-six forts.' Area, 21,240 square miles. Pop., 1901, 2,642,983; 1911, 3,246,767.

CHHINDWARA. See Chindwara.

CHIABRERA, kyä-brä′rä, Gabriello (1552–1638). An Italian poet, sometimes called the Italian Pindar. He was born at Savona, June 8, 1552. A posthumous child, he was educated under his uncle's care in Rome, where he afterward lived many years; but having taken vengeance for an injury done him by an Italian nobleman, he retired to his birthplace, where he married at the age of 50, and where, supported by the patronage of the leading princes of Italy, he spent the rest of his life in independence and the tranquil enjoyment of literary pursuits. Among Chiabrera's *canzonette* are several gems that have entered the *Golden Treasury* of Ital-

ian poetry to stay. His work in general has a great historical importance. His rigid adherence to imitation of the classics left little room for originality of thought; but the sculptural effect of his metrical studies widened the outlook of his contemporaries in matters of form, where his methods influenced moderns like Parini and Carducci. The so-called imitations of Pindar and Anacreon were really inspired by Ronsard and the French *Pleiade*, something of whose spirit Chiabrera caught and indicated to later Italian poets. Consult: bibliography by Varaldo (in *Giornale storico della lett. ital.*, xiii, xiv); autobiography in works (Milan, 1807–08, and Florence, 1863); selected works (Florence, 1865) and in *Oxford Book of Italian Verse* (Oxford, 1910).

CHIAJA, kyä'yȧ, La (dialectic form of It. *piazza*, place, park). A fashionable boulevard in modern Naples, extending along the coast for about a mile from the Largo Vittoria. Upon it is the Villa Nazionale.

CHIANA, kyä'nȧ. A river, the ancient Clanis, in central Italy, which once belonged entirely to the Tiber system. In ancient days it often flooded the valley of Clusium (modern Chiusi) and even caused a dangerous rise of the Tiber at Rome; hence in 15 A.D., according to Tacitus (*Annales*, i. 79), it was proposed to change the channel so as to divert its waters into the Arno, but the people of Florence objected, being unwilling to face the added danger of floods themselves. In the Middle Ages silt from the mountain streams converted the level, fertile valley from Arezzo to Chiusi into a swamp (which Dante spoke of as an accursed sink). Now, as the result of the drainage system carried out at the beginning of the last century by Count Fossombroni (q.v.), the valley is one of the most fruitful districts in Italy. A watershed was formed which sends the Chiana Toscana, or Maestro Canal, north into the Arno, and the Chiana Romana south into a branch of the Tiber at Orvieto. Among the lakes of the Chiana valley are Montepulciano and Chiusi.

CHIANTI, kyän'tê. A name applied to the mountain district of Siena in Tuscany, central Italy, about 30 miles southeast of Florence, which produces the red wine known by the name of the district.

CHIAPA, chê-ä'pȧ, Bishop of. A title often applied to Bartolomé de las Casas, the famous Spanish Dominican, who held that office between 1544 and 1547, and made every effort to ameliorate the condition of the Indians in Mexico and elsewhere. See Las Casas.

CHIAPAS, chê-ä'pȧs (from the Aztec tribe of *Chiapanecs*, *Chapanecs*, or *Chapas*, who derived their name from Aztec *chapa*, red macaw). A Pacific state of Mexico, situated at the southeastern end of the country, and bounded by the State of Tabasco on the north, Guatemala on the east, the Pacific on the south, and the states of Oaxaca and Vera Cruz on the west (Map: Mexico, N 9). It covers an area of 27,222 square miles. In the southern part are a number of volcanoes, ranging in altitude from about 1500 to over 7000 feet, while the centre consists of a fertile plateau, the most cultivated portion of the state. The climate is moderate and healthful. The state produces corn, coffee, cocoa, sugar, tobacco, and indigo in small quantities, as agriculture is still in a backward condition; gold, silver, copper, and petroleum are mined. Near Palenque, one of the towns in the northeast of Chiapas, are some of the most extensive and magnificent ruins in this portion of America. Pop., 1900, 360,799; 1910, 438,843, chiefly aborigines. Capital, Tuxtla Gutiérrez, pop., 1910, 10,217. Consult: Stephens, *Incidents of Travel in Central America, Chiapas and Yucatan* (2 vols., New York, 1841; 12th ed., New York, 1867); *The State of Chiapas* (Mexico, 1895).

CHIARAMONTE GULFI, kyä'rȧ-mōn'tȧ gōōl'fê. A town in the Sicilian Province of Syracuse, situated on a high hill, about 8 miles north of Ragusa. The chief occupation is the cultivation of the vine. Pop., 1901, 10,548; 1911, 13,200.

CHIARAMONTI, kyä'rȧ-mōn'tê, Museo. A division of the Vatican Museum (q.v.), arranged in a corridor 900 feet long, containing some 300 marble sculptures.

CHIARI, kyä'rê (It., clear). A city in the Province of Brescia, north Italy, 36 miles east of Milan (Map: Italy, D 2). It has silk factories and tanneries. On Sept. 1, 1701, the Austrians, under Prince Eugene, here defeated the French and Spanish, under Villeroi. Pop., 1901, 10,810; 1911, 12,489.

CHIARINI, kyȧ-rē'nê, Giuseppe (1833–1908). Italian scholar and poet. Beginning life as an official in the Department of Public Education, Chiarini was in 1866 president of the Liceo of Livorno; in 1882, of the Liceo Umberto I, Rome, and in 1892 general superintendent of secondary education. Remembered especially as the friend and interpreter of Carducci, Chiarini lives in his own right as author of nearly 200 critical studies on Italian literature of the nineteenth century, as a translator of Heine, and as the author of a volume of poems, *Lacrymæ*. Consult D'Ancona, in *Rassegna bibliografica* (1908).

CHIAROSCURO (CHIARO-OSCURO), kyä'rô-skōō'rô (It., light and dark, from Lat. *clarus*, clear + *obscurus*, obscure). Arrangement of light and shade in a work of art—a most important matter, for without light and shade the sense of projection, rotundity, and corporeity cannot exist. But chiaroscuro is more than that element which gives volume to an object or group of objects; it is at its best that pervading sense of light which merges into shadow still carrying the qualities of light and color with it, so that the whole object may be homogeneous in color. Painters often fail to produce this effect, and the color of an object, after merging into shadow, loses in some hands, in the shadowed portion, the quality that rightly belongs to it. The first great master of chiaroscuro in Italian painting was Leonardo da Vinci, and it was the chief characteristic of the art of his pupils. It was developed to the highest extent by Correggio, the chief effect of whose paintings depends upon this quality, which he mastered with consummate skill. Among the Germans it was practiced especially by Grünewald. Chiaroscuro was the most salient technical characteristic of Dutch painting, and its greatest master of all times was Rembrandt, into whose very depths of shadow we may look and still feel a sense of light reaching thither. Consult the bibliography of Color.

CHIASMA, kī-ăz'mȧ, or **CHIASM.** An X-shaped decussation of nerve trunks. The term refers especially to the *optic chiasm*, where the optic nerves meet and cross at the base of the brain. See Decussation.

CHIASMUS, kī-ăz′mŭs. See SYNTAX, FIGURES OF.

CHIASTOLITE, kī-ăs′tō-līt (from Gk. χιαστός, *chiastos*, diagonal, from χιάζειν, *chiazein*, to yawn, from χί, *chi*, name of the twenty-second letter of the Greek alphabet + λίθος, *lithos*, stone). A dark-colored variety of andalusite, consisting of stout crystals which, owing to a regular arrangement of carbonaceous impurities through the interior, show in cross section a colored cross, square, or tesselated figure. This mineral is found in Andalusia, Spain, in Tirol, in Saxony, in Austria, and elsewhere in Europe, where it is frequently sold as a gem and, owing to the crosslike appearance, is prized, especially among the lower classes. In the United States the best chiastolites are found in Lancaster and Westford, Mass., and especially in Mariposa Co., Cal.

CHIAVARI, kyä′vä-rē. A maritime city in the Province of Genoa, Italy, 24 miles east-southeast of Genoa (Map: Italy, D 3). Numerous old towers, one of them of considerable size, are scattered through the town, which has a city hall, statues of Garibaldi and Mazzini, by Rivalta, attractive public gardens, good bathing, a technical and nautical school, and a gymnasium. It is a market for wine, oil, cheese, and fish, and manufactures lace, silk, and furniture, particularly the slender chairs called *sedi di Chiavari*. Chiavari is a starting point for the ascent of Mount Penna; altitude, 5690 feet. Pop., 1901, 12,500; 1911, 13,700.

CHIAVENNA, kyä-vĕn′nä (Lat. *Clavenna*, probably from *clavis*, key). A town in the Province of Sondrio, north Italy, picturesquely situated north of Lake Como, on the Mera, at the mouth of the Bregaglia valley, through which passes the road to the Engadine (Map: Italy, D 1). The beautiful church of San Lorenzo has a campanile rising from an arcaded inclosure. Interesting, also, are the ruins of an unfinished castle, and the Giants' Kettles (*marmitte dei giganti*), in the Capiola valley. The chief trade is in fruit and wine, and the manufactures include silk, cotton, beer, and a coarse ware cut out of a soft stone found in the neighborhood. The situation made the ancient Clavenna one of the most important keys to the Alps. Pop., 1901, 4788; 1911, 4547.

CHIBA, chē′bä. A prefectural town of Japan, situated on the coast, about 17 miles by rail from Tokio (Map: Japan, G 6). It yields large quantities of marine products. Pop., 1898, 26,223.

CHIB′CHA, or MUYSCA. An important nation or confederacy centring, at the time of the Spanish Conquest, on the upper Magdalena River, about Bogotá, Colombia, their language being the general trade language throughout the whole mountain region of that country. Detached tribes of the same stock were found along the isthmus, and in Costa Rica. The chief tribes of the Chibchan stock were: in Colombia, the Chibchas or Muyeas of the region of Bogotá, the Aruacs of Santa Marta, the Tunebos, east of Bogotá; in the Isthmian region and Costa Rica, the Guaymis, Doraskeans, Talamancans, Guetares, and Guatusos. To these Rivet would add the tongues hitherto classed in three other separate stocks, viz., Barbacoan, Paniquitan, Coconucan. In culture the Chibchas ranked close to the Quichuas, practicing agriculture by the aid of an extensive system of irrigation, weaving cotton cloth, and working gold with a high degree of skill, although ignorant of the use of copper and bronze. They offered heroic resistance to the Spaniards, but were finally subdued and well-nigh exterminated, only a few remnants still surviving in their native mountains. Consult: Restrepo, *Las Chibchas antes de la conquista española* (Bogotá, 1896); Benchat and Rivet, *Affinitiés des langues du sud de la Colombie et du nord de l'équateur* (Louvain, 1910), and works therein cited. Consult also Thomas and Swanton, *Indian Languages of Mexico and Central America* (Washington, 1911), and Rivet, *Antiquités de l'équateur* (Paris, 1913).

CHIBOUQUE, or **CHIBOUK**, chī-bōōk′ (Turk. *chibuq*, small stick, tube of the pipe). A tobacco pipe used in Turkey and Egypt, having a long wooden stem, often of valuable material, a mouthpiece of glass or amber, and a bowl of baked clay.

CHIC, shēk (Fr., familiar abbreviation of Fr. *chicane*. In the expression *de chic à chic*, 'little by little,' used in France in the sixteenth century; *chic* is the Sp. *chico*). A colloquial term used in painting to express the art of giving efficiency in the most dexterous manner possible, with ability and adroitness closely united. The word is also employed in connection with fashion; and, in this sense, means style, manner, grace, and 'go.' See PSCHUTT.

CHICA, chē′kȧ (So. Amer.). A dyestuff, which gives an orange-red color to cotton. It is obtained by boiling the leaves of a species of *Bignonia* (*Bignonia chica*, Humb.), a native of the banks of the Cassiquiare and the Orinoco. The Indians use it for painting their bodies.

CHICA, chē′kȧ (So. Amer. Indian), PITO, POSO, or MAIZE BEER. A fermented liquor made from maize or Indian corn. It is much used in some parts of South America. See BEER.

CHICA (Sp., fem. of *chico*, small, from Lat. *ciccus*, trifle). A lively dance, popular in Spain and in South America as well; possibly of Moorish origin.

CHICAGO, shī-kȧ′gō. The county seat of Cook Co., Ill., the second city in population and importance of the United States, and the railroad centre and commercial metropolis of the West (Map: Illinois, E 2). It is situated on the southwest shore of Lake Michigan, at the mouths of the Chicago and Calumet rivers, in lat. 41° 53′ 6″ N., long. 87° 38′ 1″ W.; distant 2274 miles from San Francisco, 911 from New York, 790 from Washington, and 915 from New Orleans.

Description. The city, one of the few great metropolises of the world built directly on a lake front, extends along Lake Michigan for 24 miles, occupying, on a remarkably level site, an area of 191.3 square miles, at an average elevation over the larger part of about 15 feet above the level of the lake, which is 582 feet above sea level. Within the municipal limits are several bodies of water—Calumet, Hyde, and Wolf lakes. The largest of these is Calumet Lake, Wolf Lake lying partly in the State of Indiana, the boundary of which adjoins the city limits for some 4½ miles. Chicago was originally built on a flat prairie, which was but slightly elevated above the level of the lake, and which was characterized by sand and swamp; but the grade of a large portion was raised about 10 feet in the years from 1855 to 1860. Many buildings were lifted to the newly established grade during this period, an entire

business block on one occasion in a single operation. Foundations of buildings in earlier days rested on the blue clay underlying the surface layers of soil and gravel, but in the later era of tall and heavy structures it has become necessary to sink shafts filled with concrete down to bed rock, 75 to 110 feet below the surface. Upon the columns thus prepared a firm footing is provided for the superstructure.

Nature made of the lake shore a broad beach of sand and gravel, back of which there was formerly a line of sand dunes. These sand dunes, which are characteristic of the shores of Lake Michigan, extend for hundreds of miles towards the south and east, but have long since disappeared within the city limits in the course of the city's building. The city's lake front is protected south from Twelfth Street by the Illinois Central Railroad, and north from Twelfth Street to Chicago Avenue by the Government Pier, which protects the harbor. North from Chicago Avenue the Lake Shore Drive and Lincoln Park are secured by a massive sea wall. Chicago is situated upon both sides of the Chicago River (q.v.), which, at a point little more than one mile from its mouth, is formed by the junction of two streams or branches, one flowing from the northwest and the other from the southwest. The river and branches divide the city into three natural parts, legally known as the South, West, and North divisions. The South Division includes all the territory south of the main river, and the North Division the area north of the river; while the West Division comprises all that part of the city west of the two branches. These sections are connected by 66 bridges, 47 of which are movable. Of the latter, 24 are of the bascule type, i.e., having one or two leaves opening upward; one a vertical lift bridge, i.e., lifted bodily upward; and 22 are swing bridges. The bridges of all the various types are mostly operated by electricity, though some of the older swinging bridges are operated by hand power.

Notwithstanding the fact that Chicago stands on a plain of nearly 200 square miles in extent, it is remarkable that the earth beneath it and below the adjoining waters of the lake and river is honeycombed with a vast network of tunnels. These tunnels are designed for various purposes—some to convey drinking water from the lake, some to afford passage for freight between depots and large establishments, and some for street-car traffic under the river connecting the different divisions of the city. There are also minor tunnels and conduits for the use of the telegraph and telephone companies. The people of Chicago have become the greatest tunnel builders, perhaps, of any community on the face of the earth, and the completion of a new tunnel for any purpose occurs so often that it awakens scarcely a passing comment. There are seven tunnels connecting with cribs, 2 to 4 miles in the lake, delivering about 550,000,000 gallons of water per day to the inhabitants of the city, besides land tunnels connecting these to distant sections many miles to the west, north, and south. Far below the surface, low lying as it is, there are flowing rivers of water conducted through these tunnels, the volume of which is almost beyond comprehension, rivaling, indeed, if not surpassing, in their extent and capacity the aqueducts and conduits of ancient Rome. Three tunnels for the use of street cars pass under the river—one under the main river and two under the south branch; and an intricate system of tunnels, 30 feet below the surface, is in use by the Illinois Tunnel Company, devoted mainly to the carrying of heavy merchandise, thus relieving the streets from congestion to a large extent. These tunnels, with an aggregate length of some 60 miles, are also used largely for the conveyance of wires and cables.

Grade crossings of the steam railroads are obviated by numerous bridges, viaducts, and by track elevation—the city containing more than twice as many miles of elevated tracks as are to be found in the combined mileage of all other cities in the United States. There are about 150 miles of the roadbeds of the different railroads entering the city which have been elevated to an average height of 13½ feet above the level of the streets, at an expense to the railroad companies of upward of $70,000,000. The street-railroad system, comprising electric and elevated roads, operates over 1300 miles of track. There are four elevated roads, having six terminal stations. There is a loop in the business centre, with stations two or three blocks apart, around which trains may pass, although in recent practice they follow a continuous route between the outlying terminals of their respective systems. Thus, for a single fare of five cents, it is possible to travel approximately 25 miles on these lines. The street-car systems, both surface and elevated, have paid the city 55 per cent of their net profits since 1907, when the new franchise was adopted, resulting in the addition to the municipal treasury, up to the end of the year 1913, of upward of $10,000,000. These lines connect all parts of the city and suburbs and are extremely efficient, the system probably being the best in the country. The various steam railroads, which have over 1500 miles of track within the city limits, offer additional transportation facilities; and a belt line, encircling the city on three sides, affords intercommunication between the many lines and serves to unify the entire system.

The business centre is found largely in the South Division and extends from the river south to Twelfth Street. It contains the passenger stations of several railroads, administration buildings, hotels, banks, commercial houses, Board of Trade, theatres, the newspapers, and the "skyscrapers," which have made of the Chicago office buildings an architectural type. State, Clark, Dearborn, La Salle, Market, and Madison streets and Fifth and Wabash avenues are typical business streets, Adams and Market streets being prominent centres of the wholesale dry-goods interests and State Street the centre of the retail trade. In Chicago there has been a noteworthy development of the department store, establishments here ranking among the largest and most complete in the United States. Manufacturing establishments are found in various parts of the city, while the great live-stock and packing industry centres in the famous Union Stock Yards, 475 acres in extent, some 5 miles southwest of the City Hall. On the waterways, among the objects of particular interest are the great grain elevators, of which there are 30 or more. The produce markets, South Water Street throughout its whole length of a mile, and Haymarket Square on the west side, present scenes of great animation in the early hours of the day.

The streets, with few exceptions, cross at right angles and are generally wide, some of the boulevards being 120 feet in width. Some of the long thoroughfares, notably Western Avenue and Halsted Street, nearly equal the length of the city. There are over 4000 miles of streets and alleys, over 1400 of which are paved, principally with wooden blocks, macadam, and asphalt, the mileage of the last-named material having increased rapidly in the last few years. Most of the main avenues are parallel with the lake. Of these, the Lake Shore Drive, Michigan, Drexel, and Grand boulevards, Prairie and Calumet avenues, Lincoln Parkway, Rush and Cass streets, and La Salle Avenue, with Washington and Jackson boulevards running east and west, are conspicuous representatives of Chicago's more attractive residence avenues.

Detached houses mark the purely residence districts, which, together with the more recently acquired suburban areas where rural conditions to some extent still prevail, and the magnificent parks and boulevards of the public-park system, are noticeable in contrast with the congested business area, with its noise, dust, and smoke, and numerous tall office buildings. Of these varying mammoth structures, the tallest reaches 22 stories in height, and the largest has a capacity of 6000 tenants. They are constructed of a structural steel frame with an exterior shell of masonry, generally of granite, limestone, or terra cotta. For some time a municipal ordinance limited the height of buildings to 150 feet, but this restriction was removed in 1902. Under a building ordinance, passed in February, 1911, the limit of height is established at 200 feet.

Buildings. In the centre of the business quarter, and covering an entire square, is the Courthouse and City Hall—a magnificent twin building of limestone, with fine granite columns, in a free rendering of French Renaissance, erected at a cost of $10,000,000, i.e., $5,000,000 for each of the structures. The east half is used for county purposes and the west half by the city. On La Salle Street, running south from the City Hall, are some of the finest office buildings. The Chamber of Commerce building, one of the finest commercial structures in the city, costing more than $1,000,000, is 14 stories high, with a great central court roofed by an immense skylight and a richly furnished interior. The Temple, of French-Gothic architecture, 13 stories high, consists of two great wings united by a narrow vinculum, forming interior courts which admit light and air. The first two stories are faced with red granite, the rest with red brick; and near the Monroe Street entrance is the "Willard Fountain," adorned with a bronze figure. The Rookery, a Romanesque building of granite, brick, and terra cotta, contains 600 offices. The Board of Trade, at the foot of La Salle Street, is a massive granite building. Other large structures on La Salle Street are the Tacoma, the Association, New York Life, the Northern Trust, the Otis, the Corn Exchange Bank, the Continental and Commercial Bank, the Borland, the Home Insurance buildings, and the Illinois Trust and Savings Bank, the latter one of the finest edifices in the city.

The Federal Building, 16 stories high, covers an entire block, 321 by 396 feet, bounded by Adams, Jackson, Dearborn, and Clark streets. The structure is of granite and steel and is surmounted by a great dome, 297 feet in height, the interior of which rises 139 feet from the floor to the "eye." The original appropriation for the building was $4,000,000, and, in 1903, $750,000 additional was voted by Congress to finish the interior.

In this vicinity are four great buildings, 16 stories high: the Great Northern Hotel and Theatre, the Monon, the Manhattan, and the Monadnock, costing $3,000,000, constructed of steel and finished in granite and marble. Next to the last is the Union League Club, one of the most handsomely appointed clubhouses in Chicago. West of the Federal Building, on Adams Street, is the wholesale establishment of Marshall Field and Company, designed by the eminent Boston architect, Henry H. Richardson—of note as a more attractive type of the commercial building wherein purely commercial utility is not preëminent. At the corner of Monroe and Dearborn streets is the First National Bank, containing one of the largest banking rooms in the world. Dearborn Street is the site of many tall structures, among which the Unity, Hartford, Marquette, Old Colony, Fisher, and Transportation buildings are prominent. Situated on one of the most busy corners in the heart of Chicago is the 17-story building of the Chicago *Tribune*, one of the best examples of the growth of the æsthetic in Chicago. It is in the Italian style, being attractively built of Bedford stone, gray pressed brick, and terra-cotta trimmings. The corridors are floored in mosaics with marble wainscoting. The woodwork is in mahogany throughout, and the floors of the office portions of the building are of polished oak. On State Street is the Spanish Renaissance Columbus Building, completed in 1893, at a cost of $800,000. It is 14 stories high, with a tower 240 feet high, tipped with a globe of opalescent glass, lighted by a powerful electric light. Over the entrance is a bronze statue of Columbus, and in the interior are two glass mosaics depicting scenes in his life. The retail house of Marshall Field and Company, on State, Washington, and Randolph streets and Wabash Avenue, represents the climax of Chicago's great commercial buildings. The entire block, situated as above described, is occupied with this structure, besides a 20-story building on the south side of Washington Street opposite the main building and connected with it by a subway. This gives a total floor space for store purposes of about 44 acres, an area far in excess of any other store building in the world. The buildings are supported by foundations of concrete columns resting on bed rock 110 feet below the surface. On one corner of Randolph Street is the Masonic Temple, the highest building in the city except the tower of the Montgomery Ward Building, mentioned below. Other structures of interest are the Fair, a building 190 by 350 feet and 180 feet high, with a floor space of 677,500 square feet; the building of Siegel, Cooper, and Company, which affords 542,700 square feet floor space; the Title and Trust Company Building, 16 stories high, which contains offices occupied mainly by lawyers; the Venetian and Reliance buildings, the latter occupied almost entirely by physicians, the Merchants' Loan and Trust Company Building, a 12-story structure of granite, finished in mahogany and marble; the publishing house of A. C. McClurg and Company; the Kimball Hall Building, a musical centre with 200 studios, a music hall, and two recital halls;

the Schiller Building, containing the Garrick Theatre and halls, clubrooms, and offices; the Ashland Block; the Insurance Exchange; the Harris Trust Building; and the building of the Central Trust Company, four stories in height, at the front of which are placed four huge Corinthian columns, rising 50 feet from sidewalk to architrave.

On Michigan Avenue and Congress Street is the Auditorium, built at a cost of $3,500,000, of granite and brick, 10 stories high, and extending, on the longest front, 360 feet. It contains a large hotel facing the lake, and a beautiful theatre. The tower commands a magnificent view from its height of 270 feet. The main entrance, on Congress Street, leads through a beautiful court, splendidly decorated and with an elaborate mosaic floor, to the grand staircase of marble and bronze. The theatre, which seats 3700 persons, is luxuriously furnished and decorated with attractive mural paintings. The Fine Arts Building, Michigan Boulevard, is a centre of artistic, literary, and educational interests. It contains three auditoriums—Studebaker Hall, with a seating capacity of 1330; University Hall, with 703 seats; and an assembly room. North of it is the splendid Romanesque Chicago Club House, and farther north the building erected, and for many years owned and occupied for business purposes, by the late A. Montgomery Ward, with a tower which rises above its roof to a height of 394 feet, the highest point in the city. Upon its summit is the bronze figure of a goddess, 22½ feet high and weighing 2500 pounds, made to revolve freely on a ball-bearing shaft and serving the purpose of a weather vane. Opposite the end of Adams Street, fronting on Michigan Boulevard, is the Art Institute, the only structure that is permitted to occupy space in Grant Park. It has a frontage of 320 feet, is built of Bedford limestone, and is fireproof. The style is Italian Renaissance, the details classic. The institution, dating from 1866, was known previous to 1882 as the Chicago Academy of Design. It contains a library and lecture hall and collections of great value, some of which are loaned, including paintings, sculptures (both originals and reproductions), textiles, and antiquities. Adjoining the institute, overlooking the park towards the south, is the "Great Lakes Fountain" by Lorado Taft, completed in 1913. It consists of five figures, each representing one of the Great Lakes and holding a vase from which descends a stream of water into the basin below. Connected with the institute is a school of art instruction. The average annual attendance of visitors for some years has been upward of 700,000. On the opposite side of the avenue, to the north, is the magnificent structure of the Chicago Public Library, built in 1893–97. It is a successful rendering of the classic type of architecture and cost $2,125,000. The interior is enriched with Siena and Carrara marble, with 10,000 square feet of glass mosaic, and with beautiful frescoes and inscriptions. The library contained in May, 1913, 514,000 volumes, though it can provide for a much greater number. There are 17 branches located in different parts of the city, two of which are housed in splendid buildings. One is the Blackstone Library, the other the Hiram Kelly Library, both being gifts to the city. The delivery room of the main library is 134 by 48 feet in size. In 1912 the library circulated 2,250,000 volumes. The annual expense of maintenance is about $850,000. The building contains also a large G. A. R. Memorial Hall.

On the North Side, fronting on Washington Square, is the Newberry Library, an imposing structure of steel and granite, completed in 1893. In it are contained 350,000 volumes, none of which are taken from the building. It has a priceless collection of ancient manuscripts, of music and musical literature, and its department of genealogy is the most extensive in the West. Other institutions of allied character, which have noteworthy buildings, are the Chicago Historical Society, in a stone edifice at Ontario and North Dearborn streets—the repository of a fine collection of paintings and interesting historical relics and of a valuable library; and the Chicago Academy of Sciences in Lincoln Park. The University of Chicago (see CHICAGO, UNIVERSITY OF) occupies 95 acres, bordering the Midway Plaisance between Jackson and Washington parks. The Harper Library, connected with this institution, contains about 600,000 volumes and pamphlets. The structures of the university are English Gothic in style, uniformly built of dark limestone. Other notable buildings are the Union, the Chicago and Northwestern, Dearborn, and the Grand Central Railroad stations; and among ecclesiastical edifices are the cathedral of the Holy Name (Roman Catholic), the cathedral of St. Peter and St. Paul (Protestant Episcopal), First Church of Christ (Christian Science), and the Second Presbyterian Church.

Parks. Chicago has a splendid system of public parks, covering over 4600 acres and connected by wide, level boulevards which have aided materially in making the greater Chicago an organic whole. There are about 40 parks, of which seven are of considerable extent. There are, in addition, numerous attractive playgrounds to meet the needs of great masses of children who were without convenient access to the parks. The principal parks are maintained by State funds, and are controlled by a Board of Commissioners for each division of the city, appointed by the Governor; the smaller areas are under municipal control. In the city there is a system of boulevards, aggregating in length a total of 70 miles. These include the well-known Lake Shore Drive, Sheridan Road, Diversey Avenue, and Ridge Avenue boulevards in the North Division; Humboldt, Washington, and Jackson boulevards in the West Division; Michigan Avenue, Grand, Drexel, and Garfield boulevards in the South Division. The North Side park system centres in Lincoln Park (320 acres), one of the most beautiful in the city, with attractions in the way of a zoölogical collection, conservatories, and gardens. It has also statues of Lincoln and Grant (among the most notable of the city), of Linnæus, Schiller, and La Salle, and the Ottawa Indian monuments. Of the South Side parks, Grant Park (210 acres), adjoining the business section on the east, is noteworthy, being on ground mostly reclaimed from the lake. It contains the Art Institute, the spirited equestrian statue of Logan by Saint-Gaudens, and the Rosenberg Fountain. Jackson Park (542 acres) has a world-wide reputation, having been the spacious site of the World's Columbian Exposition (q.v.), of which a few features remain, the most important being the Field Museum of Natural History. It was the Fine Arts Building of the

Exposition, has a library and scientific collections, and is endowed with $4,000,000. The famous Midway Plaisance, a mile long and 660 feet wide, leads from Jackson Park past the buildings of the University of Chicago to Washington Park (371 acres), noteworthy for its trees and flowers. Other parks on the South Side are Marquette Park (322 acres), McKinley Park (75 acres), in which is placed a statue of William McKinley, and a number of smaller parks and playgrounds. The total area of the South Park system is 2495 acres. The West Side Division has a total park area of 1218 acres, including Douglas Park (179 acres), Garfield Park (185 acres), and Humboldt Park (200 acres), all of which contain lakes and special features. In the last-named park is located a fine monument to Humboldt. The distribution of smaller parks and squares throughout the city adds to the effectiveness of the system.

Other notable monuments of the city are the mausoleum and statue of Stephen A. Douglas in Douglas Monument Square; the Police Monument in Union Square, commemorating the victims of the Haymarket riot of 1886; and the Confederate Monument in Oakwoods Cemetery. At the end of Michigan Avenue a tablet marks the site of Fort Dearborn. Through a bequest of $1,000,000 made by Benjamin F. Ferguson in 1905, provision was made for the "erection and maintenance of enduring statuary and monuments" in the city of Chicago. The income only of this fund is to be used; it is administered by the trustees of the Art Institute. There are several cemeteries within the city limits. Of these, Graceland and Rosehill, in the North Division, are worthy of particular mention for beauty of situation.

Educational Institutions. The Chicago Board of Education consists of 21 members, appointed by the mayor for a term of three years, seven being appointed each year. They are free from municipal control, except that matters relating to purchase of buildings and sites and erection of buildings, etc., require the approval of the City Council.

In 1847 there were four schoolhouses in Chicago, built at a cost of $5000 each. In 1913 there were 21 public high schools and 264 elementary schools, besides a normal school, a school for juvenile printers in the House of Correction, a parental school for truants, a school for apprentices, and special classes for the deaf, blind, crippled, and mentally dull children. Manual training is taught in a majority of the graded schools. Evening schools are conducted for five months during the year and day schools for 10 months. The course of elementary instruction includes instruction in nature study and household arts, manual training, music, drawing, and physical culture. The enrollment of pupils in the public day schools for 1913 was 315,737, with 7013 teachers in charge. The enrollment in the evening schools was 26,000, and in private schools over 100,000. There are about 300 school buildings in use. The total expenditure for annual maintenance is approximately $8,000,000.

The higher educational institutions are the University of Chicago (q.v.); St. Ignatius College, Loyola University (Roman Catholic); the Northwestern University (Methodist Episcopal), at Evanston, whose professional schools, excepting the Garrett Biblical Institute, are in Chicago. The schools of theology in the city include: Chicago Theological Seminary (Cong.); McCormick Theological Seminary (Presb.); Theological Seminary of the Evangelical Lutheran Church; Western Theological Seminary (P. E.). There are several medical schools, the most prominent of which are the College of Physicians and Surgeons, the Rush, the Hahnemann, and the Bennett; several schools of law; also dental colleges, colleges of pharmacy, training schools for nurses, and a veterinary college, art schools, and schools of music. In the educational work of the city a prominent place is occupied by the Art Institute, the numerous classes of which are as free as practicable and are attended by 2500 or more students. Its Art School, which is self-supporting, offers one of the most complete courses in America; besides the usual branches of art, perspective and mechanical drawing, ceramics, and the modeling of ornament are taught by a large staff of professors. There are a year's traveling scholarship in the department of drawing and painting, and two annual scholarships for women. The library and gallery of the museum, as well as the lectures, are open to all students. The fee is from $5 to $25 for a term of 12 weeks. The Armour Institute of Technology, similar in scope to the Pratt and Drexel institutes, has been enlarged since its inception in 1893 to include, besides manual and technical training, various courses in engineering, architecture, and science, leading to the degree of B.S. The Lewis Institute, opened in 1896, is an institution for the practical training of young men and women. The Chicago Athenæum is a private philanthropic institution, maintaining daily and nightly sessions for a considerable part of the year, to which students are admitted at any time on payment of a nominal tuition fee. It has also a library and reading room.

Libraries. Chicago has three great libraries, besides that of the University of Chicago. The Public Library, founded in 1872, contains 514,000 volumes and maintains over 100 delivery stations at various points in the city, including the 17 branch libraries previously mentioned. The Newberry Library is a reference library, containing notably fine collections on music, genealogy, and religion. The John Crerar Library, which occupies temporary quarters until its permanent home shall be erected in the South Division, is endowed with $2,500,000 and has valuable works on natural, physical, and social science. It contains about 350,000 volumes and is solely a reference library. Accessions to these libraries are made with reference to the other book collections in the city, thus affording opportunity for a wide range of study. The library of the Chicago Law Institute is large and valuable, and the Chicago Historical Society has a fine collection of Americana. There are also the libraries of the several educational institutions and of the Chicago Academy of Sciences and the Field Museum of Natural History.

Charitable Institutions. The city contains a great number of hospitals—the largest being the Cook County Hospital; the Presbyterian; the United States Marine Hospital; St. Luke's; St. Joseph's; the Michael Reese; Mercy; Iroquois Emergency (erected in memory of the great theatre disaster Dec. 30, 1903); the Augustana Hospitals; and the Hospital of the Alexian Brothers. There are many dispensaries, asy-

lums, and homes, day nurseries, reformatories, and relief societies. One of the most interesting institutions is the Armour Mission (nonsectarian), the object of which is industrial, mental, and religious training. It is maintained as a memorial to Mr. Joseph Armour. The oldest and most influential of the social settlements of the city is Hull House, modeled after Toynbee Hall, London, and situated in the slum and Ghetto district on the West Side. Next in order of importance are Chicago Commons, also on the West Side; Northwestern University settlement, in the northwestern section of the city; and the University of Chicago settlement, in the stockyards district. These settlements are contiguous to or are surrounded by foreign colonies. The Chicago Bureau of Justice employs legal talent in aiding the poor to recover just wage claims. The Bureau of Associated Charities carries on a worthy work by means of its summer camps and outings; and the Chicago Charity Organization Society, made up of representatives from the various allied organizations, exercises to some extent a centralized power by virtue of its general supervision.

Theatres, Clubs, Hotels. There are numerous first-class theatres and places of amusement in Chicago. Among the leading playhouses are the Blackstone, Illinois, McVicker's, Majestic, Powers', Colonial, Garrick, Cort, Studebaker, Grand Opera House, and Palace.

Among the leading clubs the following may be mentioned: the Chicago, Chicago Athletic, Illinois, Illinois Athletic, City, Hamilton, Chicago Yacht, Commercial, University, Cliff Dwellers, Iroquois, Standard, Union League, the Chicago Woman's Club, and the Woman's Athletic Club. The Chicago, Chicago Athletic, Illinois Athletic, Union League, Hamilton, City, and University clubs have handsome and well-appointed clubhouses.

Chicago is known as a great convention city. Its hotel accommodations, which were increased considerably for the World's Fair, are very extensive. Among the most prominent hotels are the Auditorium, the Great Northern, Metropole, Palmer House, Grand Pacific, Wellington, Lexington, Victoria, Virginia, La Salle, Blackstone, Morrison, Transit, Chicago Beach, Windermere, Briggs, Majestic, New Brevoort, Stratford, Congress, and the Sherman House.

Newspapers and Periodicals. The newspaper and periodical press of Chicago occupies a high position in the publishing interests of the country, both in the number of its issues and the widespread influence exercised by its conductors. There were upwards of 700 newspapers and periodicals published in Chicago in 1914. More than a quarter of the whole number are devoted to the interests of trades and industries; altogether they cover a broad field of news and knowledge. A large proportion of the weeklies and monthlies, and about half of the dailies, are printed in foreign languages. There were in 1914 about 40 dailies, the leading ones being as follows: the *Tribune*, with a daily circulation of 261,000 and a Sunday circulation of 406,000; the *American*, daily 409,000; the *Daily News*, daily 346,000; the *Examiner*, daily 204,000, Sunday 503,000; the *Record-Herald* (later the Chicago *Herald* after consolidation with the *Inter-Ocean*), daily 173,000, Sunday 218,000; the *Evening Journal*, daily 137,000; the *Evening Post*, daily 65,000; the *Socialist*, daily 61,000; the *Farmers' and Drovers' Journal*, daily 50,000; and the *Jewish Courier*, daily (except Saturday) 30,000, Sunday 33,000. The leading dailies printed in foreign languages are: the *Staats Zeitung*, daily 40,000, weekly 30,000; the *Abendpost*, daily 47,000; the *Freie Presse*, daily 42,000; the *Skandinaven*, daily 25,000, Sunday and semi-weekly 70,000; the *Abend Presse*, daily 22,000; and the *Polish News*, daily 15,000. The journal enjoying the largest circulation was the *Woman's World*, a monthly, with 2,095,000 subscribers.

Commerce and Industry. The secret of Chicago's rapid development is found in its commanding position relative to an extensive and phenomenally productive region. Situated near the south end of Lake Michigan, the city enjoys the navigable facilities of the Great Lakes, while the railways crossing the country from the East to the Northwest and the West generally and naturally touch here. The Southern lines, connecting with the Great Lakes, also find it a natural terminal point. Chicago, the greatest railway centre of the United States, is therefore of first importance as a collecting and distributing centre. Of the 1400 trains entering the city not one passes through it; Chicago is the absolute terminal of every railroad train that enters it. The numerous railways converging in and tributary to the city operate 120,000 miles of line, one-half of the total mileage of the United States. These connections reach every State of the Union, also Canada and Mexico. The railways are supplemented, too, by lake navigation. Lines of steamers for the conveyance of passengers and freight connect with all the ports of the five Great Lakes. The number of vessels arriving at Chicago in 1912 was 5751, carrying about 8,500,000 tons of freight, of which about 55 per cent was iron ore from Lake Superior for the great steel mills in the southern part of the city. The clearances represented about the same amount of tonnage, consisting for the most part of wheat, corn, oats, and oil. The number of vessels arriving and clearing from the port of Chicago has greatly diminished in the period which has elapsed since 1890, though the tonnage has greatly increased. This is owing to the larger size of the lake craft employed in the carrying trade at the present day, many of the great "freighters" exceeding 600 feet in length. As long ago as 1870 nearly 13,000 lake vessels arrived and about the same number cleared in that year, but the tonnage, both coming and going, was only about one-third of the tonnage for 1912. The wharves along the banks of the Chicago River present a deserted appearance as compared with their aspect when throngs of smaller craft frequented the port a generation ago. In former years the shipping interests at Chicago greatly desired to engage in direct foreign commerce. A steamer with a cargo of wheat was dispatched to Liverpool in 1856, but the venture did not prove profitable, and no attempts have since been made to continue the practice. In the course of the few years following the voyage above referred to, three sailing vessels arrived from European ports at different times, but while great enthusiasm was aroused when they came, in no case were their visits repeated, and the dream of the people, that an ocean and lake commerce in unbroken shipments would be established, has entirely faded away.

The port of Chicago owes much to the presence of rivers. The mouth of the Chicago River, formerly a sluggish bayou, has been deepened by piers that extend into the lake, leaving an

CHICAGO

THE ART INSTITUTE (UPPER)
THE PUBLIC LIBRARY (LOWER)

entrance way about 500 feet wide; while long breakwaters on the east and far to the north and south, constructed by the United States government, form an outer harbor with an average depth of 21 feet and an area which is constantly varying as the extensive filling operations proceed along the city front. Additional protection to vessels is given by an exterior breakwater, which extends in a northeasterly direction about a mile from the river's mouth. In South Chicago, at the northern mouth of Calumet River, is another harbor, 300 feet wide between piers. The Illinois and Michigan Canal, constructed in 1836–48, connecting the Chicago River with the Mississippi and its affluents, extends to La Salle, the head of navigation on the Illinois. It is 96 miles in length, and its cost was $6,469,000, while its total earnings during the period of its usefulness were slightly in excess of that sum. The canal has now been practically abandoned, but during its construction period and for many years thereafter it was a large factor in the development of the city's commercial prosperity.

The largest part of the foreign exports consists of grain (wheat, corn, and oats) and packing-house products, though it is all transshipped at the seaboard for ocean passage. The largest lake import is lumber. For over 40 years the annual imports of lumber have exceeded 1,000,000,000 feet, and in the year 1913 they reached a total of 2,700,000,000 feet. About two-fifths of this import has been, in turn, shipped to other points. The imports of grain in 1912 amounted to 322,000,000 bushels (including 8,100,000 barrels of flour reduced to wheat bushels), while the exports reached a total of 244,000,000. Imports and exports of barley have fluctuated widely in recent years, the receipts in 1912 being 20,000,000 bushels (they were 29,000,000 in 1909), and the shipments only 3,500,000, thus showing a large local consumption. For the decade ending with 1912 the annual importation of hogs averaged over 7,500,000 head, and of cattle over 3,000,000. There has been recently a large increase in the importation of butter and dairy products—the imports of butter for 1912 being about 288,000,000 pounds.

According to the census of 1910 the manufactured products in the previous year reached a total value of $1,281,171,000, and there were 293,977 wage earners employed, an increase of about 33 per cent during the decade. A large percentage of the live stock received in Chicago is slaughtered and packed there, the total value of cattle, hogs, and sheep received in 1909 amounting to $358,493,000. For two decades the average number of hogs packed annually has been about 6,000,000 head. This is about one-fifth of the total number packed in the West during that period. Over 32,000 men are employed in the industry. Every part of the slaughtered animal is utilized, the value of the more important by-products, such as soap and tallow, alone amounting to $25,000,000. Leather tanning reaches a total of over $13,000,000.

The convenient location of Chicago with respect to the coal fields of Illinois and the iron-ore regions of Lake Superior is naturally utilized. The iron and steel products in 1909 reached a value of $46,000,000, while the foundry products amounted to $90,000,000. Chicago is a centre for the manufacture of harvesting machines. The capital employed in the agricultural-implement industry in 1909 was $140,000,000, under the control of one corporation, the International Harvester Company. There are extensive manufactures of lumber, the value of the manufactures of furniture being placed at $20,512,000, and the lumber and planing mills products at $32,709,000. The railway products, principally cars for steam and electric railways, amounted in value to $39,000,000. Chicago is the leading clothing manufacturing centre of the West, the total product in 1909 exceeding $85,000,000 for men's clothing and $15,600,000 for women's. A like position is held in the printing and publishing business, this output in 1909 being given at over $74,000,000. There is also a long list of other important manufactures, among which may be mentioned bakery products, value $27,000,000; electrical machinery, $20,600,000; coffees and spices, $19,600,000; paints, $19,000,000; sheet iron and copper, $12,200,000; pianos and organs, $11,500,000; confectionery, $11,000,000; and patent medicines, $10,000,000.

Government. Chicago is governed by a general Act of the Legislature passed in 1875, and by such subsequent acts as have in some measure modified the original act. The council is unicameral, with 70 elected members, there being two from each of the 35 wards. An elected mayor presides at the meetings of the council, and has a vote in case of a tie. Some of the powers vested in the council have been delegated by it to special departments, e.g., the police department. These departments are in the hands of single commissioners, who are appointed by the mayor, and whose terms of office expire with the term of the mayor (four years). The mayor is further fortified with the power to remove these commissioners, but such act may be disapproved by a two-thirds vote of the council. The legislative function of the school department is intrusted to a board of education of 21 members, appointed by the mayor and confirmed by the council. The members are appointed for two years and serve without pay. Civil-service methods prevail in the administration of city affairs, the regulations being made by the State Civil-Service Commission. Owing to prohibitive legislation, the township and county governments still exist. Township officers are elected in town meetings, and the county elects a board of commissioners. These organizations are an important factor in the financial affairs of the city.

The city owns and operates a vast and very complete water-works system. The water supply is obtained from Lake Michigan, cribs having been located at a distance of from 2 to 4 miles from the shore, in order to secure uncontaminated water. It is conveyed to the city by means of underground tunnels. Further to preserve the purity of the water supply the municipality constructed the greatest sanitary engineering work of the country, the Chicago Drainage Canal (q.v.).

Finance. The per-capita receipts and expenditures of Chicago are low when compared with those of other large cities, and it suffers from inadequate funds, as the State constitution places a limit upon tax rates. In 1898 a new revenue law was passed, creating a board of assessors which levies assessments for the entire County of Cook. Subsequent legislation abolished the numerous offices of town collectors and made the county treasurer ex-officio collec-

tor for all the towns. The municipality is compelled to resort in an unusual degree to indirect taxes—such as licenses, fees, fines, etc. Property, real and personal, was assessed on the basis of 20 per cent of its full value from 1898 to 1909, but after the latter date the rate was fixed at one-third. On this basis the total valuation of real and personal property in Chicago for 1913 was $981,788,078. The budgets are determined by committees of the council. The public debt in 1912 was $25,784,586. The following are the principal items of the receipts and expenditures, according to the report of the city comptroller for 1912: the receipts aggregated $54,248,546, of which $22,137,527 was from property tax; $6,828,600 from liquor licenses; $6,530,057 from the water works; and $1,616,955 from franchise compensations. The total expenditures were $56,339,734, of which those for schools were $15,318,088; for water works, $6,888,763; special assessment fund, $5,925,979; sinking funds, $2,743,771; and the balance, $25,463,133, for general corporate purposes. There are certain items of county and township government not herein included, e.g., the county maintains the charitable institutions, certain courts, jails, various public boards, the offices of the sheriff, recorder, coroner, and election commissioners, at a total annual cost for 1913 of $11,728,919.

Population. With but 4479 inhabitants in 1840, the city had increased in 1870 to 298,977, ranking fifth among American cities; in 1880, to 503,185, ranking fourth; in 1890, to 1,099,850, standing second; in 1900, to 1,698,575, and in 1910, to 2,185,283, still holding second place. The city *Directory* estimate for 1913 is 2,388,500; 1920, 2,701,705. Greater New York alone had as great an absolute growth during the last decade. Chicago's phenomenal growth seems quite natural, however, when compared with the development of the "Great West," of which it is a part. Chicago has a remarkably high per cent (36) of foreign-born population, and of the native-born 54 per cent are of foreign parentage. Of the foreign nationalities the Germans are most numerous, aggregating more than twice the number of Irish, the latter having shown an inclination to remain in the Eastern towns. The numbers of those who are of foreign birth or parentage are given in the following list after the names of the countries from whence they were derived: Germany, 501,832; Austria, 227,958; Ireland, 204,821; England and Scotland, 85,894; Canada, 66,453; Russia, 184,757; Scandinavian countries, 184,747; and various other countries of Europe, 303,909; making a total under this classification (exclusive of Canadians) of 1,693,918, i.e., about 77½ per cent of the entire population of the city. The negro population is given at 44,103. Chicago possesses a climate subject to sudden changes of temperature, though seldom remaining long at either extreme, the extreme heat of summer and the cold of winter being tempered by the waters bordering the city. The average annual temperature for the decade ending in 1913 ranged from 48° to 50°. The death rate per 1000 for 1913 was 15.3, a ratio which has held fairly constant for 15 years, placing the city about midway in the death rates of 50 leading American cities.

History. The name "Chicago" is probably derived from an Indian word meaning "wild onion," a plant which grows abundantly in this locality. Before the coming of the whites the place was a rendezvous for various Indian tribes and a favorite meeting place for voyageurs and traders. In 1673 Joliet and Marquette on a voyage of discovery visited this spot, and the latter spent most of the winter of 1674–75 here. Later the locality was visited by La Salle, Hennepin, Tonty, and others; and on a map published by Franquelin at Quebec in 1684, the name "Chekagou" was applied to a river placed some distance west of the real location of the Chicago River. Later maps show the name in proper position. The name "Chicago" came to be applied to the region lying contiguous to the river, and for over a century and a half after its discovery Chicago was an important outpost on the frontier where traders and savages met. During that period Chicago existed under three flags—first, under the domination of the French, when after the fall of Quebec it passed into the possession of the English. As British territory it remained until the close of the Revolutionary War, when the Western territories were ceded by the English to the United States. It has been said that "Chicago is the oldest Indian town in the West of which the original name is retained."

Jean Baptiste Point de Saible, a native of San Domingo, who came about 1779, built a house which was later known as the Kinzie house and which remained in existence over half a century. In 1796 he sold his cabin to Le Mai, a French fur trader, who in turn sold out early in 1804 to John Kinzie, the first white man to make his home here. The military importance of the place was quickly recognized by the government, which in 1795 forced the Indians to cede a tract of land "six miles square at the mouth of the Chicago River," and late in 1803 erected Fort Dearborn (q.v.) on the south bank of the river, near its mouth. On Aug. 15, 1812, in accordance with orders, Captain Heald and the garrison evacuated this fort, but were ambushed by their Potawatomi escorts and other Indians, and 38 soldiers, two women, and 12 children were killed, and many others captured. On the following day the fort was burned, but it was rebuilt in 1816. In 1830 the town was laid out, and the first map, dated August 4, gives its area as three-eighths of a square mile. There were then 12 families here, besides the garrison. Three years later Chicago was incorporated as a town, its population being 550, and its area 560 acres; and on March 4, 1837, then having 4479 inhabitants, it was chartered as a city. In 1833, 5000 Indians assembled here and sold a large tract of land in this vicinity, agreeing to move across the Mississippi.

The Illinois and Michigan Canal, begun in 1836, was finished in 1848; and in the same year the first railroad, the Galena and Chicago Union, was completed a few miles towards the west. Four years later the Michigan Southern and the Michigan Central, the first roads leading to the East, entered the city, which from this time grew with unprecedented rapidity. In 1860 the Republican National Convention, by which Lincoln was nominated, was held in Chicago. In October, 1871, one of the most destructive fires in the history of the country occurred here. Breaking out in a barn in De Koven Street and fanned by a gale, it spread with the greatest rapidity and raged uncontrolled for two days and nights, sweeping over 2100 acres, destroying 17,450 buildings, and causing 200 deaths, besides the greatest destitution and suffering. Out of

a population of 324,000, more than 70,000 were rendered homeless, and almost one-third of the property in the city ($190,000,000 out of $575,000,000) was destroyed. Relief poured in from all sides, and within a year the city was largely rebuilt.

In July, 1877, the railroad riots, caused by discontented laborers, necessitated the calling out of militia and United States troops, and in May, 1886, occurred the celebrated "Haymarket riots" (q.v.), consequent upon the labor troubles of 1885–86. On May 4, while the police were attempting to break up an anarchist meeting, a bomb was thrown among them, and 27 of their number were wounded, of whom seven subsequently died. In 1893 the Great World's Fair (see WORLD'S COLUMBIAN EXPOSITION) was held here. In 1894 a large number of laborers went on a strike, destroying property valued at $1,000,000 and again making it necessary to call out the militia and Federal soldiery. In 1904 and 1905 street traffic was seriously affected by a strike of the city teamsters.

The Mueller law, enabling the city to acquire, own, lease, construct, and operate street railways, provided that the electorate should decide by referendum vote upon questions of this nature, was passed in 1903, as a result of popular discontent with prevailing conditions. For municipal operation a two-thirds majority was made a prerequisite; a simple majority was made sufficient to authorize municipal ownership. In 1905 both mayoralty candidates were pledged to municipal ownership—the Democratic candidate, Edward F. Dunne (q.v.), promising immediate municipalization; the Republican candidate favoring a temporary agreement with the private companies which should safeguard the interests of the city and make possible municipalization under more favorable conditions than could then be secured. Mr. Dunne was elected by a substantial majority, but opposition in the council prevented him from making material progress towards the consummation of his policy. All efforts in this direction were eventually abandoned. Meantime the street-railway service degenerated, betterments were neglected, and public discontent was rife. While the companies were clamoring for extensions of their expiring franchises, the public demanded in return a new agreement, which at length was entered into, and ratified by both parties, in April, 1907. The agreement provided that thereafter the city was to receive 55 per cent of the net receipts and be given the right to purchase the existing systems at an agreed valuation at any time upon giving six months' notice. The result was that in the years following the inauguration of this plan the city received from "franchise compensations" the sum of $10,334,199, down to the end of the year 1913. The various systems greatly enlarged their facilities and improved the roadbeds in accordance with the terms of their agreement, but they are still seriously embarrassed with the constantly swelling volume of street-passenger travel. It can now be said that Chicago possesses in many respects the most modern and complete system of street railways of any city in the world.

CHICAGO, UNIVERSITY OF. A leading American university, situated in Chicago, Ill. The university was established at the instance of prominent Baptists throughout the country, and through gifts made chiefly by Mr. John D. Rockefeller, to replace the former University of Chicago—a Baptist institution opened in 1857, which had been obliged through lack of funds to close its doors in 1886. In recognition of the funds given by Baptists to start the new university, it was provided in the charter that while no religious tests should ever be exacted from the university professors or students, yet at all times two-thirds of the trustees, and also the president of the university, should be members of regular Baptist churches.

The university includes four divisions: first, schools, colleges, and academies; second, university extension; third, the university libraries, laboratories, and museums; fourth, the university press. The first division includes the graduate schools, of which the divinity school, the graduate school of arts and literature, the Ogden Graduate School of Science, and the law school have already been organized, while schools of medicine, technology, fine arts, and music are yet to be established. Of the schools established, the Ogden School of Science was founded under the will of William B. Ogden, his executors alloting to Chicago 70 per cent of the moneys he devised to charities. The divinity school was established under an agreement of the university made in 1891 with the Baptist Theological Union of Chicago, by which its seminary became the divinity school of the university. The colleges of the university include the colleges of arts, literature, science, commerce and administration, the university college, and the college of education. There were, in 1913, 404 secondary schools in coöperation with the university, these schools being allowed to send their graduates upon certificate and without examination. In the department of university extension the attempt is made to bring the university to those who cannot come to it. Lecture and study courses are given, and work done in them is on certain conditions recognized and credited by the university. The correspondence courses are definitely arranged in majors and minors, according to the regular university schedule, and on them credits are allowed, on certain conditions, towards the university degrees. The university libraries in July, 1913, contained 402,000 volumes, bound and catalogued, besides about 130,000 volumes uncatalogued and about 200,000 pamphlets. Of the total number about 217,000 volumes were in the general library and the remainder in the various departmental libraries. The acquisitions by purchase, gift, and exchange, in 1912–13, numbered about 52,000 volumes. The laboratories and museums include: The Kent Chemical Laboratory, Ryerson Physical Laboratory, Psychological Laboratory, the Yerkes Astronomical Observatory, the Walker Museum, Haskell Oriental Museum (including biblical, comparative religion, Syrian, and Egyptian collections), and the Hull biological laboratories (including the zoölogical, physiological, anatomical, and botan-

ical laboratories). The university press publishes both separate books and pamphlets and departmental journals. The departmental journals are as follows: *The Journal of Political Economy; The American Journal of Sociology; American Journal of Semitic Languages and Literatures; Biblical World; The Astrophysical Journal; Journal of Geology; School Review; Botanical Gazette; American Journal of Theology; The Elementary School Teacher; Modern Philology;* and *The University of Chicago Magazine; Weekly Calendar and Classical Philology.* Under the head of separate publications the university press issues many important pamphlets and books written by professors or post-graduate students in the course of specialized university work, and others.

The arrangement of courses at the University of Chicago is unique among American universities. The academic year consists of four quarters, and these four quarters, equally divided, complete the calendar as well as the scholastic year. Instruction is arranged with a single quarter of 12 weeks as the unit, instead of taking for the unit the scholastic year. Students are permitted to drop or take up university work at the beginning of any quarter, and a degree is given whenever the requisite amount of courses, computed by units, has been completed. The courses are arranged by majors and minors, according to the group system, and the student is required to take courses in definite groups. This system has the advantage of eradicating such artificial barriers to obtaining an education as are likely to follow from continuous courses of nine months each and from arbitrarily required studies. The degrees conferred by the university are: A.B., Ph.B., B.S., LL.B., A.M., Ph.M., M.S., J.D., Ph.D., B.D., D.D., LL.D. Bachelors' degrees are given upon completion of work in the senior colleges of the university. Chicago, however, has also junior colleges, and graduation from these entitles the students to the title of associate in arts, philosophy, or science. The work of the junior colleges is roughly equivalent to the work ordinarily done in the best American colleges in the freshman and sophomore years. The title is given on the completion of this work, mainly to give recognition to such students as are for any reason unable to complete the course.

The University of Chicago has grown with extraordinary rapidity since it was first opened to students in 1892. This growth has been made possible by many large gifts. Of the benefactors of the college should be especially mentioned: John D. Rockefeller, whose gifts have amounted to about $35,000,000; Marshall Field, who gave the original site for the university; S. A. Kent, Silas B. Cobb, Martin A. Ryerson, Charles T. Yerkes, Miss Helen Culver, Mrs. Annie Hitchcock, Mrs. Elizabeth G. Kelly, Julius Rosenwald, La Verne Noyes, and Mrs. Anita McCormick Blaine. The present buildings of the university, which have been erected almost entirely from private donations, include Cobb Lecture Hall, Kent Chemical Laboratory, Walker Museum, Ryerson Physical Laboratory, Haskell Oriental Museum, Law School, Bartlett Gymnasium, Mandel Hall, Reynolds Club (for men), Hutchinson Dining Hall (for men), School of Education, a group of graduate and divinity dormitories, Snell Hall and Hitchcock Hall (for men), Beecher, Kelly, and Nancy Foster halls for women, four biological laboratories (comprising the Charles J. Hull group), 1896–97; Yerkes Observatory, Lake Geneva, 1897; Green Hall (for women), 1898, and the Harper Memorial Library (1911–12). As shown by the president's report, the general assets of the university on June 30, 1913, amounted to $31,055,420.10, of which $18,690,563.66 represented investments, and the remainder buildings, grounds, and equipments. The current expenditures for the year previous had amounted to $1,738,610.57. In 1912–13 the total number of students, excluding duplicates, entered was 6802. These students were distributed as follows: divinity school, 359; graduate schools, 1737; the colleges, 3822; medical school, 219; school of education, 1018; law school, 286.

The president of the university from its foundation in 1891 until 1906 was William Rainey Harper (q.v.), Ph.D., D.D., LL.D., who, previous to his succession to the presidency of the University of Chicago, was professor of Semitic and biblical literature in Yale University and principal of the Chautauqua system. Harry Pratt Judson, LL.D., was made acting president in 1906 and president in 1907. The administrative and scholastic methods of the university were largely molded by Dr. Harper, and a large measure of the university's immediate success is ascribed to his influence and to his efforts in its upbuilding. Under President Judson's administration the financial resources have doubled, and the increase in the attendance of students has been very pronounced.

CHICAGO DRAINAGE CANAL. A canal constructed under an Act of the Illinois Legislature, dated May 29, 1889. The object of the canal is to reverse the flow of the Chicago River. After being in use for several years it was deemed necessary, with the growing population of southern Chicago and the near-by city of Gary in Indiana, to make similar provision for the flow of the Calumet River. Accordingly a smaller (the Calumet-Sag) canal, about 16 miles in length and 20 feet in depth, capable of carrying 2000 cubic feet per second and connecting this stream with the main Chicago Drainage Canal near Sag Bridge, was put under construction in 1912 at an estimated cost of $11,000,000 for excavation and connected works. The aim of the original canal was to divert the sewage-laden contents from the city's water supply, Lake Michigan, to the Mississippi, by way of the Des Plaines River, and also, if possible, to furnish a waterway from the Great Lakes to the Gulf of Mexico. Construction was begun Sept. 3, 1892, and the canal formally opened Jan. 2, 1900. Cost, $33,000,000; length, 40 miles. The work consisted of four parts: (1) deepening and widening the Chicago River from its mouth to Robey Street, 5.3 miles; (2) constructing the canal proper from Robey Street to Lockport on the Des Plaines River, 28.05 miles; (3) diverting this river into a new channel; (4) constructing a tail race and a new channel between Lockport and Joliet, 7.1 miles; size of canal, 160 feet bottom width in rock and 110 to 202 in earth; top width, 162 feet in rock and 200 to 300 feet in soil; minimum depth, 22 feet; capacity, 20,000 cubic feet per minute per 100,000 of population, or about 360,000 cubic feet per minute. The controlling works are located at Lockport and consist of a bear-trap dam 160 feet wide, and 7 sluice gates, 30 feet wide. In September, 1903, it was decided to utilize the 35,000 horse power being

wasted at the controlling works, by means of turbines, and to this end construction estimated at $3,000,000 was begun. At first it was feared that the turning of Chicago's sewage into the Mississippi from which St. Louis is supplied would result in an increase of typhoid and other water-borne diseases there, but chemical and bacteriological examinations failed to verify this. That Chicago benefited from a sanitary standpoint was shown by the report of the commissioner of health for August, 1904, which gave a comparison of water-borne diseases for a period of four years previous to and after the opening of the canal. Acute intestinal diseases, 1896–1900, 16.41 per 1000 of population; 1900–04, 12.44 per 1000. Typhoid fever, 1896–1900, 3.68 per 1000; 1900–04, 3.10 per 1000.

The question whether the taking of water from Lake Michigan affected navigation and the interests of States and cities on the Great Lakes was one that was seriously discussed and involved much litigation and investigation. The Chicago Sanitary Canal had never received the direct sanction of Congress. The authority to derive water from Lake Michigan was granted by Secretary of War Alger on May 8, 1899, and he permitted a flowage of 5000 cubic feet per second under certain restrictions and subject to any future action by Congress. Secretary of War Root, on Dec. 5, 1901, fixed the amount at 4167 cubic feet per second, and on March 14, 1907, Secretary of War Taft denied the application for an additional 4000 cubic feet per second for the purpose of reversing the current of the Calumet River and flowing that river also through the canal to drain the southern portion of Chicago. Subsequently the proposals to take as much as 10,000 cubic feet per second from Lake Michigan were opposed both by the Chief of Engineers of the United States Army and by an International Waterways Commission, in session in 1906, on the ground that this would interfere substantially with the navigable capacity of the Great Lakes and their connecting rivers by lowering the level of the lake. Furthermore, a treaty of Jan. 11, 1909, between the United States and Canada was believed to stand in the way of any considerable or additional diversion of water from the Great Lakes. Accordingly, on Jan. 8, 1913, the application to the War Department, on the part of the sanitary district of Chicago charged with the control and operation of the canal, was formally denied by Secretary of War Henry L. Stimson. While the Chicago Drainage Canal was a prime necessity to the city of Chicago, as was also, with the growth of the city to the south, the reversal and drainage of the Calumet River then in progress of construction (1913), yet its relations to commerce and international comity were also important. Notwithstanding the granting of limited permission for this work by the Secretary of War in 1910, the right of the city to reverse the flow of the river was pending in the United States Circuit Court in 1913. The possibilities of the canal, in addition to sanitation and the incidental power developed, as a commercial route were also considered, and it was thought possible that with the various improvements in progress the canal could be made an important link in a commercial waterway from the lakes to the gulf. If that were done, it would not solve the question of diversion of water, inasmuch as for the proper dilution and handling of sewage a considerable volume would be required, whereas in even a fairly large barge canal there would be no need of an active current or excessive drafts from the lake once the prism was filled.

CHICAGO HEIGHTS. A city in Cook Co., Ill., 27 miles south of Chicago, on the Chicago and Eastern Illinois, the Elgin, Joliet, and Eastern, and the Michigan Central railroads (Map: Illinois, E 2). It has a Carnegie library and a hospital. Manufacturing is extensively carried on; the most important products are iron and steel goods, chemicals, glass, carriages, lumber, fireproofing materials, automobiles, passenger and freight cars, linseed oil, clothing, pianos, blackboards, globes, and brick. Chicago Heights was settled in 1835 and was chartered as a city in 1900. The water works are owned by the municipality. Pop., 1900, 5100; 1910, 14,525; 1920, 19,653.

CHICAGO JUNCTION. A village in Huron Co., Ohio, 62 miles (direct) west-southwest of Cleveland, on the Baltimore and Ohio Railroad (Map: Ohio, E 3). Chicago Junction is essentially a railroad centre and contains large repair shops of the Baltimore and Ohio system. Lumber is manufactured also. The water works and lighting plant are municipally owned, and the village is known for its fine sulphur water. Pop., 1900, 2348; 1910, 2950.

CHICAGO ORCHESTRA. A permanent orchestra, founded by Theodore Thomas in 1891 and conducted by him until his death in 1905. Its name was then changed to "The Theodore Thomas Orchestra." In 1913 the original name "The Chicago Symphony Orchestra" was again adopted. The present conductor is Frederick A. Stock, who faithfully follows the ideals of the great founder. During the season concerts are given on Saturday nights and Friday afternoons. The rates of admission are designedly moderate, the deficit at the close of the season being periodically met by the guarantors of the association, a number of public-spirited citizens. The organization formerly consisted of about 60 players, but in 1901 the number was increased to 90. A strict adherence to the highest classic ideals and an unswerving refusal to be influenced by local criticism or financial exigencies at first caused considerable friction, but the annually decreasing deficit and the greatly increased attendance have amply justified the course of Mr. Thomas. Orchestra Hall, the permanent home of the organization, was built by popular subscription and opened in December, 1904. The opening concerts were the last Mr. Thomas conducted.

CHICAGO RIVER. A navigable stream in the city of Chicago, which formerly emptied into Lake Michigan, but the direction of whose current has been reversed by the construction of the Chicago Drainage Canal. It is formed by two branches, the North Fork and the South Fork, and it is less than a mile from this junction to Lake Michigan (Map: Chicago, F 7). Nearly 4 miles from the main river, the south branch separates into a west fork and a south fork. The Illinois and Michigan Canal connects the Chicago River at Bridgeport with the Illinois River at La Salle, a distance of nearly 100 miles, and during 1893–1900 the Chicago Drainage Canal (q.v.) was constructed, connecting the west fork of the south branch and Joliet, on the Des Plaines River, the distance being 28.05 miles. See CHICAGO.

CHICHAGOV, chē-chä'gôf, PAVEL VASSILIEVITCH (1765–1849). A Russian admiral. He

served under his father, Vasili Yakovlevitch (1726–1809), a Russian admiral, and completed his studies in England (1792–93). As head of the navy, to which he was appointed in 1802 by Alexander I, he greatly promoted the efficiency of the service. In 1811 he was appointed a member of the Imperial Council, and the year following received an important military command. Failing to prevent Napoleon's recrossing the Beresina, he fell into disgrace and left Russia. His *Memoirs* (1886–88) are valuable.

CHICHÉN-ITZÁ, chī-chân′ê-tzä′ (Maya, mouth of the wells of the Itzá). The most important of the ancient ruined cities of Yucatan, Mexico, situated 18 miles southwest of the town of Valladolid in the northern part of the peninsula. It derives its compound name from its former occupants, the Itzá tribe of the great Mayan stock, and from two remarkable natural pools or wells, still existing, which undoubtedly furnished the water supply of the ancient inhabitants and may have determined the original selection of the site. According to tradition preserved in the *Books of Chilán Balám* (q.v.), Chichén-Itzá was founded about 450 A.D. and abandoned for the first time about 600. It was rebuilt about 900 and for 300 years was the most important city in northern Yucatan. Towards the end of this time it became involved in war and was apparently held for a time by foreign invaders from the highlands of Mexico. It was abandoned 100 years or more before the coming of the Spaniards, but was still an important place of pilgrimage.

The principal ruins, which were first described in detail by Stephens in 1843 (*Incidents of Travel in Yucatan*), cover an area of about one square mile, with smaller edifices scattered about the encircling forest. The general structural type is that of the platform pyramid, ascended by means of broad stairways leading up to vaulted chambers, whose walls are covered with sculptured figures and hieroglyphic inscriptions or vividly colored paintings resembling those of the Aztec codices. The material is the white limestone of the country, and the walls consist of a composition of mortar and broken stone faced with neatly cut stone. Each prominent structure is known to the natives under a distinct name. One of the most interesting is that denominated the "Tennis Court" or "Ball Court." It consists of two immense parallel walls, each 274 feet long and 30 feet thick and standing 120 feet apart. Projecting from the centre of each, at the height of 25 feet from the ground, is a sculptured ring of stone, representing two entwined serpents. From contemporary Spanish descriptions it is certain that this was a courtyard, devoted to the playing of a favorite game, in which the effort was made to send the ball through the stone ring fixed in the wall. Another of the important ruins is the "Castillo," a pyramidal mound 200 feet square at the base and rising 75 feet to a platform, the approach being by means of a grand staircase with two colossal serpents' heads in sculptured stone at the base. The Palace, or Nunnery (*Casa de las Monjas*), is a rectangular mass more than 100 feet long and somewhat less in width, with an L-shaped wing on the eastern side, 60 feet long. Resting on this artificial platform, which is over 30 feet high, is a rectangular structure 90 feet long, 18 feet wide, and 18 feet in height; and this, in turn, is crowned by a smaller edifice 30 feet long by 12 feet wide. The L-shaped wing is a specimen of the best Mayan architecture. Minor ruins are the Caracol, or Round Tower, the Clichanchob, or Red House, and the Temples of the Tables, the Tigers, and the Cones. Consult: Holmes, *Archæological Studies in Ancient Cities of Mexico* (Chicago, 1895); Maudslay, "Biologia Centrali-America," *Archæology*, vol. iii, and Spinden, *Maya Art* (Cambridge, 1912).

CHICHESTER, chĭch′es-tẽr (AS. *Cissanceaster*, Lat. *Cissæ castrum*, camp of Cissa). A municipal borough and episcopal city in Sussex, England, 17½ miles east-northeast of Portsmouth (Map: England, F 6). It is well built and has wide streets. The ancient city walls are now utilized as a public promenade. The cathedral, erected in the twelfth and thirteenth centuries, is remarkable for its unique features of double aisles and detached campanile. Other notable public buildings are the guildhall, formerly the church of a Franciscan monastery; the church of St. Olave, one of the oldest in Chichester; the market cross, erected by Bishop Story about the beginning of the sixteenth century, and counted one of the finest examples of the Perpendicular style in England; and St. Mary's Almshouse, which was founded as a nunnery in the twelfth century. The town has a theological college, and there is an ancient grammar school founded in 1497. The chief trade is in agricultural products and live stock. There are malting, brewing, and tanning establishments and manufactures of wooden ware. The harbor, 2 miles to the southwest of the city, is a deep inlet of the English Channel, about 8 square miles in area, and is connected with Chichester by a canal. Chichester was perhaps the Roman Regnum, or Regni. It was taken and partially destroyed in 491 by the South Saxons, but was soon afterward rebuilt by Cissa, their King. It was for some time the capital of the Kingdom of Sussex, and was incorporated in 1213. During the Civil War it was taken in succession by Royalists and Parliamentarians. Pop., 1901, 12,200; 1911, 12,591. Consult: Hills, "Chichester Cathedral" in *Archæological Journal*, vol. xx (London, 1864), and "The City Walls" in id., vol. xlii (London, 1886); Hay, *History of Chichester* (Chichester, 1804).

CHICHEVACHE, shêsh′vàsh′. A creature in French fable, represented as a lean cow, which lived upon submissive wives. The name and the conception arose from the corruption of the old French *chichefact* ('ugly face') to *chichevache* ('lean cow'). Bicorne, the complement of Chichevache, is a fat beast, nourished on submissive husbands.

CHICHIMECA, chē′chê-mā′kȧ (Aztec, perhaps from *chichiltic*, red + *mecayotl*, race). "Dog people," a term of contempt anciently applied by the more cultured Aztecs to the wild tribes northward of the valley of Mexico. The name has no ethnic significance whatever.

CHICK′ADEE′. See TITMOUSE.

CHICK′AHOM′INY (Algonquian *k'chick-ahäm-min-nough*, coarse-pounded-corn people). A river in Virginia, about 75 miles long, flowing into the James about 40 miles southeast of Richmond. On and near this river occurred, during the Civil War, the battles of Seven Pines or Fair Oaks, Mechanicsville, Gaines's Mill or Cold Harbor, Savage's Station, Frazier's Farm, Malvern Hill, and the second battle of Cold Harbor (qq.v.). The first of these engagements was fought on May 31 and June 1, 1862. The battle of Mechanicsville took place on June 26,

1862, and the last of the seven days' battles, that of Malvern Hill, on July 1. The second battle of Cold Harbor was fought on June 3, 1864. See SEVEN DAYS' BATTLES, THE.

CHICK'AMAU'GA, chĭk'ȧ-mą'gȧ. A creek in the extreme northwestern part of Georgia and in southern Tennessee. It is a tributary of the Tennessee River, into which it empties a few miles above Chattanooga. It is famous on account of the battle of Chickamauga, Sept. 19–20, 1863.

CHICKAMAUGA, BATTLE OF. One of the most hotly contested battles of the Civil War, sometimes called "the Great Battle of the West." It was fought Sept. 19, and 20, 1863, near Chickamauga Creek, about 12 miles east of Chattanooga, Tenn., between a Federal army of 55,000, under General Rosecrans (q.v.), and a Confederate army of 70,000, under General Bragg (q.v.). Manœuvred out of Chattanooga (September 8) by the brilliant strategy of Rosecrans, Bragg had started in apparent retreat towards the south and had been followed by Rosecrans, whose troops, forced to cross the mountains at widely separated points, were scattered over a great extent of territory. Soon perceiving that the Confederate retreat was only apparent and fearing an attack in detail, Rosecrans rapidly concentrated his forces and, by shifting Thomas to the extreme left (September 18), thwarted an attempt by Bragg to attain his rear and shut him off from Chattanooga. At 9 A.M. on the 19th the battle began with a fierce attack by the Confederate right, under General Polk, on the Federal left; but Thomas held his ground, and the day ended without decisive advantage to either side. The fighting was renewed early on the 20th and was proceeding with varying fortune, when, in pursuance of a misinterpreted order from Rosecrans, a division was withdrawn from the Federal right. This made a gap in the line of battle through which Longstreet, commanding the Confederate left, poured his troops, soon routing the Federal right and centre (under McCook and Crittenden respectively) and driving them in wild disorder back towards Chattanooga. The whole Confederate army was now massed against the Federal left; but Thomas stood firm against tremendous odds throughout the day, gallantly repulsing attack after attack and inflicting great damage on the enemy. His remarkable courage and skillful generalship alone saved the whole Federal army from meeting with an overwhelming defeat and earned for him the title of "The Rock of Chickamauga." During the night, under orders from Rosecrans, he retired to Rossville and on the 21st withdrew behind the fortifications of Chattanooga. The Federal army lost 16,179 in killed, wounded, and missing; the Confederate, about 17,800. Though the battle was won by Bragg, Chattanooga, the prize for which it was fought, remained in the possession of Rosecrans. Consult: *Official Records*, vol. xxx (Washington, 1890); Cist, *The Army of the Cumberland* (New York, 1882); Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (4 vols., New York, 1887).

CHICKAMAUGA.

CHICKAMAUGA NATIONAL MILITARY PARK. A park in Georgia, situated on the site of the battle of Chickamauga, a few miles southeast of Chattanooga, Tenn., near the Tennessee and Georgia line. It was established under the authority of Congress, with the cooperation of those two States. The legal boundaries embrace a compact area of 15 square miles, which cover the main scene of the battle; but there have also been secured several small neighboring tracts which are the sites of events of special military interest. It is the object, so far as possible, to preserve the conditions as they existed at the time of the battle, and, in order to make clear the positions and movements of the troops engaged, monuments, historical tablets, and other guide marks have been set up at the proper points. Several lofty observation towers have been erected, which command a view of the battlefield. A large part of the park is forest land, but a considerable portion has been cleared of underbrush and small timber, in order to permit free access and unobstructed views. In addition to acquiring these lands, the Federal government has obtained a concession of many miles of approaching roadways which have been beautified. Congress appropriated $725,000 for this work, and the States have given $400,000 additional. The park was dedicated Sept. 19–21, 1895. It is the first time that a battlefield has been so completely marked and set aside as a monument of the event which happened within its boundary.

CHICK'AREE (imitation of its cry), or HACKEE. Old book names of the North American red squirrel. See SQUIRREL.

CHICK'ASAW. An important Muskhogean tribe, formerly occupying northern Mississippi and the adjacent part of Tennessee, and later settled in the western part of Oklahoma with an autonomous government, under the name of the "Chickasaw Nation." They are now citizens of the United States. Originally they were a restless and warlike people, and throughout the Colonial period adhered to the English side as against the French, who tried repeatedly, but without success, to subdue them. From the close of the Revolution they maintained friendly relations with the United States. In 1832 they sold all their remaining lands east of the Mississippi and agreed to remove to their present location. They joined the Confederacy during the Civil War and at its close were obliged to free their slaves and admit them to equal Chickasaw citizenship. Those of pure and mixed Chickasaw blood now number 4204.

CHICKASAW BLUFFS, or **BAYOU,** bī'o͞o, BATTLE OF. A battle fought, Dec. 29, 1862, between a Federal force under General Sherman and a Confederate force under General Pemberton, strongly intrenched on the bluffs above Chickasaw Bayou, the Federals being repulsed with great loss. It was the result of an attempt by Sherman to attain the rear of Vicksburg, by way of Yazoo River, with a view to coöperating with General Grant in his operations against that city. (See VICKSBURG, CAMPAIGN AGAINST.) The

Federal loss in killed, wounded, and missing was almost 2000; the Confederate, less than 200. An interesting account of the engagement is given in Sherman, *Memoirs* (2 vols., New York, 1888).

CHICKASHA, chĭk′ȧ-shā. A city and the county seat of Grady Co., Okla., 48 miles southwest of Oklahoma City, on the Chicago, Rock Island, and Pacific, the Frisco Lines, and the Oklahoma Central railroads, and on the Washita River (Map: Oklahoma, D 3). It is the seat of a State college for women, contains a Carnegie library, and has machine shops, cottonseed-oil mills, flour mills, and large stock-feeding pens. The water works and sewage system are owned by the municipality. Pop., 1910, 10,320; 1920, 10,179.

CHICKEN. See Fowl.

CHICKEN BIRD, or **CHICKEN PLOVER.** The turnstone.

CHICKEN CHOLERA. See Fowl Cholera.

CHICKEN FLEA. See Chigoe.

CHICKEN LICE. See Fowl; Louse.

CHICKEN POX, or Varicella (Neo-Lat., from *variola*, smallpox, from Lat. *varius*, spotted). 1. An acute contagious disease, chiefly of children. It is characterized by early fever, an eruption of papules and vesicles, with mild constitutional disturbance. In most cases fever is present 24 hours before the eruption appears. The eruption comes out in crops, on the face, scalp, or shoulders, as red, widely scattered papules, spreading slowly over the body, one crop maturing while another is appearing. Thus red papules, blebs filled with clear fluid, and crusts are found at the same time in a small area. Pitting is rare and generally occurs on the face, where the lesions are apt to become infected with pus germs. Chicken pox is extremely contagious, but very rarely dangerous. Complications or serious sequelæ are rare. Erysipelas, gangrene, inflammation of glands, abscesses, or kidney disease may occur. Isolation of cases is necessary till all crusts separate and fall off. Chicken pox bears no relation to smallpox and is unaffected by vaccination. While the two diseases differ in all essential characteristics, mild cases of smallpox may easily be mistaken for varicella and severe cases of the latter for smallpox. 2. A disease of fowls, chickens, turkeys, pheasants, peacocks, pigeons, and, much less commonly, waterfowls, caused by a filterable virus and characterized by the formation on the comb, ears, wattles, and other unfeathered parts of the body, of small nodules. These nodules, which may develop to the size of a pea, are sometimes so abundant that they coalesce. There are several clinical forms of the disease to be differentiated. The mortality is said to vary from 50 to 70 per cent of the affected birds. Treatment consists in the local application of ointments and antiseptics. Diseased fowls should be isolated at once and dead birds destroyed. Consult Hutyra and Marek, *Pathology and Therapeutics of the Diseases of Domestic Animals*, and E. W. Hoare, *A System of Veterinary Medicine*, vol. i.

CHICKEN SNAKE. 1. A very slender harmless snake, the southeastern representative of our northern pilot black snake (*Coluber obsoletus quadrivittatus*), about 6 or 7 feet long, yellowish brown, with a straw-colored head, tail, and abdomen, and two brown stripes along each side of the body. It is common from South Carolina to Florida and Alabama and often enters buildings in search of mice and young poultry and is sometimes known as the "four-lined snake." 2. In the Northern States, the milk snake (q.v.).

CHICKEN TORTOISE, tôr′tŭs *or* -tĭs, or **CHICKEN TURTLE.** One of the edible "painted" turtles (*Chrysemys reticulatus*) of the southern United States.

CHICK′ERING, Jonas (1797–1853). A piano maker, born at New Ipswich, N. H. In 1818 he became a workman in John Osborne's piano manufactory, a business in which he subsequently became a partner and finally (1823) sole proprietor. Under his management the firm developed into one of the largest piano manufactories in the United States, with an output at the time of his death of 2000 pianos yearly. His three sons continued the business. Consult *The Commemoration of the Founding of the House of Chickering and Sons* (Boston, 1904).

CHICK′LING VETCH. See Lathyrus.

CHICK′-PEA′ (corruption of *chich-pea*, from OF. *chiche*, from Lat. *cicer*, chick + Eng. *pea*). A plant of the genus *Cicer*, of the family Leguminosæ, having pinnate leaves, solitary axillary stalked flowers, and two-seeded pods, inflated like bladders. The common chick-pea (*Cicer arietinum*) is a native of southern Europe. It is an annual, 1½ to 2 feet high, of a stiff, upright habit, covered with glandular hairs. The seeds abound in starch and have a slightly bitterish taste. They are about the size of common peas and resemble in appearance a ram's head; hence the specific name. The ripe seeds are eaten either boiled entire or made into pea soup. They are sometimes roasted as a substitute for coffee. A red-seeded variety is extensively grown in the East, both for table and for stock food.

CHICK′WEED′. A name applied to a number of species of *Stellaria*, a genus of the family Caryophyllaceæ. One of the most common weeds of gardens and cultivated fields is a species called also "stitchwort," or "starwort" (*Stellaria media*). It is a native of most parts of Europe and of Asia, appearing during the colder months even on the plains of India, and has been abundantly introduced in America and elsewhere. It is an annual, with a weak procumbent stem and ovate leaves, very variable, but always characterized by having the stem curiously marked with one or two lines of hairs. The leaves of chickweed afford a fine instance of the "sleep of plants," in that they close up on the young shoots at night. Although generally regarded as a troublesome weed, chickweed is used for feeding cage birds. It is a good substitute for spinach or greens. A number of species of a nearly allied genus, *Cerastium*, also bear the name of "chickweed," or "mouse-ear chickweed," and the name is occasionally given to other allied plants, as *Holosteum umbellatum*, introduced into the United States from Europe and called "jagged chickweed."

CHICLANA-DE-LA-FRONTERA, chē-klä′nä-dā-lä-frôn-tā′rä. A town of Andalusia, Spain, about 12 miles southeast of Cadiz (Map: Spain, B 4). It is pleasantly situated on the Lirio and has manufactures of linen, earthenware, and brandy. Its mineral baths are much frequented by the inhabitants of Cadiz. Pop., 1900, 10,868; 1910, 11,496.

CHICLAYO, chē-klä′yō. A town in the Department of Lambayeque, Peru, situated in a sugar-growing plain near the coast (Map: Peru, B 5). It is the residence of a United States consular agent. Pop., 13,000.

CHICLE. See Chewing Gum.

CHICO, chē′kō (Sp., small). A city in Butte Co., Cal., 96 miles north of Sacramento, on the Southern Pacific and the Butte County railroads and on Chico Creek (Map: California, D 3). It has a State normal school, a Carnegie library, and a natural park, 2000 acres in extent. The city has important fruit-growing, dairying, lumbering, and mining interests. The industries include the plant of the Diamond Match Company, flour mills, foundries and machine shops, electric-car shops, etc. Pop., 1900, 2640; 1910, 3750.

CHICOMOZTOC, chīk-ō′mŏs-tŏk′ (Nahuatl, seven caves). The mythical birthplace of the Nahuatl race, in Aztec legend.

CHICOPEE, chīk′ō-pē. A city in Hampden Co., Mass., 3 miles north of Springfield, on the east bank of the Connecticut River, at the mouth of the Chicopee, and on the Boston and Maine Railroad (Map: Massachusetts, B 3). By means of several dams abundant water power is derived from the Chicopee River for the variety of manufactures for which the city is noted. These include firearms, cotton and knit goods, rubber tires, automobiles, knitting machines, agricultural implements, bronze statuary, swords, machine and mechanics' tools, carpets, counting scales, drop forgings, athletic goods, and many other articles. The city contains a large public library and has municipal water works and a lighting plant. The government is vested in a mayor and a council with various administrative departments. Pop., 1890, 14,050; 1900, 19,167; 1910, 25,461; 1920, 36,214.

Settled about 1675, Chicopee was incorporated as a town in 1848, including the villages of Chicopee Falls, Fairview, and Willimansett, and was chartered as a city in 1890. Consult Holland, *History of Western Massachusetts* (Springfield, 1855).

CHICOPEE RIVER (N. Amer. Indian, violent water). A river formed near Three Rivers, Mass., by the junction of the Quaboag, Ware, and Swift rivers (Map: Massachusetts, B 3). It flows west and empties into the Connecticut River at Chicopee. It is 20 miles long from the mouth to Three Rivers and with the Quaboag about 50 miles. It drains an area of 700 square miles and has 28 ponds in its basin. It has a rapid fall, thus affording extensive power at Chicopee, Chicopee Falls, Ludlow, and Three Rivers. The name "Chicopee" is sometimes applied to the Quaboag branch as well.

CHICORY, chīk′ō-rĭ, or **SUC′CORY** (Fr. *chicorée*, Lat. *cichorium*, from Gk. κιχόριον, *kichorion*, chicory). A plant belonging to the genus *Cichorium*, of the family Compositæ, the same family of plants to which the sunflower, the oxeye daisy, the dandelion, the lettuce, and other useful and obnoxious plants belong. The few species are all herbaceous perennials, with spreading branches and milky juice, natives of Europe and western Asia. Chicory has become naturalized in the United States, occurring as a weed along roadsides, in fence rows, and in fields. Common chicory (*Cichorium intybus*) grows from 1 to 5 feet high. The leaves resemble those of the dandelion, but are generally larger, with the exception of those on the upper part of the stalk, which are small and inclined to be lance-shaped, and the flowers, of a beautiful blue, though sometimes pink or white, occur in heads from 1 to 1½ inches in diameter. The plant has a long, carrot-shaped root, whitish yellow or grayish yellow in color on the outside, but white within. Chicory is quite extensively cultivated in Europe for use as a table salad, for fodder, and for the roots. It is also grown to some extent for its roots in the United States. (For illustration, see SALAD PLANTS.) The young leaves, when properly blanched, are considered equal as a salad to those of endive, a plant belonging to this same genus. The young green leaves are eaten much in the same manner as spinach, and the roots, as long as they are young and tender, are also used as a food. The plant also has some merit as a forage crop. It is principally cultivated, however, for its roots, which are roasted and ground and in that form are used as a substitute for coffee and as an adulterant for coffee, snuff, and other articles. Chicory itself, however, is sometimes adulterated.

CHICOT, chē′kō, *Fr. pron.* shē′kō′. See GYMNOCLADUS.

CHICOUTIMI, shē-kōō′tē-mē′. The capital of Chicoutimi Co., Quebec, Canada, at the confluence of the Chicoutimi River with the Saguenay, and on a junction line of the Quebec and Lake St. John Railway (Map: Quebec, G 2). It is an important lumber town, with an extensive lumbering establishment and two large pulp mills. It is the see of a Roman Catholic bishopric, and has a cathedral, a classical college, convents, and sailors' hospital. The settlement dates from the Jesuit chapel built in 1670, relics of which were found during the erection of a new chapel in 1893. Pop., 1901, 3826; 1911, 5880.

CHIEF (OF. *chef*, chief, It. *capo*, from Lat. *caput*, head). In heraldry (q.v.), an honorable ordinary.

CHIEF JUSTICE. In the English and American judicial systems, the title of the presiding justice of a bench or court of judges—the terms "judge" and "justice" being identical in meaning. The presiding or superior judge of the King's (or Queen's) Bench and of the Court of Common Pleas in England has always borne this title, the former being known also as the Chief Justice of England, and ranking all other judicial officers of the kingdom except the Chancellor (q.v.). The corresponding officer of the Court of Exchequer, whose judges were known as barons, was called the Chief Baron. See BARON.

The presiding justice of the Supreme Court of the United States, and of the courts of highest jurisdiction in most of the several States, bears the title of Chief Justice or Chief Judge, as the case may be. The Chief Justice of the United States is the highest judicial officer of the Republic. Among his functions are those of administering the oath on the occasion of the inauguration of the President and Vice President, and of presiding over the Senate of the United States when that body is resolved into a high court for the trial of impeachments. The Chief Justice ranks next after the President of the United States in official dignity.

CHIEMSEE, kēm′zā′. The largest lake of Bavaria, situated in Upper Bavaria, about 42 miles southeast of Munich, at an altitude of over 1700 feet. It covers an area of about 33 square miles and is irregular in shape. The south coast is generally swampy; on the other sides the country is hilly and picturesque (Map: Germany, E 5). The tributaries of the lake are the Roth, Achen, and Prien, and its outlet is the Alz. It contains three islets; Herrenwörth, on which is the royal palace built by King Louis

II; Frauenwörth, on which is a Benedictine convent founded in 766; and Krautinsel.

CHIERI, kyā'rê (Lat. *Carea,* or *Ceara*). A city in the Province of Turin, north Italy, in a fertile, hilly country, 11 miles southeast of Turin. The most interesting churches are San Domenico, dating from 1260, and Santa Maria della Scala, from 1405. Chieri has a gymnasium, a technical school, and a theatre, and linen, cotton, and silk factories. It was a manufacturing centre as far back as 1422. In the eleventh century it was an independent republic. Pop., 1900, 14,312; 1911, 15,454.

CHIETI, kyā'tê. An archiepiscopal city in south Italy, capital of the Province of Chieti, 99 miles south of Ancona, near the Pescara (Map: Italy, J 5). It has nine churches besides the magnificent Gothic cathedral, a gymnasium, a normal school, a technical school, a seminary, a theatre, four conservatories of music, a military hospital, and a chamber of commerce. It is an important centre of trade; markets wine, oil, grain, and silk, and manufactures silk and wool. There are a few remains of the ancient Teate Marrucinorum, which was the most important city of the Sabelli and fell into the hands of the Romans 305 B.C., in the last Samnite War. It was held successively by the Goths and by the Lombards and was destroyed by Pepin the Short. It was rebuilt by the Normans, who made it the capital of the Abruzzi. From it the Order of the Theatines, founded in 1555 by Paul IV, was named. Pop., 1901, 26,000; 1910, 26,897.

CHIFF'CHAFF' (imitation of its cry). A small European warbler (*Phylloscopus collybita*), having a twittering note suggesting the name; also called "willow wren" in Great Britain, where it is common about gardens during summer.

CHI-FU or **CHEFOO,** chē'fōō'. A city in the Province of Shantung, China, so called by foreigners, though the Chinese name is Yen-tai, and Chi-fu proper is on the opposite side of the harbor (Map: China, F 4). Chi-fu is in lat. 37° 32′ N. and long. 121° 22′ E. The town was opened to foreign trade in 1858. The natives are very orderly and civil. The climate is so bracing that in summer Chi-fu, with its good hotels and boarding houses, is a much-visited sanitarium, being but two days' journey from Shanghai. The winter is severe, the spring lovely and cool, the summer hot and rainy, and the autumn perfect, with warm days, cool winds, and cold nights. Since the Chino-Japanese War Chi-fu has become a coaling station much resorted to by the navies of foreign countries. The city was the seat of the famous convention of 1876 between Sir Thomas Wade and Li Hung Chang. The trade is largely in bean cake and beans, exported mainly to ports in the southern part of China. Silk, straw braid, and vermicelli are the other chief exports. The making of wine is a promising industry. Gold mines 20 leagues away are worked by native capital. The value of the foreign trade for 1905 was over $23,287,000, of which $13,725,000 represented imports and $9,562,000 represented exports. During the investment of Port Arthur by the Japanese in 1904–05 Chi-fu was a rendezvous for blockade runners. Pop., 1910 (est.), 54,000.

CHIGGER. See CHIGOE.

CHIGI (kē'jē) **FAMILY.** An eminent Italian family, mentioned as early as the thirteenth century. AGOSTINO CHIGI, its first prominent member, was a celebrated banker, born at Siena about the year 1465. Established in Rome as early as 1485, Chigi grew immensely wealthy through banking and the possession of valuable alum mines. His income was estimated at 70,000 golden ducats a year (about $700,000). He was one of the great art patrons of the day, and the leading artists, including Peruzzi, Perugino, Sebastiano del Piombo, and, above all, Raphael, owed much to his generosity and friendship. Peruzzi built for him the famous Villa Farnese, which Raphael and Sodoma decorated with frescoes. He died in Rome in 1520. There is a good biography of him in Italian by Cugnoni, *Agostino Chigi, il magnifico* (Rome, 1881–83). Consult also Gregorovius, *Geschichte der Stadt Rom* (4th ed., 8 vols., Stuttgart, 1886–96; Eng. trans., London, 1894–1902).—FABIO CHIGI. See ALEXANDER VII, Pope, 1665–67.—FLAVIO CHIGI, Cardinal, born in 1819, was, up to the year 1848, an officer in the papal noble guard. He then took orders and became Bishop of Mira *in partibus.* In 1856 he represented the papacy at the coronation of Alexander II, Czar of Russia, and from 1861 to 1873 he was the papal nuncio in Paris. In the last-named year he was created a cardinal. Chigi was distinguished for his finesse and courtesy of bearing in all diplomatic business. He died in Rome, Feb. 15, 1885.

CHIGNECTO (shĭg-nĕk'tō) **BAY** (Micmac *sigunikt,* footcloth). The northern extension of the Bay of Fundy, partly separating Nova Scotia from New Brunswick (Map: Nova Scotia, E 3). The main portion of the bay is about 30 miles long and averages 8 to 10 miles in width; but in its northern part it separates into two narrow arms, one extending northward about 12 miles, and the other about the same distance to the northeast. Numerous towns border the bay and its extensions, and it receives several tributary streams. See also FUNDY, BAY OF.

CHIGNON, shĭn'yŏn, *Fr. pron.* shê'nyôN'. See HAIR DRESSING.

CHIGOE, chĭg'ō, **CHIGGER,** chĭg'gĕr, or **JIG'GER** (of West Indian or South American origin). 1. A species of flea (*Sarcopsylla penetrans*), rather smaller than the common flea and with less powerful limbs, found in the West Indies and South America, where it is excessively troublesome. The female insect attacks any exposed part of the human body and effects a lodgment between the skin and the flesh, often under the skin of the foot or the nails of the toes. At first its presence is indicated only by a slight itching or tingling; but this soon becomes intolerable, and an ulceration due to the development of a mass of eggs is likely soon to be the result, which is not only very painful, but even dangerous. Another species (*Sarcopsylla gallinacea*) attacks the eyelids of poultry.

2. In the southern United States the name is applied to the minute scarlet forms of various mites which attach themselves to the skin of man and other vertebrates or even burrow into it; they seek those parts of the body particularly upon which the clothing presses tightly. Their bite is very annoying, though not fatal to man; but they may collect in such numbers under the wings of newly hatched chicks as to cause death. Salt-water bathing alleviates the burning of their bites on man, and on such animals as chicks salted lard or the drippings of salted bacon soon give relief when smeared on the infested surfaces. During the Civil War the soldiers often kept a

piece of bacon with which to rub infested parts of their bodies after the day's march.

CHIHUAHUA, chē-wä'wà (Aztec, water-course). An inland, and the largest, state of Mexico, bounded on the north by the United States, on the east by the Mexican State of Coahuila, on the south by Durango, and on the west by Sinaloa and Sonora. Area, 89,998 square miles. The surface can be divided into the two regions of an elevated plateau on the east and a mountainous section formed by the Sierra Madre on the west. Neither region is well watered. The state's chief river is the Rio Conchos, a tributary of the Rio Grande. The climate is temperate and healthful and the soil fertile wherever watered. Agricultural products consist of corn, wheat, several kinds of vegetables, and fruit, including grapes. Cotton is also grown successfully in the Torreon district. The forests are found mostly in the mountainous districts of the west. Chihuahua has considerable mineral deposits, its silver mines being among the richest in the republic. Some of them were worked by the Indians at the time of the Spanish Conquest. The state's production of lead is noteworthy. Zinc is also abundant. Over 5250 mining properties are recorded for its entire area. The state is traversed from north to south by the Mexican Central Railway. Other important lines operated within its area are: the Sierra Madre and Pacific; the Mexican Northern; the Chihuahua and Pacific, and the Kansas City, Mexico, and Orient. Pop., 1900, 327,784; 1910, 405,265. A considerable portion of the population is creole or white; the rest consists of Indians partly civilized. There are some Apaches in the mountains, who still continue their forays on the settlements. The close of the nineteenth century, however, witnessed great changes in the status of the state. Large numbers of foreigners, chiefly Americans, have secured control of the industries and have already raised the state to a leading place in the republic. A flourishing Mormon agricultural colony was founded in 1886 west of Ciudad Juarez. Capital, Chihuahua.

CHIHUAHUA. The capital of the North Mexican state of the same name, on the Mexican Central Railway (Map: Mexico, F 3). It is situated at an elevation of about 4650 feet, on the Chihuahua River, in a plain surrounded by mountains on all sides except the north, and it is regularly built, with broad, well-kept streets. It has a fine public square, in which is a monument erected to Hidalgo and his generals, the leaders of the revolution of 1810. The parish church, completed in 1789, is the most pretentious building, and other features of interest are a college, formerly belonging to the Jesuits, and an aqueduct which dates from the close of the seventeenth century. The city is the centre of a rich silver-mining district and is known also for its stock-raising and industrial interests, the cotton and woolen mills being among the most important in the republic. Fruits, particularly grapes and figs, are grown extensively in the adjacent region. A United States consulate is located here. Chihuahua was founded in 1703 or 1705, and at one time was a much larger city, its population in the late eighteenth century having reached 70,000. Pop., 1895, 18,279; 1910, 39,061.

CHIKARA, chē-kä'rà. See CHOUSINGHA.

CHIKHACHEV, chē'kà-chĕf', PETER ALEXANDROVITCH (1808–90). A Russian geologist and traveler. In 1843 (with Elie de Beaumont, Heppert, and Verneuil) he investigated the Altai Mountains, the result of these investigations being embodied in *Voyage scientifique dans l'Altaï oriental et les parties adjointes de la frontière de Chine* (1845). An attaché in the Russian Embassy at Constantinople (1845–47), he mastered Turkish and during 1848–63 traversed Asia Minor, making large geological, paleontological, archæological, zoölogical, and botanical collections. He embodied the results of his studies in *Asie Mineure* (8 vols., 1853–69). Among his other works are *Voyage dans l'Altaï Oriental* (1844–45), presenting an account and scientific interpretation of his explorations in the Orient; and *Etudes de géographie et d'histoire naturelle* (1890).

CHILÁN BALÁM, chē-län' bà-läm', BOOKS OF. The native name of a series of documents in Spanish script but Maya words preserved by the Maya Indians of Yucatan. The name refers to the priests who wrote them and means 'priestly interpreter,' or, more literally, 'tiger mouth.' The books are based on ancient records destroyed at the time of the Spanish Conquest and relate primarily to history. The count is made in 20-year periods, called "katuns," and in Chronicle I extends back to 160 A.D. The events refer primarily to the tribe of the Itzás and to the cities of Chichén Itzá, Uxmal, and Mayapan. Consult Brinton, *Maya Chronicles* (Philadelphia, 1882), for the translation, and Morley, *Am. Journ. Arch.*, vol. xv (2d series, 1911), and Spinden, *Mem. Peabody Mus.*, vol. vi (1912), for the historical value. Under the caption *The Book of Chilán Balám of Chamayel* a facsimile reproduction has recently been issued by Dr. Gordon in the "Anthrop. Series," vol. v, of the Museum of the University of Pennsylvania.

CHIL'BLAIN, or FROSTBITE. A dermatitis, or skin disease of the feet with inflammation, following exposure to the cold and to chafing or pressure in the shoes. It may affect also the fingers, the nose, chin, or cheeks. The lesion is a small oval or round patch of reddened and elevated tissue with a purplish centre. Ulceration, or even sloughing, may follow in severe cases; but in ordinary chilblain, or *pernio*, there are only itching, burning, and stinging of the spots when warm, with tenderness on pressure. Tincture of iodine, ichthyol, tincture of the chloride of iron, tincture of camphor, are all efficacious. Sweating of the feet and sudden changes of temperature should be avoided. Hosiery should be changed whenever moist. General tonic treatment and outdoor exercise should be taken. See FROSTBITE.

CHILCOTT, ELLERY CHANNING (1859–). An American agriculturist, born at East Hamburg, N. Y. From 1882 to 1892 he was United States deputy surveyor, during most of this period also owning and managing a stock ranch in Campbell Co., S. D. He became State Senator in 1892. At South Dakota Agricultural College he was professor of agriculture in 1892–97 and professor of geology and agronomy and vice director from 1897 to 1905. He was agriculturist in the United States Experiment Station, South Dakota, from 1893 to 1905, when he was placed in charge of the dry-land agricultural investigations of the Bureau of Plant Industry. He is author of *A Study of Cultivation Methods and Crop Rotations for the Great Plains Area* (1910), a bulletin of the Department of Agriculture.

CHILD, DEVELOPMENT AND GROWTH OF. The

poet calls the child "an epitome of man." Not so the scientist, who sees rather a creature very simple, yet very complex, who will, by many changes and much evolution, one day become a man. These changes are anatomical, physiological, and mental. Says Camerer, "The most interesting task in anthropology is the study of child growth."

We begin with the skeleton. Although the bones are very incomplete in development, having ends largely cartilaginous, the relative proportion to body weight is greater than in the adult, viz., 16.7 per cent. The infant bones are soft, and the larger ones are abundantly filled with red marrow, while the adult bones are hard and filled with yellow marrow. This is significant, as the chief function of the red marrow is the formation of red blood cells, so essential to growth and good health. The infant spine is nearly straight, because of little rigidity in its many parts, the vertebræ; but, as time goes on, lime is deposited, so that the cartilage, instead of containing 2.24 per cent of salts, contains 7.29 per cent. Moreover, the cartilage largely becomes solid bone. The muscles keep pace with this development and, acting upon the limbs and trunk, bring about the curves in the small of the back and at the neck. The infant head differs much from the adult in size and in proportion—the diameter of the former exceeding the height of the face and skull, while in the adult the diameter is but half the height. The bones of the skull are imperfectly joined at birth, which allows the head to mold itself in passing through the rigid pelvis of the mother. There is an entire absence of bone at the anterior fontanelle, the soft spot on the top of the head where the parietals meet the frontal bone. This space is filled by solid bone at the age of a year and a half. If rachitis (q.v.) develops, the space becomes more than full and is knobbed and elevated.

The ribs of the young infant are more nearly horizontal than in later life; hence the barrel-like chest and abdominal breathing. The lungs until birth are collapsed, but with the first cry they are expanded by the inrushing air and never cease their function while life lasts. From now on the heart and lungs coöperate in a very intimate manner, as we shall consider later. The heart at birth is .89 of 1 per cent of the body weight, but the labor of constantly pumping causes it to grow until at maturity it has increased to 12 times its original size, and the left ventricle has become greatly thickened as compared with the right, which only forces blood through the lungs. The infant heart is comparatively small, but the arterial system is large; hence the low blood pressure. Studies by the writer showed an average blood pressure of 91 millimeters at three years, 109 millimeters at 15 years, and thence on to 120–140 millimeters, the standard in the healthy adult.

The eyes are imperfect at birth: the macula lutea is not distinct; the lens is nearly a sphere, which grows less spherical in adult life and in old age becomes flattened. The lachrymal glands for a time do not secrete tears, and the

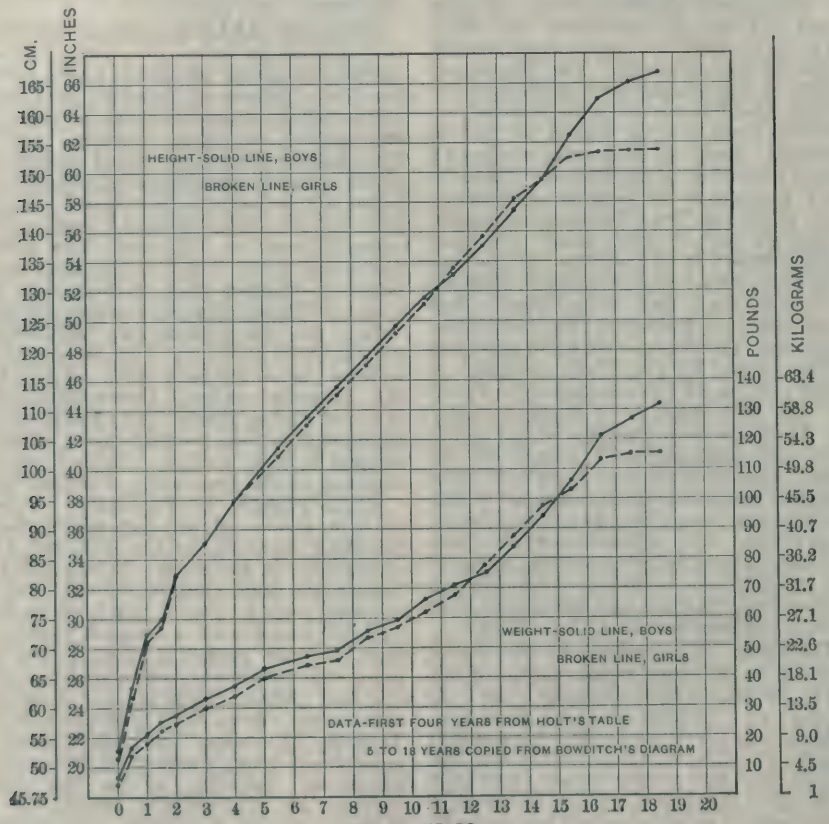

Chart showing height and weight (redrawn from Carr and Yale).

eyes do not coördinate perfectly until the age of three months. The ears undergo considerable change: in the beginning the membrana tympani, i.e., the drum membrane, is on a plane almost horizontal, and the Eustachian tube also. Later, both assume a nearly upright position. In the flattened and patent tube we find one explanation of the ease with which children become affected with catarrhs and infections of the middle ear. At three months the child listens attentively, though it evidently can hear a month earlier.

The digestive tract is practically a long tube. The portion called the stomach is in the infant an upright dilatation, having a capacity of about an ounce and a half. There is little muscle tissue at first and therefore little sphincter action. This accounts for the ease with which infants vomit or pour out the stomach contents. By the time the child is weaned the muscle fibres have grown thick and strong, so that there is peristaltic action sufficient for other foods than milk. The rectum of the young child is straight, as its name implies, and for this reason prolapse of the bowel is common.

The lymphatic system with its glands is early in evidence, but there is more variableness in the glands having secreting functions. The parotid gland, e.g., with its starch ferment, does not functionate until the fifth month. The glands of Lieberkuhn and of Brunner in the intestine are not fully developed until needed to digest mixed diet. The thyroid and thymus glands in the neck behave very unlike—the former relatively diminishing towards adult life, while the latter practically disappears.

The liver is relatively a third larger than in the adult. In general, the liver and lungs have similar ratios of growth and also the heart and kidneys. Secretion and absorption are much influenced by blood pressure, and are normal in the growing child, but distinctly abnormal in the adult with heart or kidney disease. The suprarenal capsule is as large at birth as in the adult, although the kidney beneath will increase 15 times in size.

The blood of the infant is not so rich in hæmoglobin as is that of the adult, therefore it does not carry so much oxygen. The proportion of white cells is high, 2100 at birth and averaging 10,000 to 14,000 at six months, the latter figure being double the normal for adults. Infant blood is deficient in coagulating ferment.

The average infant at birth measures 20.5 inches in length and weighs seven and a half pounds. He has 20 years in which to become an adult in stature and in mental and moral development. Man alone has so long a period of infancy, and it has been said that "the brute pets and playmates of his childhood all die of old age before he reaches his majority."

For the first few days after birth the infant loses weight, but by the end of the first year he has reached three times his birth weight. During the second year he adds six pounds and during the next year four. Growth is not steady, there being periods of special activity, as at the time of the second dentition and a year or two before puberty. Until 12 years of age boys are both taller and heavier than girls, but after that girls assume the lead for about three years. At 14 girls cease to grow much in height, but increase in weight, with the deposit of fat characteristic of adolescence. The changes in growth and in height are clearly set forth in the accompanying chart, adapted from that of Yale and Carr, based upon studies of American children. Statistics of English children show less height and weight, while those of German children show greater.

The Development of the Faculties of the infant were carefully recorded by Preyer, from whom the following statements are mainly taken. During first month: eyes follow object on eleventh day; recognizes sound towards end of the month; first tears on the twenty-third day; begins to hear about fourth day; begins to smile. During second month: recognizes human voices, and direction from which they come; smiles when music is heard; recognizes mother; turns head towards sounds. During third month: moves arms to express pleasure; able to support head a little; listens attentively. During fourth month: eyes coördinate perfectly; reaches after objects; first attempt to sit upright. During fifth month: recognizes strangers as such; holds head straight; sits alone; moves legs as if to walk; stretches out arms to be taken. During sixth month: distinguishes faces, staring at strangers but smiling at friends; turns head towards person leaving the room; begins to creep and to "crow." During seventh month: purposive movements; points with finger at pictures; extends hand when asked; follows objects dropped from hand; associates persons and names; recognizes with pleasure its image in a mirror. During eighth month: sits upright when carried; some children attempt to walk at this time. During ninth month: begins to imitate tunes; laughs heartily; begins to beg for things. During tenth month: takes intense interest in its food; begins to walk alone; answers questions by motions and indicates where certain things are. During eleventh month: stands quite alone; pushes chairs, begins to articulate its own name; understands language fairly well. During twelfth month: imitates laughter of others; puts out arms to enforce its demands; improvement in walking and standing; watches other persons attentively. Fourteenth to sixteenth month: independent speech is acquired; repeats spoken words easily; in seventeenth month speaks short sentences, using verbs; from this time on there is steady improvement in the memory of words and the use of language; at two years repeats rhymes. Colors are distinguished before their names are learned; in fact Garbini found that only 35 per cent of children name colors at six years of age.

Speech. "Action is eloquence, and the eyes of the ignorant more eloquent than their tongues." Actions are much the same in children of all nations, and the gesture language of primitive races and of children is everywhere similar. The intelligent use of words begins at about the second year and increases in proportion to the culture and intelligence of parents or guardians. Recent records show that children have a much larger vocabulary than was formerly taught. For example, the Salisbury boy at five and a half years had 1528 carefully checked words which he "used understandingly." Children can easily acquire any language if they begin to hear it soon enough. Moreover, the natural aptitude of all races is about the same. Three boys, known to the writer—a Hottentot, a Bushman, and a Negro from an asylum—were brought up in the same mission school; they were quite like normal white boys of the same

age. Their bodies were inherited, but their language was acquired.

Teeth. At birth the teeth are in sacs buried in the gums. In six or eight months the lower central incisors come through and are followed at irregular intervals by others until the temporary set of 20 teeth is completed at 24 to 30 months. The accompanying diagram indicates the relative position of the temporary or deciduous teeth with reference to the permanent teeth, also their order and time of ruption. Order in Roman numerals, months and years in Arabic numerals.

The ruption of teeth in the healthy child is a physiological process without disturbance, but in some it is accompanied by swelling of the gums and pain.

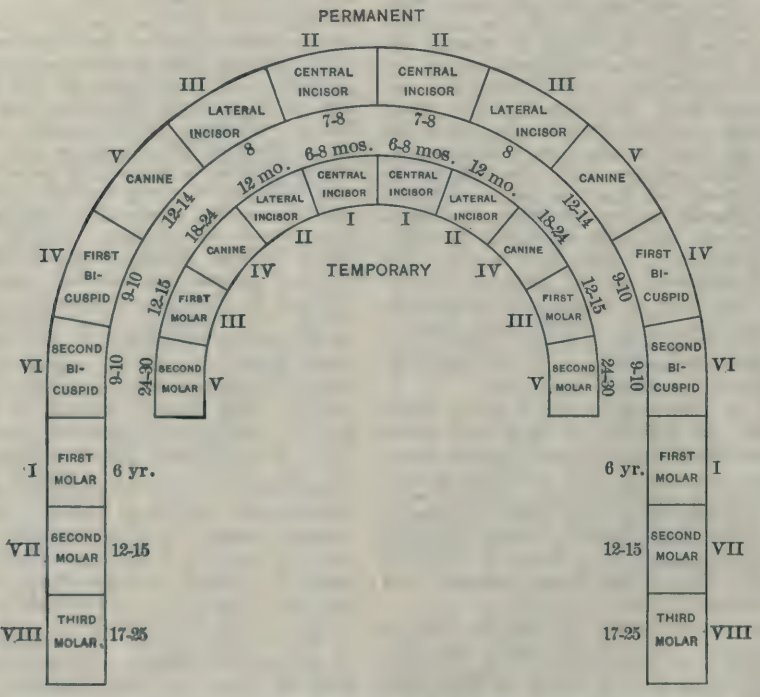

Diagram showing what permanent tooth replaces each temporary tooth, and also the order of succession of the teeth of each set, with time of ruption (in part after Gerrish).

The Brain. At birth the weight of the brain is one-sixth of the body weight, while at 20 years it is one-thirty-sixth; however, "growth is less important than development, and perfect function than either." In the development of the brain the centres first perfected are those presiding over the viscera, as the heart and lungs, then the limbs, next the centres of sensation, and lastly the centres of thought and reason. The child acquires knowledge very rapidly, at first by observing and imitating its associates; reason and conviction are developed after school age. At the adolescent period the child begins to realize that his brain is his own, and his independence may exasperate his superiors. This state passes with the approach of maturity and the realization of personal responsibility. It is said that the nerve cells are not functionally perfect until 18 or 20 years of age; therefore we should not be surprised if the young fail sometimes fully to appreciate truth, right from wrong, or exhibit those moral characteristics that adults have acquired from experience and by injunction. Imagination is active in the child, but logic and judgment are the products of time.

Hygiene of Childhood. The normal body heat of 98.6° must be maintained in young or old in all seasons and climates. The metabolism necessary therefor is dependent upon the amount of muscular activity and the proportion of body surface, both great in the young child. The infant gives off a very large amount of carbonic-acid gas and therefore needs a relatively large amount of fresh air. The skin contains 28 miles of ducts, carrying off effete matter in the perspiration; hence the need of clean skin properly protected. Infants require a daily bath, and older children two or three baths each week. Proper protection means woolen clothing next the skin in cold weather and at all times except when there is great heat. Children, on account of their activity, do not need heavy clothing, but should have warm wraps to wear when at rest. They should never remain in damp clothing or shoes, but change to dry as soon as they cease being active. The circulation is feeble during sleep; hence the need of warm night clothing. The temperature of the sleeping room should be 50°–60° and the windows open according to season. It should be remembered that one gas jet consumes as much oxygen as five persons, therefore excess of lighting should be avoided.

Sleep. The heart rests one-quarter of the time between beats, but the brain can rest only during sleep. A child under four years of age requires a nap in midday; a child of six or eight years, 12 hours of sleep; at 10 years, 11 hours; at 12 to 14 years, 10 hours. A child restless in sleep probably has trouble with his digestion. "Do not blame Providence for parental improvidence." The child should have sim-

ple food and proper action of the bowels daily. Physiological habits must be commenced in early life.

Diet. Children require food both for fuel and for growth, whereas the adult needs are for heat and repair only. The feeding of infants is such an important matter that it will be dealt with as a special topic. (See INFANT FEEDING.) A few simple principles are sufficient for the purposes of this article. After weaning, young children should have an abundance of milk both as food and drink; a variety of cereals; stale breads of all kinds, never hot; baked potatoes; stewed fruits; milk products such as junket, custard, rice pudding, etc. Though meats are not allowed, clear soups are permitted, and a little later chicken is added. Sweets are to be avoided except with meals, and even then if there be feeble digestion. Milk and eggs should be the source of proteids for the very young. They need not be stinted as to vegetables and ripe fruits. When 9 or 10 years old, they may have meat once or twice a day. Healthy children at 12 or 13 years require about as much food as an adult and of as great variety, plain food of course being understood. Neither tea nor coffee is nourishing, and although commonly used should be dropped from the dietary. Milk and cocoa or water are the proper drinks, and if children were taught to chew their food more thoroughly, they would not want so much fluid. Articles difficult of digestion should be avoided, e.g., rich pastries and puddings, hot breads, unripe fruit; among meats, pork, tongue, corned beef, and salted fish; also nuts or cheese in excess. The amount of food required will depend largely upon the weight of the child; e.g., a child of 3 years, weighing 30 pounds, will need 980 calories per day; a 5-year-old, weighing 40 pounds, will need 1200 calories, and a 15-year-old, weighing 100 pounds, will require 2000. The chemistry of food and the fuel value of ordinary diets will be found under FOOD (q.v.).

Exercise. Children play with little urging, but not always in active games. An active body means an active circulation, which in turn leads to an active mind. Young boys and girls should play the same games together, especially out of doors. At the time of puberty there are anatomical and physiological reasons for the girl desisting from some of the more strenuous sports. A list of active games for young children would include hoop rolling, skipping rope, bean bags, handball, tether ball, roller and ice skating, and, for indoors, calisthenics. Older children will play baseball, tennis, hockey, "shinny," leapfrog, tag, etc., and will also row and swim. It should be stated, as a principle, that adults may wisely suggest games, but that they are to be carried through with a minimum of outside interference.

Play is work to children and an important factor in their development. They are keenly interested in company drills, military, Swedish, or any of those common in school and gymnasium. Gorst especially advocates jiu-jitsu, which in Japan is practiced by men and women without apparatus other than their partners. Rankin wisely remarks that "some children break down from overstudy, but more from underhygiene." See PARENT AND CHILD; CHILD STUDY; CHILD PSYCHOLOGY; CHILD LABOR.

Bibliography. There has grown up a very extensive literature upon "the child" viewed from many sides. The following titles indicate works each of special value in its own field. Preyer, *The Mind of the Child* (1881); Hall, *Adolescence* (1904); Chamberlain, *The Child* (1900), with very extensive bibliography; King, *Psychology of Child Development* (1906), also extensive references; Rankin, *Hygiene of Childhood* (1890); Oppenheim, *The Development of the Child* (1898); Rowe, *Physical Nature of the Child* (1899); Gorst, *The Children of the Nation* (1907); Pfaundler and Schlossman, *Diseases of Children* (1912), for metabolism, foods, etc.

CHILD, FRANCIS JAMES (1825–96). A distinguished American scholar and teacher. He was born in Boston, was educated there in the public schools, and graduated from Harvard College in 1846. He immediately entered into the service of the college, becoming in 1851 Boylston professor of rhetoric and oratory, and in 1876 professor of English, which post he held until his death, Sept. 11, 1896. His zeal for learning and genuine love of literature, supplemented by a thorough knowledge of the best in foreign scholarship, enabled him not only to make his courses at Harvard very valuable, but also to enrich American scholarship with a series of excellent editions and studies. His contributions are an edition of *Four Old Plays* (1848); the *Poetical Works of Edmund Spenser* (5 vols., 1855), which remains the best edition of the poet and which was his special contribution to the American edition of the British poets, of which he was general editor; *Observations on the Language of Chaucer* (1862); *Poems of Sorrow and Comfort* (1865); *Observations on the Language of Gower's Confessio Amantis* (1866); and his greatest work, the definitive and monumental edition of the *English and Scottish Ballads*. This was first issued in 8 small vols. (Boston, 1857–58) and, after a most painstaking research and revision, appeared in 10 large vols. (Boston, 1882–98). For biographical sketches of Professor Child, consult Norton, in vol. vi of the *Harvard Graduates' Magazine* (Boston, 1899), and Kittredge, in the revised edition of the *English and Scottish Ballads* (1904).

CHILD, SIR JOSIAH (1630–99). An eminent London merchant and one of the popular English writers on commerce and political economy. He was the second son of Richard Child, a merchant of London. His principal work is entitled *Brief Observations Concerning Trade and the Interest of Money* (1668); a second edition, much enlarged, entitled *A New Discourse of Trade*, was published in 1694. In this work Child takes the position of a moderate mercantilist, accepting the balance of trade doctrine, but urging the advantage of a relaxation of the restrictions upon trade. The work was translated into French by Gournay in 1754 and exerted an important influence upon the development of liberal doctrines. The work is also of significance as a contribution to the literature of pauperism. Child was one of the directors, and for some time governor, of the East India Company, and a tract entitled *A Treatise wherein it is demonstrated that the East India Trade is the most National of all Foreign Trades* (1681) is attributed to him. In 1678 he was created a baronet. He died June 22, 1699.

CHILD, LYDIA MARIA FRANCIS (1802–80). An American author, born in Medford, Mass. Inspired by an article in the *North American Review*, she wrote a novel dealing with early New England life entitled *Hobomok* (1821).

Her next story, *The Rebels* (1822), dealt with Boston before the Revolution. In 1829 she wrote *The First Settlers of New England*, and in 1836 a biography of Madame de Staël. After a short experience at school-teaching, she married, in 1828, David Lee Child, a journalist, and a little later, coming under Garrison's influence, both she and her husband found their real life work. In 1833 she published what is regarded as the first antislavery book by an American, *Appeal for that Class of Americans Called African*. She was, of course, more or less ostracized, but made converts. In 1840 she began to edit the *National Anti-Slavery Standard* in New York. In 1844, with her husband, she settled in Wayland, Mass., and continued her work of propaganda, having meanwhile published many volumes of a miscellaneous nature, including her best performance, *Philothea* (1836), a tale of the time of Pericles. In 1853 she issued *Isaac T. Hopper: A True Life* (reprint, New York, 1881), having learned to know that philanthropist during her stay in New York. She should also be remembered as a writer for children. Her literary work has not continued popular, being often overambitious, as in the case of her *Progress of Religious Ideas through Successive Ages* (3 vols., 1855); but her personality was a fine one and is well depicted in Higginson, *Contemporaries* (Boston, 1899). Consult her *Letters* (Boston, 1882).

CHILDBIRTH. See Obstetrics.

CHILDEBERT. See Franks.

CHILDE (chīld) **HAR'OLD'S PILGRIMAGE.** A narrative poem, by Lord Byron, in four cantos, the first two of which appeared in March, 1812, in quarto, and the last two in 1816 and 1818, severally. The publisher, Murray, gave £600 for the first two cantos and 2000 guineas for the fourth. The piece abounds in descriptive passages and is conceived in an eminently "Wertheresque" spirit, detailing the impressions of a romantic youth during his *Wanderjahre*.

CHILDERMAS, chīl'dēr-mâs (AS. *cilda mæsse*, or *cildra mæsse*, children's mass), or Holy Innocents' Day. A day (December 28; in the East, December 29) observed by the Roman, Greek, Anglican, and other churches in remembrance of the children killed by Herod. The learned Gregory says: "It has been a custom—and yet is elsewhere—to whip up the children upon Innocents' Day morning, that the memory of Herod's murder might stick the closer." It is also a holiday in the Church of England.

CHILDERS, chīl'dērz, Erskine (1870–1922). Irish revolutionist, opposition leader to the Free State in 1921; the son of R. C. Childers, the Orientalist; educated at Trinity College, Cambridge, and became widely known in 1903 by his book *The Riddle of the Sands*, which prefigured a German invasion. For many years he was a champion of Home Rule, and in 1917–18 was in the secretariat of the Irish Convention. When that body failed, he went to the extreme in opposition and became a leader in the revolt against the new Free State government after the peace negotiations in 1921. He was captured by Free State troops in County Wiklow, Nov. 10, 1922, tried by court martial and shot Nov. 23. He also wrote a volume of *The History of the War in South Africa*, published by the London *Times* (1907); *German Influence on British Cavalry* (1911); and *The Framework of Home Rule* (1911).

CHILDERS, Robert Cæsar (1838–76). An English Oriental scholar. He was educated at Wadham College, Oxford, where he was Hebrew scholar. In 1860 he was appointed a writer in the Ceylon Civil Service and acted as private secretary to the Governor, Sir Charles McCarthy. The state of his health forced him to return to England in 1864, and in 1872 he became sublibrarian at the India Office, London. From 1873 until his death he was the first professor of Pali and Buddhist literature at University College, London. While a resident in Ceylon, Childers had acquired a thorough knowledge of the Singhalese or Ceylonese language. In 1869 he published his first contribution to Oriental literature, in the *Journal of the Royal Asiatic Society*. This was the Pali text of the *Khuddaka Patha*, with a translation into English, and notes. It was the first Pali text ever printed in England. To the preparation of the Pali dictionary, of which he felt the imperative need, Childers devoted nearly all of his time from 1869 until his death. This work was completed in 1875, in 2 vols., and was awarded the Volney prize for 1876 by the Institute of France. After the completion of this great work he contributed many minor papers to the transactions of the learned societies, and had in contemplation a complete translation of the Buddhist Jataka Book. His unwearied exertions, however, told upon his enfeebled constitution, and he developed consumption, of which he died, July 25, 1876.

CHILD LABOR. The employment of children in industry, while dating from the earliest historical times, did not become a social problem of the first importance until the introduction of the factory system in England in the latter part of the eighteenth century, in other modern countries during the nineteenth century, especially after 1860. Under earlier conditions the employment of children, either under their own parents or as apprentices under a master bound by law and custom to safeguard their interests, was regarded as an excellent thing. Thus the habits of steady industry, so necessary under the existing system of production, were inculcated in the earliest years. The close personal relation between the master and apprentice or parent and child and the restraining influence of public sentiment were, as a rule, sufficient to prevent serious abuse; moreover, experience showed that it was difficult to drive a child beyond his powers of physical endurance.

In the last quarter of the eighteenth century the introduction in England of power machinery for spinning cotton, and later for spinning wool and for weaving, brought about a fundamental change in the conditions of child labor. The work required rather deftness than physical strength; accordingly the labor of children was in many cases more productive than that of the existing adult population, trained in agriculture or in the more leisurely methods of domestic industry. A large supply of child labor was to be had from the poorhouses, the custom having long existed of apprenticing pauper children to any person who would engage to bring them up to honorable employment. Accordingly the new cotton mills in the north and west of England collected pauper children throughout the kingdom, obtaining their services for the cost of their maintenance. Profits were naturally high at first, and competition increased. In the struggle to maintain profits the various manufacturers—especially those who operated antiquated

machinery—lengthened the hours of employment for their child workers and cut down the costs of food and housing, until at last an indescribable condition of child slavery came into existence. Children of five years were in some cases compelled to work from 13 to 16 hours a day; their food was barely sufficient to keep them alive, and no regard was had for the most primitive rules of sanitary housing. At length in 1802 an Act of Parliament limited the working day to 12 hours, forbade night work, and required elementary instruction for apprentice laborers in cotton factories. In the meantime the competition of the factories had practically destroyed domestic production of textiles, and families formerly engaged in home work were driven to migrate to the factory towns, where the low rate of wages and high cost of living compelled them to place their children in the mills. To such children the Act of 1802 did not apply; and the evils of the apprentice system were duplicated in the case of children living with their parents. In 1819, after many years of agitation, a law was enacted forbidding employment in cotton factories of all children under nine, and limiting hours for children under 16 to 12 daily. No special provision was made for the enforcement of the law, and it was frequently evaded. In 1825 an Act was passed which provided a Saturday half holiday for child workers in cotton factories, and in 1831 night work of persons under 21 was prohibited. This legislation was replaced by the Factory Act of 1833, which made provision for factory inspectors, prohibited night work for persons under 18, fixed 48 hours a week as the maximum for children between 9 and 13, and 69 hours for persons between 13 and 18. Two hours' schooling per day was required for all children. The Act applied to all textile works with the exception of silk mills. In 1842 employment of children under 10 in mines and collieries was prohibited. The Act of 1844 limited the hours of children under 13 to 6½ per day and required school attendance for the remaining half day. In 1848 the hours for children under 13 were limited to 5, and those of "young persons" (13–15) to 10. This Act may be regarded as the basis of all modern regulation of child labor. In the following three decades a number of acts were passed extending the scope of the law and improving its machinery for enforcement. In 1878 all previous legislation was consolidated into one great factory act. The minimum age of employment was raised to 10 years, and children from 10 to 14 might be employed only one-half day or on alternate days. For persons from 14 to 18 the work day was required to begin at either six or seven in the morning and to close at the same hours in the evening, with an intermission of two hours for meals and rest. All Saturdays were made half holidays, as well as eight other days in the year. Minute regulations were made relative to the fencing of dangerous machinery and to sanitary conditions. In 1902 a new and more complete code went into effect, raising the minimum age to 12 years. Many of the provisions of the law were extended to home workshops.

In the United States, while some children were employed in factories in the first half of the nineteenth century, the problem did not become serious until the great industrial expansion in the first decade after the Civil War in the Eastern and Middle Western States and in the last decade of the century in the Southern States. By 1879, in Massachusetts children from 8 to 11 were found working in factories from 11 to 14 hours daily. Even worse conditions prevailed in New York and Pennsylvania. According to the census of 1900 children under 16 formed 13.3 per cent of all persons engaged in cotton manufacture in the United States. In 1909 the percentage had declined to 10.4. For manufactures in general the percentage of children under 16 declined from 3.4 in 1899 to 2.4 in 1909. The largest percentages of child workers were in South Carolina (12.9) and North Carolina (11.3). The total number of children under 16 employed in manufactures remained practically stationary through the decade 1899–1909. In the former year the number was 161,276; in the latter, 161,493. The greatest employer of child labor in 1909 was the cotton manufacturer (40,221). Hosiery and knit goods (11,111) and canning and preserving (11,035) were next in order of importance. Over one-half of the children employed in industry were found in the Middle Atlantic States (44,464) and the South Atlantic (41,856). New England employed 33,575.

Laws relating to child labor in the United States generally fix a minimum age limit prohibit certain kinds of employment for children, as dangerous to health or morals, limit the number of hours a person under a certain age may be employed, prohibit night work for children, and, in a large number of cases, fix educational requirements for children under a given age as a prerequisite to employment.

The attempt to regulate child labor by the Congress of the United States has not been very successful. In 1916, after years of effort, a law was passed by Congress which prohibited the employment of children in mills, factories, mines, and quarries under the power of Congress to regulate commerce among the several States. This law became effective on September 1, 1917. Almost immediately the constitutionality of the statute was attacked. The opponents of the measure stated in the hearing before the Supreme Court that the statute contravened the "due process" clause of the fourteenth amendment, and that it deprived the States of opportunity to limit the ages of employment so as to adjust them to differences of climate, industry, and wealth. The government argued that the new knowledge of child hygiene and the newer ideals of preparation for citizenship and economic efficiency made child labor repugnant to the modern standards of morality. The government also showed how the States with advanced child labor laws suffered from the competition of States with inadequate laws. The decision of the Supreme Court was handed down on June 3, 1918. It declared the act unconstitutional, on the grounds that it interfered with the powers reserved to the States under the tenth amendment. The question of child labor in mines and factories was a "matter purely local in its character." "The power of the States to regulate their purely internal affairs by such laws as seem wise to the local authorities is inherent and has never been surrendered to the general government." It was further held that the act transcended the power of Congress over interstate commerce.

Congress almost immediately determined to pass a new law which would avoid the constitutional pitfalls of the old one. An act was signed

by President Wilson, on February 24, 1919. This act placed a 10 per cent tax on the net profits of any mine or industry in which child labor was employed, thus shifting the constitutionality of the law from the interstate power clause to the broad field of taxation. Public opinion seemed to believe generally that the law would stand the test of the courts and be declared constitutional. The opium law and the sulphur match law were cited as similar taxation laws which had been upheld. A suit was brought under the law in the courts of South Carolina and the measure was declared unconstitutional. The case was appealed to the United States Supreme Court and came before that body on December 10, 1919. A decision was not handed down until May 15, 1922. Contrary to widespread belief the act was declared unconstitutional. The law was attacked on the ground that it attempted to regulate an exclusively state function in violation of the tenth and fourteenth amendments, and was defended as a mere excise tax levied by Congress under its broad power of taxation. The decision, which was rendered by Chief Justice Taft (without dissent), stated that the law was invalid because it was an attempt by Congress to regulate through its taxing powers, something entirely within the jurisdiction of the various States in the exercise of their police powers. The decision also attacked the idea of taxing as a "penalty" instead of as a means of revenue.

These two decisions of the Supreme Court thus left the question of child labor entirely in the hands of the States. One of the most useful sources of information, nevertheless, comes from a Federal Bureau (the Children's Bureau, under the Department of Labor), which was created in 1912 to systematize inquiries into the conditions under which children, particularly child laborers, live throughout the country. The legal standards adopted by the various States to protect children from the hazards of too early employment are summarized by the Children's Bureau as follows: In all except 4 States the minimum age for work at least in factories and often in many other employments is placed as high as 14 years, and 7 States have an age minimum of 15 or 16 years. Exemptions exist in most of these States, but they apply in many cases to children employed outside school hours or during vacations. Twenty-nine States have recognized the 8-hour day standard for children under 16 by prohibiting them from working longer hours in certain occupations, or by extending this prohibition to all gainful employments, usually, however, exempting housework and work on farms. Of the other States, nearly half limit the working hours in the regulated occupations to 54 or less a week. The 11-hour day still exists in 2 States, with a weekly maximum of 60 hours. Forty-one States have some prohibition of night work applying to children under 16, and of these 17 prohibit such work without exemptions, except in some cases for agricultural pursuits and domestic service. Eighteen States, including some of the principal industrial States, require a child under 16 to have a physician's certificate of physical fitness before he can obtain an employment certificate, and 10 others permit the certificate-issuing officer to impose this requirement in his discretion. For work in mines the general minimum age standard is 16, but 10 States still permit the employment of boys 14 years of age, and 6 have no minimum age for such work.

The administration of the child labor laws is in some States intrusted to factory inspectors. In some States, especially in the south, no machinery for enforcement is provided. In very few of the States is the law effectively enforced. Trade unions and voluntary organizations give active aid to enforcement agents. In some 15 States child labor committees have been formed to secure the carrying out of existing laws and the enactment of further legislation. The State committees are federated in a National Child Labor Committee, which holds annual meetings and carries on a propaganda throughout the country. In this way it is hoped that one of the most serious objections to child labor legislation may be removed, viz., that stringent laws in one State tend to drive industries across the border into States where such laws are lax or uninforced. A uniform child-labor law was adopted by the committee in 1911, which in several instances has been enacted by State legislatures.

Before the Great War which broke out in 1914, the child labor laws in the various European countries were very strictly enforced. Great Britain was the pioneer in child labor legislation (1833). Germany modelled her law after Great Britain's (1839). In other countries child-labor legislation is of much more recent date. European laws fixed a minimum age, limited the working day for children employed in certain occupations, and prohibited night work and employments, regarded as dangerous to health or morals. Although the standards were high in some countries, the general average was considerably below that of many of the American States.

The effects of the war were serious and far-reaching. The combination of high wages and high prices had resulted in the United States in children leaving the schools at earlier ages, being more irregular in attendance, applying more frequently for work permits, or otherwise reducing their schooling. A systematic propaganda as to the advantages of an education and the severe economic depression that followed the war resulted in a strong "back to school" movement which rapidly restored the pre-war conditions.

In Europe the effects of the war on child labor were far greater than in the United States. In Great Britain alone it was estimated that more than 600,000 children were prematurely taken from school. In the other European countries practically all restraints and safeguards were cast aside. General estimates placed the number of children engaged in all forms of industry anywhere from 25 to 50 per cent of those of school age.

The child-labor question was so pressing that the Commission on International Labor, appointed by the Peace Conference, recommended, among other things, a minimum age of 14 for all countries. The Peace Conference failed to adopt the recommendation but adopted instead a resolution, providing for "the abolition of Child Labor and the imposition of such limitations as shall permit the continuation of their education and assure their proper physical development." In 1921 and 1922 the International Labor Office of the League of Nations (Geneva) reported progress from a number of countries that have passed laws restricting child labor.

CHILD OF NATURE, THE. A play by Mrs. Inchbald. It was produced at Covent Garden, Nov. 28, 1788, and published in London.

CHILD OF THE SEA. A surname given to Amadis de Gaul, the mediæval hero. It originated in the story that, while still in his cradle, he was thrown into the ocean by his mother to conceal her dishonor.

CHILD PSYCHOLOGY. The study of the mind of the child forms one department of general psychology. The existence of such a department implies that the mental processes of the child are, in a certain measure, different from our own or, perhaps, that they demand a special method of investigation. In some cases the child has been subjected to experiment and asked to give a verbal report, though it must be admitted that these cases are few in number. The methods employed in the experiments of Darwin and Preyer are precisely the same as the methods of animal psychology (q.v.), except that they were not so well controlled; the behavior of the infant was taken in lieu of a verbal report and was interpreted as accurately as might be. The behavior report is, however, much less precise than verbal report, and the interpretation also must therefore be less precise. Moreover, neither kind of report is of scientific value unless the experiment has been controlled, unless every known source of error has been eliminated and the experiment varied and repeated. Unfortunately these conditions have not been met in a large proportion of the work in child psychology. An evaluation of the results cannot be made, therefore, until the methods have been examined.

One of the methods used extensively in child psychology is known as the questionary method. The procedure is to prepare a list of questions and to send it to parents, interested friends, teachers, students, etc., with the request that they record the behavior report of the child. In cases of this kind it is evident that the person who records the report is, ipso facto, an experimenter, whose business it is to note the conditions, to eliminate the errors, and to interpret the report. As a general rule, such an experimenter is untrained in scientific method, is unable to distinguish between fact and fancy, and he may have a personal affection for the child and a desire to show its superior intelligence. The results are, then, on a par with those obtained by the anecdotal method of animal psychology. The person who originally submitted the lists, and who also has the task of interpreting the many replies, is a second experimenter, who has at hand a large amount of material obtained under conditions of which he knows practically nothing; who finds that many of his questions have not been answered specifically, while some replies defy interpretation; who is forced to sift, to pick and choose, and, finally, to bring his material under some imposed system of classification; so that the accuracy of the final product is doubtful in the extreme. However, it should in justice be said that many psychologists have never used the method, and that of recent years it has tended, save in a few exceptionally favorable cases, to fall into disuse.

Another method which has been frequently employed, and which may be designated the "diary method," has proved to be of greater value, especially when employed by skilled observers. By its use we have obtained a great deal of knowledge of the sensory and motor development of the infant, of the beginnings of its perceptual and emotional life, and of its early attempts at the construction of a language.

The psychology of the child of school age has been investigated, for the most part, by means of methods devised for the purposes of experimental pedagogy. These methods usually take the form of tests, and they are designed to discover the "ability" of the child to discriminate between stimuli, to concentrate the attention, to memorize such and such material, etc. (See MENTAL TESTS.)

It appears, from this brief review of its methods, that child psychology, as it exists, is not a structural or qualitative psychology, but is rather a functional or statistical psychology. The fault, if it be a fault, is not due to method per se; for, with additional refinements, a qualitative study of the child mind would be possible. The results obtained, however, are of the kind needed by experimental pedagogy, in the interest of which much of the investigation has been done. Moreover, the results do not show us a typical child mind, as experimental psychology has given us a typical adult mind; but there are several child psychologies, each typical in the sense that it discusses the same set of faculties or capabilities at different levels. Since, now, these capabilities are functions of the nervous system, and since the nervous system shows well-marked periods of growth and development, child psychology is necessarily written from the genetic point of view, and the stages of mental development are naturally brought into correspondence with periods of physical growth. (See CHILD STUDY.) We have, then, three periods: infancy, from birth to school age; childhood, from school age to puberty; and adolescence, from puberty to about the twenty-fifth year. However, from the psychological point of view as opposed to the physiological, the first six years in the life of the individual comprise two epochs, that which precedes and that which covers the acquisition of language; the period of infancy, therefore, might well be subdivided.

The most general result of the investigations of the child mind is that the sensitivity and the power of discrimination of the child, in all sense departments, are less than in the adult; and they are the less developed, the younger the child. However, with the possible exception of sound, the newly born infant experiences intensive stimuli of all kinds.

By the end of the first six months the child has learned to perceive and localize objects within its reach, has recognized persons, and

has experienced the emotion of fear. By the close of the first year the child has perceived objects at a distance, has experienced the emotion of anger, has learned to walk, and has thereby increased his notions of space. He is also learning to speak, a fact which probably marks the beginnings of conscious meaning. From this time until the school age of the child the most important acquisitions are those of the images of memory and imagination. These images are apparently more vivid than in adult experience, and it is with great difficulty that memories and fancies are distinguished from each other and from sensory experience. Sensory discrimination and sensibility develop slowly. The ability to name colors is poorly developed even by the seventh year, though white and black are well known; of the colors, red and orange are best known, then follow purple, violet, and blue, then green, and finally yellow; pitch discrimination and memory for melodies show wide individual variation. Spatial perceptions develop much earlier than temporal; infants from 14 to 16 months are often able to follow a rhythmical movement, but boys of six and seven years have shown great difficulty in marking a rhythm with the proper time intervals; children also have much difficulty in forming temporal ideas of long periods of time, like weeks or months, though the shorter periods of the day give less trouble. The most important characteristic of the adolescent period is the appearance of new emotions, many of which are doubtless the correlate of the development of the sexual life; but the intellectual, ethical, æsthetic, and religious sentiments also, as a rule, become manifest for the first time.

CHILDREN, Diseases of. Diseases of children have occurred as far back in history as have diseases of adults, but in recent years their study has become a recognized specialty under the title "Pediatrics" (child cure).

Monographs on the subject began to appear in the fifteenth century, usually in Latin. The English translation of Harris's *De Morbis Acutis Infantum* appeared in 1734; the original appeared in 1715. French and German books followed at intervals, and by 1850 Meissner of Leipzig completed his *Grundlage der Litteratur der Pädiatrik* containing 7000 titles.

Among the larger works should be mentioned Keating's *Cyclopædia of the Diseases of Children*, 1889, and *The Diseases of Children* by Pfaundler and Schlossman, 1908. Americans seem to give more attention to the diseases of children than do other nations, and the specialty is well recognized here. A few authors have subdivided the specialty and now treat of the surgery of children. A generation ago medical students heard the subject alluded to or attended an occasional clinic by the midwifery professor, who might show a sick child. Now every well-regulated college has a chair of pediatrics with regular lectures and clinics.

Since 1880 there has been a children's section in the leading medical associations, both here and abroad. The American Pediatric Society was founded in 1889. In 1913 New York City contained 121 hospitals, 12 of which were specifically for children, and most of the general hospitals had a children's ward. These statements indicate the importance of the subject. Children are not merely small adults. They differ in anatomy, in much of their physiology, and in their reaction to drugs. (See Child, Development and Growth of.) The children's physician has a field quite his own, with distinct pathology, symptomatology, and therapeutics.

Children give off heat rapidly and therefore bear cold badly. They are, consequently, frequent sufferers from catarrh of the nose, throat, lungs, and intestinal tract. The tonsils are frequently enlarged in the young, and with that condition may occur adenoids (q.v.). Bronchitis is very common and causes 45 per cent of the deaths under five years. Pneumonia is of the catarrhal form in children, rather than croupous, as in adults. Diarrhœa and enteritis are catarrhal troubles and cause seven times as many deaths under two years as after that age. In 1910, in the registration area of the United States, 28.9 per cent of infant deaths were diarrhœal. Intussusception of the intestine is an infantile ill and often fatal. Most intestinal diseases of childhood and infancy are unlike those of adults in that they are more severe and likely to be fatal.

Fevers are well borne by the young, even typhoid, which they not infrequently contract from infected milk. Diphtheria and the eruptive fevers, as measles, scarlet fever, German measles, chicken pox (q.v.), are counted as children's diseases, though adults may have them if they have not acquired immunity by attacks in youth. Croup is diphtheritic membrane in the larynx. It calls for antitoxin as much as if it were a visible exudate in the throat.

The nervous system is undeveloped in the young; hence the readiness with which they have fits or convulsions, not as the initial symptom of acute illness, but at any time. Poliomyelitis, or infantile paralysis (q.v.), and chorea (q.v.), or St. Vitus's dance, are seen in the young almost exclusively. Hydrocephalus, acute or chronic, begins in early life. According to Gowers, 12 per cent of the cases of epilepsy begin before three years of age. In the intestinal tract we find parasites: *Ascaris lumbricoides*, or round worms, and *Oxyuris vermicularis*, or threadworms. The child host of a tapeworm generally entertains *medio-canellata*, while the adult harbors *Tinea solium*. (See Worms.)

Acute articular rheumatism is not so common in children as in adults; nevertheless they often have valvular lesions of the heart. Tuberculosis occurs in the lungs of children, to be sure, but its favorite seat of attack in the young is the bones or glands. Orthopædic hospitals are mostly filled with children, and the majority of them suffer from spinal, hip, or other joint diseases that are probably tuberculous. Any doubt as to diagnosis is cleared up by the Von Pirquet test, a cutaneous inoculation with tuberculin (q.v.). Enlarged glands were called strumous by the older writers, but are now regarded as tuberculous. (See Scrofula.)

There are several rare affections of the newborn known by the names of the first describers —*Buhl's disease*, an acute fatty degeneration of the tissues with ecchymosis and extravasations of blood everywhere. The symptoms are very like phosphorous poisoning. It is caused by an

infection of unknown origin and leads to death in a week. *Winckel's disease* is similar, being a disorder showing a tendency to punctiform hemorrhages, jaundice, cyanosis, and hæmoglobinuria. It is at times endemic and usually ends in death. *Barlow's disease* is infantile scurvy, and is found in older infants, especially those fed upon improper artificial foods. It is characterized by hemorrhages in the gums and under the periosteum of the long bones, thereby causing pain on motion or on being handled. *Duke's disease*, also called "Fourth disease," is in its *eruption* like scarlet fever, though the temperature does not rise so high nor are there likely to be serious sequelæ.

The following diseases are common in infancy and childhood, but show deviations from the adult form when occurring. *Jaundice* or *Icterus neonatorum:* This appears on the second or third day after birth and continues for a week or two in varying degrees of intensity. It is due in some cases to sepsis rather than to obstruction of the bile ducts, as in later life. No treatment is required, though saline laxatives are sometimes given. *Diseases of the navel:* If the navel fails to heal properly, it may be dusted with boric acid. Should it tend to form a hernia, it should be reduced by placing a coin firmly upon it and fastening it with adhesive plaster. *Congenital debility:* This is not always from prematurity nor from syphilis. Warmth and proper nourishment will effect a cure. The first is had by putting the baby in an incubator; the second will tax the ability of the physician to the utmost. *Scleroderma:* A serous or adipose hardening of the skin, chiefly of the lower extremities, but extending all over the body. It begins soon after birth, and if slight will recover under the use of warmth. The cause is not known. *Diseases of the blood:* As compared with the adult, the infant blood contains less hæmoglobin and an excess of leucocytes, or white cells. Many illnesses result in anæmia, and many conditions lead thereto, e.g., poorly ventilated schoolrooms. The remedy is plenty of fresh air, or the out-of-doors school in some cases. To these add iron, arsenic, and other tonics, with a liberal diet, preferably vegetable. *Leukæmia:* A disease with excessive increase of white blood cells and an increase in size of the lymphatic vessels and glands. It is possibly due to parasites. The spleen becomes very large. Treatment is unsatisfactory, death occurring in a few weeks or months. Cause unknown. The blood shows diminished hæmoglobin and in general the picture of anæmia with nucleated red cells. The mortality of hæmophilias is 87 per cent (Von Etlinger). *Heart disease* is likely to show in the pulmonary or mitral valves in the young, whereas the aortic valves are affected in later life. The *tumors* of childhood are most often sarcomata, rather than cancer as in adults.

The therapeutics of childhood differs from that of the adult in more than the size of dose administered. The young do not bear cold baths well, nor bleeding, nor shock. Burns and blisters are exceedingly severe on the tender skin of the child. Opiates must be given with care, if at all, and not often repeated. Preparations of arsenic, belladonna, iron, and mercury, on the other hand, are well borne in comparatively large doses. Mercury, if given in too large quantity, does not salivate the child, but causes intestinal irritation. The child tolerates heart stimulants in large doses, but not so depressants. The metabolism of childhood is active, and the prognosis is better than in adult life, because of the strong tendency to growth and repair instead of degeneration.

Consult: Holt, *Diseases of Infancy and Childhood* (1911); Sachs, *Nervous Diseases of Children* (1905); Pfaundler and Schlossman, *Diseases of Children*, Eng. trans. by Shaw and La Fetra (1912); Grulee, *Infant Feeding* (1912); Batten and Thursfield, *Diseases of Children* (London, 1913).

CHILDREN, Societies for. In modern charitable work great emphasis is laid upon work for the children, as they stand in the greatest need of protection and assistance and can be most easily influenced for the better. The children's aid societies and foundling hospitals care for the dependent children and find homes for them, while the Humane Association and Society for the Prevention of Cruelty to Children shield them from abuse. Juvenile offenders are trained in industrial schools and reformatories. There are homes for crippled children, special hospitals for the sick, crèches for those whose mothers must work, schools for the deaf and dumb, the blind, and feeble-minded. Boys' and girls' clubs are found in all cities. Home libraries bring books within easy reach. In some States boards of children's guardians become responsible for those left destitute. See Dependent Children; Penology.

CHILDREN IN THE WOOD, The. A British ballad, better known under the title of "The Babes in the Wood." According to Ritson, it "appears to have been written in 1595, being entered that year on the Stationers' Books." Bishop Percy considers the subject to have been derived from an old play by Robert Yarrington (1601), which tells of "a young child, murthered in a wood by two ruffins with the consent of his unkle." As the scene of the latter piece, however, is laid in Padua, not in Norfolk, Percy's reasons for a later date are by no means conclusive. As a matter of fact, nothing is definitely known of the authorship or date of the poem. A black-letter copy, very old, was contained in Pepys's collection and bore the title *The Children in the Wood, or the Norfolk Gentleman's Last Will and Testament; to the tune of Roger.*

CHILDREN'S AID SOCIETY. An association for rescuing neglected, wayward, and dependent children. The first was started in New York City in 1853 by Charles L. Brace. Its objects are to rescue neglected and dependent children, train them, and find situations and homes, chiefly in country districts. These and similar societies, under various names, are found in all cities and have done a valuable work. See Dependent Children.

CHILDREN'S BUREAU. A bureau established under the Department of Commerce and Labor (in 1913 placed under the Department of Labor) by law of April 9, 1912. Under the law the bureau is authorized to investigate, and report to the Department of Labor, all matters pertaining to child welfare and child life. Such matters as the birth rate, infant mortality, juvenile courts, accidents and diseases of children, child labor, labor laws of the various States affecting children, are specified in the law as falling within the province of the bureau. The bureau is under the direction of a chief appointed by the President with the advice and

consent of the Senate. The first chief of the bureau was Miss Julia C. Lathrop.

CHILDREN'S COURTS. See JUVENILE COURTS.

CHILDREN'S CRUSADE. A movement in 1212, in which thousands of boys and girls with some older persons set out to recover Jerusalem. Many French children wandered about in processions for a time, but soon were compelled to return home. The German children, who are said to have numbered 20,000, marched up the Rhine valley, across the Alps, and down to Genoa. They believed the Mediterranean would open and leave a passage, as the Red Sea had done for the children of Israel. Some went on to Rome and Brindisi; some were induced to embark and sold into slavery; some remained in Italy; the remnant returned home after some months of wandering. The movement excited great interest among contemporaries and gave rise to many false stories. Modern accounts, such as Gray's *Children's Crusade*, have generally followed the fabulous tales and are untrustworthy. See *American Historical Review*, April, 1914, for the true story.

CHILDRESS. A town and the county seat of Childress Co., Tex., 200 miles (direct) northwest of Fort Worth, on the Fort Worth and Denver City Railroad (Map: Texas, B 2). The railway shops are located here and comprise the town's chief industry. The water works are the property of the municipality. Pop., 1900, 697; 1910, 3818.

CHILDS, GEORGE WILLIAM (1829–94). An American publisher and philanthropist. He was born in Baltimore, entered the navy in 1842, and spent 15 months in the service. He then became a clerk in a bookstore in Philadelphia, but established an independent business in 1847, and in 1849 became a partner in the publishing house of Childs and Peterson. In 1864 he purchased the Philadelphia *Public Ledger*, one of the earliest cheap newspapers of the country, which under him attained a wide circulation and influence. His public gifts were munificent, including a memorial window in Westminster Abbey to Cowper and George Herbert; one in St. Margaret's, Westminster, to Milton; a reredos in St. Thomas's, Winchester, commemorating Bishops Ken and Andrews; a monument at Kensal Green to Leigh Hunt; a memorial fountain at Stratford-on-Avon; and in the United States, the presentation to the Typographical Society of Philadelphia of the printers' cemetery, Woodlands, in that city; the erection of monuments over the graves of Edgar A. Poe and Richard A. Proctor; the erection of a stone cross on the site of the first Christian service on the California coast, at Point Reyes; and a subscription that made possible the erection and endowment of the Home for Union Printers at Colorado Springs. His benefactions to private persons also were large. Childless himself, he educated as many as 800 boys and girls. He constantly had a number of aged literary workers on his private pension list and made many gifts and loans to struggling authors. He frequently bought up an entire edition of some book of an author whom he wished to aid. In 1885 he published *Recollections of General Grant* and in 1890 a volume of *Personal Recollections*.

CHILDS, THOMAS SPENCER (1825–). An American clergyman, born at Springfield, Mass. He was educated at New York University and Princeton Theological Seminary. Having been ordained to the Presbyterian ministry, he held pastorates at Hartford, Conn. (1851–66), Norwalk, Conn. (1866–70), and Washington, D. C. (1882–90); from 1871 to 1879 he was professor of biblical and ecclesiastical history at Hartford Theological Seminary, and from 1880 to 1882 professor of mental and moral science at the University of Wooster. He joined the Protestant Episcopal ministry in 1890 and was first archdeacon of Washington from 1894 until 1901, when he became rector of the church of Chevy Chase. His writings include: *Justification* (1861); *Hints to Christians* (1862); *The Heritage of Peace* (1868); *Christ His Own Witness* (1880); *The Voice of God to the Nation* (1901); *Christian Unity and Church Unity* (1902); *Mormonism and the Labor Question* (1904).

CHILD STUDY. A term which has been used to include the studies of the physical, psychological, and educational development of the child from birth to adulthood. At the present time many of the topics which were formerly included under child study either have an independent existence of their own or have been absorbed into experimental pedagogy. The study of the child seems to have had its origin in the pedagogical revival with which the names of Rousseau and Basedow are associated, although the first systematic study is credited to Tiedemann (1787). It was nearly a century later, however, that the best known of the earlier writers upon child study, Darwin in England and Preyer in Germany, published personal observations of infants, and Stanley Hall in America began a child-study movement which soon extended to other countries and which aroused widespread enthusiasm for the popular and scientific study of the child. While much of the earlier investigation had little scientific value, the interest in child study has grown until at the present time there are no less than 23 periodicals published in five languages devoted entirely to the child. Furthermore, we have at least the beginnings of a child psychology and a human genetic psychology, and we possess a fairly accurate knowledge of the anatomical and physiological development of the child. In recent years child study has concerned itself more and more with such problems as child labor, delinquency, defectives, abnormalities among children, juvenile courts, school hygiene, etc.; and these in turn have given rise to the child-welfare movement, which seeks to conserve and protect the child by improving the educational, hygienic, and social conditions under which he must live.

Since the mental development of the child is treated under child psychology and genetic psychology, and the educational studies are discussed under experimental pedagogy, there remain for discussion here the methods and results of the investigations of the child's physical development.

Methods. The methods which have been employed are (1) careful observations of individual children, principally as regards inherited and acquired reflexes and muscular coördinations, gross changes in the size and appearance of the body, changes in the voice, etc.; (2) the various methods of physiology which are employed in the study of the development of the organs of the body and of their functions, of changes in the composition and circulation of the blood, in respiration, voice, and speech, activities of the skin, digestion and assimilation of food, bone and muscle, and of the development of the

nervous system and sense organs; and finally (3) the anthropometric methods by means of which the size and weight of the body, shape of the head, etc., at different stages of growth are accurately measured. See ANTHROPOMETRY.

General Results. The most general result of these investigations is that the child is not, as is frequently supposed, an adult in miniature; on the contrary, the relative size and function of the bones, muscles, vital organs, and nervous system of the child are vastly different from those of the mature individual. For example, in the child the bones, at least in many parts of the skeleton, are not completely formed; they are more pliable and not so easily broken; the legs are relatively shorter, the trunk longer, and the head larger; the pulse rate is more rapid, the work demanded of the heart is greater, and the blood pressure is less; the capacity of the lungs is smaller and the frequency of respiration is greater; the total length of the digestive canal is relatively longer; bodily movements are quicker, but more irregular; and finally, the child has about one-third of the height and one-nineteenth of the weight of the adult. The development of the child is therefore not uniform in all its parts, and the rate of growth is not constant.

Periods of Development. By computing the average of a large number of measurements which show the development of each part and function of the body for each year of age, physiological norms have been made out (physiological age). However, any one individual may show a considerable variation from the norm, and for the following reasons: the nationality, the physical environment, and the health of the child, the social position, the occupation, and the material circumstances of the parent are factors which must be taken into account. Moreover, since the parts of the body may fail to develop in accordance with the requirements of the norm, a child whose chronological age is seven years may have the height of the eighth year, the weight of the sixth year, and the vital capacity of the seventh year of physiological age. But in spite of these individual variations, and because the normal organism grows now in one part and now in another, it is possible to distinguish periods or stages of growth. While there is some disagreement as to the boundaries of these periods, we may regard the first six years as the period of infancy, from 6 to 12 or 14 years as the period of childhood, and from the close of childhood until about the twenty-fifth year as the period of adolescence.

Infancy. The period of infancy is marked by a rapid growth in height and weight of the body, by an increase in the weight and size of the brain, and by the large number of muscular coördinations which are effected. The brain has increased in weight more than threefold by the sixth year of age, and it has then reached almost its normal size. The child has also acquired its permanent teeth and the difficult coördinations of locomotion and speech.

Childhood. Growth in this stage is much slower and more uniform than in the former period. There is, however, a prepubertal increase in the rate of growth, near the close of the period, which begins earlier for girls than for boys, so that at this time the girls are heavier than boys of the same age. The strength of the heart is not in proportion to the size and activity of the body in the earlier years of this stage, so that the child is easily subject to fatigue.

Adolescence. In both sexes there is at first a very rapid increase in the rate of growth in all parts of the body. At the age of 18 girls have reached the normal height of adulthood, while boys continue to increase in height until the twentieth or twenty-first year; both sexes, however, may continue to increase in weight until middle life. The period of adolescence is also characterized by the development of the sexual organs, changes in the voice, lessened motor control, increase in strength of muscle and in vital capacity, and a decrease in the frequency of heart rate. See CHILD, DEVELOPMENT AND GROWTH OF; CHILD PSYCHOLOGY.

CHILE, chē'lā, or **CHILI,** chē'lē (an Indian name whose origin has not been satisfactorily explained, no less than six derivations having been suggested; perhaps from the Quichua *chiri* or *chili*, cold, referring to the perpetual snow on many of the mountains). A republic in South America, occupying the west coast of the continent from the river Samu, 17° 57′ S., down to Cape Horn. In the terms of the decision of King Edward VII, signed Nov. 20, 1902, as referee in the Argentine boundary dispute, all the territory south of lat. 52° S. belongs to Chile, with the exception of the eastern half of the Tierra del Fuego Territory and Staten Island, both assigned to Argentina. Chile is bounded by Peru on the north, by Bolivia and Argentina on the east, and by the Pacific on the south and west. Thus defined, Chile has a length of about 2700 miles, while its width varies from about 250 miles in the Province of Antofagasta to about 68 miles in its narrowest part, with an average of about 87 miles. Pop. (est.), 1921, 3,754,723, of which the larger part is of European origin. It includes 50,000 Indians. The area and population in 1903 and 1910 are shown in the following table:

PROVINCE	Area square miles	Population 1910	Population 1903	Population per square mile 1910

Topography. The coast rises steeply from the sea throughout the greater part of its length. The region bordering it is called the "Coast Cordillera." This is not a mountain range, but a diversified table-land rising at some points to 3300 feet, but usually much lower. It is composed of granite and mica schists, skirted in some regions by Tertiary deposits which in places extend far inland. Older sedimentary rocks do not occur in the coast regions excepting a narrow strip of chalk skirting the shore. Chiloé and the smaller islands to the south have the characteristics of the Coast Cordillera and are a continuation of it.

The topography of the country behind the Coast Cordillera may be divided into four parts. The most northern, extending from the border down to the neighborhood of Copiapo, about 27° 25′ S., is a fairly even plain falling steeply towards the sea and rising to the Bolivian plateau from 12,000 to 14,000 feet above sea level. Here and there are terrace escarpments, and mountains rise in some places above the plateau; but there is no continuous range, and the numerous volcanoes, one of which, the Llullailaco, is higher than Chimborazo by about 100 feet, are completely isolated from one another. There are no east-and-west cordilleras in this part of Chile, which is crossed by the railroad from the port of Antofagasta to Bolivia with no zigzags and without a single tunnel, large cutting, or great embankment.

The second division, between 27° 25′ and 33° S., is marked by a number of transverse spurs running from the cordilleras which form the eastern boundary to the ocean and separating the river valleys from one another. These spurs, in traveling north or south, are crossed by passes which are often very steep.

In the third section the mountainous coast lands are separated from the cordilleras by a longitudinal valley which extends without interruption from the transverse ridge of Chacabuco, north of Santiago, to Puerto Montt, sloping from an elevation of 2300 feet in the north to sea level at Puerto Montt; continuing under the sea, it cuts off the island of Chiloé from the mainland. This central valley, about 600 miles in length, was originally a huge cleft that was gradually filled up by detritus washed down from the Andes and the Coast Cordillera. The drift and alluvial deposits form a layer fully 330 feet thick through which no well has yet been sunk. The soil is very rich, and as the valley is traversed and irrigated by numerous rivers from the Andes, it is the great agricultural region of Chile. In the northern part of the valley is Santiago, the capital.

In the fourth section, south of Puerto Montt, the cordilleras approach the sea, and the mainland consists of nothing but the slopes of the mountains and a strip of country lying to the east between some of the highest elevations of the cordilleras and the water parting between the two oceans. Possession of this strip was long disputed by Argentina and Chile. A treaty defined the boundary as the water parting formed by the high cordilleras. When it was ascertained that the water parting did not coincide with the line of greatest elevation, but was in large part east of it, the Chileans claimed all the country west of the water parting, while Argentina insisted that the line of greatest elevation formed the frontier. The dispute, referred to the British government, was settled by a compromise in 1902. The chain of the Andes is composed not only of volcanic products, but also of upheaved strata of the older Cretaceous and Jurassic formations. It continues straight to Cape Horn, forming a labyrinth of fiords, heading in glaciers, islands, and peninsulas. This configuration is similar to that of the Norwegian coast and of western North America, north of lat. 50°.

The chief rivers run from the Andes straight to the sea through openings in the Coast Cordillera. Their principal tributaries, however, flow from south to north in spite of the slope southward of the central valley, a singular fact first observed by Dr. Peter Möller. The river Maule, which reaches the Pacific at about lat. 35° S., is navigable from the central valley for light craft; farther south, the rivers Imperial, Biblio, Valdivia, and Bueno are navigated for some distance by small steamboats. Many rivers rise east of the cordilleras and for a space run north or south until they find an opening in the range through which they reach the ocean. A striking feature of the southern part of the central valley is the existence of several large lakes at the western foot of the Andes.

Most of the coast line is remarkably uniform, and it is only in the region of the fiords, mainly south of the forty-second parallel, that excellent natural harbors are found; but commerce here is small and the harbors are little utilized. Valparaiso, the principal port of the west coast of South America, stands on a bay exposed to heavy seas, and vessels are wrecked in the harbor every year. The ports to the north are merely roadsteads, the most important being seven little towns from Arica to Taltal, known as the "Nitrate Ports," because nitrate of soda, the leading export of the country, is shipped from them. The best shipping facilities south of Valparaiso are at Constitución, Tomé, Arauco, and Lebu (coal shipments), Valdivia, and Puerto Montt. Punta Arenas, on the Strait of Magellan, is a coaling station for all vessels passing through the strait.

Climate. The climate of Chile must be characterized as oceanic or insular, the changes of temperature being relatively slight. The northern coast lies within the region of winds which in summer blow both towards the equator and towards the interior of the continent, and is in winter almost free from storms. The southern coast lies within the region of strong westerly winds which blow at all seasons of the year. The fact that the sea air is drawn towards the land accounts for the uniform temperature. The climate of the Chilean coast much resembles that of the coast of California. In the summer the diurnal periodicity of the wind is one of the marked climatic features; on the coast the sea breeze blows during the day with great strength, and on the Andean heights with stormy violence. The average temperatures at low altitudes vary during the year from 65° F. at the north to 40° F. at the extreme south; during January they vary from 72° F. at the north to 50° F. at the south, and in July from 62° F. at the north to 32° F. at the south. The temperature decreases about 1° F. for each 300 feet of altitude. The average annual rainfall along the coast is less than 8 inches north of lat. 35° S., but from the latter parallel the amount increases very rapidly southward to over 80 inches in lat. 38° S.; and this excessive rainfall, reaching in some cases 130 inches, ex-

tends almost to the Strait of Magellan. The rainfall towards the interior increases slightly at the north, but decreases very rapidly in the region of great precipitation at the south. In the northern part all months lack rain; between latitudes 30° and 40° S. winter is the rainy season, with dry summers, but south of about lat. 40° S. not only is the winter rainy, but in the summer time considerable precipitation occurs.

The marked contrasts in the amount of rainfall in different parts of Chile show clearly the climatic control over the distribution of the population and their pursuits. From about lat. 28° S. to the northern boundary, the country lies in the rainless zone of the southeast trade winds and is consequently a desert, agriculture being impossible except in small irrigated districts. Mining is here the only important industry, minerals are the only exports, and nearly everything in the way of food must be brought into the northern third of Chile. South of the twenty-eighth parallel the influence of westerly or sea winds begins slightly to be felt, some rain falls, and the quantity steadily increases towards the south. In this region agriculture is profitable and is the chief occupation. The barren nitrate fields and mining districts are replaced by green valleys and vine-clad hills. The agricultural zone extends south to about the fortieth parallel, where the rainfall becomes excessive, as the coast is exposed to the full force of the prevailing westerly winds. This is a region of extensive forests, and, when developed, its large industries will be lumbering and fisheries. South of the forty-fifth parallel the size and variety of the trees begin to diminish under the influence of the lowering temperature.

Flora. About lat. 40° S. the vegetation of Chile reaches its maximum growth. In this climate of no extreme cold the flora is always green and of mixed variety; in luxuriance the plant growth is almost tropical. The plains have the peumo tree, and a species of palm which is becoming rare. Forests of beech and cypress also occur. North of this middle region the rainfall diminishes, and the vegetation becomes thinner; the forests are confined to the mountain slopes, and the plains remain bare. The cacti are the last plants bordering on the arid plateau region of northern Chile. South of the central region, where the temperature decreases while the rainfall increases, are forests in which are found the *Fitzroya patagonica*—wrongly called a larch—the cypress, and the beech. The most widely diffused plant introduced from Europe and other regions is the oak, which grows more rapidly in Chile than in the Northern Hemisphere; among other imported plants are the poplar, which lines the favorite drives in the larger towns; the willow, chestnut, eucalyptus, and apple trees, and a number of economic plants, as wheat and the vine.

Fauna. Chile is poor in animal life. The chief mammals are the puma and other wild cats, fox, polecat, otter, the guanaco (which frequents the southern sections in large herds), the huemul, the pudu deer, the chinchilla, and the coypu. Among the marine mammals are the whale, dolphin, and seal. Birds include condors, buzzards, hawks, owls, cranes, parrots, humming birds, and, in the southern archipelagoes, many varieties of waterfowl. Among the reptiles of the northern part are found several kinds of lizards, and farther south toads and frogs. Turtles are absent. Snakes are not numerous or venomous. Few fishes exist in the Chilean fresh waters, but the coastal marine waters are prolific of both animal life and algæ, Beetles abound. Land mammals are scarce in the archipelago regions.

Agriculture. The agricultural activities of Chile are almost wholly confined to the great central valley. This is the region of large estates equipped with modern machinery and owned by the wealthy classes, who are so potent in the political life of the republic. Furthermore, a large part of the best agricultural land is held by the Roman Catholic church, whose political and material power is relatively greater in Chile than in any other of the Spanish-American states. The census returns show that about half of the population is engaged in agricultural pursuits. A large proportion of the natives are engaged as farm laborers on the extensive estates. The high price of lands prevailing in the central valley (based more on the mineral deposits they are supposed to contain than on their fertility) makes purchase difficult for the lower classes. The unoccupied land in the less favorable part of the country usually requires a considerable outlay of labor and capital before it yields crops; even then its fertility is not always sufficient to repay the farmer. Another obstacle to the development of the farming resources of the country is the "nitrate boom." Owing to the rapid development of nitrate mining and the scarcity of labor in Chile, wages increased in a considerable degree, and many families from the agricultural districts of the south were induced to move to the mining districts of the north, thereby greatly raising the price of agricultural labor. The most important crops are wheat, maize, and barley. Apples and grapes are the leading fruits. Most of the breadstuffs of California were formerly supplied by Chile, which also exported great quantities of cereals to Europe; but owing to the development of grain raising in the Pacific coast region of the United States and the increasing competition of Argentina, grain exports have largely declined. The revision of the United States tariff, and the opening of the Panama Canal are expected to open new markets for Chilean raw materials and to increase production. The principal crops of 1911–12 were: wheat, 248,460 tons; potatoes, 101,240 tons; barley, 26,281 tons. Next to cereals, the vine is the most important agricultural industry, about 250,000 acres, for the most part in the provinces of Concepción and Colchagua, being given to grape raising. Wine is the preferred beverage in the provinces, where the industry is important, and considerable quantities are exported to other Latin-American states. The figures for 1911 are: wine, 26,004,394 gallons; chichas, 5,591,782 gallons; cordials, 4,794,980 gallons. Many other farm crops and fruits of the temperate zones thrive in the central valley. Industrial plants such as flax, hemp, and tobacco are cultivated only with a view to supplying the local needs. The climate is very favorable for domestic animals. On Dec. 31, 1912, the live stock of Chile comprised: horses and mules, 415,000; oxen, 1,640,322; sheep, 3,537,738; pigs, 159,000. The horse of Chile is valued as highly as that of Argentina. Cattle raising has made rapid progress since a heavy tax was placed upon imports from Argentina in 1896. Ox teams are

everywhere employed on the farms; the cows are inferior as milkers, but dairy farming is on the increase. Sheep thrive in the central valley, and superior wool grades are being introduced. Goats are very numerous in the mountainous regions.

Mining. Chile is one of the chief mineral-producing countries of South America. Prior to the Peruvian War the mineral for which Chile was mainly known was copper, which still occupies an important place in the mining output of the country. With the acquisition of the Province of Tacna from Peru, the inexhaustible nitrate deposits of that region attracted the attention of foreign investors, and since then the output of that mineral has reached such enormous proportions that Chile is found to be the chief source of the world's entire supply. The nitrate deposits are worked mainly by European, and especially English, capital, and the output is almost entirely exported to Europe and the United States, where it is used for fertilizing purposes. The export of this material, which first entered the trade reports in 1884, shows the following figures in recent years, the amounts being stated in tons: 1907, 1,649,000; 1908, 2,033,000; 1909, 4,657,000; 1910, 5,078,000; 1911, 5,323,000. The copper mines are chiefly in the provinces of Coquimbo and Atacama in two ore belts about 100 miles apart. The total production of fine copper from 1844 to 1900 is estimated at 1,830,000 gross tons. Chile was in 1875 the largest copper producer in the world, but has now fallen to the sixth place after the United States, Mexico, Spain, Japan, and Australia. There is becoming apparent a revival of the industry, due to improved methods in smelting low-grade sulphide ores. Gold and silver ores are in paying quantities, and the annual output of these two metals amounts to more than $4,000,000. While most of the mining industries are in the north, a large field of coal, somewhat inferior in quality, is found in the south; coal is carried to the sea by the Arauco Railroad, and some is exported to the more northern republics. Borax, lead, tin, borate of lime, and a few other minerals are also mined. The value of all the mineral exports from Chile in 1911 was $124,400,000, United States money.

Manufactures and Commerce. The manufacturing industries of Chile are unimportant. The natives, like most Spanish-Americans, do not take readily to manufacturing, while the foreign element is still too small to exercise a perceptible influence on the industrial life of the country. In the southern part of Chile, and especially in the German settlement of Valdivia, there are a number of large breweries, distilleries, tanneries, and saw mills. Soap, furniture, and shoes are also manufactured. The mineral products constitute about 85 per cent of the total value of the exports, and agricultural products about 9 per cent. The imports are made up chiefly of manufactured articles, and include necessaries of life, articles of luxury, also machinery and other metal products. The scarcity of labor and inadequate communication facilities will probably prevent the industrial development of the country for some time, foreign capital confining itself chiefly to the more remunerative exploitation of the mineral resources, whose rapid development has been attended by a corresponding increase in both its export and import trade, as shown in the following table:

YEARS	Exports	Imports
1855	$19,000,000	$17,000,000
1894	25,000,000	18,000,000
1905	96,801,000	68,838,000
1907	102,940,700	107,267,000
1908	118,852,725	97,618,000
1909	111,716,834	85,726,000
1910	118,955,045	108,657,000
1911	127,500,000	126,472,000

Over 35 per cent of the trade is with Great Britain. Germany figures second, and the United States third. The trade of the United States with Chile amounted at the close of the century to more than $10,000,000, and in 1911 to $17,431,969. While the exports from Chile to the United States greatly increased during the last decade of the century, the imports from the United States remained practically stationary, as the following figures will show:

YEARS	Exports from Chile to the United States	Imports into Chile from the United States
1891	$3,403,000	$3,146,000
1896	4,709,000	3,432,000
1900	7,112,826	3,288,000
1905	15,624,000	6,887,000
1910	10,810,015	5,860,733
1911	11,484,831	6,915,493

Nitrate of soda and other chemicals make up about 95 per cent of the value of the exports of Chile to the United States, while the chief imports from the United States are iron and steel manufactures (nearly 25 per cent), petroleum (less than 20 per cent), cotton textiles (16 per cent), breadstuffs (6 per cent), besides wooden articles, instruments, and other manufactures.

The chief ports are Valparaiso, Iquique, Talcahuano, and Antofagasta. The first serves mainly for imports, and the second handles most of the export trade. In 1912 the first state bank of issue, Caja de Emisión, was authorized by law. There were 19 joint-stock banks of issue at the close of 1912. These institutions guarantee their note issue by depositing gold or accepted securities with the government. The public savings banks, 72 in number, had 301,353 depositors Dec. 15, 1912. A number of land banks issue interest-bearing scrip payable to bearer, and lend money when secured by first lien on real estate.

Transportation. In regard to transportation and communication facilities, Chile stands in the front rank among South American countries. The first railway line in Chile was opened in 1852—the short line connecting Copiapó, the capital of Atacama, with Caldera, on the coast. The construction of railway lines by the state was begun as early as 1857, when the line between Valparaiso and Santiago was opened. It was not, however, until 1888 that the construction of state lines was begun on a large scale. In that year Congress authorized the construction of 12 lines by the state, with a total length of about 750 miles. In 1911 the total length of railways in operation was about 3952 miles, of which 1979 miles were operated by the state; 1828 miles were under construction at the beginning of 1912. The state lines are conducted in a progressive way in regard to equipment and management, while the rates are unusually low. Numerous new railway lines are projected,

and a number are nearing completion. The line connecting Valparaiso with Buenos Aires, Argentina, has been completed by building from Los Andes to the summit of the Cordillera, where it effects a junction with the Argentine line from Mendoza, the system being put into continuous operation in April, 1910. The Arica line to La Paz was opened Aug. 6, 1912, with a length of 127 miles in Chile and 139 in Bolivia. (For a further account of this undertaking, see *Railways*, under ARGENTINA.) Tramway lines are operated in every city of importance. The telegraph lines owned by the state had a total length of 16,513 miles in 1910. There were 5821 miles owned by private companies. The telegraph rates are very low, and the use of the telegraph and telephone is extensive, owing to the poor condition of the country roads. There were 8000 miles of telephone lines owned by the telephone and railway companies, also a wireless telegraph system with 13 stations. The shipping of the Chilean ports exceeds that of any other country in South America. In 1911, 14,698 vessels of 26,164,068 tons entered, and 14,649 vessels of 25,941,833 tons cleared. About 40 per cent of the carrying trade is done in British bottoms, and the rest in German, French, and Chilean. The Chilean merchant marine numbered, in 1911, 84 steamers of 69,604 tons net, and 91 sailing vessels, 52,918 tons net. The Chilean South American Steamboat Company under state subvention operates 12 steamers in ocean trade and 7 in river navigation. The British-owned Pacific Steam Navigation Company operates 43 steamers on the coast and to the United Kingdom, and six other British companies are in Chilean trade. The Cosmos and Roland lines afford communication with Germany, and the Italian Lloyd Pacific operates a line to Genoa.

Finance. The financial condition of Chile is far from satisfactory. The occasional wars have enormously increased the public debt, and the rapid increase in the revenue since the Peruvian War, on account of the export duties on nitrate, brought about extravagance in public expenditures.

In the last years for which a statistical return has been made the state of the national finances is shown in the following table, in terms of the gold peso, valued at 36 cents American, and the paper peso, subject to fluctuations around 20 cents:

YEARS	REVENUE		EXPENDITURE	
	Gold	Currency	Gold	Currency
1908....	$65,230,892	$160,428,470	$39,102,517	$198,311,785
1909....	123,088,021	245,267,030	135,169,887	300,459,758
1910....	82,764,423	152,975,645	60,677,704	234,143,253
1911....	71,908,379	213,214,928	60,775,635	204,191,707
1912....	101,050,000	189,200,000	71,358,378	281,128,726

The external debt of Chile amounted to $85,650,000 at the beginning of 1905, and the internal debt to $39,116,000. The external debt on June 1, 1912, amounted to 336,781,600 pesos gold, or about $175,818,000. The internal debt was 180,593,372 pesos paper ($36,479,860), of which 150,366,403 represent issues of paper money. The rate of interest on the external debt varies from 4½ to 6 per cent, and the annual service amounts to about $6,000,000. The gold standard was adopted by Chile in 1895. In 1898 paper money to the amount of about $17,000,000 was issued, and a new loan of $20,000,000 was authorized for the conversion of this paper within four years. In 1901 the government decided to extend this period two years.

Government. The constitution of Chile, adopted May 25, 1833, guarantees to all citizens equality before the law, the inviolability of property, immunity from restraints on domicile and migration, and freedom of instruction, association, petition, and the press. The legislative authority is vested in a National Congress, consisting of a Senate and a House of Representatives, which meet at the capital, Santiago. The members of the lower house are elected directly by the people (one for every 30,000 inhabitants), for a term of three years, while the members of the Senate are chosen from the provinces, by the same electorate, for a period of six years, on the basis of one senator for every three deputies. Electors to either house must be 21 years of age and able to read and write. Members of Congress receive no remuneration. The executive power is exercised by a president, elected for a term of five years, by delegates chosen by the people of the provinces, to the number of three delegates for every deputy. He is assisted in the discharge of his duties by a council of state, consisting of five members nominated by himself and six members named by Congress, and by a cabinet of six ministers who preside over the departments of the Interior, Foreign Affairs, Worship and Colonization, Justice and Public Instruction, War and Navy, Industry and Public Works. The supreme judicial power is lodged in a high court of justice, located at Santiago, which is composed of seven members, and exercises control over the tribunals of the nation.

A democratic republic in form, the government of Chile in reality is more like an oligarchy than a democracy. The overthrow of the Spanish authority produced no change in economic or social conditions, and political power under the new régime remained in the hands of the great landowners who had controlled affairs under the monarchy. The great majority of the population have continued to remain content under the old conditions. The Conservative party has been dominant from the very beginning of the establishment of the republican form of government, when Spanish rule was thrown off, and has always wielded a great influence over the people at large. As a result of the monopoly of power by a small number of families, the civil service has suffered. Lucrative places under government are distributed as favors to impecunious relatives, or as rewards for political services, and the country is overburdened with public functionaries. Higher ideals of government, however, are upheld by an active Liberal opposition, which agitates its cause in Congress and in the press, and has best furthered its aims by secularizing and reorganizing public education.

The system of local government is uniform in Chile, and is characterized by the concentration of authority in the president of the republic and his agents. For administrative purposes, the country is divided into 23 provinces, which are subdivided into 78 departments and one territory, 865 subdelegations, and 3068 districts. At the head of each district is an inspector; the inspectors are responsible to the subdelegates, the subdelegates to the governors of the departments, and these to the

intendentes of the provinces. The governors and intendentes are appointed and controlled by the president. The departments constitute one or more municipal districts, whose affairs are administered by a council of six aldermen and three alcaldes, presided over by the intendentes, governors, or subdelegates, who possess a veto power. No one may be a member of the council who is connected with the state either as employee or as a contractor for the performance of some public service. The authority of the municipality extends over the matters of police (in the capitals of the departments the police are under the control of the president), sanitation, primary instruction, and the regulation of agriculture, industry, and commerce. The expenses of government are met partly by direct and indirect taxation and partly by subsidies from the general government. The council is responsible to the popular assembly, composed of all registered electors, whose sanction is required in such important matters as the negotiation of municipal loans, the inception of important public works, or the alienation of the public domains. The popular assembly, too, votes the annual budget and audits the municipal accounts as submitted by the alcaldes.

Justice is administered in the first instance by district judges in petty or civil disputes and misdemeanors, and by justices of subdelegation in more important civil suits and minor criminal offenses. Cases of greater consequence are tried, in the first instance, before the judges of letters, of whom there is one at least in every department. Appeals from their decisions lie to the courts of appeal, six in number, located permanently in the chief cities, and exercising jurisdiction over groups of provinces. The tribunal of last resort is the high court at Santiago. For national colors see Colored Plate of FLAGS.

Education. Public instruction is gratuitously provided by the state, and until recently was in an unsatisfactory condition. Steady advance, however, has been made in late years through the efforts of the progressive element among the people. A large number of teachers have been brought over from Germany, and not a little has been done towards reorganizing the educational system on the most modern principles of pedagogy and school administration. Primary instruction is provided in elementary and graded schools, controlled by district visitors and inspectors. In 1911 there were 2896 public primary schools, with 375,274 pupils and 4829 teachers. Secondary instruction is afforded by the Instituto Nacional; also by the lycées, 77 in number, of which there is one in every provincial capital and in the chief towns of the principal departments; in 1911 the number of students in the secondary schools was 20,329. The State University at Santiago gives courses in law and political science, medicine and pharmacy, the physical and mathematical sciences, and fine arts, omitting the doctorate degree as undemocratic. There are, besides, schools of agriculture and mining, seminaries, etc., for girls, a pedagogical institute, normal schools, 6 for men and 10 for women, free of all charges for the five-year course, but entailing an obligation of service as state teachers for at least seven years; an academy of painting and sculpture, a conservatory of music and oratory, and military and naval academies. In every bishopric there is a seminary for the training of the Catholic clergy. Every year the state sends to Europe, to be educated at the national expense, such students as may have distinguished themselves in the institutions of higher learning at home. Upon their return they are required to render some service to the state for a certain period, in whatever calling they may have chosen. The number of students in private institutions of different grades was 66,962 in 1911.

Population. The population of Chile, according to the census of 1885, was 2,527,320; but these figures are regarded as too high. In 1895 the population was 2,712,145, and at the end of 1910 it was given at about 3,415,000, or about 11.6 per square mile, a ratio about twice as great as that of Argentina, and Brazil. The number of foreigners in 1910 was 134,500, and included 18,755 Spaniards, 9800 Frenchmen, 10,724 Germans, 13,000 Italians, 9800 Englishmen, and natives of 10 more European countries, 27,100 Peruvians, 21,900 Bolivians. About one-fourth of the native population is of pure Spanish origin, while the remainder are either mixed or of pure Indian origin in three stocks, Fuegians, nomadic in the Strait of Magellan; Araucans, numbering about 100,000, in the south; Changos of the north coast.

Immigration, notwithstanding the energetic efforts of the Chilean government, has been rather light and attended with little success. One of the most promising colonial ventures is the German colony of Valdivia; pop., 1910, 17,681. Its success, however, has been due to the exceptional character of the colonists, as well as to the conditions under which they came. When the Chilean government, encouraged by the example of the Valdivia colony, began to encourage colonization on a larger scale, by means of foreign agencies and free passage to the country, the immigrant population became less desirable in character, and only a small proportion became permanent settlers. Still, the foreign population has played not a little part in the development of the country. Throughout Chile, nevertheless, the natural increase of population is small, owing to the utter disregard for life among the natives, and to the high rate of infant mortality, amounting to about 59 per cent among children below the age of seven.

Religion. The Roman Catholic faith is the religion of the state, and is maintained by the general government, which has the right of nomination to the archiepiscopate of Santiago and to the bishoprics of Concepción, San Carlos de Ancud (Chiloé), and Serena, and to the Vicariates Apostolic of Tarapacá and Antofagasta. Religious instruction is compulsory in the public schools, and the clerical institutions are allowed full freedom of education. The congregations are formed by the state, and the constitutional limitations on their rights to acquire property are disregarded. The priests possess an immense influence over the people, who look to them for guidance in politics as well as in matters of faith. The privilege of religious worship is accorded to other faiths by a law of 1865, with the secularization of cemeteries. Marriage was made a civil contract by the law of 1888.

Army and Navy. Military service is obligatory on all citizens between 18 and 45. The army, of which the permanent nucleus is 6000 men, ranks in importance below the navy, which, after that of Argentina, is the most powerful in South America. The national guard comprises all citizens between the ages of 20 and 40. Re-

cruits are called up in their twentieth year and are trained under arms for one year, serve for nine years in the reserve of the active army, then pass to the second reserve until 45. In 1912 the peace establishment was fixed at 19,360 of all arms and 1737 gendarmerie, the army budget calling for $6,000,000.

History. The Araucanians were the most important of the Indian tribes living in what is now Chile, and the history of the country before 1800 is mainly concerned with the continuous efforts of the Spanish to subjugate this fierce and intelligent nation. The survivors of the pure native race who still maintain their virtual independence are few; in general, the mixture of Araucanian blood with that of the Spanish conquerors has given to the Chilean race its remarkable efficiency in war. The Incas of Peru, at the period of their greatest power (1450–1533), subdued a few of the northern branches of the Araucanian race, but at the time of the Spanish conquest their dominion was not firmly established. As soon as the Incas in Peru had been overwhelmed, Almagro gathered a force for the conquest of Chile, and in 1535 started south. He spent two years and a half in the country, but, encountering little success, withdrew to Peru in 1538. In 1540 Valdivia led a second expedition into the Araucanian territory and began the real conquest of Chile. He founded Santiago in 1541, Concepción in 1550, and Valdivia in 1552, and thus secured, after much hard fighting, a permanent hold on the country.

For 250 years the history of Chile is the record of slow expansion, through the development of mines and farms, and of almost constant wars with the natives. These were finally forced to sign a treaty in 1773, which in their weakened condition they continued to respect. The governors of Chile were appointed for the most part by the viceroys of Peru, and the post was considered the regular stepping-stone to the viceregal office. The news of Napoleon's invasion of Spain and the abdication of Ferdinand VII aroused great unrest in all the Spanish-American colonies, and induced a number of leading Chileans to call an assembly which forced the Governor to resign, and, Sept. 18, 1810, organized a *junta de gobierno* to govern the land so long as the French should hold Spain. This date is considered the anniversary of Chilean independence. There followed several years of intermittent fighting with the Spanish forces in Peru, with numerous struggles between rival factions among the patriots, led by the Carrera brothers and by Don Bernardo O'Higgins. In 1814 this rivalry enabled the Viceroy, Osorio, to reëstablish his authority in the south, and to maintain it for two and a half years. In the winter of 1816–17 Gen. San Martin led an army of Argentine *gauchos* across the mountains, and by the decisive victory of Chacabuco, Feb. 12, 1817, forced the Spaniards out of Chile. A year later, on the anniversary of the battle, O'Higgins formally declared the absolute independence of Chile. The Chilean forces were defeated by Osorio on March 19, 1818, but on the Maipú Plains, near Santiago, on April 5, another battle was fought which virtually ended the Spanish domination, although desultory fighting continued for a few years, Chiloé, the last stronghold of the Spanish, being taken in 1826. It was not until 1844 that Spain formally recognized the loss of her provinces.

O'Higgins ruled as dictator from 1818 to 1823, when he was induced to withdraw, and a constitution was adopted. This was revised in 1828, and again in 1833, when substantially the same document in force at present was adopted. It has, however, been amended frequently, the most important changes being made in 1874. This constitution provides for a republican form of government, with a property qualification so high that the voters form practically an oligarchy. In 1843 the question of the Argentine boundary arose, and continued a menace to peaceful relations until 1881, when a treaty was signed which gave Chile half of Tierra del Fuego and the shores of the Strait of Magellan, providing, however, for the neutrality of this waterway. Another boundary commission was then needed to determine the exact position of the line, which was to follow the watershed of the Andes. Disputes and rumors of war continued to distract both countries until 1902. (See ARGENTINA.) Spain, in 1864–65, forced both Peru and Chile into war by a series of petty squabbles over diplomatic titles, and there followed a year of active naval warfare. Hostilities dragged on until 1869, when the United States minister succeeded in putting an end to active operations. Spain, however, refused to acknowledge herself beaten until 1871, when a provisional treaty was signed at Washington, followed by a definitive peace in 1879.

The valuable nitrate deposits in the Atacama Desert, north of Chile, were opened up by Chilean capital, but disputes ensued with Bolivia owing to the absence of definite boundary lines in the region. In February, 1879, Chile seized the Bolivian port of Antofagasta, and in April Peru, as the ally of Bolivia, declared war on Chile. The Chilean armies were outnumbered, but were far better equipped and officered than those of their opponents, and Chile's fleet was much superior. Naval operations were watched with special interest by all outside powers, as being the first between modern ironclads. On Oct. 8, 1879, the Peruvian battleship *Huascar* was taken by the Chilean fleet, and on November 19 the combined Peruvian and Bolivian forces were almost annihilated at Dolores. In October, 1880, Chile was in possession of all the disputed territory, and the United States minister succeeded in bringing about negotiations for peace. The conditions imposed by Chile were not accepted by the allies, negotiations were broken off, and the battle of Miraflores, Jan. 15, 1881, gave the Chileans possession of Lima, Callao, and practically all of the other Peruvian cities. Desultory fighting continued until Oct. 20, 1883, when a treaty dictated by Chile was finally signed. Bolivia ceded to Chile the Province of Antofagasta, while Peru gave up Tarapacá in perpetuity and Tacna and Arica for 10 years, a plebiscite at the end of that period to determine whether the inhabitants wished to return to Peru or continue under Chilean rule. The government of Chile, however, was careful to postpone such an appeal to the popular voice, and as late as 1900 the Chilean Congress rejected a convention concluded with Peru in 1898 providing for a plebiscite. In 1891 war broke out between the President, Balmaceda, and his opponents in the congress. The Congressionalists induced the principal part of the national fleet to revolt, and seized the nitrate provinces, and, with the revenue derived from them, purchased modern arms and munitions, with which they defeated the regular army near Valparaiso, cap-

tured that city, and entered Santiago (August). Balmaceda committed suicide, and order was promptly restored with the election of Jorge Montt as his successor. During the Civil War the United States had taken sides with the established government, and, as a result, after the capture of Valparaiso, there was much ill feeling against her. A number of sailors from the United States steamship *Baltimore* on shore leave were attacked by a mob, and one of them was killed. Serious complications threatened for a while, but the Chilean government eventually apologized and paid $75,000 for the benefit of the injured sailors. President Montt was succeeded in 1896 by Federico Errazuriz, during whose administration the boundary dispute with Argentina entered on an acute phase. It was settled under his successor, German Riesco (1901–06), largely through American and British good offices, and, after the settlement of outstanding difficulties, Chile and Argentina in 1902 signed a permanent arbitration treaty. The administrations of Pedro Montt (1906–10), who died suddenly while abroad after a visit to the United States, and of Ramón Barros Luco (1911–) were marked by a continuation of the period of peace and progress. Only the recurrence of periodic financial depression, due to fiscal conditions and the cost of internal administration, marred this season of prosperity. Extensive harbor improvements were made, and trans-Andean railway connection was completed with Argentina and Bolivia. The long-standing Alsop claims, which in 1909 threatened diplomatic difficulties with the United States, were adjusted through the arbitration of Great Britain in 1911, while the unsettled territorial dispute with Peru, seemingly on the way to settlement in 1912, was undetermined in 1914. Throughout 1913 the more important events in Chile were anticlerical riots in Santiago, brought about by the sale of church lands; the extensive enlargement of the navy, and efforts to monopolize the fast-disappearing nitrate deposits. The most recent general history is that of Barros Arana, *Historia general de Chile* (16 vols., Santiago, 1884–1902). Consult also: Wright, *The Republic of Chile* (Philadelphia, 1905); Aurique and Silva, *Ensayo de una bibliografia historica y geografica de Chile* (Santiago, 1902); Mansfield, *Progressive Chile* (New York, 1913); Koebel, *Modern Chile* (London, 1913); Chisholm, *The Independence of Chile* (Boston, 1911); Elliot, *Chile* (New York, 1907); Orrezo, *Chile contemporaneo* (Santiago, 1904).

CHIL'EAN GUAVA, gwä'vä. See MYRTLE.

CHILE PINE. See ARAUCARIA.

CHILI. See CHILE.

CHI-LI, chē'lē. See PE-CHI-LI.

CHILI MILLS. A machine used for pulverizing ore preliminary to recovering the values. These mills have vertical rollers running in a circular inclosure on a die. The rollers and dies may be of stone or steel. They are largely used on ores of gold-silver and the sulphides of the base metals.

CHIL'KOOT PASS. A pass in the coast range of the Rocky Mountains in Alaska. It crosses the watershed which divides the headwaters of the Yukon River from the affluents of Lynn Canal. Its greatest height is 3502 feet. It is about 20 miles long, extending from Dyea, at the head of Lynn Canal, to Lake Bennet, in the Canadian-Yukon district. It was the route taken by gold seekers in the rush of 1896–98, but has been superseded as a route by the railroad over White Pass, which was completed in 1899.

CHILLÁN, chē-lyän'. The capital of the Province of Nuble, Chile, 56 miles northeast of Concepción (Map: Chile, C 11). It is regularly built and has a Franciscan missionary church and a normal school. To the east-southeast are sulphur baths which were discovered in 1795, and to the east is the volcano of Nevado de Chillán, 9528 feet high. Pop., 1907, 34,269. Chillán was founded in 1579 and rebuilt in 1835, after its destruction by an earthquake.

CHILLICOTHE, chĭl'lĭ-kŏth'ē. A city and the county seat of Livingston Co., Mo., 86 miles northeast of Kansas City, on the Chicago, Milwaukee, and St. Paul, the Wabash, and the Hannibal and St. Joseph railroads (Map: Missouri, C 2). It has a public library, the State Industrial Home for Girls, Sisters of St. Joseph Academy for Girls, and a private normal school. The city is the commercial centre of an agricultural, lumbering, coal-mining, and stock-raising country; ships apples, eggs, poultry, wool, and hides; and manufactures staves, handles, boxes, etc. The water works are owned by the city. Pop., 1910, 6265.

CHILLICOTHE. A city and the county seat of Ross Co., Ohio, 98 miles by rail east by north of Cincinnati, on the Baltimore and Ohio Southwestern, the Cincinnati, Hamilton, and Dayton, and the Norfolk and Western railroads, and on the Scioto River and the Ohio and Erie Canal (Map: Ohio, E 7). The notable features of the city include the large public library, the city hospital, Grandview cemetery, Adena, the home of Ohio's first governor, and two attractive parks. The leading industrial establishments are the railway shops of the Baltimore and Ohio Southwestern Railroad, pulp and paper mills, and manufactories of wagons, shoes, furniture, flour, carpet sweepers, canned goods, cigars, engines, etc. Chillicothe was first incorporated in 1802 and is governed under a general law of 1902, which provides for a mayor, department of public service, president of council, treasurer, and solicitor, all elected for two years. Pop., 1900, 12,976; 1910, 14,508; 1920, 15,831.

About 9 miles from Chillicothe was situated the Indian village of the same name, which in May, 1779, was unsuccessfully attacked by a band of Kentuckians under John Bowman, and in August, 1780, was burned by Colonel Clark. Chillicothe was first settled by the whites, under Nathaniel Massie, in 1796 and was the capital of Ohio from 1800 to 1810. Consult Howe, *Historical Collections of Ohio*, vol. iii (Columbus, 1889–91).

CHIL'LIES. See CAPSICUM.

CHIL'LINGHAM CATTLE. See CATTLE, CHILLINGHAM.

CHILLINGWORTH, WILLIAM (1602–44). An eminent English theologian. He was born in Oxford in 1602, educated at Trinity College, Oxford, and elected fellow in 1628. The arguments of a Jesuit named Fisher induced him to become a Roman Catholic, and in 1630 he withdrew to Douai; but his godfather, William Laud, then Bishop of London, persuaded him to reëxamine the whole controversy between Roman Catholics and Protestants, the result of which was that in 1631 he left Douai, and in 1634 returned to the Anglican Church. In 1637 he published a work entitled *The Religion of Protestants a Safe Way to Salvation.* It

was exceedingly keen, ingenious, and conclusive in point of argument. Chillingworth was perhaps the ablest disputant of his age; and had there not been a certain fickleness and want of solidity about his intellect, and a nervous suspicion that all human reasoning might be vitiated by undiscovered fallacies, he might have produced a really great work. *The Religion of Protestants* acquired a wide popularity. Chillingworth was offered church preferment, which he at first refused—having certain scruples in regard to the subscription to the Thirty-nine Articles—but afterward accepted. He became chancellor of Salisbury, prebendary of Brixworth, in Northamptonshire (1638), and master of Wigton's Hospital in Leicestershire. He was a strong Royalist and on the outbreak of the Civil War (1643) accompanied the King's forces. He died, a prisoner of war, at Chichester, Jan. 30, 1644. The best edition of *The Religion of Protestants*, along with his other works, appeared in 3 vols. (1838). For his life, consult T. Birch (London, 1742).

CHILLON, *Fr. pron.* shē'yôN', *Eng. pron.* shĭl'lŏn *or* shĭl-lŏn'. A castle and fortress of Switzerland. It is situated in the Canton of Vaud, at the eastern end of the Lake of Geneva, on an isolated rock almost entirely surrounded by water. The castle was founded many hundred years before the fortress, which was erected by the rulers of Savoy in the middle of the thirteenth century and is celebrated in connection with Bonnivard, the Genevan patriot, who was imprisoned in one of its underground dungeons from 1530 to 1536. Byron has treated this subject in his "Prisoner of Chillon." See BONNIVARD. The illustration "Alpine Scenery" in the article ALPS shows this castle.

CHILOÉ, chē'lō-ā'. The insular province of Chile, consisting of an archipelago off the west coast of South America. The group takes its name from its principal island (Map: Chile, C 12). It is separated from the rest of the republic by the Gulf of Corcovado and the Strait of Chacao, and consists of the main island and over 100 small, mostly uninhabited islets, with a total area of 8693 square miles. The principal island contains most of the population of the province. It is of volcanic origin and mountainous, covered largely with thick forests yielding great quantities of wood for export. In the eastern part the soil is fertile and well cultivated. The climate, although hot and moist, has none of the deadly qualities which characterize that of the mainland. Corn, wheat, barley, and hemp are produced extensively, and domestic animals are raised in large numbers. Pop., 1895, 77,750; 1903, 95,914; 1910 (est.), 91,657. Ancud, or San Carlos Ancud, the seat of government and chief seaport, is situated on the north coast and has a population of 3979. The archipelago was discovered by the Spaniards as early as 1558. It was the last portion of Spanish America to throw off the mother country's yoke, which it did in 1826.

CHILOGNATHA, kī-lŏg'nà-thà (Neo-Lat. nom. pl., from Gk. χείλος, *cheilos*, lip + γνάθος, *gnathos*, jaw), or DIPLOPODA (Neo-Lat. nom. pl., from Gk. διπλόος, *diploos*, double + πούς, *pous*, foot). A division of Myriopoda containing the millipedes (q.v.).

CHILON, kī'lŏn (Lat., from Gk. Χίλων). A Lacedæmonian, son of Damagetus, first Ephor in 560 or 556 B.C. (he is said to have originated that office). It is further said that he died of joy at the news of his son's victory in the Olympian games. He was reckoned one of the Seven Wise Men of Greece, and many pithy sayings, among them the famous "Know thyself" and "Nothing in excess," are ascribed to him. Consult Mullach, *Fragmenta Philosophorum Græcorum*, vol. i.

CHILOPODA, kī-lŏp'ô-dà (Neo-Lat. nom. pl., from Gk. χείλος, *cheilos*, lip + πούς, *pous*, foot). A division of Myriopoda containing the centipedes (q.v.).

CHIL'PERIC. The name of two Merovingian kings. CHILPERIC I, King of Soissons from 561 to 584, was the husband of Fredegunda. He did not rule over all the Franks, but divided the kingdom with his three half brothers. (See BRUNHILDA.) He was cruel, unjust, and irreligious, but energetic and brave. CHILPERIC II was King of Neustria from 715 to 720, but was conquered by Charles Martel. In 719, after submitting to the latter, he was proclaimed King of all the Franks, but ruled only one year longer. Consult Sergeant, *The Franks* (New York, 1898).

CHIL'TERN HUNDREDS, STEWARD OF THE. An English crown officer, formerly appointed to preserve peace and protect the inhabitants and neighbors of the three hundreds (nominally villages) of Stoke, Burnham, and Desborough in Buckinghamshire, from the robbers who infested the beech forests of the adjacent Chiltern Hills. This primary purpose is, however, obsolete; the office is now applied for by members of the House of Commons who wish to resign their seats, an allowable excuse for such resignation being the acceptance of a place of "honor and profit" under the crown. As such, the stewardship of the Chiltern Hundreds, among other similar sinecure offices, more generally presents itself, with its salary of 20 shillings and accompanying fees. It is rarely refused by its patron, the Chancellor of the Exchequer, and, as soon as obtained, is vacated in readiness for the next resigning member. The practice began about the year 1750. Its legality has been disputed, but numerous precedents have established it. One refusal is recorded in 1842. Consult *Standard Library Cyclopedia* (London, 1848), and Foster, *The Chiltern Hundreds* (London, 1897).

CHIL'TON. A city and the county seat of Calumet Co., Wis., 78 miles by rail north of Milwaukee; on the Chicago, Milwaukee, and St. Paul Railroad, and on the Manitowoc River (Map: Wisconsin, E 4). It is the centre of an agricultural and dairying district largely interested in barley cultivation and the manufacture of cheese, and has grain elevators, condensed-milk and canning factories, flour mills, machine shops and boiler works, brewery and malting plant, sash, door, and blind factory, etc. Pop., 1900, 1460; 1910, 1530.

CHILTON, ROBERT HALL (1817–79). An American soldier, born in Virginia. He graduated in 1837 at the United States Military Academy, rose to be captain of the First Dragoons in 1846, and major and paymaster in 1854. During the Mexican War he distinguished himself at the battle of Buena Vista. In 1861 he resigned from the United States army, in the same year was appointed a lieutenant colonel in the Adjutant General's Department of the Army of the Confederate States, and in 1862 became a brigadier general. For some time he was chief of staff to Gen. R. S. Lee, and inspector general of the Army of Northern Virginia. In 1869–79

he was president of a manufacturing concern in Columbus, Ga.

CHILTON, William Edwin (1858–). An American lawyer and legislator, born at St. Albans, Kanawha Co., W. Va. In 1880 he took up the practice of law at Charleston, W. Va., and in 1891 became a practicing attorney before the Supreme Court of the United States. He was appointed prosecuting attorney of Kanawha County (1883), was chairman of the Democratic State Executive Committee (1892), and Secretary of State for West Virginia (1893–97). Later he became United States Senator for the term 1911–17.

CHIMACHIMA, chē′mȧ-chē′mȧ. A caracara of the American Isthmian region (*Ibycter chimachima*), prevailingly white when adult. See Caracara.

CHIMÆRA, kī-mē′rȧ (Lat., from Gk. χίμαιρα, *chimaira*). A mythical monster, killed by Bellerophon (q.v.) with the aid of Pegasus. According to Homer, the chimæra was a fire-breathing monster with a lion's head, a goat's body, and a serpent's tail, who long devastated Lycia and Caria. According to Servius (q.v.), on *Vergil, Æneid,* vi, 288, Chimæra represented a mountain whose top was the resort of lions, its middle of goats, and the marshy ground at the bottom of serpents; Bellerophon first made this mountain habitable. The district in which Chimæra was localized was volcanic. The chimæra alone and in conflict with Bellerophon is not uncommon in ancient art. The finest representation is the large bronze in Florence. The word "chimæra" is now used figuratively to denote any monstrous or impossible conception, the unnatural birth of the fancy.

CHIMÆRA. A representative of a family (Chimæridæ) of strange cartilaginous fishes (q.v.) constituting the Holocephali. They are sharklike and very interesting to the ichthyologist in their structure, which shows their strong affinity to ancient types of which they are the scant survivors, but have nothing but their grotesqueness to attract popular interest, as their flesh is not good. The large eggs, fertilized internally, are surrounded by a horny case which in some species may be 10 inches long. There are three living genera—*Chimæra, Callorhynchus,* and *Harriotta. Chimæra* is found along the coasts of Europe and Japan, on the west coast of North America, and at the Cape of Good Hope. *Chimæra monstrosa,* of the Mediterranean and Atlantic, is its largest and best-known species and may reach a length of 3 feet; in Europe it is called "king of the herrings"; in America, "chimæra, ratfish, sea cat," etc. *Callorhynchus* occurs in the south temperate zone, and *Harriotta* is confined to the deep seas. Consult Dean, *Chimæroid Fishes and their Development,* Carnegie Institution Publication, 32 (Washington, 1906). See Plate of Dipnoi and Chimæra.

Fossil Forms. The genus *Chimæra* is found in a fossil state in the Tertiary deposits from the Miocene upward. Many related but extinct genera are known from the Devonian upward. The chimæroids reached their maximum of evolution in the Cretaceous and Eocene, and many of the extinct species were much larger than any now living. The strong cutting teeth of *Rhynchodus* and *Ptyctodus,* described from the Lower Devonian of North America and Russia, are the only remains of the earliest members of the group, of which no other traces have been found. In the Liassic of England specimens of *Myriacanthus* have been found so well preserved as to show the form of the cartilaginous snout, which resembles that of the modern genus *Callorhynchus.* Teeth and dorsal spines of chimæroids are common in the Mesozoic and Tertiary rocks. One genus, *Ischyodus,* of which a perfect skeleton was found in the lithographic limestones of the Solenhofen Jurassic, has also been found in the Cretaceous of New Zealand and the Eocene of North America, indicating that this genus enjoyed in those early days a very wide distribution. See Squaloraja.

CHIMÆRA, in Plants. A name applied to certain graft hybrids which combine the characters of both stock and scion. The term "graft hybrid" is applied when the stock and scion fuse in such a way as to produce new shoots that are intermediate between the two parents. In the chimæra the tissues of the two parents remain distinct from one another in the hybrid. For example, the epidermis may belong to one parent and all the inner parts to the other. In this case, when the tissue of one parent insheathes that of the other, the chimæra is spoken of as a periclinal chimæra. In other cases the hybrid is a sort of patchwork or mosaic of the characters of the two parents; these cases being called hyperchimæras. A notable case of the latter kind has been produced by a graft between the tomato and the nightshade, a shoot arising which combines the characters of both stock and scion. Of course, in all such cases the seedlings revert to one or the other of the parent forms.

CHIMANGO, shē-mäṉ′gō. A widespread and familiar carrion hawk (*Milvago chimango*) of the plains regions of South America, black, with the under parts brownish ochre in the adult. For affinities and habits, see Caracara and the books there mentioned.

CHIMAPHILA, kī-măf′ī-lȧ. See Wintergreen.

CHIMAY, shē′mȧ′, Jeanne Marie Ignace Thérèse de Cabarrus, Princess de (1773–1835). She was the daughter of the Comte de Cabarrus, Minister of Finance in Spain; was married at 16 to the Marquis de Fontenay, but divorced from him in 1793 and in the same year married Tallien, the French revolutionist, whom she induced to engage in a plot for the overthrow of Robespierre, thus becoming the chief promoter of the Revolution of July, 1794. Her social triumphs, consequent from her beauty and her free manners, gave her husband offense, and he left her, going with Napoleon to Egypt. A divorce followed on his return (1802) and Jeanne married in 1805 the Comte de Caraman, afterward the Prince de Chimay, with whom she lived peaceably. While ranking first among the beauties of the time, she was never admitted to court circles. Consult Houssaye, *Notre Dame de Thermidor* (Paris, 1866).

CHIM′BORA′ZO, *So. Amer. pron.* chēm′bō-rä′sō (native name, *Chiquipoya*). A volcanic peak, one of the highest of the Andes, in Ecuador, rising 20,500 feet above sea level, but only about 11,000 feet above the level of its own tableland of Quito (Map: Ecuador, B 4). Its lat. and long. are 1° 20′ S. and 79° W. The mountain has no crater, is built up of trachytic volcanic rocks, and is evidently an extinct volcanic peak. It is capped with perpetual snow and was long regarded as the loftiest mountain in the world. The summit was for the first time reached by Whymper in 1880. Humboldt, Bous-

singault, Hall, and Stübel all made ineffectual attempts to reach its top.

CHIMBOTE, chêm-bō'tâ. A seaport in the Department of Ancachs, Peru, situated on the Puerto Ferrol (Map: Peru, B 5). It has an active trade and is the terminus of the railroad from Huaraz, whose port it is.

CHIMENTI, kê-mân'tê, JACOPO DI. See CLEMENTI, JACOPO DI, DA EMPOLI.

CHIMERE, shĭ-mēr'. See COSTUME, ECCLESIASTICAL.

CHIMES (from AS. *cimbal, cimbala*, from Lat. *cymbalum*, from Gk. *κύμβαλον, kymbalon*, cymbal, from *κύμβος, kymbos*, Skt. *kumbhā*, jar). Music played on a set of bells in a church tower, either by a performer or by mechanism. This ancient and interesting class of music is believed to have originated in some of the German monasteries. In the fifteenth century the ringing of church chimes became very general in North Germany, Holland, and Belgium; the last-mentioned country was especially famed for its bell ringing, retaining this prestige for three succeeding centuries. Bell ringing has always reached its greatest popularity in flat countries, where the sound of the bells can "carry" over a great distance. In England, where it is often called "change ringing," this custom has also found great favor and may be said to be one of the national institutions. A chime of bells may number from 5 to 12 and is rung by swinging, causing the clapper inside to strike the bell. With this limited scale, and the rather uncertain method of producing the tone, only very simple diatonic melodies are possible. *Carillons* are more elaborate affairs, in which the bells are stationary and are rung by striking on the outside with a hammer. Carillons were formerly played by a performer, who struck the huge keys that connected with the hammer and with his feet operated the pedals that communicated with the larger bells. His place is now usually taken by machinery. The number of bells in a carillon varies from 10 to 40, or even more; the famous one at Ghent has 48. Chimes have been introduced into many American churches. Those of Christ Church in Philadelphia, Christ Church in Boston, and Trinity Church in New York are probably the oldest in the United States. The chimes of the old Christ Church of Philadelphia have an historic interest. The bells were sent from England as a present from Queen Anne, and during the Revolution they were taken down and sunk in the Delaware River, as it was feared the British might capture them. At the close of the war they were rehung in the old belfry. Among the celebrated chimes of Europe are those of Copenhagen, Ghent, and Amsterdam. The word "chimes" is here used in its general sense, including both carillons and the smaller set of bells. Consult: F. E. Robinson, *Among the Bells* (London, 1909); J. Berthelé, *Archives campanaires* (Abbéville, 1911); O. H. Metzger, *Die Glocken im Friedländischen* (Friedland, 1912). See BELL.

CHIMES, THE: A GOBLIN STORY OF SOME BELLS THAT RANG AN OLD YEAR OUT AND A NEW YEAR IN. A Christmas tale by Charles Dickens, written in Genoa in 1844 and published in London in December of the same year. It was illustrated by Doyle, Leech, Maclise, and Stanfield.

CHIMESYAN, chĭm'e-syan. A small linguistic family on the Nass and Skeena rivers, British Columbia. They comprise the Tsimshian, Sitksan, and Niska tribes. They are athletic and well formed, practice tattooing, and wear labrets, together with rings in the nose and ears, but do not flatten the head as do the more southern tribes. They are expert fishermen, weavers, and basket makers, and live in large communal houses of boards, with gable roofs and verandas. They have the clan system and are organized into three distinct social orders. Slavery also exists among them, as among other tribes of the northwest coast. They have many ceremonial customs, including the potlatch (q.v.). The name is said to signify people living 'on the main river,' i.e., the Skeena. They number now about 2450 in British Columbia, besides some 729 who have within recent years crossed the line into Alaska. (See METLAKAHTLA.)

CHIM'NEY. Any structure, vertical or otherwise, of metal or masonry, including stone, brick, and reinforced concrete, having a hollow interior or flue serving the purpose of carrying off the waste gases of combustion from a stove, furnace, or fireplace, and at the same time creating a draft. It is quite probable, since we have no record to the contrary, that the chimney was unknown in either the early Greek or early Roman house, and that the smoke from a fire was permitted to escape through an aperture in the roof. Chimneys in their very simplest form were first introduced into England about the year 1368, while in Venice it is recorded in an account of the great earthquake of 1347, that a number were overthrown there.

The action of the chimney depends upon the principle that a column of heated air is lighter than a cooler one of equal height; when therefore a flue full of heated air communicates freely by the lower part with the cooler air around it, the weight of the latter pushes the warm air up, and thus an ascending current is produced. The draft velocity of flow varies as the square root of the height. In engineering work, where the chimney has received its greatest development, it is constructed either of steel, self-sustaining or supported, brick, stone, or concrete.

The design of the structure depends upon certain conditions which in Germany are required to satisfy government specifications. The practice there, upon which American construction is largely based with more or less modification, requires that the wind pressure on the base be assumed as acting upon a full median vertical section with a force W equal to 25.6 pounds per square foot, and that the centre of pressure be taken as the centre of gravity. If this area be called A, for different forms of chimney we have the following effective pressures: for round stacks, 0.67 WA, for octagonal stacks, 0.71 WA, and for rectangular stacks, 1.0 WA. The permissible stresses on the brickwork are (1) 100 pounds per square inch for common brick laid in 1 to 3 lime mortar, (2) 171 to 214 pounds per square inch for masonry of hard-burned brick laid in lime-cement mortar, and any other unit stress may be used up to 365 pounds per square inch where the factor of safety is 10 or over. If the foundation is made of concrete, the maximum allowable stress shall be 85 to 114 pounds per square inch when the concrete is simply laid, and 142 to 214 pounds per square inch when it is well rammed. On good soil the maximum shall be 43 to 57 pounds per square inch.

Chimneys of reinforced concrete, which were

attempted on a large scale in the United States about 1901, are now successfully built of considerable heights and give eminent satisfaction. The advantages in such chimneys that make them more desirable than those of either brick or steel are (1) the smoothness of the interior surface, which reduces the friction factor, (2) the fact that concrete is a poor conductor of heat, and (3) its ability to resist high temperatures. From the standpoint of cost it comes next to steel, which is least, and is followed by brick, which is the most expensive. For durability it excels both of the others, with brick next and steel last.

That reënforced concrete can be used in structures of considerable height is shown by the chimney at Butte, Montana, which is 350 feet in height by 18 feet in diameter. Another notable chimney, which up to the time of its completion, in May of 1905, was the tallest reënforced concrete chimney ever built, was put up for the Tacoma (Washington) Smelting Company, a branch of the American Smelting and Refining Company. The height of this chimney is a little over 300 feet with a constant interior diameter of 18 feet. The construction is quite typical of work of this character and may be briefly outlined. For a distance of 90 feet above the foundation the chimney consists of a double shell, the outer being 9 inches in thickness and the inner 5 inches, separated by an air space of 4 inches, with air inlets at the bottom. Above this 90-foot section the chimney consists of but one shell 7 inches thick. At the top is a lead lining extending over the coping and to a depth of 20 feet on the interior.

The concrete used for reënforced concrete chimneys usually is composed of 1 part cement, 3 parts sand, and 5 parts gravel for the foundation, while the chimney proper is of 1 part cement and 3 parts sand. The wind pressure, which is an important consideration in chimney design, is commonly assumed as exerting a force of from 25 to 50 pounds per square foot on an area equal to one-half a vertical median section; but this is believed to be higher than is necessary, for even with a wind velocity of 100 miles per hour ability to resist 20 pounds per square foot is considered ample.

There is a chimney 230 feet high and 12 feet in diameter at the plant of the Portland, Oreg., General Electric Company, and one 250 feet in height by 11 feet in diameter at Lawrence, Mass.

Steel Chimneys are of two general kinds—those that require to be braced or supported by steel guy ropes and those which are self-sustaining. Naturally the former are less important and simpler in construction. In the latter the base of the chimney, which rests on the foundation, is usually bell-shaped, though it may be secured by means of turnbuckles, bolts, angle irons, etc. Such chimneys are usually partially lined, the object of the lining being to protect the metal skin, as it is found that it is destroyed quite quickly from various causes. Corrosion of the iron also frequently takes place, caused by the condensation of the gases of combustion upon the sides of the stack. This, in a measure, may be avoided if the chimney is given a coating or two of graphite paint.

Two very tall stacks of this type were constructed for the Maryland Steel Company at Sparrows Point, Maryland. They are duplicates, each being 225 feet high, with an internal diameter of 13 feet 9 inches. They rest on an elevated masonry foundation 13 feet above the ground and have no bracing. The weight of metal in each chimney is 77 tons, while the weight of brick is equal to 900 tons. The pedestal and foundation weigh 1600 tons, making a total of 2600 tons for this form of construction, as against 7400 tons had brick alone been used. The base is a square, 40 feet on the side, and the unit load is 1.62 tons per square foot. Inside, the shaft is lined with brick, diminishing in thickness in 40-foot sections from 7 bricks at the bottom to 2 bricks at the top.

What was believed to be the tallest steel stack in the world was under construction during 1913 at the new works of the United Verde Copper Company, at Jerome, Ariz. This chimney, 400 feet 1 inch in height from the top of the foundation to the top of the steel, has a lining 30 feet in diameter inside of the steel shell, which is 30 feet 9½ inches inside diameter. The brick lining is supported on the legs of circular angles riveted to the inside of the shell and spaced 15 feet apart, so that the weight of brick is carried directly by the entire structure and not merely by the lining itself, whose bearing capacity might thus be exceeded. Furthermore, any section can be removed at once for replacement or repair. There are connections for three flues, and the steel plates are protected from the flue gases. The total weight of the chimney is about 875,000 pounds, and it is founded on a concrete base.

Among other high steel chimneys in America is that of the Nichols Chemical Company of Brooklyn, N. Y., with a height of 310 feet and a diameter of 35 feet at base and 12 feet at the top. Notable, also, is the chimney of the Compañia de Penoles, of Mapimi, Mex., which is 300 feet high.

Brick Chimneys. The tallest chimney on record which is also built of brick is at the plant of the Boston and Montana Copper and Silver Mining Company, Great Falls, Mont., built in 1908. It is 506 feet in height, has a foundation 74 feet in diameter, an interior top diameter of 50 feet, and exterior top diameter of 54 feet, and was designed so that 60 feet additional could be added if desired. In this the barrel has a circular ring section, but the lower 46 feet, which forms the base, is octagonal in exterior outline. The chimney has four separate batters, the upper 180 feet having 1 per cent, the next 100 feet 2 per cent, the next 180 feet 3½ per cent, and the octagonal base 4 per cent. A heat-protecting lining, 4 inches thick, extends from top to bottom. The cost was about $200,000. Next in height among brick chimneys is probably the Hallsbrückner Hüt chimney near Freiburg, Saxony. It has a height of 460 feet and an internal diameter of 15 feet 7 inches, its outside diameter being 33 feet at the base and 16 feet at the top. Of more recent construction is the brick chimney of the Heller and Merz Company, Newark, N. J., 350 feet in height with an inside diameter of 8 feet. This chimney was made of special radial brick, which finds wide employment in making American chimneys, laid in mortar of 1 part cement, 2 parts lime, and 5 parts sand. It is lined with 4 inches of special brick to resist acids, and an air space of 2 inches is left between the lining and the shell. The

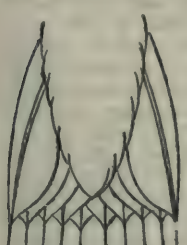
Eastman Kodak Company, at Rochester, N. Y., has a chimney 366 feet in height, with an internal diameter at the top of 9 feet 10 inches and at the bottom of 20 feet 5 inches.

Another large brick chimney is that of the power plant of the Metropolitan Street Railway Company in New York City. It is 353 feet high, with an internal diameter of 22 feet, weighs 8540 tons, and required 3,400,000 bricks for its construction. The chimney is built of two concentric shells, and the outer shell is stiffened by 12 interior longitudinal ribs projecting radially towards the inner shell and having a clearance on one-half inch. The top of the chimney is protected by a cast-iron cap.

Bibliography. Consult section on "Chimneys" in Kent, *Mechanical Engineers' Pocket Book* (8th ed., New York, 1913), where are given lists of notable chimneys and bibliographical references. Merriman, *American Civil Engineers' Pocket Book* (2d ed., New York, 1913), also may be consulted. The most satisfactory sources of information on recent practice and construction are the files of the engineering magazines and the records of engineering societies, as well as the descriptive matter prepared by various constructing engineers and manufacturers. See STEAM ENGINE.

CHIMNEY SWALLOW. 1. In North America, the chimney swift (q.v.). 2. In the Old World the familiar house swallow (*Hirundo rustica*), which ranges eastward into western China, where it is replaced by another species (*Hirundo gutturalis*). Several African swallows belong to this group, as also does our barn swallow (q.v.), which English writers sometimes call, unfortunately, the "American chimney swallow."

CHIMNEY SWIFT. The small, sooty, swallow-like bird, commonly but mistakenly called a "swallow," which throngs about chimneys in all parts of North America and represents an almost cosmopolitan family. (See SWIFT.) It is migratory, spreading northward into Labrador and the fur countries in early summer and escaping in winter to Central America. Supported upon narrow wings, each an inch longer than its total length (about 5 inches) from beak to tail, it spends its time almost continuously in the air, rarely if ever alighting except inside the hollow tree or chimney where it lives, and ceaselessly pursuing, open mouthed, the minute insects upon which it lives, catching all of them on the wing and doing us an important service. It even gathers in this way the materials for the nest, grasping with its beak tiny dead twigs projecting from lofty tree branches, snapping them off and bearing them away, without a pause in its flight. Before the civilization of the country, as yet in remote districts, it inhabited hollow trees, sometimes for many generations in succession, attaching its nest to their interior wall; but as soon as houses were built, the old trees were abandoned for the new chimneys, the superior attractiveness of which lies in greater safety and in better satisfying a racial tendency to inhabit caves. In some northerly districts these birds are latterly abandoning chimneys for attics and similarly sheltered but light situations. The nest is formed of small twigs, glued together by the bird's saliva, shaped like a half-cup or hollowed bracket, and glued to the interior wall of the chimney. The eggs, four to six, are small and pure white; and it is some time after the nestlings are fledged before they are permitted to scramble out and try their wings. In these chimneys or trees the swifts sleep at night, clinging upright with their long toes to the surface, and supported upon the stiff spine-tipped feathers of the tail, firmly pressed against the wall. In accustomed and favorable places large flocks live together; and one of the most familiar and pleasing exhibitions of American bird life is to watch the swifts at sunset circling in a twittering crowd about the chimney top, into which, as dusk comes on, they drop, one after the other, as if each went down the vortex of a whirlpool. The scientific name of the common species of the United States is *Chætura pelagica*. See Plate of SWIFTS AND THEIR NESTS.



CHIMNEY SWIFT, SHOWING SPINES AT END OF TAIL FEATHERS.

CHIMPANZEE, chĭm-păn'zē *or* chĭm'pan-zē' (Guinea). An anthropoid ape of equatorial Africa, which has been known to Europeans for 500 years. The chimpanzee, though taller than an orang-utan, falls short of the stature of the gorilla and never exhibits the breadth and massiveness of frame shown by an old male of that species; 5 feet is a good height for this animal, and no great difference is observable between the sexes. This height is a matter of measurement rather than of observation, however, as the chimpanzee rarely stands upright and habitually walks bent over and supporting itself upon its long forearms and knuckles, the fingers being bent in; most of its time, indeed, is passed in trees. The range of the genus extends from the Atlantic coast of mid-Africa eastward through the forest region to the Nile, from about 10° south to 12° north of the equator. Throughout this great area it seems to be fairly numerous and is known under many names. Although it is convenient to speak of *the* chimpanzee, several species are

DENTITION OF CHIMPANZEE.

recognized, and there are probably a number of others as yet undescribed. Dr. Elliot, in the latest summing up of these animals, admits 10 species, one of which is divisible into two subspecies. *Pan* is the latest accepted name for the genus; former names being *Troglodytes, Mimetes,* and *Anthropopithecus.* The species are *calvus, fuliginosus, satyrus, kooloo-karuba, leucoprymnus, chimpanse, aubryi, vellerosus, fuscus, schweinfurthi,* and *s. marungensis.* They are strictly forest-dwelling animals, haunting the densest jungle and climbing to the topmost branches, where they go about in families or small bands, feeding almost wholly upon soft fruits, but varying their diet with grubs, insects, honey, birds' eggs, fledglings, birds, etc. This appetite causes them to wander widely in search of fresh food, and in some districts they are greatly destructive of the banana and other plantations of the natives. Simply guarding these plantations, when the fruit is ripe, is usually sufficient to save the crop, since the apes are timid towards men and run when they can; but if cornered they prove very troublesome foes to deal with, showing much courage and seeking to grasp their enemy in their long arms, chew his hands, and gash his throat with their terrible teeth. Dr. Livingstone and others say that the chimpanzee is a match for the leopard, but is quickly killed (but not eaten) by the lion. The robust natives of the central Sudan chase these animals into the tree tops, drive them into traps, and otherwise kill them off by regular hunts. They seem to be largely nocturnal and often fill the woods with loud, reiterated cries, which are varied through every variety of horrid noise; can be heard a long distance, and seem to be uttered by large troops in concert, though perhaps only a few are really screaming and bellowing together. Such noises doubtless serve the double purpose of keeping the apes wandering through the blackness of the forest night, within hail of one another and of terrifying possible enemies. No particular sleeping place seems to be made by this ape, but when one is about to become a mother, the pair build a platform-like nest in a tree top, upon which the female rests until her young one (twins are only occasional) is born and able to travel. The young are often captured and kept as tame pets by the negroes and wandering Arabs, and thus for two or three centuries the civilized world has been supplied with living examples.

No other of the greater apes is so human in its characteristics, appearance, and intelligence, and numberless accounts exist of the interesting ways and great docility of the animal when properly treated and trained. Though it often becomes morose and savage when old (if able to survive the pulmonary diseases which kill most of its kind in youth), when young it is teachable, affectionate, and playful to a remarkable degree. Like most other animals, wild chimpanzees when young show the instinct for play as strongly developed as when confined in a zoölogical garden. So entirely human are the chimpanzees in their ways that the natives of certain tribes believe them to be relations which have been degraded from a former higher state to their present forest life.

The structural resemblance to the gorilla has been noted; but the head is rounder, and the face lacks the great ridges above the eyes and massive jaws of that animal, and the canines are smaller, while the lips are more extensile and mobile and the whole expression milder; the ears are very large and the nose insignificant. The naked skin of the face is yellowish, darkening with age, but that of the palms of the hands and soles of the feet much darker; and gray hairs often become conspicuous about the mouth and chin. The body is covered everywhere else with shining black hair, most abundant on the head and shoulders, where it hangs long and thick.

Much has been written as to these animals, especially in the works of Savage, Du Chaillu, Livingstone, Schweinfurth, and other explorers of western and Central Africa; also in regard to chimpanzees in captivity. A good general account is contained in *Cassell's Natural History,* vol. i (London, 1883); and a more scientific one in Hartmann's *Anthropoid Apes* (New York, 1886), where a full account is given of "Mafuka," the supposed hybrid between gorilla and chimpanzee, long resident in Dresden. A famous educated captive, "Sally," lived for eight years in the London Zoölogical Gardens and was the subject of psychological training and experiment, described by Romanes in the *Proceedings of the Zoölegical Society of London* (1889); and the history and exploits of another celebrated chimpanzee, "Joanna," are recorded in the same *Proceedings* (1899, pp. 296 et seq.). For the latest technical treatment of these animals, see Elliot, *A Review of the Primates* (New York, 1912). See GORILLA; ORANG-UTAN; and Plate of ANTHROPOID APES.

CHINA (Fr. *Chine,* ML. *China,* Ar. *Sīn,* Pers. *Chīn,* Skt. *Cīna;* Gk., for the people, Σίναι, *Sinai,* Σῆρες, *Sēres,* Lat. *Seres;* Turk. *Khatai,* Mongol. *Kitat,* whence Eng. *Cathay,* Russ. *Kitai,* from the race, generally held to be Tungusic, of *Kitan,* or *Khitan,* who ruled in the north of China from the tenth to the twelfth century; the natives call their country *Chung-ku,* 'Midland,' poetically *Chung-hua,* 'Flower of the Middle.' The name "China" and the corresponding ancient names (*Sinai,* etc.) are derived from the westernmost feudal state called *Ts'in,* which stood in close relations with the Central-Asiatic Tatars, and this may possibly be the channel through which it reached the countries of the West. The name *Sin* (*Sinim*), used in the Book of Isaiah in reference to the most distant nation in the East, may thus refer to those of the Ts'in state centuries before one of its sovereigns became Emperor of China in 220 B.C.). A country, formerly an empire, but a republic since Feb. 7, 1912, extending over most of the southeastern third of Asia, and embracing the whole area of continental drainage into the Pacific south of the Amur River, with the exception of Indo-China and Korea. It has an area of approximately 4,376,400 square miles. It is irregularly circular in shape, lying between lat. 18° and 54° N. and long. 74° and 135° E.; and it includes, besides China proper, Tibet, Eastern Turkestan, Mongolia, and Manchuria.

Tibet, with an elevation of 15,000 feet above the sea, is cold and sterile except in the south, where valleys teem with cultivation. To the north is Eastern Turkestan, a remarkable depression, with a central sand waste, drained by the Tarim River and bounded by lofty mountains. To the east, Turkestan merges with the high table-land of Mongolia with its summer heats and subarctic winters. To the east of Mongolia is Manchuria, with an exceptionally rich

soil and potential resources, but colder by 10° to 20° than the corresponding latitudes of New England. These outlying dependencies, with their snow mountains and half-desert plateaus, gave China the buffer territory desired, shutting it off from the rest of the world on the land side. They supply only a little over 4 per cent of the population and a mere trifle of the total products of the country, but, in area, they are two-thirds of it.

China Proper. This is the compact, roughly quadrangular area forming the southeastern third of the country, extending from the coast (some 2500 miles in length) westward to the lofty and crowded mountain ranges that form the eastern border of the Tibetan plateau, and northward to the southern border of Mongolia. The only artificial boundary is the comparatively short one between China and Tongking. The total area of China proper is estimated at about 1,532,420 square miles, or about one-third of that of the whole Republic, and within this area is included all but 3 or 4 per cent of the total population of the Chinese Republic. The whole circuit of the land frontier (about 4000 miles) consists of almost impassable mountains and deserts, which from remote antiquity have effectually cut off this corner of the world from interchange of people, products, and ideas with other regions and races; from this physical isolation have arisen most of the peculiarities characteristic of Chinese civilization and manner of thought. The vast mountains and plateaus between China and Tibet cover a wide area, and send many spurs eastward and southward, especially into north-central China, where the Kun-lun is prolonged eastward in two lines, which diminish to hills towards the coast, but rise again in the Shan-tung peninsula. Similarly, the Himalayas are continued across the southern part of China in reduced and broken lines of elevation, and this prolongation then sweeps northward in the prominent range which reaches from Canton to Ning-po, outside of which is the coast region of Kuang-tung and Fu-kien. Southwestward of all lie the heights that form the northern backbone of Indo-China.

These primary east-and-west lines of mountains divide China into three great valleys. The southernmost, south of the Himalayan extensions, is that of the Si-kiang, which drains the two Kuang provinces into the sea at Macao. North of its watershed, and dividing China proper into two very nearly equal portions, lies the valley of the Yang-tse-kiang, which is the most densely populated, highly cultivated, and important part of the whole country. This mighty river, exceeding 3000 miles in length, originates in central Tibet and flows through hundreds of miles of self-eroded mountain valley, leading first eastward, then southward to northern Yün-nan, then northeastward through the cañons of the Province of Sze-chuan, until it finally reaches the plains and traverses them to the Yellow Sea. It has many names, but all recognize it as Ta-kiang, 'great river.' As far up as Hankow-Wu-chang (680 miles) it may be navigated by ocean steamers; still farther, 363 miles up to Ichang, by smaller vessels. There the gorges begin, and further navigation is by hand boats, which can scarcely be hauled at high water. Yet navigation is being effected by small steamers as far as Chungking and beyond to the boundary of Yün-nan. Like all snow-fed rivers, the Yang-tse-kiang is subject to sudden floods, which often amount to 50 feet as far down as Hankow; a resultant compensation, however, is the constant renewal of fertility to the flooded lands, which enables them to be incessantly cultivated by a dense population. The largest lowland tributary of the Yang-tse-kiang is the Han, which drains the interior valley of the double Kun-lun extension.

North of the watershed of the Yang-tse-kiang, occupying the northern quarter or third of all China, is the vast basin of the Huang-ho, or 'Yellow River,' a river hardly inferior to the Yang-tse-kiang in size though not in economic importance. It also forces its way out from its lofty Tibetan birthplace through hundreds of miles of mountain gorges, makes a long detour to the north, then flows for a great distance due south, after which it turns abruptly to the east, and finally flows due northeast to the Gulf of Pe-chi-li. Down this vast stream come floods from the melting of snows or from sudden storms in the mountains along its upper course; and, as the river is constantly shallowed by silt, the inundations are frequently so overwhelming, in spite of marvelous protective works, that thousands of lives are lost, and sometimes widespread famine follows the desolation of the land. The river has changed its lower course 11 times in 25 centuries.

On the whole, China is very mountainous, so that about half of the country, including much of the western half, is not available for tillage, except in the valleys and on mountain slopes, many of which the Chinese terrace and cultivate to a high altitude. There are only two great low-lying plains, both of them in the east, in the basins of the lower and middle Huang and Yang-tse rivers and coastal streams mostly to the north of the Yang-tse. Nowhere else is population so dense as on these plains, excepting in the Province of Shan-tung. The larger plain extends north and south, from the Gulf of Hang-chow, south of Shanghai, to the mountains north of Peking, 700 miles in length, with a maximum width near the latitude of the Yang-tse mouth of 400 miles. It extends everywhere to the sea, excepting among the mountains of Shan-tung. The smaller plain is that of the middle Yang-tse and lower Han and comprises only about 20,000 square miles. It is connected with the lower Yang-tse by a plainlike valley. Subordinate drainage basins of less extent are those of the Pei-ho, in Pe-chi-li; the Huai-ho, in Ho-nan, consumed in irrigation works; and the small coast streams cut off from the Yang-tse-kiang basin by the coast range that runs from Hong-kong to Ning-po. The coast is broken with many bays and gulfs and a number of fairly good harbors. On the north is the Gulf of Pe-chi-li, with its arm, Liao-tung Gulf. South of the mountainous Shan-tung peninsula is the Yellow Sea, and in the south coast is the Gulf of Tong-king. Of islands, the largest is Hainan, off the south coast.

Nearly all the lakes are in two groups on both sides of the Yang-tse River. The upper group (400 to 700 miles up the river) are gradually silting up, but in flood time they extend far beyond their borders and cover the cultivated fields. The lower group (to the north and south of the Yang-tse mouth) are shallow. Several of them are important as feeders for the Grand Canal. The largest lake, Tung-tien-hu, is fabled to be the cradle of the aboriginal kings. Po-yang-hu, 90 miles long, is famous for its artificial floating islands. The Grand Canal, running from Hangchow to Tientsin, but practically

serviceable through its feeders from Nanking to Peking, was formerly the route of the great fleet of vessels bearing the tribute of rice to the capital. Artificial rivers and canals greatly aid navigation in China.

The Great Wall. The Chinese rarely use stone for architectural purposes, except in commemorative arches and bridges, and chiefly for trimming or paving; they are much given to the use of brick. The great wall is surfaced with brick. This wall, one of the most stupendous works ever conceived and executed by man, was primarily erected towards the close of the third century B.C., in sign of the destruction of the feudal system in China, and of the unification of the many provinces into an empire by Shi-Hwang-ti, i.e., 'first' Emperor of the Ts'in dynasty. It has been preserved and extended through many reigns with the futile idea of keeping back the Tatars. About the year 1547, under the Ming dynasty, its length was increased by about 300 miles. At the present time it is, along large parts of its course, little more than a mass of débris. It is 25 feet thick at the base and 15 feet at the top, with towers at intervals of about 100 yards. It is over 1500 miles long, stretching over high hills and very deep valleys and across rivers. Beginning at the western frontier of Kiang-su, it follows the general eastward trend of the mountains, making great bends north and south. In Shan-si it has a long loop embracing over half the province and forming double walls many miles apart. It reaches the sea at Shan-hai-kwan.

Climate. China lies mainly in the north temperate zone, the extreme southern portion only being within the tropics. Lying on the eastern side of the Continent, with most of its area within the region of the prevailing westerly winds, it has a continental climate, with considerable range of temperature throughout the year, except upon the immediate seacoast. The mean annual temperature at Peking, in the north, is 51°; at Canton, in the south, 69°. At Peking the monthly range of temperature is from 79° in July to 23° in January, while at Canton the corresponding figures are 82° and 55°. The temperatures at Canton are greatly modified by the monsoon winds, to which the south coast is exposed. Inland the range of temperature is much greater. On the whole, the climate shares the extreme character of all continental east coasts, i.e., it is cold and rough in the winter and excessively hot in the summer.

The rainfall is greatest on the south coast, where it often exceeds 100 inches annually, and diminishes northward. At Hongkong it is 90 inches, at Peking 24 inches. It is greatest on the coast and diminishes inland over the inhabited areas, though it is in most parts of China and in most years sufficient for the needs of agriculture; still, disastrous local droughts have occurred, causing famines. The coincidence of most of the rains with the summer months enables parts of north China to grow cotton, sugar cane, and other products that are usually confined to warmer latitudes.

Flora. Tea, rice, the mulberry, and bamboo are the four most valuable vegetable products—the first for drinking (not usually taken at meals), the second for food, the third for the production of silk, and the fourth for the construction of habitations and implements. The vast area and climatic conditions of China allow a wonderful variety both of natural products and of products grown by man. Northern China is remarkably bare of trees, shrubs, or herbage, except shade and fruit trees, crops, and, on steep hillsides, strong-rooted grass. This is the work of man, who has destroyed vegetation in supplying individual need. The tallow, varnish, and camphor trees, pine and banyan, cypress and mulberry, flourish. The mulberry is cultivated by the millions, but rather as a bush, and almost wholly for its leaf, which is the food of silkworms. In the south the coconut and other kinds of palm, with the subtropical fruits and nuts, are numerous. Among the fruits, those of the Occidental genera prevail in the north, such as apples, pears, grapes, peaches, many excellent varieties having been introduced from America. In the south the oranges, pineapples, pomeloes, mangoes, li-chi, bananas, and many fruits of native growth without European common names, enable most of the inhabitants to enjoy fruit throughout the year. The bamboo, of which over 60 varieties have been described, is of all sizes, furnishing not only its young sprouts as food, but serving numberless purposes. What iron is to the American, bamboo is to the Chinese. It is used in the building trades, in the decorative arts, and in the manufacture of furniture and utensils and also of paper. It plays an important part in pharmacy. It furnishes themes for Chinese poets. "Order used to be maintained throughout the whole Empire by it, and a sprig of it is borne in the van of the funeral procession." Many plants now common in the West, such as camellias, azaleas, and gardenias, are natives of China; on the other hand, quite a number of cultural plants have been imported into China from abroad, such as the jasmine shrub and the henna plant, brought to Canton by Western traders during the early centuries of our era.

Fauna. The vast tracts of sparsely inhabited country, and the wide variations of elevation and climate, cause considerable differentiation in the fauna. Tigers, panthers, leopards, wild cats, civet cats, tree civets, and martens, black and brown bears, 20 species of bats, several varieties of monkeys, wolves, foxes, antelopes, deer of 11 kinds, including three of the musk deer, and, in Yün-nan Province, the elephant, rhinoceros, and tapir, are some of the wild animals. The water buffalo, cattle and horses (few in number), sheep and goats, mules and donkeys, pigs, weasels, otters, badgers, stoats, sea otters, moles, muskrats, hedgehogs, hares and rabbits, 12 kinds of squirrels, and 25 species of rats and mice are known. The lists of Swinhoe and David contain 200 species of mammalia. Sea food is so abundant that in Macao one may have a different kind of fish for breakfast every morning in the year, it is said. Porpoises, fin whales, eels, sharks, and sturgeons are numerous off the coasts; and alligators, snakes, frogs, and tortoises abound. Of birds, over 700 species have already been described. The entomology has been very little studied. Locusts in swarms often do great damage, and scorpions, the mantis or "praying beetle," centipedes, fireflies, and beetles are found everywhere.

Geology and Mineral Resources. Our knowledge of the geology of China is still based largely upon the wide researches of Pumpelly and Von Richthofen, supplemented recently by those of other explorers, such as Bailey Willis, and especially by mining and railroad engineers. The prolongations in China of the Kun-lun

Range are almost wholly composed of granites, gneisses, and other crystalline and some eruptive rocks, and approximately mark the boundary between very distinct formations to the north and south of them. To the south the predominating formation is a vast area of Jurassic strata, including all the Red Basin of Sze-chuan which, with irrigation, has been made the most productive part of China; carboniferous limestone is also conspicuous in the south. To the north the prevailing rocks were said by Von Richthofen to be carboniferous limestone, but the fossils discovered by Bailey Willis have proven it to be limestone of Ordovician age. This geologist also discovered on the Yang-tse, as far south as the latitude of New Orleans, a large body of Glacial deposits of Cambrian age. This demonstrates the existence of Glacial conditions in a very low latitude in the early Paleozoic. His observations also show that the history of mountains in North America and China run closely parallel in time, in manner of development, and in resulting features of relief. The recent studies of specialists in western Asia and central Europe extend the same generalization to those regions, and this is a point of prime interest in the comparative geology of the continents.

One of the problems of China's geology has been the extensive and thick mantle of yellow earth with fine texture and vertical structure to which Von Richthofen gave the name of loess. It spreads over a vast area in east China, especially in Shen-si, Shan-si, Ho-nan, and Hu-peh, and even extends in small areas to the south of the Yang-tse. It forms a remarkably fertile and friable soil, so porous however that much rain is required to keep it in good condition for cultivation. Many of the beds are hundreds of feet in thickness, and great quantities of it are carried by the Huang-ho and other rivers to the ocean, tinting its waters; hence the name of the Yellow Sea. Von Richthofen maintained the theory that the material is wind-carried dust from the deserts of Central Asia. Later students, in view of the enormous mass of the loess, incline to the opinion that both rivers and winds contributed to the deposits. Rock débris borne to the sea is adding to the eastern land area.

The mineral resources of China are enormous, and the most important is coal. Such researches as have been made since Von Richthofen only confirm his judgment as to the vast extent and richness of these fields. Those in eastern Shan-si and southern Hu-nan stand out above all others in richness. The Shan-si anthracite field has an area of about 13,500 square miles with seams up to 40 feet and everywhere at least 15 feet in thickness, the fuel being equal to the best Pennsylvania anthracite. The western half of this province is nearly as rich in bituminous coal. Southeastern Hu-nan is one great coal field, but in about one-half of the area, which is 22,000 square miles in extent, the coal is buried too deep to be mined. Sze-chuan, Kan-su, Pe-chi-li, and Shan-tung are the other provinces that are especially rich in coal. Iron ores are also widely diffused, but only ores that may be easily smelted by native methods are as yet utilized. Such ores exist in great abundance throughout the Shan-si coal fields, and the fact that coal and iron are near together in three of the mining regions of Manchuria gave rise to the iron industry of that country. Iron ores are sparsely distributed, however, in the coal regions of Hu-nan. Considerable gold is washed out of the sands and gravels of many streams in the Red Basin of Sze-chuan, and copper is mined in the same region for minting the current coin of the realm. The tin mines of Yün-nan are confined to an area of about 10 square miles west of Meng-tse. Silver, lead, zinc, and salt are among other minerals and metals.

Agriculture. China is essentially an agricultural country, the bulk of the people being tillers of the soil. Agriculture is held in the highest honor, the farmer ranking, in theory at least, next to the scholar, and before the merchant and artisan, in the four classifications of the people. With solemn ceremonies the Emperor, in the Temple of Agriculture in Peking, annually used to inaugurate the farming season at the spring equinox. China has a more equal distribution of land than any European or American nation, estates of a few thousand acres being rather rare, and a plot of 10 acres being considered a good-sized farm. Nominally the land belongs to the government, and as a matter of actual practice a man's title to his land ceases as soon as he fails to cultivate it. Owing to the great congestion of population, extremely small subdivisions of acreage are the rule. However, as it results in a highly intensive method of cultivation, it is by no means an unmixed evil, for the land is cultivated with a care and an intelligence unrivaled in the world. The system of rotation of crops has been adopted since time immemorial, and such a high appreciation is shown of the value of fertilizers that no part of the animal and vegetable refuse is wasted. Not satisfied with cultivating every inch of fertile land, the Chinese proceed with wonderful patience and endurance to create artificial fields wherever they can find place for a layer of soil. Thus, it is a matter of common occurrence to meet in Chinese waters floating fields consisting of large rafts covered with earth. Another and more important extension of arable land is by means of the so-called terrace fields, which are formed by covering the mountain slopes with fertile soil. Even the shifting sand fields are gradually converted into rich ground. The implements of the Chinese are crude and clumsy. They cannot buy expensive farm machinery, for their holdings are too small. Irrigation is highly developed, and the country is covered with canals and ditches—even the terrace fields on the mountain slopes have abundant water.

The chief agricultural products of China are grain, cotton, and tea. Of grain, rice is the most important staple, and is raised largely in the middle and southern parts. In the north wheat, corn, buckwheat, oats, and a little rice are produced. Tea is grown mostly in the south, although its cultivation is carried as far north as lat. 31° N. It is planted, as a rule, on the mountain sides sloping to the south, and in soil composed mainly of loam. The tea bushes yield three crops a year—April, July, and August. (For further details, see TEA.) Cotton is raised as far north as the Province of Shan-si, but only in the low valleys here. The provinces in which it is considerably grown are Shen-si, Kiang-su, An-hwei, Che-kiang, Hu-peh, Kiang-si, Hu-nan, and Kuang-si. Tobacco is cultivated throughout China, and the opium-smoking habit, though now suppressed by government, may yet call for the cultivation of the poppy here and there. By an Imperial decree of 1908 the plantation of poppy was to have been eradicated by the year 1915. Cane sugar is successfully produced in four

southern provinces—Che-kiang, Fu-kien, Kiang-si, and Kuang-tung; indigo in Che-kiang and Kiang-si; and hemp in two middle provinces—Hu-nan and Shen-si. The silkworm culture centres in the Province of Kiang-su and in the delta lands south of Canton City. The vegetables include carrots, peas, cabbage, pepper, garlic, and beans. Stock breeding claims little attention. Milk, butter, and cheese are practically unknown, and eggs, fish, and game are considered more important than the flesh of domestic animals.

Manufactures. The Western world is under a great debt to China for many inventions which have been brought to Europe and there improved. For many centuries the Chinese alone had silk, paper, jade, porcelain, the art of printing, the magnetic needle, and gunpowder. They excel in whatever requires patience and routine skill. For political reasons, western machinery was formerly discouraged, but is now being rapidly applied. Materials used are silk, cotton, linen, bamboo, clay, and wood. Printing by means of wooden blocks and also by movable type was known in China from an early age, and many books thus made and still extant are older than the time of Gutenberg and Koster. However, the invention of movable type, so strikingly useful in a system having but 26 phonetic letters, is of far less value when tens of thousands of characters are used. The making of porcelain goes back to about the year 600 A.D., though the question of its discovery depends, of course, largely on the definition of the term "porcelain" in the technical sense. Their weaving, embroidery, engraving on wood, stone, and metal, fine gold and silver work, ivory carving, lacquer ware, and bronze casting are worthy of high admiration. Foreign methods and machinery have been introduced, and native spinning, weaving, and flour mills, ironworks producing rifles, cannon, steel rails, and other iron and steel products, match factories, and some other industries conducted on Japanese or Western lines are making progress. Most of these establishments are under the supervision of foreigners.

Transportation and Communication. There are many roads throughout the well-settled parts of China, but they are in bad repair and are almost impassable for wheeled vehicles; but broad macadamized roads have been constructed in the larger towns, where land was available. The navigable rivers furnish many avenues of commerce, and these, with canals, carts, wheelbarrows, and porters, carry a vast volume of trade. The railway question may be said to be the pivotal matter of Chinese economic and political life. Great strides have been made, although lack of funds has been and still is an impediment in carrying out the several plans. The immense extent of territory and the wretched condition of Chinese highroads combine to hinder commercial intercourse between the various parts of the country. Heroic sacrifices are being made to improve the highways and to complete a series of trunk and subsidiary lines connecting the chief towns and ports. Railways were introduced as concessions to rival foreign claims for trading privileges; but, as the necessary capital and experts are lacking in China, the subject of railroads has become a politico-diplomatic matter, each Power endeavoring to secure concessions for what are expected to be the most profitable roads, as well as for such as may have strategic value should a partition of China or a conflict of foreign powers in her territory eventually take place. Railway building in China is in its infancy; but some of the lines that will become main trunk roads have not only been mapped out, but actually surveyed, and all preliminary steps, such as securing government concessions and financial backing, have been taken.

Mr. Liang Tun-yen, who studied at Yale University, was placed, in May, 1914, in charge of China's railways as Minister of Communications. He set about developing the plan prepared for Dr. Sun Yat-sen by several American experts. At the end of 1912, with 5886 miles of railway in operation, China proper had 0.3 mile of line to every 100 square miles. This is very little, but progressive, and China will soon have a respectable net of lines, if funds required are obtainable.

Railroads would have been introduced long ago if it had not been for the hostility of the Chinese government. The first railroad, built in 1876 between Shanghai and Wu-sung, was thronged by the people, but in a year was bought and destroyed by the authorities. The next line was from the Kaiping collieries, northeast of Tientsin, to navigable water, and this was followed, in 1897, by a line 73 miles long from Tientsin to Peking, which was so successful that it was soon double-tracked. The expected has happened. It is not only that railroads are a part of the new government policy of development, but also that existing lines have been object lessons to the nation, and their advantages have been so conspicuously demonstrated that regions which do not yet possess them are beginning to demand them. The Chinese themselves are eager to participate more largely in the building and ownership of railroads. As it is, the Chinese government is closely in touch with all railroad enterprises and projects. All the companies are subject to the regulations imposed by the Department of Railroads, forming under the Republic the first division of the Ministry of Communications; no road can be built except on the authority of a government concession, and concessions are withdrawn if development does not go forward as stipulated. Many concessions have been granted, and the building of railroads is in progress in many parts of the country. Most of the detailed information on the geography of large parts of China has come from foreign engineers who have been looking for favorable railroad routes. Thus the Americans, under Mr. Parsons, made a distinct contribution to our knowledge of the largely unknown Province of Hu-nan while selecting a route from Hankow to Canton; and the British have surveyed most of the country to the east of Sze-chuan in seeking a favorable route through the mountains by which this rich region may be tapped. The aims chiefly in view are to construct trunk lines like that from Peking to Canton, now partly completed; to build feeders from these trunk lines, especially to the coal and iron fields, so that their commodities may be cheaply moved; and to construct lines from the leading ports to interior cities that are great collectors and distributors of commerce in the regions around them. The Chinese railroads that were in operation, being constructed, or were still merely projected in 1912, may here be briefly noticed. In all there were in 1912 about 5886 miles of road in operation and 2300 additional under construction.

The railways of China may be more or less accurately divided as between government railways, railways constructed under foreign concessions, and provincial railways. The government railways are financed in various ways—some through loans by the government and some through loans by private parties. The following are the principal government railways.

The Canton-Hankow has in operation 209 miles of main line and 32 miles of branch lines on what is known as the Kuang-tung section and 560 miles of main line and 65 miles of branch lines, part of which is open for traffic and part still under construction in 1912 on the Hupeh-Hunan section. The Kuang-tung section was built under the direction of a Chinese engineer, Jeme Tien-yu. The Hupeh-Hunan section is being built under the direction of a British engineer, A. H. Collinson. The gauge of both sections is 4 feet, 8½ inches. The Kuang-tung section is being built by a Chinese company with a nominal capital of $40,000, of which it is understood the paid-in part has been subscribed for in China, largely in Canton. The Hupeh-Hunan section is being financed by a foreign loan from British bankers, amounting to about £6,000,000.

The Peking-Hankow, which was begun in 1898, was opened for traffic in December, 1905. The gauge is 4 feet, 8½ inches, and the main-line mileage 755 miles, with 62 miles of branch lines. The engineer in charge of construction was a Belgian, Jean Jadot. The cost of construction is estimated to be about $87,960,000, and the capital was raised largely in France and Belgium, there being, however, a £500,000 loan by British and French bankers jointly. In 1911 the company earned gross $11,311,536, and its expenses, presumably exclusive of any interest charges, amounted to $3,642,043. The remarkably low operating ratio is worthy of attention. The total tonnage of freight carried in 1911 amounted to 1,854,370, and the total number of passengers carried, 2,147,586. There is no available data to show what the average length of haul for freight or the average length of passenger journey was, but the receipts from freight amounted to $7,657,559 and from passengers $3,053,977. Even if the average haul of freight were 200 miles, which would be an unusually long average haul for an 800-mile road, the total ton mileage would be 371,000,000, and if the passenger journey averaged 100 miles, which again is taking an extremely long average, the total passenger mileage would amount to 214,800,000, and under this assumption the average receipts per ton per mile would be two cents, and per passenger per mile 1.7 cents. It will be seen that while the ton-mile receipts look very high as compared with American or European freight rates, the receipts per passenger per mile are correspondingly low. With the very low rate of wages in China it is not therefore surprising that the operating ratio should be so very much better than that shown on either American, English, or European roads.

The Shanghai-Nanking is probably the best-built railroad in China. It was begun in 1904, and the first 80 miles were open for operation in July, 1906. The last section from Chinkiang to Nanking was opened in April, 1908. The total mileage operated is 203 miles. Fifty-four miles are double track. The gauge is 4 feet, 8½ inches, and many of the cars and some of the locomotives were ordered from the United States. The road was built largely through British loans, and expenditure for materials and supplies was under the supervision of English engineers. The road runs over a nearly level country, but is the most expensive in China; its construction cost was about $50,000 per mile. In 1911 the company earned $2,251,072, and the expenses for that year amounted to $1,490,186. The great bulk of the business done is passenger business. The total number of passengers carried in 1911 was 4,672,335; the tonnage of freight carried exclusive of live stock was 314,516 tons. Passenger fares per mile on this road are about 2 cents, first class, 1 cent, second class, and ½ cent, third class. There is a fourth-class rate for coolies, averaging about ⅓ cent per mile. Approximately 95 per cent of the total passenger business is third class.

The Peking-Kalgan was begun in 1905, and, in 1913, 218 miles were in operation and about 140 miles projected but not completed. Taotai Jeme Tien-yu was the engineer in charge of construction. He was a graduate of Yale University of the class of 1883. The line was built very cheaply, and Chinese newspapers generally base their plea for having Chinese railroads built without the supervision of foreigners on the very much lower cost of the work done in this way, contrasting the cost of the Shanghai-Nanking with the Peking-Kalgan. The capital for building the road was largely the surplus earnings of the Peking-Mukden. The road runs over the Nankou Pass; this part of the line represents the most difficult railroad construction in China. Trains are broken up into two sections, and at one place on the line a switch-back is employed. Passenger trains are taken over the pass with Mallet locomotives, and freight trains with the American-geared Shay locomotives, such as are used on the coal branches in West Virginia on the Chesapeake and Ohio Railway.

The Kiangsu-Chekiang, about 78 miles long, was begun in 1904 and was opened for operation in 1906. The line was built entirely with Chinese capital and has $10,000,000 which was subscribed by about 53,000 stockholders. Some idea of labor costs on Chinese railways may be had from the fact that an engineman's wages on the Kiangsu-Chekiang are from $28 to $37 per month, and station labor is paid from $8.50 to $16 per month.

The Tientsin-Pukow was built in two sections. The northern section, about 455 miles, which is known as the German section—a German engineer was in charge of the specifications for material, etc.—was begun in 1908, and various subsections were opened at different times in 1910, 1911, and 1912. The southern (British section) will be about 236 miles long when completed, and a part of the line was opened for traffic in 1912. The Revolution had very much hampered the completion of this line, but the country traveled is one in which a large amount of freight traffic originates, most of which now goes by the Grand Canal.

The principal foreign concessionary railroads in China are the Chinese Eastern, the South Manchuria, the Shantung, and the Yün-nan.

The Chinese Eastern was begun in 1897 with Russian capital, and the engineer in charge of the construction was a Russian, M. Turgovitch. There are in operation about 1078 miles of road, which is of 5-foot gauge. The line was opened

for operation in 1901, and after the Russo-Japanese War the southern portion, from Kuanchengtze to Tairen, was turned over by the Russians to the Japanese. The road carried, in 1910, 1,362,644 passengers and 1,141,200 tons of freight.

The South Manchuria Railway was opened for operation in 1907. A part of the road, as mentioned above, had been begun by the Russians and was ceded to Japan under the Treaty of Portsmouth. The gauge was changed to 4 feet, 8½ inches. In the year ended March 31, 1912, the road carried 3,158,270 passengers and 4,705,690 tons of freight.

The Shantung was built with German capital, is about 256 miles long, and began operation in 1904. The Yün-nan was built with French capital, is meter gauge, and was opened for operation in 1910. It is part of the Chemins de fer de l'Indo-Chine et du Yün-nan, of which about 289 miles are in China.

Early in 1914 it was reported that the Chinese government had granted to Japan the right to build about 1250 miles of railway in Manchuria. The several lines included are as follows: Ssupingkai to Taonaufu, about 190 miles; Changchun to Taonaufu, about 150 miles; Taonaufu to Jehol, about 454 miles, or to Hulutao, about 364 miles; Kaiyuan to Kirin via Hailungcheng, about 220 miles, and from Kirin to the Korean frontier, about 212 miles. It is said that the construction work will be done by the South Manchuria Railway, with whose lines the proposed ones will be connected. The first line to be constructed will be that between Ssupingkai and Taonaufu. At the present time the existing highway between these two points is 230 miles long. The railway will be but 190 miles in length. The estimated cost is about $4,980,000, or $25,896 per mile. There will be no great engineering difficulties or unusually expensive construction work, with the exception of a bridge across the Liao River. Japan will probably have to negotiate a foreign loan for this work, and it is supposed that, if a loan of $9,960,000 can be negotiated under favorable conditions, the line between Kaiyuan and Hailungcheng will also be undertaken in 1914. The purchase of such materials as will be required from abroad will be made at Dairen, where the South Manchuria has its general offices.

An Imperial edict of May 9, 1911, ordered that all trunk lines under construction or projecting in China were to be taken over by the government, and branch railways were to be built by local interest or presumably provincial governments. This order was one of the contributing causes of the Chinese Revolution. Dr. Sun Yat-sen, after he resigned as President, made a study of China's railway needs and recommended the building of three main trunk lines: (1) from Hainan through the provinces of Kuang-tung, Kuang-si, Kuei-chow, and Sze-chuan to Tibet; (2) from Shanghai through Kiang-su, An-hwei, Honan, Shen-si, Kan-su, and Sinkiang to Ili; (3) from Chinwangtao in the gulf of Chihli through the peninsula of Liaotung and through Mongolia to Urianghai. The National Railway Union, which met in Peking to consider Dr. Sun's proposals, recommended that No. 1 be extended westward to Constantinople, and that No. 3 should be a trunk line connecting Peking with Tomsk in Siberia. This work was to be done by granting concessions to foreign syndicates for the construction and operation of the roads for 40 years, at the end of which time the roads were to revert to the Chinese government. Dr. Sun is now engaged in trying to interest foreign countries in these proposals and in getting the necessary concessions from railroads and companies who already have franchises for parts of the routes covered in his proposals.

In 1908 the government took over all telegraph lines in China. There are in operation in China about 36,339 miles of telegraph lines (1912) and about 102 miles of underground cables. There are about 561 telegraph stations. On June 1, 1912, a uniform charge for telegrams (in a foreign language) was adopted at the rate of 9 cents per word for all places in the same province and 18 cents per word from stations in one province to stations in any other; and 6 cents and 12 cents respectively for telegrams in Chinese.

The Chinese postal service, which had originated from a side department of the Maritime Customs under Sir Robert Hart, was in May, 1911, transferred to the new Ministry of Posts and Communications, where it now forms a special department under a Chinese and a French director. Although the unsettled state of affairs in China has somewhat interfered with the regularity of its working, the new service justifies all the hopes placed in it. At the beginning of 1912 more than 6000 postal establishments were in existence, and the statistics of articles dealt with show most noteworthy increases. The service is being gradually extended to Chinese Turkestan and Tibet.

Commerce. Commercial relations between China and foreign countries have existed ever since the great expedition to western Asia of the general Chang K'ién at the end of the second century B.C., when the markets of Central Asia and the countries of the Mediterranean began to exchange their products against Chinese silk, skins, and iron. This trade was carried on by caravans through Eastern Turkestan to about the middle of the second century A.D., when ocean trade connections were added with a city called Cattigara, probably on or near the coast of Tungking, as the terminus of western navigation. It appears that Syrians and Indians were the principal traders in that period. They were followed by Persians of the Khalif Empire, who monopolized Oriental trade up to the fifteenth century, when the Portuguese arrived in India via the Cape of Good Hope. Trade was during this period carried on under the name of "tribute," the Chinese court receiving and trading in tribute goods, for which counter gifts were bestowed. That these counter gifts were equivalents encouraging regular traffic may be concluded from the continuous tribute missions arriving from Arabia, India, and other foreign countries as registered in Chinese records. The Portuguese established a trading port in China as early as 1522, and trade was thenceforth carried on almost without interruption by them and the Dutch, the English, and the Americans; but these secular relations lacked stability and safety, owing to the refusal of the Chinese government to grant suitable protection and to its avowed hostility to foreigners. Only since 1842, the year of the conclusion of the Treaty of Nanking, which followed the so-called Opium War with England, has commerce enjoyed the official sanction of the Chinese government in specially designated ports. The number of these ports steadily increased as one or another European power succeeded in wringing concessions from China. At the end of 1912

trade in foreign bottoms and under foreign treaty regulations was carried on in 48 different ports and stations. The more important ones are enumerated below, together with the estimated gross values with which they participate in the total trade of China.

PLACE	GROSS VALUE OF THE TRADE		
	1905	1911	1912
Newchwang	$34,428,000	$42,981,420	$37,274,900
Chinwangtao	14,498,000	7,031,480	6,834,640
Tientsin	59,505,000	86,237,380	75,671,920
Chefoo	23,288,000	22,622,540	21,264,640
Kiaochow	14,445,000	34,145,080	40,486,880
Chungking	18,180,000	21,562,860	19,652,540
Ichang	2,282,000	3,556,440	4,111,220
Shasi	998,000	2,179,260	4,098,120
Changsha	4,168,000	1,309,060	16,308,020
Yochow	371,000	2,557,440	4,650,900
Kiukiang	17,545,000	25,657,280	25,649,880
Wuhu	22,803,000	15,859,680	21,814,440
Nanking	7,612,000	6,706,620	9,081,280
Chinkiang	21,747,000	17,375,200	15,952,180
Shanghai	131,450,000	14,597,240	137,573,400
Shoochow	2,929,000	5,091,200	8,414,540
Hangchow	11,712,000	13,096,520	14,952,440
Ningpo	12,817,000	16,443,540	16,503,480
Wenchow	14,369,000	1,969,520	2,775,000
Santuao	1,761,000	2,128,240	2,690,160
Foochow	13,005,000	12,799,040	13,344,420
Amoy	9,918,000	15,105,620	14,453,420
Swatow	22,777,000	38,047,840	42,469,340
Canton	67,875,000	75,645,576	71,166,540
Kowloon	29,786,000	32,743,520	29,010,220
Lappa	8,125,000	13,490,200	12,750,200
Kongmoon	2,728,000	4,071,480	4,892,880
Samshui	2,921,000	4,206,900	4,567,280
Wuchow	6,865,000	7,886,920	9,084,240
Nanning	.....	3,478,740	5,205,160
Kiangchow	5,309,000	4,007,100	3,947,160
Pakhoi	2,250,000	1,819,920	1,876,640
Mengtsz	7,675,000	8,432,300	14,481,800
Tengyueh	1,344,000	1,246,160	1,854,980
Total	$495,030,000	$565,189,316	$714,864,140

The growth of China's foreign trade since the opening of the above treaty ports may be seen from the following table:

YEAR	Imports	Exports
1845	$10,277,000	$19,098,000
1875	50,496,000	51,484,000
1885	64,586,000	44,254,000
1890	94,778,000	65,358,000
1895	125,338,000	107,470,000
1896	147,891,000	98,314,000
1899	193,266,000	146,838,000
1900	154,081,000	119,246,000
1904	227,080,000	158,061,000
1905	358,128,000	182,538,000
1910	342,593,100	281,816,000
1911	348,913,000	279,230,000
1912	350,192,000	274,184,000

These figures show the unexampled increase in the trade of China in the year preceding the Boxer uprising, when both the imports and exports more than doubled in value as compared with 1890. The Russo-Japanese War did not have any important effect upon the trade of most parts of China, and commerce is still steadily increasing. As the statistical secretary of the Maritime Customs of China said some years ago, there is no reason why these figures should not treble within a comparatively short time—as soon as railway facilities shall enable the Chinese producer to dispose of his surplus products to the foreign trader. He cannot do this all at once, owing to the extremely high cost of transportation. To quote from the official report: "To form an idea of what future prospects are, it is fair to make a comparison with India. The areas of the two empires are almost identical and their products very similar. But China has a larger, a more industrious, and more intelligent population; while, on the whole, the country is probably more fertile and possesses greater mineral resources. In the former country trade is assisted by good roads, railways, and lightness or absence of taxation; in the latter, at present, it is hampered by directly opposite conditions. The result is that the exports from India are worth three times the exports from China. With equal opportunities, which the building of railways and opening of mines will bring about, the discrepancy should disappear."

As may be gathered from the following table

CHINA'S TRADE BY COUNTRIES, 1912

COUNTRIES	Imports from	Exports to	Total trade with
Great Britain	$55,393,662	$11,765,260	$67,158,700
Hongkong (mostly British products	109,372,740	76,504,160	185,877,640
Japan	67,352,580	40,893,880	108,246,460
Continent of Europe (except Russia)	27,729,280	59,988,840	87,718,120
United States	24,361,199	29,573,732	53,934,931
India	34,518,040	5,604,020	40,122,060
Russia	15,711,680	33,445,780	49,157,460

of the export and import trade with the leading countries in 1912, the closest rivals for the growing trade of China in order of importance are Great Britain, the continent of Europe, Japan, and the United States.

The principal imports and exports in 1912 were as follows:

LEADING IMPORTS AND EXPORTS, 1912

IMPORTS		EXPORTS	
Cotton and cotton goods	$106,625,860	Silk, raw and manufactured	$69,232,180
Metals	13,499,080	Raw cotton	1,259,554
Copper (included in above)	2,630,720	Tin	9,141,220
Railway plant	1,897,360	Hides	8,666,140
Other machinery	3,341,840	Wool	5,078,620
Kerosene oil, America	10,453,980	Hemp	2,360,600
" " Sumatra	5,086,630	Oil	10,471,000
" " Borneo	2,204,460	Matting and straw goods	8,446,360
" " Russia	608,280	Paper	2,405,000
Coal	6,032,480	Tea	2,499,720
Matches	5,168,900	Beans and bean cake	3,049,244
Opium	35,303,180	Sesame	8,854,840
Cigars and cigarettes	6,759,900	Eggs	1,753,800
Sugar	17,823,640	Cattle	2,146,000
Flour	9,393,560		
Fish	7,807,740		

Leading net imports for 1912, expressed in quantity, were as follows: cotton, raw, 279,192 piculs; cigarettes, 4,339,782,000; cigars, 38,638,000; coal, 1,516,801 tons; fish and fishery products, 1,204,893 piculs; hemp, 14,036 piculs; hides (cow and buffalo), 24,569 piculs; leather, unmanufactured, 92,711 piculs; matches, 30,090,020 gross; condensed milk, 387,253 dozen tins; kerosene oil, American, 123,441,777 gallons, Sumatra, 47,345,842 gallons, Borneo, 22,423,644 gallons, Russia, 3,975,648 gallons; flour, 3,202,501 piculs; sugar, all kinds, 4,725,279 piculs. Leading Chinese exports, 1912, in quantity, as follows: silk, raw and unmanufactured, 227,458 piculs; cotton, raw, 805,711 piculs; tea, 1,481,700 piculs; eggs, 291,705,236; beans and bean cake, 19,099,489 piculs; cattle, 77,949; pigs, 266,125; poultry, 2,403,581; hides, dressed and undressed, 7,876,612; tin, 145,227 slabs; sesame, 1,999,761 piculs (1 picul = 133⅓ pounds).

The value of American trade for the last three fiscal years was as follows:

	1910	1911	1912
Imports into U. S.	$29,990,370	$34,227,503	$29,573,732
Exports from U. S.	16,320,612	19,287,836	24,361,199

In silk China furnishes one-third of the world's supply, besides using an enormous quantity for home consumption. Tea is largely exported by land to Russia and Siberia, via Tientsin and Kiachta, and also by caravan through Mongolia. Manchuria is the great bean-producing province and had a good crop in 1912 in spite of the internal situation. Opium again showed an increase in cultivation, because the checks had been removed by the temporary disorganization of the government. On the whole, in spite of the prevailing uncertainty, the year was fairly good in trade. One advantage came in the conversion of much trade from junk to steamer for greater security, and this change will doubtless be permanent. China offers a fair field for all nations, and at present there is not much rivalry in the main for the trade. Japan holds most of the tobacco market, while the United States again has the flour trade, besides a monopoly on dried fruits, but cotton and cotton goods from America seem to be a little too fine in quality and too high in price to suit the average Chinese purse. However, the recently concluded agreement of the Standard Oil Company with the Chinese government for the exploitation of oil in partnership will tend to divert this important commodity into American channels. The prosperity of Manila under American rule has been carefully observed by the Chinese, and the United States could use this to good advantage by making Manila the distributing point for American goods and samples. Chinese trade is capable of enormous increase—in fact, beyond the bounds of imagination; but first the people must be taught to use foreign goods and to acquire a taste or a desire for them. As China's industries are as yet undeveloped, there is no danger of China competing seriously in the world market for the present, and for many years to come the Republic will be dependent upon the great trading nations, Japan, Great Britain, France, Germany, and the United States.

Shipping. The total shipping of the treaty ports, entered and cleared, in 1911, was as follows:

Flag	Tons
British	34,712,440
Japanese	19,172,727
German	6,849,069
French	3,154,157
American	712,161
Total foreign shipping	67,890,431
Chinese	17,881,542
Grand total	85,771,973

The flags sharing most in the Chinese carrying trade in 1911 were the British, with 40.47 per cent of the total; the Japanese, with 22.35 per cent; and the German, with 7.99 per cent. The United States received only 0.83 per cent, whereas in 1906 it had been 1.78 per cent. Since 1905 there has been a steady decline in the percentage of American tonnage. On the other hand, the Japanese increased from 15.01 per cent in 1906 to 22.35 per cent in 1911. The following table shows the Chinese carrying trade during the 10 years beginning with 1902 and ending with 1911:

YEAR	TOTAL SHIPPING		CHINESE SHIPPING	
	No.	Tons	No.	Tons
1902	66,498	53,990,000	26,303*	9,341,000
1903	77,012	57,290,000	30,708	9,111,000
1904	223,835*	63,775,000	146,865	14,768,000
1905	223,959	72,756,000	148,755	16,407,350
1906	208,547	75,819,888	139,304	16,186,750
1907	217,932	80,109,424	147,193	16,686,300
1908	207,605	83,991,289	136,663	16,945,860
1909	208,516	86,771,809	135,053	17,860,810
1910	219,810	88,776,689	146,075	19,597,822
1911	193,398	85,771,973	130,828	17,881,542

* This and the following include Chinese junks and tonnage.

The above figures are all the more remarkable as compared with 1894, when only 38,063 vessels entered and cleared, with 29,622,001 tons.

Government. Recent events in China not only led to the expulsion of the Manchus, but caused a revolution in government as well. While it is true that several old offices and abuses still survive, the Chinese are exhibiting a willingness to discard the customs and traditions of past centuries. Now, for the first time, China is becoming really nationalized.

China has always suggested a confederation of provinces rather than a powerfully centralized government. The vast extent of the country and the lack of communication and transportation facilities naturally led to the provinces and their viceroys and governors assuming much power without interference from Peking. Of course, the Emperor was the autocratic head of all, and his edict or command was law, but with the ordinary routine of affairs the Imperial court rarely interfered. When extraordinary matters arose, the Provincial Governor had the right to petition the Emperor directly. Between the Emperor and the provincial governors was the Viceroy. This office, like that of High Commissioner, gave scope to men of special abilities, and this explains the fact that in recent years foreigners have been familiar with the names only of two or three prominent viceroys. The viceroyalties consisted of two or three provinces, and there were thus 10 or 12 viceroys or

governors-general, who worked together with or independently of the provincial governors. Usually the Governor and the Viceroy were the sole mediums of communication between the capital and province, though the provincial Treasurer and the Provincial Judge were powerful assistants or checks, as the case may have been. Thus these four functionaries constituted the actual government of each province.

Each province had its own army and navy, and in past years may have been uninterested and may have taken no part in wars going on in distant sections of the Empire. Such was the case in the Chino-Japanese War, which was regarded by most Chinese as a personal quarrel of the Manchu court with Japan over Korea. The highest viceroyalty was that of the two Kiangs, with its seat at Nanking; the second was that of Pe-chi-li, with its seat at Peking; the third was that of the two Kwangs, with its headquarters at Canton, the other important capitals being at Fu-chow, Hang-chow, Wu-chang, Chang-sha, Yün-nan, and Ku-yang. The provinces of Shan-tung, Shan-si, and Ho-nan, the oldest parts of China, had no viceroy, while Sze-chuan had no governor, but only a viceroy. Thus each of the 18 provinces, with its own army, navy, and tax system, and its own social customs, was in the past a complete state in itself, whose corporate existence was in no way dependent upon any other state. Only in the regulation of the salt trade, the management of the navy, and occasional "Imperial" appropriations were they under Imperial control. The Peking government made no new laws, left each province to its own devices, and resembled rather the general staff of an army, absorbing and giving out, when necessity called, able men for the administration of affairs.

Although the internal situation of the provinces is changing, the administrative system is still based on the real unit of Chinese corporate life, the *hien*, or city district. Of these there are 1300 in the Republic. Each province has from 70 to 100 or more *hien*, a term which Europeans translate 'district,' 'department,' 'canton,' or 'prefecture.' Thus the half-barbarian Kwei-chow has but 34 *hien*, with numerous districts in which dwell half-civilized natives, while Pe-chi-li has 140 *hien*, the total including the Peking and Mongol districts. The *hien* always consists, in pure Chinese tracts, of a walled city and an area of 500 or 1000 square miles around the town. The *hien* magistrate is the heart and soul of all official life. The people call him "father and mother officer," for he is always close to the masses. Usually entering office with literary or scholastic qualifications only, he is assisted by a permanent staff of trained specialists. He must keep also from 30 to 300 runners, collectors, lictors, and policemen for the administration of justice.

Every group of two or more *hien* is under a *fu*, or city of the first class, and each province has from 5 to 10 *fu*. The ancient customs and privileges of each province, district, and city are still potent in practical politics and make it utterly impossible to give a uniform description of the system of administration, for in reality this federation of states and cities is much on the order of mediæval Germany. The Republic is studded with villages and hamlets, and, as in European nomenclature, many popular names for places are words denoting shop, temple, nunnery, rapids, school, inn, fair, market, bend, etc. The various Chinese districts less than provinces may be likened to the capital, cathedral town, state capital, municipality of the first rank, municipality of the second rank, abbey town, and borough of Europe, differing greatly in territory and population, however, and also in relative historical or commercial importance. But, on the whole, China is a nation of villages, three-fourths of the people dwelling in these. Relatively to the whole population there are fewer large cities in China than in Western lands.

At Peking there was the Emperor as autocrat, assisted by two councils. These were (1) the Grand Secretariat and (2) the Grand Council. The Grand Secretariat was composed of 4 members, 10 learned aids chosen from the Hanlin College, and 200 secretaries. This council deliberated on state affairs and assisted the Emperor in general. The Grand Council, or Imperial Privy Council, was composed of 5 members and 60 secretaries. This one was in recent times the more important, and consulted with the Emperor and prepared edicts for the Imperial signature.

Assisting these two councils were six administrative boards, as follows: 1. Civil Board; had jurisdiction over the mandarin, or official, classes, as to appointing them and regulating their pay, duties, promotion, etc. 2. Board of Revenue; received contributions from the provinces, also selected women for the Imperial harem. 3. Board of Rites; provided for ceremony and feast days, court dress, observances, and etiquette. Governed strictly by the "Book of Rites" (14 vols.). 4. Board of War; never of much importance in past Chinese history, as the "Book of Rites" carefully prescribed the discipline and conduct of the Imperial armies. 5. Board of Punishment; like a court of appeal, a sort of supreme court for deciding capital offenses; also formed the judicial department at Peking. 6. Board of Works; controlled everything in the nature of building, construction, sanitation, repairing highways, etc.

An additional department was created in 1861, as one of the conditions of peace with Great Britain and France. This was the famous Tsung-li Yamen, or Foreign Office, and was closely identified with the Grand Council. In the Peace Protocol of 1901, concluding the Boxer Rebellion, its name was changed to the Wai Wu Pu, now called Waichiaopu, and from then on it took rank before the above six boards. Before 1900, so little did the Chinese regard the importance of foreign affairs that to be ordered to serve on this board was looked upon as a sort of official censure or punishment.

Thus the system of government in old China was largely one of checks and balances, where all divisions were practically free to manage their own affairs, and yet where all coöperated, one with the other, when necessity so demanded.

Since the inauguration of the Republic there have been considerable changes. It is too early to say what the outcome will be, as China is in a state of transition, and some time must elapse before reconstruction assumes a permanent form.

The provisional constitution, adopted March 10, 1912, by the National Council at Nanking, proved impracticable and unworkable. Its greatest defect lay in the inadequate powers it gave to the president, but in other respects it failed to provide for the needs of govern-

ment, and it led to the trouble which arose immediately after the convocation of the first National Parliament at Peking. President Yüan Shī-k'ai found himself seriously hampered by the Kuomintang partisans, some of whom were very sincere, though visionary reformers, and others openly distrustful of Yüan. This party refused to permit the President's message to be read at the opening session and employed obstructive tactics to embarrass Yüan, such as meaningless interpellations, refusal of financial relief, and an attempt to impeach members of the cabinet. Finally Yüan Shī-k'ai's patience gave way, and he issued three mandates dissolving the Kuomintang and unseating its parliamentary members. As this threw out some 300 members, the Parliament was useless as a representative body, and on petition of the Vice President (General Li Yuan-hung), many of the *tutus* (military officers of the provinces), and other high officials, Yüan Shī-k'ai dissolved the Parliament. At the same time he created an administrative council of 71 members and announced that a new parliament really representative of the people would be summoned to meet as soon as the necessary changes could be effected in the constitution. In fulfillment of this promise, on March 18, 1914, a call was issued for a constitutional convention composed of two members from each province, four from Peking, and eight from the territories. This convention met and drew up a workable constitution, with the assistance of foreign advisers, including Dr. Frank J. Goodnow, now president of Johns Hopkins University, formerly professor of administrative law and municipal science at Columbia University, and Dr. N. Ariga, the noted European expert on government.

The new provisional constitution was promulgated May 1, 1914. It contains 68 articles and is believed to meet and overcome all the objections discovered in the document hurriedly adopted by the earlier Nanking Council. It is entitled "The Constitutional Compact of the Chung Hua Min Kuo." The following is an epitome of its provisions:

The first part (Arts. 1–3) is introductory in character. Arts. 4–13 relate to citizens, their equality and rights, freedom of speech, assembly, religion, and petition. Arts. 14–29 refer to the President. He can convoke the Legislature, open, prorogue, and close its sessions. He may initiate legislation and may issue special ordinances in time of need which will have the force of law. He is the head of the army and navy, can declare war and conclude peace, and has extensive treaty-making powers. Arts. 30–38 relate to the Legislature and enumerate its duties. It is composed of one house, chosen by the people. It may impeach the President. Sessions are public and are four months in duration. Members enjoy inviolability for their official acts. Arts. 39–43 refer to administration. Assisting the President are departments of Foreign Affairs, Interior, Finance, War, Navy, Justice, Education, Commerce, and Communications. Arts. 44–48 refer to courts of law, composed of officers appointed by the President. Art. 49 provides for the Council of State. Arts. 50–68 relate to finance. The remaining articles are supplementary in character.

The following plan was adopted (June, 1914) with regard to the provinces: 1. Abolition of the revolutionary *tutuh*. 2. Appointment of governors-general for each province, the Governor-General to be assisted by two lower classes of officials, (*a*) the *tao-yi*, or Prefect, and (*b*) the magistracy.

The Governor-General and his subordinates have direct control over internal provincial affairs, education, and industries. The provincial departments of finance are abolished, also the provincial courts of justice. It is intended that all matters of finance and justice be under the control of the central government.

Formerly the government of China resembled that of a confederation of semiautonomous provinces rather than one with a powerful central authority. The Emperor interfered as little as possible with his viceroys, the latter enjoying almost regal powers in their respective administrations. In the present scheme a radical reorganization is effected, with the purpose of making every part of the country subordinate to the central authority at Peking. Thus many offices heretofore associated with the provinces have been transferred to Peking, or to officials responsible to the Peking government.

The Chinese have never yet had training in popular government of a parliamentary kind, and the absence of definite, well-organized parties makes such popular government difficult at this time. Furthermore, the Chinese need to be educated in the principles of modern republicanism, and, to be successful to any great extent, the whole nation and not only a small portion must take part in the work of rehabilitation. Drawing heavily on what other nations have adopted as the best systems may be the only way at present, but to comprehend the value of these systems is extremely difficult for the majority of the people. In time, no doubt, China will evolve a system of her own based largely on her own peculiar needs. In the meantime the best the Chinese can do is to follow the advice of foreign experts in creating a strong, centralized government and a powerful executive, and then trust to the future for the necessary additions to meet the local situations. In the great changes which are needed for the reorganization of Chinese life, much time and patience will be required for their fulfillment. It is reasonable to suppose that the Chinese, who have for ages followed a fixed routine, will not painlessly adapt themselves even to the better things of a civilization that has been so completely foreign to their nature, training, and environment. For National Colors, see Colored Plate of FLAGS.

Chinese Law. Chinese law is the growth of many centuries and is based on immemorial custom. Though voluminous and complex, it is regulated by the fundamental principle of parental authority which has been the great conserving force and unifying power throughout the ages. The laws are divided into *lut* and *lai*, i.e., fundamental and supplemental—the former permanent, and the latter liable to revision every few years. They may be classified as general, civil, fiscal, military, criminal, and those relating to public works. The criminal code is remarkable for the conciseness and simplicity of its language, yet the actual punishment inflicted depends very much on the judge. In theory the accused is already guilty, and a Chinese judge, like the French, acts as prosecutor as well as arbiter. In spite of the prevalence of bribery, judges are apt to give common-sense decisions,

as public opinion plays a greater rôle in China even than in Western lands, because of the absence of a comprehensive code and statute system. Torture is still used to extract testimony, and punishments inflicted are flogging with the bamboo, banishment, and death by strangling or decapitation. A criminal usually receives short shrift in China. As far back as 1901 the process of mixing Chinese and Western law was begun, to supply what was lacking in the native legislation. Yet China to-day is far behind Japan and the Western Powers in her legal system. This makes it necessary to have foreign courts in China for the protection of foreigners, and to enable them to be judged by their own law. The United States District Court at Shanghai was established in 1906. This system of foreign procedure grafted upon Chinese life, and called extraterritoriality, will necessarily continue until China succeeds, like Japan, in bringing her law up to date in spirit and essence like the law of Europe and America. When China succeeds in doing this, and, with the consent of foreign Powers, abolishes extraterritoriality, she will be a full-fledged member of the family of nations, and not before.

Army and Navy. Until 1895 China had no regular troops in the modern sense. Military forces consisted of the eight Banners (composed of Manchus, Mongols, and Chinese, these Chinese being the descendants of those who aided the Manchus in the conquest of China) and the Green Flag or provincial troops. In the eight Banners were enrolled all descendants of the Manchu forces that had overthrown the Ming dynasty; originally these were a fine body of mediæval soldiery, but they had degenerated into a worthless rabble, living on government rations. As modern soldiers they were entirely useless. They were stationed at Peking and other important towns and were commanded by Tatar generals. The Green Flag army was composed of the forces which each province was supposed to maintain, and these were more like garrisons and constabulary than regular troops. The disastrous War of 1894–95 led to the first attempt to reform the army. Five divisions were raised, but disbanded some years later, except for one division under Yüan Shī-k'ai. A division was composed of about 12,500 soldiers on a peace footing, and in war numbered some 20,000 officers, men, and noncombatants. In 1901 a decree ordered the reorganization of the military, but little was done, except again by Yüan Shī-k'ai, who by 1906 raised six divisions of troops on the modern scale. These formed the basis for the new Chinese army. Then it was planned to form 36 divisions by 1912. Eight divisions were organized by 1907, and by 1912 there were 12 divisions and 19 mixed brigades. Service in the army at present is mainly voluntary. An enlistment of three years is required, and then three years in the First Reserve, where drills are held one month in a year. From there they pass into the Second Reserve, where there is only one month's drilling in alternate years. After that there is no further liability for military duty. Careful regulations now govern enlistments, and opium smokers and other undesirables are not accepted. Military service is now looked upon with favor as an honorable profession, whereas in past years the soldier was ranked among the lowest in Chinese life—in fact was treated with contempt. The Revolution and modern China completely overturned that idea. A pension system has been elaborated, and full military education for officers and men, which in recent years has been given mainly by Japanese and German instructors. An attempt is also being made to put the provincial forces on a strict military footing. The division of Imperial Guards, formed in 1908, and originally intended for the royal service, still remains without change in numbers and pay, but is now attached to and controlled by the Republican government. Figures showing the present strength of the army can be approximate only. One estimate placed the number of men under arms, regular and irregular, at the abdication as 800,000. The estimate of the *Luchun*, or national army, and the *Hsun Fang Tui*, provincial forces, in 1911, was given as 517,796, and in 1912 the Chinese army, including all forces, was placed at 428,485.

Under the Manchus each province controlled its navy independently of the Peking government, but now all will be controlled by the Ministry of the Navy. The budget for 1912 estimated naval expenditure at $17,500,000, including pay, manœuvres, balance still owing for shipbuilding abroad ($10,000,000), construction, and arsenals. In 1912 the *personnel* of the navy was about 1000 officers and 4830 men.

The navy is deficient, with no dreadnoughts or first-class battleships. In 1912 the enrollment included 1 second-class cruiser, 3 third-class cruisers, 1 training cruiser, 8 torpedo boats, 16 gunboats, 3 transports, and 2 training ships. Of ships being built there were, in 1912, 5 destroyers, 2 gunboats, 7 river gunboats, 1 training cruiser, and 1 cruiser. Ships not organized, belonging to the various provinces, totaled 19 gunboats, 11 torpedo boats, and 2 transports.

Population. The population of China has never been definitely determined, as no census on the Western plan has ever been taken. In 1912 the customs' estimate, including Manchuria (19,290,000), was placed at 441,983,000. The Mincheng-pu, Chinese census, returns the number in the same year as 331,188,000, to which must be added Chinese Turkestan, 2,491,000; the Manchu military organization, 1,700,000; Tibet, 6,500,000 (some say only 1,500,000); and other dependencies, 760,000; making a grand total of 342,639,000. W. W. Rockhill gave the number in 1904 as 270,000,000; while H. B. Morse believes 385,000,000 the safest estimate for China proper, 16,000,000 for Manchuria, and 10,000,000 for Mongolia, Tibet, etc. Total 411,000,000. A 1919 estimate places it at 327,910,000. The figures for Peking vary between 500,000 and 1,650,000. Other large cities are: Siang-Tau 1,000,000, Si-gnan 1,000,000, Tientsin 80,000, Chungking 614,000, Shanghai 651,000, Canton 900,000, Suchow 500,000, Hangchow 594,000, Chang-sha 250,000, Hankow 870,000, Fuchow 624,000, Amoy 114,000, Chinkiang 184,000, Nanking 270,000, Shasi 95,000, Ichang 55,000, Wuhu 98,000, Wen-chow 100,000. If the Chinese should develop their energies by the introduction of scientific farming, mining, engineering, and railways, China proper could easily double its population without endangering its food supply. The following is a list of provinces, with the meanings of their appellations:

PROVINCES	Meaning of name
Pe-chi-li (Chi-li)	Direct Rule
Shan-tung	Mountain East
Shan-si	Mountain West
Ho-nan	River South
Kiang-su	River Su
An-hwei	Peace Glory
Kiang-si	River West
Che-kiang	Che River
Fu-kien	Happiness Established
Hu-peh	Lake North
Hu-nan	Lake South
Shen-si	Shen West
Kan-su	Sweet—Sedate
Sze-chuan	Four Streams
Kuang-tung	Broad East
Kuang-si	Broad West
Kwei-chow	Noble Tract
Yün-nan	Cloudy South

The Chinese abroad are found in every civilized and uncivilized country—there being in the United States, including Hawaii, about 95,000; in the Dutch, British, and American East Indies and French Indo-China, between 5,000,000 and 7,000,000, with many also in Australia, Japan, and Korea; 13,000,000 Chinese are estimated to be in Manchuria and 2,250,000 in Formosa. In 1912 there were in China 2328 commercial houses and 144,754 foreigners.

The following table contains the areas and populations of the provinces, as estimated by the Chinese government in 1911.

Provinces	Areas in square miles	Population (est.) 1911
Pe-chi-li	115,800	20,937,000
Shan-tung	55,970	38,247,900
Shan-si	81,830	12,200,456
Ho-nan	67,940	35,316,800
Kiang-su	38,600	13,980,235
An-hwei	54,810	23,670,314
Kiang-si	69,480	26,532,125
Che-kiang	36,670	11,580,692
Fu-kien	46,320	22,876,540
Hu-peh	71,410	35,280,685
Hu-nan	83,380	22,169,673
Shen-si	75,270	8,450,182
Kan-su	125,450	10,385,376
Sze-chuan	218,480	68,724,890
Kuang-tung	99,970	31,865,251
Kuang-si	77,200	5,142,330
Kwei-chow	67,160	7,650,282
Yün-nan	146,680	12,324,574
Total	1,532,420	407,253,029

Ethnology. In common parlance the term "Chinese" is applied indiscriminately to the general population of Chinese territory. The Chinese proper are the result of a fusion of peoples, few of whom were far removed from one another in speech or in blood, though in the process of conquering the vast territory which they now control, they have received the blood of a number of more primitive races, not all of whom are with certainty to be credited to the Mongolian stock. Chinese literature throws no light on any of the alleged wanderings which some Western scholars have credited the nation to have performed before they settled down in and near the valleys of the Wei-ho and the Yellow River in its lower course. Babylonia, India, Khotan, Siberia, and other parts of Asia have been designated as the original homes of the Chinese, but the several books and papers published on the subject furnish no tenable proofs of any prehistoric wanderings. We have to content ourselves, for the present, with knowing that, according to Chinese tradition, the nation occupied a comparatively small territory about the present city of Si-an-fu. By conquest and amalgamation with the neighboring non-Chinese tribes it extended its territory, chiefly to the east and south. While this expansion was going on, the northwest and north of the country were invaded by a succession of barbaric Sibiric tribes, from which quarter came also the Mongol conquerors of the Chinese in the thirteenth century of our era, and the Manchu dynasty that since 1644 has reigned over the people.

In general the Chinese present the characteristic features of the Mongolian race. The features are square, angular, and flattened, the cheek bones high, the ears usually large and standing out from the head, the chin usually small; the neck short and thickset, and the expression of the face monotonously uniform. The average height is 5 feet 4 inches. The cranial capacity is from 1200 to 1300 cubic centimeters, or about 100 cubic centimeters below the Caucasian average. (For illustration, see Colored Plate accompanying article Asia.) Among the Chinese proper three physical types may perhaps be distinguished: 1. A northern, taller, lighter-skinned, less brachycephalic group. Baelz (1901) considers this type to be "Manchu-Korean" in origin, in part at least, with perhaps proto-Aryan admixture. 2. A central group, which Deniker (1900) thinks has preserved best the original Chinese type. 3. A southern, shorter, darker-skinned, partly brachycephalic and partly mesocephalic type, presenting generally an approximation to the physical type of southern Mongolia, with many suggestions of Malayan admixture. In the opinion of Baelz, the Mongol type prevails in central and southern China, while in the extreme south Malayan influences are very perceptible. Underlying all the non-Chinese admixtures Baelz believes there is an element derived from a quasi-Caucasian race (the Aino of Japan, etc., are perhaps a distant offshoot), once widespread over northeastern Asia, and split in two by the advancing Mongol-Tatar tribes. Zaborowski (1900) holds that the Hakkas (immigrants from northern China into the extreme south), a dolichocephalic Mongolian type, which he considers related to the long-headed element found among the Tunguses and in the tumuli of the Trans-Baikal country, are the real representatives of the ancient Chinese proper. Of the more or less "aboriginal" and non-Chinese people of China the following may be mentioned: the Miao-tzĭ in the eastern parts of Kui-chou, the south of Hu-nan, northern Kuang-si, and northwestern Kuang-tung; the Lolos (or Néaus) of western Sze-chuan and northeastern Yün-nan; the Tu-jen, Meo, Yao, etc., of Kuang-si; the Shans and other Thaĭ tribes of the Burmese-Chinese frontier, who belong more or less remotely to the same stock as the Burmese, Siamese, etc. Of these aboriginal peoples the most important are the Miao-tzĭ, looked upon by many authorities as representing the earlier population of a great part of China and as having a "sub-Caucasian" strain of blood, but considered by others as allied to the Tibetan type. The Lolos appear, by speech at least, to be closer to the Thaĭ peoples of Farther India. All through the south and west of China the intermingling of peoples has taken place, sometimes on a large scale. The "savages" have not been so nearly exterminated or driven out as some believe.

The most marked mental peculiarity in the Chinaman is the wonderful development of the faculty of memory, without a corresponding exercise of the faculty of judgment. Books are frequently learned by heart and repeated from beginning to end without mistake. The Chinese are persevering and industrious, patient, peaceable, and polite. Their dread of giving offense makes them seem to the foreigner deceitful, often when they are least so. Credulity and sympathy are marked characteristics. As to their morals and religion, the judgments of foreigners are worth very little, for these differ greatly and are so tinged with the personality of the observer that fair conclusions are impossible. With little fear of death, though they politely avoid the subject in conversation or make use of euphemisms, the Chinese resort readily to suicide when in difficulties. In the stolidity with which they undergo torture they resemble the North American Indians. As a rule, they look with contempt upon arms and war, and have always cultivated the arts which maintain peace and harmonious human intercourse, so that for ages China has been practically without an army and without a police force. In one respect China is the freest country in Asia; local self-government has been carried to a very high degree, insuring both personal freedom and excellence in civil organization. The Chinese are lacking, however, in military or naval discipline, and are apt to lose self-control and yield to panic in times of sudden danger. In the main they are temperate, practical to the last degree, unimaginative, imbued with a mercantile spirit, yet literary. Though there are manifold varieties of character and disposition, the inhabitants of China proper are practically one people, notwithstanding that differences in dialect are so great as to make it nearly impossible for the uneducated of distant provinces to understand one another.

The essence of the Chinese social system, which has survived all political changes, assimilating all new elements, and absorbing China's conquerors, is the worship of ancestors, the word "worship" being taken in the old English sense of honor. Filial piety is the first of all virtues. All Chinese worship at the tombs of their parents. In the houses of the well-to-do one room, the domestic sanctuary, is set apart for the tablets inscribed with the names of deceased relatives and ancestors, before which ceremonies, regulated by the classic 'Book of Rites,' are performed. Indeed, China is ruled more from the cemetery than from the Emperor's palace, the care of the dead being often apparently a more important duty than the sustenance of the living. It is always the past that is the Golden age, and reverence for a man or thing is in proportion to age. Much thought is given to the location of graves and cemeteries, this matter, like a myriad of others, being regulated by the *fang-shui* (literally, wind and water), a most elaborate system of superstition, which contains the germs of a rude natural science. To be buried properly is the ambition of every Chinaman; the possession of a handsome coffin is often the most desirable of assets, and frequently this article is a most acceptable present to elders or relatives. The dead are honored by banquets, and in the crises of life ancestors are appealed to for help and direction. In ancient times human sacrifices were made at the graves of the dead. The firecrackers, which are set off in such great numbers at the burial of the dead or in visits to cemeteries, are but substitutes for the figures of men; in the course of time the powder-charged paper has taken the place of the human sacrifice. At the present time these pyrotechnics are supposed to drive away the foul spirits which love to lurk about the haunts of men, and with which the Chinese imagination overpopulates heaven, earth, and air.

Next to death, marriage is the most important event, and is universal, bachelors and old maids in health and mature life being quite unknown. Yet in social life there is a strict separation of the sexes, and the preliminaries of marriage are taken in charge by parents or professional matchmakers called the go-betweens. Often the future bride and groom do not see each other until the woman raises her cap from her covered eyes on the wedding day. Minute regulations direct every step in this and in all other social ceremonies, so that at all times and circumstances the Chinese know just what to do, and even in a house know just where and when to sit down or to stand up. Polygamy is not legal or general, but if the wife proves barren the husband is very apt to take a concubine, for the order of Chinese society requires heirs, and especially sons, to keep up the ancestral sacrifices. The parents have full power over their children, but the duty of administering chastisement is usually left to the wife. Though in times of generous food supply child murder is but little practiced, yet millions of young children die every year; for a sick child when unresponsive to remedies is suspected to be nonhuman and must pass through an ordeal of neglect, cold, or starvation. If it dies, the inference is that it was not human, but either of demoniac origin or else possessed. If it lives, it is human. The Chinese are thus continually under the influence of superstition, which not infrequently bursts out into great disorders, as in the Boxer uprising. In all their intercourse, especially among the higher classes, a tedious and laborious etiquette rules all actions, the Chinese being the slaves of precedent, a circumstance which accounts in part for that lack of mental initiative which is the curse of the nation. Chinese manners were regulated by the code in the *Li-ki*, or 'Book of Rites,' 3000 years ago, and anything that savors of innovation is hooted down as impiety, if not treason. At Peking a department of the government, the Board of Rites, has charge of the interpretation of the *Li-ki* and the direction of ceremonies. The Chinese are therefore prone to think that most Occidentals, though good mechanics, perhaps, are destitute of politeness and morals.

The daily food of the Chinese is for the most part rice with a morsel of fish, pork, or poultry, though millet is much used by the poor in the north. In their cookery, which in the main is wholesome, are some peculiar delicacies, such as soup made from a glutinous substance that is found in birds' nests, sharks' fins, deer sinews, and ducks' tongues. Their drink is brewed from rice and is a mild beer, though distilled liquors from the same grain are very strong. The samshu of southern China and the whisky of Manchuria, with the unextracted fusel oil, make mischievous drunkards. Usually, however, liquor is drunk hot out of tiny cups at mealtime, and tea before or after meals only, in cups that have no saucer or handle, but a cover which

holds the "draw." Out of this cover the Europeans, on introducing tea, made a saucer, adding a handle to the cup. Many festivals and holy days, local, religious, and national, are celebrated, but the greatest of all is New Year's Day, before which debts are paid and new clothing is bought. Congratulations and festivities prevail, for this is every one's birthday, all dating their ages from this day. Though a child be born 24 hours before New Year's Day, it is considered to be in its second year. The Festival of the First Full Moon, the Feast of Lanterns, and the Festival of the Dragon Boat, are the other famous holidays. The streets on such occasions are full of music and gayety, and night is turned into day by myriads of lanterns made of paper and gorgeous with painted scenes in many hues. The Chinese are usually afraid of losing their dignity by active effort, and outdoor sports are not as yet in vogue, unless some utilitarian object is in view, kiteflying and shuttlecock being the most violent in which adults engage; but cards and dominoes, the theatre, gossiping and visiting, story-telling, peep shows and entertainments given by itinerant showmen are very common and much enjoyed. There are hundreds of children's games and sports. Thousands of traveling performers, acrobats, wonder-workers, marionette players, and purveyors of amusements of every sort, including movable refreshment stands and bakeshops, gain a living by amusing the little folks. Nonsense rhymes and comic doggerel for children are chanted by nurses and parents, though for the most part these are as unknown to foreigners as of old the Arabian Nights' Entertainments were to the closest students of Arabic. The Chinese do not shake hands with friends, but join their own hands by way of salutation, and kissing is unknown among them, but prostrations and congratulations are very frequent.

From the standpoint of common sense the Chinese dress is one of the best in the world, varying in material and thickness according to the season; the state of temperature usually takes its name and quality from the number of garments put on. One prominent idea in the theory of Chinese dress is to conceal or minimize the visible distinctions of sex, and only in their headdress and footgear are the women noticeably different in appearance from the men. A loose jacket fitting closely around the neck, and short wide trousers, are the principal garments. Shoes are made of silk or cotton, with thick felt soles, but the upper classes wear boots of satin, into which they thrust their fans or pipes. The mourning color is white. Until their conquest by the Manchus, the Chinese wore their hair like the Koreans, gathered in a knot at the top, and only after much bloodshed were the conquerors able to compel the Chinese to adopt the symbol of subordination and loyalty. Not so very long ago all males without exception shaved the front part of their heads and braided their hair in a long queue. This fashion gave employment to multitudes of barbers, for it is rarely that even a poor man attends to his own hairdressing. For months after the death of an emperor, an event which allowed no one to shave for 100 days, the barbers had difficulty in earning a living. Hot water is preferred both for drinking and washing. After meals the face is wiped with a damp hot cloth. It is thought dangerous in itself to put cold water in the stomach, as it certainly is where drainage is so little attended to. Water to be drunk is first boiled. Unlike the Manchu women, Chinese girls, especially among the upper classes, had their feet bound in early childhood. After the torture of years is over, the lady with "lilies" totters about as best she can, rarely going out of the house, and hearing of the outside world through servants and visitors, her circle of friends contracting rather than enlarging as life goes on.

Many of these habits of life are undergoing a change at present which may do away with a great many time-honored customs. As in Japan, the old Chinese calendar has been exchanged for the Western one. The better-class natives are more and more taking to European styles, queues are no longer worn by officials, including the President of the Republic, and by soldiers; tailors and shoemakers are prepared to work in Western patterns, and that cruel habit of binding the feet of female children is but seldom resorted to, thanks to the agitation of a society initiated by foreign ladies for the special purpose of persuading Chinese families to give up that objectionable custom. Foot binding was not a custom of Manchu families, though, and the late Empress Dowager was one of the first to patronize the anti-foot-binding society. The enormous change now taking place in the social habits of the people is, of course, followed by a great demand for foreign piece goods, hats, shoes, etc., and will cause fluctuations in many branches of the import trade.

For art in China, see CHINESE ART.

Religion. There are five religions in China that are well established. These are the Confucian, Buddhist, Taoist, Mohammedan, and Christian; each of them a "book" religion, and, excepting Taoism, each with an historical founder. The religion of the ancient Chinese consisted of the double worship of God and of ancestors. Confucius gathered up and gave literary form to the national traditions. In doing this he so edited the ancient documents as to throw into shadow the spiritual and to lay emphasis upon the material side of life. By forbidding ambition he cut the taproot of progress and produced a stagnant civilization. His system is still the basis of Chinese society and has a strong influence on the government. It is less a religion than a philosophy and practical code, having reference simply to this life, and making good citizens and neighbors rather than developing the possibilities of mankind. On its philosophical side Confucianism has gone through many changes, until it has become the creed and the substitute for religion with the lettered classes. (See CHU HI.) Though his tablet is saluted, and sacrifices of oxen and sheep are made before it at the equinoxes, it is hardly accurate to say that Confucius is worshiped.

Lau-tzĭ (q.v.)—or, to Latinize it, Laocius—a contemporary of Confucius, though older than he, was more of a true philosopher or inquirer into the causes of things. He taught the doctrine of Tao. His remarkable treatise, the *Tao Teh King* (*tao* means 'reason'), contains neither superstition nor religion, but a system of rationalism. A vast, intangible, impersonal first principle is regarded there as the parent of all things, and man must try to realize this principle by escaping from all distraction. Lao Tsĕ's speculations paved the way for introduction of Buddhism. In its subsequent develop-

ment, or degradation, it has become little more than a fantastic system of spirit worship, of which alchemy, incantation, and intercourse with the dead are the chief characteristics. As a religion it is not so ancient as Buddhism, and there is little or no connection between Lau-tzĭ's teachings and the Taoism of to-day.

Buddhism entered China shortly after the opening of the Christian era, and in its development has taken the Northern, or expanded form, with its paradise, goddess of mercy, scriptures, voluminous and imposing ritual, passionate rhetoric, and a thousand stimulating influences which satisfied a mental craving not provided for in the simple materialism of Confucius. Besides monasteries and images, the Buddhist temples are found all over China, but in decay. The priests are illiterate, and despised by the educated. The monks and nuns are usually beggars, the former recognizable by their yellow robe. Only in a few places can Buddhism be said to be vigorous. The language of the sacred canon is Sanskrit, now known to few in China.

Mohammedanism was introduced directly from Arabia, and, as is believed, by the maternal uncle of Mohammed. Arriving in caravans from Central Asia, or in ships by sea, the missionaries preached the faith industriously, and there are now from 15,000,000 to 20,000,000 Moslems in the Republic. They have obtained state recognition, but their religion marks them as separate from the rest of the Chinese. Yet many of them have attained high positions in the service of the government. Three provinces—Yün-nan, Kan-su, and Shen-si—contain nine-tenths of these believers in one God, there being 10,000,000 north of the Yang-tse-kiang and 200,000 in Peking. Mosques are numerous, each containing a tablet in gold letters and reading "May the Emperor live 10,000 years." There is a large native literature on the subject of the faith of Islam in China.

The progress of Christianity has been slow. A tablet found in 1626, at Changan, Shen-si, indicates that the Nestorians introduced Christianity into China early in the sixth century. The Jesuits Ruggiaro and Ricci went to China in 1579 and 1581. Protestant missions were led by Robert Morrison in 1807. The latest estimates attribute to the Roman Catholics 1,363,697 converts, 49 bishops, 1426 foreign and 701 native priests, and to the Protestants about 325,000. Many of the men in the Reform party have been pupils of the missionaries.

Confucianism has enjoyed state patronage and protection for about 2100 years. There have been severe struggles among the various adherents of "the three religions" for supremacy; but the Chinese mind, indifferent to things abstract, is in its way tolerant, and there is outward peace. Millions of natives, scarcely knowing "the three religions" as separate, accept them in a mechanical unity, each meeting a different want in human nature. Confucianism supplies the need of a moral code, Taoism ministers to the superstitious mind, and Buddhism, with its metaphysics and vague aspirations, appeals to the mystic element in man. There is also a state ritual, with the Temple of Heaven in Peking, at which sacrifices of the first class, to heaven and earth, are made. This leading offering was originally made by the Emperor for his people. With the abdication it was discontinued for a time, but recently Yüan Shĭ-k'ai again performed the ceremony, to hold the people true to the old standards of morality which had grown somewhat lax during the Revolution. The second class of offerings is to the sun, moon, gods of the land, spirits, and sages, and the third class to deceased statesmen and scholars. On a smaller scale these ritual ceremonies are observed by the magistrates; for, above all, the Chinese in every rank are pantheists. Practically the Chinese are religiously inclined, having deep veneration for the idea of a soul and of immortality. Hence their great respect for the dead, love of funeral ceremonies, readiness to spend money over graves, desire to propitiate the ghosts of ancestors, yearning for sons, the strong family sentiment of unity, and the strict subordination of the younger to the elder. They are tolerant and nonmilitant. Except that there is no day of rest, and that the idea of "praise" never enters the Chinese mind, a good man in China is, in natural religion, very much what a good man is in Christendom. In faith, doctrine, and dogma it is very different, for the average Chinese is uninterested in metaphysics. In the propagation of religion by foreigners true and simple Christianity exercises a lasting effect for good on China. Most of the so-called "religious" troubles come from the clashing of militant alien doctrine with the village customs and social habits so dear to the rustic mind. Towards the questions of liquor, slavery, and concubinage, and in social customs generally, the entire mental attitudes of Europeans and natives still differ to a great extent.

Education. Enormous numbers of the adult population are unable to read or write. The reform of education is one of the greatest subjects now before the Chinese. The government in 1903 appointed a commission of three high officials to study the whole question. The result of its report is that a board of education was established in Peking to decide upon methods of introducing Western education and a school system of different grades. For ages there has been a special literary class who alone knew the literature of their country. Examinations, confined chiefly to moral philosophy and literature, have been held at frequent intervals in the chief cities of each province for the purpose of awarding the degrees that were the necessary passport to positions in the public service. This entire system of literary examinations was abolished by an Imperial decree of Sept. 3, 1905, which introduced a new system by which scholars in the modern scientific schools that are to be introduced will be able to enter the civil or military services.

Practically the only immediate result of the Emperor's attempted reforms in 1898 was the establishment of the Peking University, which to-day is in a flourishing condition. In 1911 there were foreigners engaged with this university and the College of Laws, as follows: 8 professors of science, 5 of law, 6 of engineering, 3 of agriculture, 1 of commerce, and 4 for the preparatory classes at Peking University. A National Education Conference was held, July 11–Aug. 11, 1912, at Peking, at which it was proposed to make the primary grade a four years' course for the ages 7 to 10, and which was to be compulsory. Other grades recommended were the higher primary schools, 3 years' course for ages 11 to 13; the middle schools, 4 years' course for ages 14 to 17; the

preparatory schools for colleges, 3 years' course for ages 18 to 20; and the college and professional institutions, 3 years' course for ages 21 to 24. In addition, three new government universities were proposed, at Nanking, Canton, and Wuchang, to embrace courses in science, law, commerce, medicine, agriculture, and industry.

Great credit is due to the missionaries for having fostered the cause of Western learning in years past, and it is largely the result of their efforts that the old Chinese system is now being abolished. Of foreign colleges in China there are over 35 of Protestant denominations, and also numerous schools and colleges of the Roman Catholic church. The British at Hongkong opened a university March 11, 1912, which is already proving effective. Several of the large American universities are actively engaged in extension work, of which the medical institution at Canton is a conspicuous example.

History. The historical period in the development of the Chinese may be said to begin with the Chou dynasty, founded in 1122 B.C., and, on the strength of a number of sacrificial bronze vessels and bells containing hieroglyphic inscriptions ascribed by Chinese critics to the preceding Shang dynasty, we may accept the latter part of that period, falling into the end of the second millennium B.C., as quasi-historical. Unfortunately China cannot boast of any such living witnesses of the high antiquity ascribed to her history by her own literature as the pyramids and the royal tombs of Egypt. It is for this reason a matter of individual choice how far we can trust the literary tradition in its earliest periods. The only unmistakable criterion is the casual mention, with year, month, and day, of an eclipse of the sun, stated in an old poem of the *Book of Odes* to have occurred in 776 B.C., which European astronomers have calculated to have actually occurred and been visible in north China on that very day. This is the reason why some Western critics date the historical period from the eighth century B.C., though Chinese historians give it fully 2000 years more. We cannot blame them for their credulity, if we see what the much too ingenious combinations of the lively imagination of some Western scholars have made of the clearly legendary traditions of Chinese literature. Some of these speculations look for the original home of the race in Babylonia (Terrien de Lacouperie), or in Khotan (Von Richthofen), or in Egypt (De Guignes). In the face of these and other untenable theories Professor Giles's view is the only one dictated by common sense, when he says, "No one knows where the Chinese came from," and he adds, "it appears to be an ethnological axiom that every race must have come from somewhere outside of its own territory." The Chinese themselves have certainly, as far as their literature goes, never assumed that their forefathers 4000 or 5000 years ago were seated anywhere but at what they consider the cradle of their race, the valley of the Wei River and the neighborhood of the present Si-an-fu. There they imagine lived the man whom they considered the first Emperor of their history, Fu-hi (2852 B.C., according to that entirely fictitious chronology). Fu-hi is considered the founder of Chinese social order, to which he raised his people out of a state of chaos characterized by the absence of family life—children knowing their mothers, but not their fathers. The legendary account of this Emperor's life refers to a period of hunting and fishing, whereas his successor, Shen-nung (2737), represents an agricultural period. It is important to note that, although the names of these quasi-historic emperors were not unknown in the literature of the Chou dynasty, most of the deeds ascribed to them must have been invented by later writers. The great historian Sse̊ma Ts'ién, known as "the Herodotus of China," begins his history with Huang-ti, the 'Yellow Emperor' (2704–2595), to whom most of the elementary inventions of cultural life are ascribed. But the favorite heroes of these most ancient times are Yau and Shun (2357–2206), the model emperors, who stand at the head of Confucius' extract from older records known as the *Shu-king*. In Yau (the Chinese King Alfred) and Shun the Chinese find not only the patterns of regal virtue and the models of all wisdom, but the originators of their civilization and prosperity. These legendary worthies established marts and fairs, drained flooded lands, extended the Empire to the sea, and, in brief, made the golden age of China. Their descendants became degenerate and were supplanted by the Shang dynasty (1766–1154 B.C.), with 28 rulers, most of them vicious and cruel. The feudal system arose under the Chou dynasty (1122–255 B.C.), by which China was governed for 900 years, during which period literature and the fine arts flourished. China was divided into 72 principalities, out of which arose several states whose names and importance, even yet in the twentieth century, exert a potent influence on the internal politics of China. All traces of nomadic life disappeared, agriculture became universal, and great public works were constructed. This is the classical China pictured in ancient poetry and affecting so powerfully the imagination of the modern Chinese. Luxury, misrule, and internecine war, however, brought the nation to deep distress, in the midst of which Confucius was born (551 B.C.). The three great sages, Confucius, Lao-tse, and Mencius, flourished within a century or two of one another. Vice and anarchy were too great to be checked by the wise men; and in 255 B.C. the Chou dynasty came to an end, and was followed by the Ts'in, from which China derives its name.

The Ts'in restored order, abolished the feudal system, drove back the Hun Tatars into the desert, began to build the Great Wall as a symbol both of defense and of United China, and extended the Empire southward of the Yang-tse-kiang valley. To break utterly the power of feudalism, which was popular with the scholars, the Ts'in ruler beheaded hundreds of them and ordered all literature to be destroyed. He was the first Emperor, or Shĭ-huang-ti. The title "Huang-ti" has been borne since by the emperors of China, and forms the basis of Chinese political orthodoxy and of China's claim to sovereignty over all the nations of the eastern half of Asia. After his death rebellion broke out, and the Han line of rulers (c.206 B.C.–220 A.D.) began. Henceforth no dynasty occupied the throne for so long a period as three centuries, most of them lasting a much shorter time. China's political organization, with its changes and developments (there have been no fewer than 33 dynasties),

compels contrast with the stability of her social system. Under the great Emperor Wu-ti (140–86 B.C.), China began to realize that she was not the only great nation on the Asiatic continent. The Emperor's ambassador Chang K'ien, sent on a diplomatic mission to the West, penetrated as far as the Oxus and Bactria and brought back the descriptions of the great kingdom of western Asia. From this time onward, expeditions to these countries were fitted out, and a lively exchange of products and cultural ideas, including influences in art, followed. From Wu-ti's time dates the trade in Chinese silk overland to Syria and the Roman market. During the time of the Hans the Jews entered China, settling in Ho-nan Province. Buddhism was also introduced about that time. The ancient texts of Confucius were recovered and engraved on stone, ink and paper were introduced, libraries were established, and famous scholars arose. The system of competitive examinations for entrance into the civil service became an institution. The soldiers of China drove the Tatar hordes as far west as Turkestan and added Mongolia to the Empire. The Chinese still proudly call themselves the "sons of Han." The epoch of the three kingdoms (220 to 265 A.D.) was one of war and misrule, but, owing to the adventures of its heroes, was also the romantic period of Chinese literature. During the great T'ang dynasty, one of the longest in the annals of historic China (618–907 A.D.), the Empire extended from the Caspian Sea to the Pacific Ocean, and embassies from Persia, Japan, Korea, Tibet, and various other nations often met at the court of China. Chinese armies won victories on all sides. The Han-lin Yüan ('Forest of Pencils'), or the Imperial Academy (whose library, the largest in China, was burned during the siege of Peking, 1900), was founded. The art of printing by blocks imparted a powerful stimulus to native literary activity in this golden age of literature, when commerce with western Asia, Japan, and the East Indies also flourished. On the fall of the T'ang dynasty, through vice and effeminacy, five feeble dynasties ruled, between 907 and 960. Then the era of the Sung (960–1278) opened, with a fresh burst of literary splendor, and brought in the Augustan age of China, with its amazing activity in bookmaking and printing, and the formation of libraries.

But another great change was impending. Under the leadership of Genghis Khan, the Mongols overran northern China. Under Kublai (1280–94), grandson of Genghis, who established the Mongol dynasty in China, the Empire reached its most splendid development. Kublai's realm extended from the Dnieper in Russia to the Pacific Ocean and from the Arctic Ocean to the Straits of Malacca. The laws were codified, and literature and public works flourished. For a half-century there was considerable commerce with Italy. Marco Polo and his two uncles then lived in the Empire, in the service of the Khan, used paper money and passports, and traveled on the Grand Canal, at a time when paper money, passports, and canals were unknown in Europe. Intercourse with the Arabs and the Persians was continuous, and the highway into Europe was maintained until the Mongols in Central Asia embraced Islam and turned bigots, when communication ceased. The Mongol dynasty, one of the many foreign dynasties of China, ended in 1368, when the throne was occupied by the native Ming or Bright dynasty, noted as patrons of the arts of peace. They cultivated friendly relations with other nations and encouraged Christian missions. Under their rule the Portuguese and Spaniards entered China, Canton became the centre of foreign trade, and Peking, under Ricci, the focus of Roman Christianity.

Modern History. The last Chinese Imperial line, the Ming dynasty (1368–1644), was of low origin, its founder having risen to power in a national reaction which followed the period of disorder due to the disintegration of the Mongol Empire under the successors of Kublai Khan. The first Ming sovereign added Tongking and Cochin China to the Empire. China, however, was continually harassed by the Tatars, and in 1643 the warlike Manchus, besought to defend the country against its enemies, entered it as peaceful conquerors, and a Manchu prince established himself in Peking without serious opposition, beginning the Tats'ing, or 'Great Pure,' dynasty (1644). The enforced adoption by the Chinese of the plaited queue of the Manchus at first produced friction between the races, but this gradually disappeared, and Manchus and Chinese assumed harmonious relations, although the former remained a distinct military and official caste. In most cases the customs of the country and the methods of administration remained Chinese, as did the language, and, like most numerically weak conquerors, the Manchus were assimilated to the ways of the people whom they had subdued. K'ang-hi (1662–1723), the second of the Manchu emperors, was perhaps the greatest of his line. Under him the boundaries of the Empire were extended, notably by the conquest of Tibet; sciences and arts were encouraged, and the great dictionary of the Chinese language and a number of other extensive compilations were begun. His successor, Yung-cheng (1723–36), began the persecution of the Catholic missionaries. These had entered the country following in the footsteps of the Portuguese traders, who had appeared in China as early as 1516, and had been well received at first. The Chinese were never able to comprehend how adherents of the same religion could quarrel as they saw the Jesuits, Franciscans, and Dominicans quarrel, and the missionaries lost credit accordingly. Nor did the Portuguese traders conduct themselves in a way to win the respect of the Chinese, and the avarice, violence, and the spirit of bitter rivalry exhibited by them, as well as by the Spanish, Dutch, and English, all of whom in the seventeenth century followed the Portuguese in the Chinese field, tended to accentuate the suspicion with which the foreigners were regarded. A narrow and exclusive policy, intended to protect China from the aggression of the "barbarians," was initiated before the close of the Ming period, and was developed by the Manchu emperors as time went on. Mutual misunderstandings due to the collision of diametrically opposed civilizations generated continual troubles. Since the liberal days of the Mongol rulers the Chinese had been retiring within themselves, and the admission of foreigners to privileges of trade and intercourse was regarded as a special grace to inferiors. Diplomatic intercourse, in the Western sense, they could not understand, since

the Emperor, the Son of Heaven, had no equals, and those who approached him could do so only as vassals. The Western nations failed to understand this point of view, and Portugal, Spain, Holland, and England tried to enter into permanent relations with the Chinese government, with most humiliating results. Only Russia had any success in dealing with China officially before the first English war. Russia's rapid march across Asia had brought it into contact with China in the sixteenth century, and the first treaty made between China and a Christian Power was that of Nertchinsk with Russia, Sept. 12, 1689, by which the latter's advance on the Amur was checked. The Russians, with their knowledge of Oriental peoples, have always known better than other Europeans how to deal with the Chinese, conceding much to their prejudices in nonessentials, but refusing to acknowledge any inferiority. The United States entered the China field in 1785; and in the palmy days of the old Oriental trade the commerce of the United States was second in volume among the Western nations; but the American government made no attempt to safeguard the interests of its citizens, or to enter into relations with the Chinese government. England began to trade with Canton in 1635, but this amounted to little until 1664.

From 1664 until 1834 England's Chinese trade was in the hands of the East India Company, which the people of the Far East could never learn to regard as a political power. The Chinese government looked upon the representatives of the East India Company in the same way as they regarded the *hong* merchants, i.e., the foreign merchants of Canton—a body without political status, to whom all matters regarding foreign trade had been relegated. The growth of English trade was vigorously fought by the Portuguese, who were first in the field and wished to maintain a monopoly; but the trade and influence of the Portuguese declined rapidly after 1753, until their once prosperous station of Macao hardly paid its own expenses. The growth of European interests in the Far East created an epoch in Chinese history in spite of the spirit of exclusiveness prevailing on the Chinese side. A crisis was precipitated when the monopoly of the East India Company came to an end in 1834, at about the same time when the heavy responsibilities to their own government which the *hong* merchants were compelled to assume had made several of them bankrupt. Trade, which had been regulated by these two corporations, became demoralized, and, under the conditions of mutual distrust and misunderstanding which already existed, trouble was inevitable. The opium traffic, a most important part of Oriental trade, brought existing differences to a head. This traffic had been made illegal by the Chinese government in 1796, but the edicts had never been enforced. Chinese officials connived at the trade, the *hong* merchants found it profitable, and the English government refused to suppress it. In 1837 the Chinese government decided to carry out its decrees, and a governor, Lin, was sent to Canton in 1839 for that purpose. Lin called upon the *hong* merchants and others to surrender the opium in their possession. Elliott, the British superintendent of trade, secured all the opium in the hands of British subjects and turned it over to the Chinese governor; but he refused to sign a bond which would have made all vessels thereafter engaging in the traffic subject to confiscation, and persons connected therewith punishable with death. The reluctance of the British government to interfere with a trade that was worth from $5,000,000 to $8,000,000 annually to the government of British India made all efforts to avoid war unavailing, and hostilities were opened at the beginning of 1840. After the British had captured several ports, taken Ching-kiang in a bloody assault, and threatened Nanking, a treaty was made at the latter city in 1842 by which the five ports, Canton, Amoy, Foochow, Ningpo, and Shanghai, were opened to British trade; a war indemnity of $21,000,000 was exacted; the island of Hongkong was ceded to England; a regular customs tariff was established at the open ports; and in consideration of a transit duty to be levied in addition, goods were given free conveyance to all places in China. The opium question was not touched upon. This first commercial treaty entered into officially by China aroused great interest in Europe and America. An embassy from the United States, headed by Caleb Cushing, negotiated a similar treaty in 1844, and a treaty with France was concluded the same year. British trade grew rapidly after the treaty, the terms of which China persistently sought to evade. In 1856 a Chinese *lorcha*, the *Arrow*, was seized by Chinese officials for alleged piracy, whereupon the owners ran up the English flag and claimed that the *Arrow* was an English boat. Thereupon England's representative in China, Sir John Bowring, made an imperative demand upon China for restitution and an apology to the British government. His demands, though unwarranted by the facts in the case, were all met by China, except that for an apology. This the Chinese officials refused to make, and the complications arising from the incident brought on a new war in the autumn of 1856. France had an old complaint against China for the murder of some missionaries, and joined England in 1857. The war closed temporarily in 1858, with the Treaty of Tientsin. England and France were to have ministers at the Chinese court, at least on special occasions, and China was to be represented at London and Paris. Christianity was to be tolerated in China. A certain measure of freedom of access to Chinese rivers for English and French merchant vessels, and to the interior of China for subjects of the contracting powers, was guaranteed. China was to pay the expenses of the war, and the term "barbarian" was no longer to be applied to Europeans in China. Two years later it became necessary to renew the war to secure a ratification of the treaty by the Imperial government, and this was obtained only when the allied armies held Peking at their mercy. At the time of the conclusion of the Treaty of Tientsin with England and France China signed a treaty with Russia, in which she ceded the Amur territory to that power.

Meanwhile, in 1850, there had broken out in southern China a formidable insurrection, which did not fail to affect the foreign relations of the country. This was the T'ai-p'ing Rebellion, as it was known outside. By the Chinese it was called the "War of the Long-haired Rebels." A schoolmaster named Hung Siu-ts'üan had become possessed of a religious enthusiasm through the writings of some Protestant con-

verts, and had set up a propaganda to overthrow Confucianism and bring China to the worship of the true God. His followers were known as "God worshipers." They soon allied themselves with lawless bands of rebels against the government. Their leader assumed the title of T'ien-wang, or 'Heavenly King,' and established himself as a ruler in Nanking, where he lived a life of cruelty, license, and tyranny. The dynasty which he intended to found was named the P'ing-ch'au, or 'peace dynasty,' which, with the prefix T'ai ('great'), gave the popular foreign name to the rebellion. In the early part of 1853 the rebels had become masters of Wu-chang and Nanking, which latter place became their capital. In 1860 the treaty port of Shanghai was threatened by the T'ai-p'ing, who thus came into collision with the Western powers. A small army, raised at the expense of the Shanghai merchants and maintained by the Imperial government, was created. It was named the Ever-Victorious Army and was organized and led by an American, Ward, who showed great ability, but died before much had been accomplished. His successor, Burgevine, also an American, was promptly dismissed, and the army remained under the command of an Englishman, Holland, until he was defeated at Tai-tsan, Feb. 22, 1863. Li Hung-chang, then Governor-General of the Kiang provinces, applied for an English officer, and Charles George Gordon was authorized to enter the Chinese service. He brought the little army of 3000 or 4000 men to a discipline and steadiness that enabled him to perform wonders with it. At the same time the French forces gave effective aid to the Imperialists. In July, 1864, the Imperialists took Nanking, and the rebellion was practically stamped out, although desultory warfare still continued for a time. Bad faith shown by Li in dealing with the defeated rebels led Gordon to refuse to serve longer in connection with him; he refused all rewards from the Emperor, but completed the overthrow of the rebels. See GORDON, CHARLES GEORGE.

The United States had watched with deep interest the progress of the second Anglo-Chinese War, and President Buchanan sent William B. Reed to follow the course of events, and to mediate on behalf of his government if that should be possible. In its friendly attitude the United States was supported by Russia. The efforts of Mr. Reed resulted in a new treaty between the United States and China, negotiated on June 18, 1858. This was a treaty of amity and commerce under which the United States government guaranteed that no American vessels should engage in contraband trade with China. The United States Minister to China from 1861 to 1867, Anson Burlingame, was so successful in winning the confidence of the Chinese administration, then in progressive hands, that upon his resignation he was asked to head a Chinese embassy accredited to 11 leading nations. In 1868 he set out from Peking at the head of an imposing deputation of the highest Chinese officials, and during the short time before his death in 1869 he did much to bring about friendly relations between China and the Christian Powers. The Burlingame Treaty with the United States supplemented the Reed Treaty in some important respects. Even as late as this China had not recognized the full equality of other nations by admitting their envoys to personal audience with the Emperor, but on June 29, 1873, the Chinese Emperor, under the enlightened influence of Prince Kung and his associates, gave personal audience to the Japanese Ambassador and to the ministers of Russia, the United States, Great Britain, France, and Holland, with the German Secretary as interpreter. The significance of this audience is evident. It represented the final breaking down of Chinese isolation, and the recognition of the Great Powers of Europe as the equals of China. In 1884 France, in attempting to make good her protectorate over Annam (q.v.), became involved in a campaign against the Chinese forces in Tongking. The war was ended in June, 1885, by a treaty giving France control of Tongking and Annam, but leaving open the question of Chinese suzerainty.

In 1894 Japan took advantage of disorders in Korea to revive certain old claims to rights in that country (see JAPAN and KOREA), and sent an expeditionary force into the peninsula. China, which had always claimed suzerainty in Korea, but had allowed Japan to obtain distinct diplomatic advantages in 1876 and 1882, hastened to meet this demonstration, and after minor collisions had taken place Japan declared war, August 1, and on the 26th concluded an offensive and defensive alliance with Korea. On September 16 the Chinese were defeated at Ping-yang, and on the 18th a Chinese fleet was destroyed in a severe naval battle at the mouth of the Yalu River. In November Port Arthur, in the Liao-tung peninsula, China's strongest fortress, was invested, while the main column of the invading army pressed on through Manchuria towards Peking. Prince Kung made an appeal to the Powers for intervention. The United States offered its services as mediator, but they were declined by Japan. Port Arthur was taken on the 21st. The Japanese pushed their operations vigorously, without regard to the approach of winter; defeated the Chinese at Kung-wa-sai, December 19; captured Kai-ping, Jan. 10, 1895; and the strongly fortified port of Wei-hai-wei, in the Shantung peninsula, on February 14. The loss of Wei-hai-wei, together with the remnant of her navy, left China at the mercy of her enemy, with Peking in imminent danger of capture. Li Hung-chang (q.v.) was commissioned to negotiate a peace. By the Treaty of Shimonoseki, April 17, 1895, China recognized the full independence of Korea, ceded to Japan the peninsula of Liao-tung, the island of Formosa, and the Pescadores, and agreed to pay an indemnity of 200,000,000 taels. A new commercial treaty with Japan, much more favorable than that which had been invalidated by the war, was promised. Japan was to retain military occupation of Wei-hai-wei until the commercial treaty was made and the second installment of the indemnity paid, the balance of the latter to be secured by pledging the customs revenue. The collapse of China surprised most of the world, which had been taught to believe that there was tremendous reserve force and power of endurance in this unwieldy but ancient Empire. The revelation of its weakness seemed to be just the opportunity for the great European Powers that were ambitious of influence in the Far East. Russia, France, and Germany promptly protested against the cession of the peninsula of Liao-tung, and brought such pressure to bear that Japan relinquished this part of its conquest.

In the weakened condition of the Chinese gov-

ernment it was more than ever apparent that political influence must go hand in hand with commercial development in China. The embarrassments of the Imperial government resulting from the war afforded an opportunity to the Powers to obtain valuable concessions. Russia in 1895 placed, through France, a loan amounting to $77,200,000, to enable China to meet the payments of the indemnity. In 1896 the sum of $80,000,000 was provided by German and American capitalists, and in 1898 the same amount was advanced by the Hongkong and Shanghai Banking Corporation and the Deutsch-Asiatische Bank. In return for these loans, valuable railway and trading concessions were exacted, with a view to establishing in the decaying Empire spheres of influence which could in any event be guarded against dangerous rivals. In 1897 Germany, by way of reparation for the murder of two German missionaries, seized the port of Tsing-tao (Kiao-chow), on the Shan-tung peninsula, and obtained extensive mining, trading, and railway privileges in the rich Province of Shan-tung. In the early part of 1898, while the British government was endeavoring to secure guarantees that the Yang-tse-kiang region should not be alienated in any way, and that the river should be more freely opened to navigation, Russia obtained a lease of the harbors of Port Arthur and Talien-wan in the Liao-tung peninsula, with railway concessions in the adjacent territory. As an offset, Great Britain obtained Wei-hai-wei for as long a period as Russia should retain Port Arthur.

The danger to China from the foreign Powers now became so evident that two parties appeared, divided upon the method of resistance. One was a nationalist reform party, led by K'ang Yu-wei, a Cantonese, and including Chang Chi-tung, the Viceroy of Hu-peh and Hu-nan; the other a reactionary conservative party, inspired by the Dowager Empress. For a brief period the reformers seemed to have gained control at the palace and held the ear of the young Emperor Kuang-sü. Their wish was to bring China into the ranks of modern nations, along the road which Japan had trod so swiftly and so surely, and to throw off foreign influence by creating a strong and independent Chinese nation. Numerous edicts issued from the palace during the summer of 1898, which seemed to point to the regeneration of China. But against this attempt at reform by proclamation there were the inertia of the most conservative of people, the hatred of all things foreign, and the constant intriguing of the Empress Dowager, a relentless and unscrupulous woman, mother of the late Emperor T'ung-chï and aunt of Kuang-sü, whom she had put upon the throne. Long accustomed to control the affairs of the palace, she kept the weak young Emperor in subjection. In September, 1898, he issued a proclamation practically transferring the sovereign authority to her and confessing himself sick in body and mind. From that time he was lost sight of, and rumors of his death became frequent. A number of the reformers were executed, but K'ang Yu-wei escaped and went into exile. Antiforeign demonstrations in many quarters began almost immediately, and marines were sent to Peking from the foreign naval vessels on the China station to guard the legations. Assaults on the missionaries and destruction of their property became of frequent occurrence, and it was evident that the exactions and dictatorial ways of the foreigners had irritated the Chinese. If the liberal reformers could have had their way, the difficulty might have been peaceably met by creating an orderly, civilized government that would command the respect of the world; but with the triumph of the reactionaries in the government, the spirit that was abroad found vent in violent and barbaric outbreaks that only served further to discredit China with civilized nations. The seizure of full power by the Empress Dowager was marked by the substitution of Manchus for Chinese in the higher offices, which meant the infusion of a more brutal and violent spirit in the government. In January, 1900, the puppet Emperor was heard from once again, in a proclamation made by the orders of the Empress Dowager, naming Pu Chun, son of Tsai Yi, Prince Tuan, as the successor to the throne.

Reports were heard soon after of the activity in Shan-tung of the organization popularly known as the Boxers (a very free translation of the Chinese name meaning 'The Fist of Righteous Harmony'). This organization and another which seems to have become identified with it were apparently the beginnings of a patriotic volunteer militia which was intended for the defense of the country against foreign aggression. It had at the outset the favor of many really well-meaning men, but it soon came into the control of fanatics, whose motto was "Exterminate the foreigners." As reports of its acts began to come in, the foreign ministers made frequent representations to the Tsung-li Yamen, or Board of Foreign Relations, but without obtaining any satisfaction. Matters went from bad to worse, until the very legations in Peking were threatened by the reign of terror which enveloped the capital. A relief force of 2000 marines and sailors from the foreign fleets set out from Taku for Peking, June 10, under the command of Vice Admiral Seymour, the British commander, but this force was unable to reach Peking. On June 11 the Chancellor of the Japanese Legation was murdered in Peking by Chinese soldiers. Already there was little doubt that the Boxer outbreak was encouraged from the palace. On June 17 the allied fleets bombarded and captured the Taku forts. Three days later Baron von Ketteler, the German Ambassador, was murdered in the streets of Peking, on the way to the Tsung-li Yamen. The diplomatic corps, together with their households and guards, before the end of June, were all gathered in the British Legation, which was fortified as well as possible. Cut off from all communication with the outside world, they endured the horrors of a siege for nearly two months. Meanwhile an allied army of relief had been assembled at Taku. It captured Tientsin on July 14 and advanced to the relief of the besieged legations. The march began on August 4, the force numbering about 18,000 men—Japanese, Russian, British, American, and French. Peking was reached and the legations were relieved on the 14th, the Imperial City being taken on the following day. The court escaped into the interior. On the 28th troops of all the nationalities represented (now including some bodies of Germans also) marched through the sacred precincts of the Forbidden City, as a symbol of the humiliation of China.

The advance on Peking and the occupation of Chinese territory were attended with much looting, brutality, and license, not at all creditable to the Christian nations. Li Hung-chang and Prince King (or Ching) were commissioned to treat with the Powers, and after months of wearisome negotiation, prolonged by the differences among the Powers and by the peculiar methods of Oriental diplomacy, a protocol embodying the terms of peace to be imposed upon China was submitted to the Imperial government. This document set forth the expiatory measures imposed upon China on account of the Boxer outrages; forbade the importation of arms and ammunition or the materials for their manufacture; provided for the payment and distribution of an indemnity of 450,000,000 Haikwan taels, or $333,000,000; the conversion of ad valorem into specific duties, and the improvement of the Pei-ho and Whang-pu rivers, at the joint cost of the foreign Powers and China; prohibited Chinese membership in antiforeign societies under pain of death, and abolished government examinations for five years in cities where foreigners had been massacred; ordered the dismissal of governors who should hereafter permit antiforeign agitation; and transformed the semiofficial Tsung-li Yamen into a Ministry of Foreign Affairs, the Wai Wu Pu, taking precedence of the other ministries. A legation district in Peking which might be fortified and guarded was defined, and certain points were indicated that might be occupied by the foreign Powers to keep communication open between the capital and the sea. In accordance with this protocol, all foreign troops except the legation guards were to be withdrawn in September, 1901, and the status quo was to be reëstablished.

In an Imperial edict issued in February, 1901, China accepted these terms. While the Boxer movement was in progress and the siege of the legations in Peking was going on, the Chinese forces made a vigorous and at first irresistible advance against the Russians in Manchuria, which became the scene of bloody warfare. In July, 1900, the Chinese cannonaded Blagovyeshtchensk, on the Amur River. Russia assembled large forces which finally drove back the enemy, and at the beginning of October Mukden was in Russian hands. During the progress of the peace negotiations the Powers dispatched punitive expeditions in various directions, these operations continuing into the spring of 1901. In June, 1901, Count Waldersee, who had been at the head of the allied forces in China, laid down his command. In January, 1902, the Chinese court returned to Peking. The outcome of the Boxer uprising did not leave the Empress unaffected. The return of the court was followed by the promulgation of various reform edicts placing Western sciences and arts among the courses of study at the Imperial military academy, legalizing intermarriage between Chinese and Manchus, and urging the abandonment of the custom of foot binding. An edict of April, 1903, provided for the establishment of a single monetary standard for the Empire and the erection of a mint at Peking to supply the provinces with a uniform currency. On Sept. 5, 1902, a treaty was concluded with Great Britain providing for the abolition of the *likin*, or internal taxes, as soon as the other Powers should have made like agreements; for the opening of a number of treaty ports; and for the revision of the laws governing mining and internal navigation. Similar treaties were concluded with the United States and Japan, Oct. 8, 1903, and with Portugal, Nov. 11, 1904, but nothing was done by the government to carry its promises into effect, other than the appointment of the progressive Yüan Shī-k'ai (q.v.) as Minister of Commerce with full control over mines, railways, and telegraphs. But, however the Chinese government might be affected by collision with the modern Powers, the national character rendered it seemingly impossible for China to follow the example of Japan in assimilating Western civilization thoroughly and rapidly. The forces of conservatism were as yet too strong, and in consequence the high hopes of speedy reform entertained in some quarters after the Boxer uprising were in large measure destined to remain unrealized.

The question whether the Boxer indemnity should be paid in gold or silver was debated for a number of years. It was settled by an agreement between the government and the Powers on July 2, 1905, making the indemnity a gold debt. During 1905 the last of the foreign troops guarding the line of communications between Peking and Tientsin were practically withdrawn.

Russia, in spite of an agreement entered into April 8, 1902, for the evacuation of Manchuria, made little effort to redeem its promise, and at the beginning of 1904 was still in full control. The war between Japan and Russia followed. (See Russo-Japanese War, where the Manchurian question is treated in detail.) Soon after the outbreak of hostilities the Chinese government issued a proclamation of neutrality (Feb. 12, 1904), and acting under the inspiration of Japan announced the intention of preventing military operations from extending to any part of the Empire but Manchuria. Japan in return disclaimed all desire to acquire any increase of territory at the expense of China. The sympathies of the Chinese people were with Japan, primarily because the defeat of Russia was necessary to the restoration of the integrity of the Empire. In the field of war the Chinese rendered valuable assistance to the Japanese as scouts, while armed bands of the Hungshutz, or Chinese bandits, sometimes under Japanese officers, operated on the western flank of the Russian armies and in Mongolia. The Chinese government made some attempt to obtain representation in the peace conference at Portsmouth in 1905, but without success. The outcome of the negotiations, however, was to its advantage. Russia and Japan pledged themselves to evacuate Manchuria within 18 months and to restore it to the exclusive administration of the Chinese. The two governments, however, were to retain their guards for the protection of their respective sections of the Manchurian Railway. Russia abandoned all claims to territorial advantages or preferential concessions in Manchuria. The transfer by Russia to Japan of the Liao-tung peninsula and the railway from Port Arthur north to Chang-chun was made conditional on the consent of the Chinese government. Such consent was granted in the Treaty of Dec. 22, 1905, between Japan and China, which provided in addition for the opening to trade of 16 principal ports and cities in Manchuria after the evacuation of the country by the forces of the two combatants.

The triumph of the Japanese arms reacted

on the Empire in a twofold manner: it spurred on the throne to an increasingly progressive policy and quickened among the people at large the feeling of national consciousness. Important factors in this development were the large number of Chinese students in Japan and the presence of Japanese teachers, military instructors, and engineers in the various centres of the Empire. The growth of the native press was greatly fostered by the war. Directly this was due to the efforts made by both the Russian and the Japanese government to influence public opinion through the establishment of subsidized vernacular publications, but the general interest in the events of the war also led to a considerable increase in the number of newspapers and a far greater increase in the number of newspaper readers. The influence of the budding "fourth estate" in China was apparent in the boycott movement of 1905 mentioned below. Military progress was conspicuous after 1902. A highly efficient army of more than 50,000 men was developed by the able Yüan Shī-k'ai, Viceroy of Chi-li, as the nucleus of a future army commensurate with the extent and the resources of the Empire. In July, 1905, an Imperial edict ordered the dispatch of four missions abroad for the purpose of studying modern political institutions. One of these visited the United States in January and February, 1906, and a second mission on its way to Europe passed through the country in March. In September, 1905, an Imperial decree ordained the abolition of the old system of literary examinations for office and the institution of a method of selection from the schools of new learning. Parallel with this reforming activity was manifested a tendency to refuse the grant of all further railway or mining concessions to European capital and to reacquire concessions already granted, as in the case of the American concession for the construction of the Canton-Hankow Railway, which was canceled in August, 1905. Partly as a result of general anti-Western feeling and partly in retaliation against the treatment of Chinese in the United States, a boycott of American goods was set on foot in southern China in the summer of 1905 and continued with more or less thoroughness during the year. Probably unconnected with the boycott but attributable to the same state of ill feeling was the murder of five American missionaries by a Chinese mob at Lienchow in October. In December there were serious riots at Shanghai arising from a conflict of authority between the European and the native members of the mixed tribunal. In May, 1906, an Imperial edict placed the entire customs administration of the country, including the Imperial Maritime Customs, which had been managed by Sir Robert Hart since 1863, under two supreme native administrators to whom the Inspector General was made subordinate. The Powers united in opposing the terms of the edict, but with some modifications and guaranties it remained in effect. It was believed that the Chinese government intended to make use of the revenue funds in the upbuilding of the army.

Among the many reforms planned and completed as the result of the Russo-Japanese War, none was perhaps, for practical reasons, more important than the strengthening of China's defensive power. In 1907 Yüan Shī-k'ai and Chang Chī-tung, the viceroys of Chi-li and Hukuang respectively, were appointed to memberships of the Grand Council, in which capacity they pushed matters considerably towards reshaping the Chinese government on the lines of modern progress. To Yüan Shī-k'ai, the experienced creator of foreign drilled troops, fell the rôle of reorganizing the army, besides that of furthering advanced views in education and improvements in the civil service, and Chang Chī-tung was not slow to follow as far as his provinces were concerned. A centralization of military forces was aimed at by weakening as much as possible the control of provincial authorities and placing the military reins in the hands of metropolitan chiefs. Naval reforms followed more slowly, but the promises for liberal changes in the Imperial government were but partially and very reluctantly complied with, although many important changes had taken place. The much-longed-for convocation of a national parliament was in 1907 deferred to a distant future. An agitation, fostered by the Imperial government as well as by patriotic circles among the population, for suppressing the opium vice was one of the great reforms following an Imperial edict issued in September, 1906, according to which all opium smoking was to cease within 10 years, and steps towards the gradual extinction of the vice were taken by the Chinese government with the coöperation of Great Britain, the government of India promising to decrease the importation of the drug at certain rates per annum, and opium dens being closed in Hongkong. Many of the reforms suggested by K'ang Yu-wei and suppressed by the coup d'état of 1898 were now carried out, chief among which was the abolishment of the so-called wen-ch'ang system of civil-service examination. The celebrated examination halls were now devoted to other purposes; temples and public halls were changed into schools where foreign sciences were taught by native and foreign teachers. Among the latter many Japanese were engaged, and Chinese students were sent to Japan, the United States, and Europe. The United States had an important share in the education of young Chinese, and the very best class of students were sent to American schools and universities, because, unlike the other belligerents, America had remitted to China the indemnity due from the Boxer War in 1900 so that large sums could be appropriated for purposes of education in the United States. It is quite possible that the fact of so many of the best students having picked up their first lessons in constitutional law, political economy, education, etc., in republican surroundings has helped to pave the way towards the great change in China from the most absolute monarchy to a republic.

The prelude to this great change may be seen in the sudden deaths of both the Emperor Kuang-sü and the Empress Dowager Tz'ŭ-hi in November, 1908. Kuang-sü's successor was the infant son of the Emperor's brother, Prince Chun. He reigned under the style Süan-t'ung with his father as regent, whose liberal inclinations certainly were no impediment in the progress of reforms. In 1909 provincial assemblies were called in, and a Senate was formed in 1910, and several new railway lines were completed and opened to traffic. But, though the Imperial government was now free from committing such crimes as had marked former generations, the foundation had been laid

for changes which nobody at the time dared to foresee. If we review the several factions then at work in China according to the views of their leaders, we may make the following distinctions. There was, in the first instance, the Manchu conservative, or reactionary, party, counterbalanced by the liberal adherents to the Manchu government. K'ang Yu-wei and Liang K'i-chou, the reform philosophers of 1898, were by no means opposed to the Manchu dynasty, as has been occasionally assumed. Their programme was in favor of a constitutional monarchy under a Manchu emperor, with the exclusion of the Empress Dowager Tz'ī-hi, and after her death they looked upon the young Emperor Süan-t'ung with his liberally inclined uncle, the regent Prince Chun, as the power that would carry out their ideas in the future. A comrade as it were in his wish for liberal government in China and a fellow victim of the persecution of the late Empress Dowager, though with widely different aims before him, was Dr. Sun Yat-sen, a native of the Kuang-tung Province, educated in Honolulu and Hongkong, where he studied medicine under Sir Patrick Manson's successor, Dr. Cantlie. His patriotism, coupled with the impressions he had received from his education in a quasi-foreign atmosphere, led him to conceive the plan of organizing among his countrymen a revolution against the Manchu dynasty. In this, in spite of many reverses and after years of patient perseverance, he succeeded. In 1896, while on a visit to the United States and England, he issued a manifesto calling upon the people to rise against their oppressors, the Manchu government. An attempt to make him a prisoner at the Chinese Legation in London had failed through the interference of the British government, and for a number of years he traveled abroad as one of the most indefatigable and finally successful agitators the cause of liberty has ever seen. The attempt at an insurrection made on the frontier of Tongking in 1907 had failed; but the fruit of his great work was to ripen in the summer of 1911. A railway strike in Sze-chuan, caused by the introduction of foreign capital and material, had resulted in the sending of Imperial troops from Wuchang, and this furnished the ground for a general rising against the Manchus. This rising spread from province to province, the people of which soon found themselves to be one in the cry for a change in government. The ground had been well prepared, and when, in the face of too many reverses the Imperial troops had suffered in various parts of the Empire, the court seemed prepared to yield to the demands of public opinion, it was too late even for Yüan Shī-k'ai, who had been recalled from his voluntary retreat and appointed Prime Minister in November, 1911, to save the dynasty. The revolutionary committee, which had been joined by the former envoy to the United States, Wu Ting-fang, had invited Yüan Shī-k'ai to become the head of a Chinese republic, the establishment of which seemed to be unavoidable, but the Premier may have thought his opportunity had not come yet; but on December 28 the Imperial family left the capital, placing the decision as to the form of government, whether monarchy or republic, in the hands of the people in its National Assembly. The result was that Dr. Sun Yat-sen, the spiritual father of the republican idea, was elected the first President of the Chinese Republic under a provisional constitution. In the meantime weeks elapsed until the court could be got to acknowledge the course of events by the abdication of the Emperor Süan-t'ung, which was formally announced on Feb. 7, 1912. The Manchu dynasty had reigned in China since 1644. A parliament created by the revolutionary provisional government met, Aug. 8, 1913, and through a committee drafted a constitution, but only the articles providing for the election of a President and Vice-President became law. Yüan Shī-k'ai was elected President, October 6, for the term of five years, but died, June 6, 1916, having meanwhile given offence to Dr. Sun Yat-sen and the radical element by governing without a parliament and by his high-handed measures. He was succeeded in the Presidency by Li Yuan-hung under whom the parliament was restored and resumed its work of framing a constitution. In March, 1917, China having decided to take sides with the Allies in the European war severed diplomatic relations with Germany. At this time there was an irreconcilable conflict over the constitution between the President and the Legislature on the one hand, and the Prime Minister, Tuan Chih-jui and the Cabinet on the other, and the question of the proper method of declaring war brought matters to a crisis, which resulted in the dismissal of the Prime Minister. The latter rallied to his side the generals of the Northern Provinces and after a *coup d'état* by a dissident military governor in July who proclaimed the restoration of the emperor, Tuan and his party prevailed. Tuan was then restored as Premier. Meanwhile, after the dissolution of parliament in 1914, Dr. Sun Yat-sen and his supporters had established an independent military government at Canton, which they declared to be the sole representative of the constitutional government set up by the revolutionists in 1911, and thenceforth a state of war existed between the north and the south, marked by desultory hostilities down to and after the Disarmament Conference at Washington. Hsu Shih-Chang was inaugurated President, Oct. 10, 1918. By that time the Peking Government had lost all real authority owing to the usurpation of the local governors, who from time to time attempted a *coup d'état*. In addition to this civil confusion China was constantly involved throughout this period in difficulties with Japan. The latter's retention of Shantung, occupied by her during the European war, was one of the stumbling blocks of the Peace Conference, and its decision as embodied in the Treaty of Versailles was objectionable in China, who refused to sign the Treaty. Friction between China and Japan over this and other matters continued during the Disarmament Conference of 1921, and afterwards, and led at intervals to a Chinese boycott of Japanese goods. At the same time there was an increasing body of public opinion in China that opposed the exploitation of the country by the western powers and insisted on national integrity and independence. See SUPPLEMENT. For national coat of arms, see Colored Plate in article HERALDRY.

Bibliography. Bibliographies of China comprise: Griffin, *Select List of Books* (Washington, 1904); Cordier, *Bibliotheca Sinica* (3 vols., Paris, 1880–95; 2d ed., 1904–08); Reynolds-Ball, "A Modern Bibliography of China," in *Literature*, vol. vii (London, 1900); Windeyer,

"China and the Far East," being *Bibliography 25 of the New York State Library, Bulletin 59* (Albany, 1901).

Some of the more important works may be classified as follows:

1. For general reference: Williams, *The Middle Kingdom* (New York, 1883); Ball, *Things Chinese* (ib., 1900); Scidmore, *China, the Long-Lived Empire* (ib., 1900); *La Chine, Expansion des grandes puissances, en extrême-orient, 1895–98* (Paris, 1899).

2. Description and natural resources: Huc, *Through the Chinese Empire* (2 vols., New York, 1855; Chicago, 1900); Thomson, *China and its People* (4 vols., London, 1873–74), and *Through China with a Camera* (ib., 1898); Von Richthofen, *China, Ergebnisse eigener Reisen und darauf gegründeter Studien* (4 vols., Berlin, 1877–1912), and *Schantung und seine Eingangspforte Kiautschou* (Berlin, 1898); Playfair, *Cities and Towns of China* (Hongkong, 1879); Edkins, *Modern China: Thirty-one Essays* (Shanghai, 1891); Gundry, *China, Present and Past* (London, 1895); Martin, *A Cycle of Cathay* (New York, 1897); Colquhoun, *Overland to China* (ib., 1900); Bishop, *The Yang-tse Valley and Beyond* (ib., 1900); Wolf, *Im Innern Chinas* (Stuttgart, 1900); Navarra, *China und die Chinesen* (Bremen, 1901); Wilda, *Von Hongkong nach Moskau* (Altenburg, 1902); C. Denby, *China and her People* (2 vols., Boston, 1906); Treves, *The Other Side of the Lantern* (London, 1905); Richard, *Comprehensive Geography of the Chinese Empire and Dependencies*, trans. by Kennelly (Shanghai, 1908); Dyer Ball, *Things Chinese* (ib., 1903); Giles, *China and the Chinese* (New York, 1902); Réclus, *L'Empire du milieu* (Paris, 1902); Williams, *The Middle Kingdom* (New York, 1904); Willis, *Research in China* (Washington, 1906–07); Tiessen, *China, das Reich der achtzehn Provingen* (Berlin, 1902).

3. Government and laws: Mayers, *The Chinese Government* (Shanghai, 1886, 1897); Ross, *The Manchus, or the Reigning Dynasty of China* (London, 1880); Staunton, *Ta-tsing-Leu-Lee: The Penal Code of China* (ib., 1810); Alabaster, *Chinese Criminal Law* (ib., 1899); Bell and Woodhead, *The China Year Book, 1913* (ib., 1913).

4. Religion and civilization: Johnson, *Oriental Religions: China* (Boston, 1877); Edkins, *Religion in China* (ib., 1878), and *Chinese Buddhism* (ib., 1880); Douglas, *Confucianism and Taoism* (London, 1879); Deal, *Buddhism in China* (New York, 1884); Wilson, *China: A Study of its Civilization and Possibilities* (ib., 1887 and 1901); Terrien de Lacouperie, *Western Origin of Early Chinese Civilization* (London, 1894); De Groot, *Religious Systems of the Chinese* (4 vols., Leyden, 1894–1901); Heig, *Die Religion und Kultur Chinas* (Berlin, 1900); Chen Huan-chang, *The Economic Principles of Confucius and his School* (2 vols., New York, 1911); Wang Ching-Dao, *Confucius and New China* (Shanghai, 1913?); Franke, "Das religiöse Problem in China," in *Archiv für Religionswissenschaft*, vol. xvii (Leipzig, 1914).

5. Character, manners, and customs: Hardy, *John Chinaman at Home* (New York, 1905); Davis, *The Chinese* (ib., 1836); Doolittle, *Social Life of the Chinese* (2 vols., ib., 1876); Lee Yan Phou, *When I was a Boy in China* (Boston, 1887); Simon, *La cité chinoise* (Paris, 1890); Smith, *Chinese Characteristics* (London, 1892), and *Village Life in China* (New York, 1899); Douglas, *Society in China* (London, 1894); Fielde, *A Corner of Cathay* (New York, 1894); Holcombe, *The Real Chinaman* (ib., 1895); Bard, *Les Chinois chez eux* (Paris, 1899); Mrs. Little, *Intimate China* (London, 1901); Wu Ting-fang, "Chinese Civilization," in *University Record*, vol. v (Chicago, 1901); Parker, *John Chinaman and a Few Others* (London, 1901); Macgowan, *Men and Manners of Modern China* (1912).

6. Commerce: *La mission lyonnaise d'exploration commerciale en Chine* (Lyons, 1898); Beresford, *The Break-up of China* (New York, 1899); Parker, *China: Her History, Diplomacy, and Commerce* (ib., 1901); Morse, *The Trade and Administration of the Chinese Empire* (ib., 1908); Sargent, *Anglo-Chinese Commerce and Diplomacy* (Oxford, 1907).

7. Economics: Jernigan, *China's Business Methods and Policy* (London, 1904); Raveneau, "La Chine économique," in *Annales de géographie*, vol. viii (Paris, 1899); Parsons, *An American Engineer in China* (New York, 1900); Schumacher, "Eisenbahnbau und Eisenbahnplane in China," in *Archiv für Eisenbahnwesen* (Berlin, 1899–1900).

8. Literature: Legge, *The Chinese Classics* (5 vols., Hongkong, 1861–72); Martin, *The Chinese: Their Education, Philosophy, and Letters* (New York, 1881), and *The Lore of Cathay* (ib., 1901); Watters, *Essays on the Chinese Language* (Shanghai, 1896); Giles, *A History of Chinese Literature* (London, 1901); Grube, *Geschichte der chines-litteratur* (Leipzig, 1902).

9. History: De Mailla, *Histoire générale de la Chine* (13 vols., Paris, 1777–85); Hirth, *The Ancient History of China to the End of the Chou Dynasty* (New York, 1908); Semmedo, *History of China and of the Late Tartar Invasion* (London, 1655); Brine, *The Taeping Rebellion* (ib., 1862); Giles, *Historic China* (ib., 1882); Boulger, *History of China* (3 vols., ib., 1881–84); Bretschneider, *Mediæval Researches from East Asiatic Sources* (2 vols., ib., 1888); Hirth, *China and the Roman Orient* (Leipzig, 1885); Inouye, *The Japan-China War* (Yokohama, 1895); Vladimir, *The China-Japan War* (London, 1896); Williams, *History of China* (New York, 1897); Krebs, *Chinesische Kriege seit 1840 und seine heutigen Streitkräfte* (Berlin, 1900); Edwards, *The Story of China* (London, 1900); Michie, *The Englishman in China* (2 vols., ib., 1900); Parker, *A Thousand Years of the Tartars* (ib., 1895); Hirth and Rockhill, *Chau Ju-Kua* (St. Petersburg, 1911); Lynch, *The War of the Civilizations* (London, 1901); Martin, *The Awakening of China* (New York, 1907); Macgowan, *A History of China* (Shanghai, 1897; 2d ed., 1906); Oxenham, *Historical Atlas of the Chinese Empire* (2d ed., London, 1898); Bland and Backhouse, *China under the Empress Dowager* (ib., 1910); Gowen, *An Outline History of China* (2 vols., Boston, 1913); Thomson, *China Revolutionized* (Indianapolis, 1913); Cantlie, *Sun Yat Sen and the Awakening of China* (London, 1912); Bland, *Recent Events and Present Politics in China* (1912); Miss Carl, *With the Empress Dowager of China* (1905); Princess Der Ling, *Two Years in the Forbidden City* (1912); Geil, *Eighteen Capitals of China* (1911); Kent, *The Passing of the Manchus* (1912); Ross, *The Changing Chinese* (1912).

10. Missions, politics, and foreign relations:

Staunton, *Earl Macartney's* (q.v.) *Embassy to China* (London, 1797); Huc, *Christianity in China, Tartary, and Tibet* (3 vols., ib., 1857); Comenge, *Los Chinos; social y polltico* (Manila, 1894); Curzon, *Problems of the Far East* (London, 1894); Norman, *Peoples and Politics in the Far East* (ib., 1895); Speer, *Missions and Politics in China* (New York, 1900); Michie, *China and Christianity* (Boston, 1900); Colquhoun, *China in Transformation* (London, 1898); Krausse, *China in Decay*, with bibliography (ib., 1898); Reinsch, *World Politics at the End of the Nineteenth Century, as Influenced by the Oriental Situation* (New York, 1900); Wen Ching, *The Chinese Crisis from Within* (London, 1900); Holcombe, *The Real Chinese Question* (New York, 1900); Leroy-Beaulieu, *The Awakening of the East*, trans. by R. Davey (ib., 1900); Chang Chih-tung, *China's Only Hope*, trans. by Woodbridge (ib., 1900); Cordier, *Histoire des relations de la Chine avec les puissances occidentales* (Paris, 1901); Smith, *China in Convulsion* (New York, 1901); Landor, *China and the Allies* (ib., 1901); Ku Hung-ming, *Papers from a Viceroy's Yamen* (Shanghai, 1901); Moule, *New China and Old* (London, 1902); Parker, *China, Past and Present* (ib., 1903); Brown, *New Forces in Old China* (New York, 1904); Weale, *Manchu and Muscovite* (ib., 1904); id., *The Re-Shaping of the Far East* (ib., 1905); Morse, *The International Relations of the Chinese Empire* (Shanghai, 1910); Eliot, *Some Roads towards Peace* (Washington, D.C., 1913).

CHINA and **CHINAWARE.** See POTTERY.

CHINA (kī'nȧ *or* kē'nȧ) **BARK.** See CINCHONA.

CHINA CINNAMON. See CASSIA.

CHINA CLAY. See CLAY; KAOLIN.

CHINA GRASS, or **CHINESE GRASS.** The popular name of a fibre used in China for the manufacture of a beautiful fabric known as grass cloth. The name appears to have originated in the belief that the fibre was that of a grass; but this is not the case, it being obtained from *Bœhmeria nivea*, a plant allied to the nettle. Grass cloth is now brought in considerable quantity to stores, especially in the form of handkerchiefs and other textiles. It has a fine glossy appearance and a peculiar transparency. See BŒHMERIA; RAMIE.

CHINA INK. Another name for India ink (q.v.).

CHINANDEGA, chē'nän-dā'gȧ. A town of Nicaragua, situated 25 miles northwest of León and connected with the Pacific coast by railroad (Map: Central America, D 4). It is the capital of a department of the same name, is the centre of a corn district, and has considerable trade. Pop., 12,000. In this town was formulated in 1849 the celebrated Chinandega Agreement, an unsuccessful attempt to form a strong federation of the Central American States. San Salvador, Honduras, and Nicaragua drew up the agreement. Later Costa Rica adopted it, with certain specific limitations; but Guatemala rejected it with indignation.

CHINA SEA, or SOUTH SEA. A partially inclosed sea, lying off the southeast coast of Asia (Map: Asia, L 7). It is bounded by China and Formosa on the north, where it connects by the Strait of Formosa with the Eastern Sea; by French Indo-China, Siam, and the Malay Peninsula on the west; and by the island loop of Borneo and the Philippines on the south and east. On its west border are the indentations occupied by the Gulf of Siam and the Gulf of Tongking, the latter being partly shut off by the island of Hainan. The sea increases in depth from south to north; soundings of more than 13,000 feet have been made off Luzon, but much of the southern portion has a depth of less than 1000 feet. Typhoons of great violence endanger navigation during certain seasons. The chief ports on the China Sea, or close to it, are Manila, Singapore, Bangkok, Saigon, Canton, and Hongkong. The largest rivers draining into it are the Mekong, Menam, and the Si-kiang, or West River. With the exception of Hainan, there are no large islands.

CHINA TREE, PRIDE OF INDIA, or PERSIAN LILAC (*Melia azedarach*). A handsome tree, a native of India and Persia, and the type of the family Meliaceæ. The tree is widely distributed throughout the warmer portions of the globe. It grows to a height of 30 or 40 feet, and has bright-green compound leaves and fragrant lilac flowers. It resists drought and is highly thought of as a shade tree in regions adapted to its requirements. It will withstand considerable cold, but cannot be recommended for regions where freezes are frequent. The abundant lilac-colored flowers appear early in the spring, and the leaves are retained late into autumn, followed by the clusters of yellowish berries, making the tree attractive at all seasons of the year. The wood is rather coarse, but durable and handsomely marked, making it valuable for cabinet use. The leaves, flowers, and berries are reputed to have medicinal properties, although not recognized in some pharmacopœias. In Australia the tree is known as white cedar, and its uses are numerous. A number of forms of China trees are common in cultivation, one of the most handsome being that known as the Texas umbrella tree. Its spreading habit and dense foliage make it one of the most desirable shade trees known.

CHINA WAX. The secretion of an insect (*Coccus*) which lives on the ash trees of China. See WAX.

CHINCHA ISLANDS, *Sp. pron.* chēn'chȧ. A group of three small islands in the Pacific, near lat. 13° 40′ S. and long. 76° 30′ W., 12 miles from the coast of Peru (Map: Peru, B 6). The area of the entire group is only about 4000 acres. The surface is rocky and devoid of vegetation. The islands were of some importance formerly, due to immense guano deposits which began to be exported by the government in 1840 and were exhausted by 1874.

CHINCH BUG (from Sp., Portug. *chinche*, It. *cimice*, from Lat. *cimex*, bug, and Eng. *bug*). A small blackish bug (*Blissus leucopterus*), with white wing covers marked with a 6-shaped dark line. It belongs to the Lygæidæ, one of the most extensive and injurious families of plant bugs, of which some 175 species belong to North America. The chinch bug is spread all over the United States and throughout Central America and the West Indies, and is the most destructive bug, and probably the most destructive insect, in the country, especially in the Mississippi valley. It appears in incalculable numbers in dry seasons, and the Department of Agriculture places the average annual damage at $20,000,000. The adults live through the winter in old grass and rubbish. Early in the spring the female lays 500 or more eggs on the roots and stems of grain. The young, at first, are red in color, and, clustering in crowds on the stems and leaves

of grain or maize, suck out the juices and kill the plants. Wheat suffers most. There are two generations in a year. When arriving at maturity, the broods scatter, and should a strong wind be blowing at the time the insects are on the wing, they may be blown or carried many miles. Wet and cold springs and severe winters help to keep down the number of this pest. In Kansas several contagious diseases that attack this bug have been discovered, and to facilitate the spread of such diseases infested chinch bugs are sent to various parts of the State with alleged encouraging results. Several illustrated monographs of this species have been issued, of which the most complete is that by F. M. Webster, *The Chinch Bug* (Department of Agriculture, Washington, 1898).

CHINCHILLA, chĭn-chĭl'lȧ (Sp., from So. Amer. Indian). A small South American rodent allied to the cavies, but outwardly much resembling a ground squirrel, which represents an extensive family (Chinchillidæ). All the species are gregarious, feed much on roots, for which their strong and sharp incisors are particularly adapted, and live either in holes, which they select for themselves in rocky districts, or in burrows, which they excavate. They are valued for their fur, particularly the chinchilla of the Andes (*Chinchilla lanigera*), whose mouse-gray and extremely soft and lustrous fur constitutes an important article of commerce; but their numbers are said to be perceptibly decreasing. The ancient Peruvians were accustomed to employ the wool of the chinchilla for the manufacture of fine fabrics. See Plate of CAVIES.

CHINCHILLA DE MONTE-ARAGÓN, chĕn-chē'lyȧ dā mōn'tā ä'rȧ-gōn'. A town of Spain, in the Province of Albacete, 10 miles southeast of the city of that name (Map: Spain, E 3). It is surrounded by walls and has a castle. Previous to the nineteenth century Chinchilla was considered the most important city in the territory of what is now called the Province of Albacete. It has manufactures of cloth, linen, leather, earthenware, and glass, and a trade in the agricultural produce of the district. Pop., 1900, 6544; 1910, 6795.

CHINDWARA, chĭnd-wä'rȧ. The capital of a district of the same name in the Nerbudda Division, Central Provinces, British India (Map: India, C 4). It is situated in lat. 23° 4′ N. and long. 78° 57′ E., on the Satpura plateau amid the Deoghur Mountains, 2200 feet above sea level. Its climate is agreeable and salubrious and attracts many visitors in search of health or recreation. The city contains an English school, an Arabic private school, and two dispensaries. Area of district, 4631 square miles. Pop. of town, 1901, 4216; 1911, 3404; of district, 1901, 407,865; 1911, 516,948.

CHINESE ARROWROOT. See NELUMBO.

CHINESE ART. Until recently very little was known of Chinese art. But the publications of the Japanese, with their admirable reproductions in color, the looting of the Imperial treasures at the sack of Peking, and the recent political events, culminating in the real opening of China to the western world—these and other factors have not only thrown light upon the development of Chinese art, but have enabled us to study it from the originals. The recent expeditions sent by the various European governments, especially the German and British to the Kingdom of Khotan on the northwestern Chinese frontier, have thrown much light upon its origins. Chinese art is a homogeneous and continuous development, the beginnings of which rival the Egyptian and Babylonian in antiquity, and its development has continued into our own day. China occupies the same important and influential position in the art of the Far East, with its endless ramifications, as Greece in the Occident. The art of China began to be important in the third millennium before Christ, attained an important development under the Shang dynasty (1766–1154), a second in the Chow (1122–255); a third and stronger creative effort with the Han dynasty in the second century B.C.; its culmination in the T'ang period (618–907 A.D.) and the Sung (960–1280). It continued to flourish under the Mongol conquerors (1280–1368), experienced a renaissance under the Ming dynasty (1368–1644), and continued, though with less originality and force, under the Manchus to our own day. Although a highly national and characteristic development, it was repeatedly influenced by external forces. It seems to have felt the remote influence of the Mycenæan style and was certainly affected by the Scythian and by the mixed style of Central Asia. China was not unaffected by the Hellenic culture of the Eastern Empire, with which it had commercial relations. The most powerful external influence, however, and the chief factor in the development of Chinese art, followed the adoption of Buddhism. A modified form of the Greco-Indian art, starting from its home in Gandhara (northern India), progressed triumphantly through Central Asia and entered by way of Khotan into China during the third and fourth centuries A.D.

Painting. The origin of painting, which is the most important development of Chinese art, is found in calligraphy. For Chinese script is written with the brush and requires highly artistic execution. Only fluid colors are used on highly absorbent materials, such as silk or paper, upon which no change or retouching is possible. Unlike Occidental painting, Chinese is essentially romantic rather than naturalistic in character. Its purpose is not to represent facts, but to suggest a poetic idea. Although exquisite in color, its chief beauty is one of line. It is decorative in character, avoiding modeling and shadows. The Chinese painter must conform to certain conventional schemes, which are themselves admirable syntheses of the chief structural formations in nature, but is unrestricted in the expression of feeling. As early as the third century B.C. there was in China a highly developed painting, secular in character and devoted chiefly to history and portraiture. Paintings were then made on wooden panels and on walls prepared with line, as well as on silk and paper. In the second century we hear of the beginnings of landscape. The T'ang period (618–907 A.D.), under the influence of Buddhism, was the age of classic figure painting, with Buddha and the sages as principal subjects. The human figure was decoratively conceived, not naturistically, but with wonderful power of expression. The chief characteristic of Buddhist painting was a grand rhythm of line and arrangement; the colors were bright and harmonious. Wu Taotsŭ, universally conceded the greatest of all Chinese painters, flourished during the period. A painting in the Freer collection (Detroit), attributed with some probability to him, affords an excellent idea of his style. This age saw the further

development of landscape painting in two great schools—the southern, which was romantic and literary in character, and the more naturalistic northern. At the head of the former was Wu Wang Wei, of the latter Li Ssühsün. The golden age of painting was under the Sung dynasty (960–1280) which saw the culmination of the landscape. Like the painters of Barbizon, 1000 years later, the Chinese depicted all the moods of nature with the most intimate charm and with a power of suggestion never after equaled. Their theme, however, was the spirit of nature rather than its actual appearance. Particularly delightful are the paper scrolls upon which whole series of landscapes are painted. The solitary figures of hermits or sages in the landscape serve to accentuate the emotional quality. Among the greatest landscape painters of the epoch was the Emperor Hwei-tsung. There were animal as well as landscape painters; and every object of nature, animate or inanimate, was depicted with impartial love and skill. The Mongol (Yuen) dynasty continued the established manner, but with a certain petty realism. Genre, flowers, birds, and insects were favorite subjects. The early Ming period (till c.1500) attempted a renaissance of Sung painting, but with emphasis of the accidental rather than the typical, but afterward followed rather the Yuen style. Elegance replaced simplicity, yet such painters as Lin Lang are worthy of comparison with those of the great age. Pictures of court life with brilliant color effects were favorite subjects. Under the Manchus art petrified. Technical ability remained, but this was chiefly an age of copies. Still, much good painting was produced, even to the present time. One of the most characteristic forms of Chinese painting is the ink sketches of the Sung and later periods, which are marvels of vigorous and delicate executions. The finest collection of Chinese painting in the western world is probably that lately acquired in China by Charles L. Freer, which will pass after his death to the National Museum in Washington. Other important collections are those in the British Museum, and the Musée Guimée of Paris, the Metropolitan Museum of New York (q.v.), and the Boston Museum.

Architecture. Architecture in the usual sense is not known to have been carried to important results in China before the appearance there of the Buddhist influence in the course of the first century A.D. Then Indian types were introduced, and the Taa, or pagoda, of Chinese form appeared; although none of such early date has been identified. These towers, as they now exist, are usually constructed of brick, which material is concealed in many cases by an elaborate facing of what are spoken of as "tiles," but which are frequently very massive and of elaborate form, embossed with sculptured designs very richly painted. Others exist, which are built chiefly of stone. Some reach the height of 13 stories, but this seems to be unusual.

The roof is far more prominent in Chinese architecture than in that of Europe; and the roofs must have been always of wood, as they are to this day; round logs of no great size, or lengths of bamboo. The curious and often noted tentlike form of these roofs with hollow curves, the steep pitch of the upper part, growing less and less until the broad eaves are almost horizontal, are not to be ascribed to any attempted imitation of the actual tent of canvas or textile material. They are unquestionably the result of the peculiar framing of the roof, which, whether built of hollow bamboos or of light solid pieces, whether squared or preserving the natural form of the log, is constructed in a way altogether different from that used in the roof building of Europe. The artistic importance of these roofs, their value, individually or in groups, and their novelty to Europeans, have led to a hasty assumption that Chinese architecture takes its forms and its design mainly from original timber building. Of this, however, there is no evidence; bricks are known to have been used in great abundance in China at an epoch long before the commencement of our era, and skill in handling granite and stratified stone is traditional. Wood must have been common, from an antiquity comparable to that of the buildings of Chaldæa.

As to the general plan of buildings, it is evident that from the beginning until the present time the Chinese idea of a residence has been nearly that which the peoples of the Mediterranean held during the years of classical antiquity; and that the Chinese palace and temple have been what those of the Mediterranean world were until the time came for competition between towns and states in the way of more striking and more permanent structures. A Chinaman's house, if he is a rich man, is a group of small one-story buildings interspersed with gardens, all within a bounding wall. Precisely the same tendency is visible in the temples of China, the "pagodas" or tower-like structures of whatever form being decorative and symbolical accessories, like the church steeple in a village of low wooden houses in America. In such low buildings the roof is, of course, the most visible and striking feature, and the fact that the forms of this roof interested the builders and became the dominating element in their design, even in the towers, is in no way surprising. We see this in full glory in Japan down to an epoch now scarcely closed. (See JAPANESE ART.) The construction is unlike that of Europe, inasmuch as it ignores diagonal bracing and substitutes for it a steplike series of vertical struts and horizontal ties. Thus, if we have to carry a pair of sloping rafters, these rafters are, in Europe, secured at the top of the wall and again where the two rafters meet at the ridge; but the Chinaman supports each rafter at four, five, or six points in its length, and thus prevents it from having any tendency to push sidewise. The purlins, or long horizontal pieces which carry the light outer rafters and the roof coverings are supported in Europe by the main rafters of the truss (see ROOF), but in the East on the successive steps resulting from the square-framed structure. The scientific construction of Europe is so entirely identified with the triangle (see ROOF; TRUSS) that we can hardly imagine wooden architecture which ignores it; and yet such buildings in China and Japan have been found to last 1000 years in perfect condition.

The monumental gateways of China have always been admired by Europeans. The term *pai-loo* is applied to these, although some writers use that term for such a gateway when having several divisions, and *pai-long* when there is but one opening or passage. The pai-loo on the road leading to the tomb of the Ming emperors is of marble and has five openings; another, at the

entrance of the Chun-Tsiang-Cha, has three round arches, and the one called the Porcelain Gate has three pointed arches—all these being in Peking. There is a great pai-loo of granite in the city of Ning-po, and several in the southern provinces are elaborately worked in marble. These gateways are frequently set up as memorials, approved by the sovereign as deserved by one of his subjects.

Although public buildings are very commonly devoid of great massiveness and of that kind of dignity which comes of ponderous and enduring structure, this is replaced very largely by elaborate surface decoration. For this purpose the unequaled skill of the Chinese in all forms of ceramic art, their great power as decorative sculptors in wood and stone, and the knowledge and taste they show in painting in permanent colors by a method which we call roughly "lacquering"—though in reality lac does not enter into it—give their permanent decoration great value. Wooden screens and partitions, verandas and garden houses, receive exquisite adornment in modeled and colored patterns, the use of textile fabrics and enameled tiles.

Sculpture. Carving in stone was practiced in China during the earliest periods, but the first real impulse towards a monumental sculpture came with Buddhism. Temples, similar to those in India, were adorned with rock-cut images of Buddha and his disciples, carved in the Greco-Indian manner. A typical example of such a temple with a multitude of carvings is at Tatong (Shansi) dating from the fifth century, and there are a number of others. Colossal Buddhas of stone were characteristic of the T'ang period. Owing to the inability to represent the human figure, except in a conventional fashion, the Chinese never produced anything comparable to the sculpture of Western lands, excepting in decorative work. On the whole, sculpture in China is identified with movable pieces of decorative effect more than with architectural enrichment or with close representation of nature. Wood carving and elaborately wrought modeling in clay, which is afterward fired, and the surfaces painted and glazed, are carried to a refinement unknown in Europe. The carving of hard stones, like jade and rock crystal, and soft stones like opaque, veined talc and steatite, and of ivory, is an art especially identified with China. Jade carvings are of great elaboration, as where a single piece containing 250 cubic inches is wrought into two complete vases, side by side and separated from one another, except as leaves and twigs, all cut out of the solid mass, connect them.

Bronzes. In the modeling and casting of bronzes, especially those of a decorative character, the Chinese are unexcelled. The development of the art has lasted uninterruptedly for a period of 3000 years. The products are for the most part images and utensils used in the temple services, such as vessels for offerings, vases for wine, flowers and many other purposes, bells, drums, as well as objects of a similar character intended for secular use. These bronzes have been preserved in such numbers that it is possible to form an adequate idea of the development of the art. Pieces of temple furniture exist as early as the Shang and especially the Chow (1122–255) dynasties. They are severe and grandiose in form, to which the rich ornament is strictly subordinated. During the Han period conventionalized decorative images of human, animal, and plant life are used in decoration, and Hellenistic methods appear. The T'ang style unites more realistic conceptions with a more suave execution, and prefers curved linear form. This character was further developed during the Sung period, in which the effect is gained more through quality of surfaces and purity of form than through detailed execution. This was also the period of some of the finest inlaid work, in which gold, silver, and semiprecious stones were used, a technique in which the Chinese especially excelled. Artists of the Ming period, on the other hand, emphasize a richly decorative detail, sometimes to the neglect of the general effect. Ancient forms were reproduced with remarkable technical skill, but with an added elegance which somewhat impaired their purity. The same remarkable technical ability continued throughout the Manchu period to the present day, but with too much emphasis upon detail and decoration.

Applied Arts. The importance and beauty of Chinese porcelain and cloisonné are such as to require special treatment under the titles PORCELAIN and ENAMEL. The textile fabrics likewise are treated under VELVET and similar titles.

Bibliography. A very extensive literature on Chinese art, much of it written contemporaneously with the great art epochs, exists in Chinese; but the works accessible to Occidental readers are, for the most part, of a recent date. The following works treat, with some detail, all the arts of China: Giles, *An Introduction to the History of Chinese Art* (Shanghai, 1905); Bushell, *Chinese Art* (2 vols., London, 1904–06); Münsterberg, *Chinesische Kunstgeschichte* (2 vols., Esslingen, 1910–12); Fenollosa, *Epochs of Chinese and Japanese Art* (New York, 1912); Glaser, *Die Kunst Ostasiens* (Leipzig, 1913). The Chinese point of view is admirably expressed in Binyon, *The Flight of the Dragon* (London, 1911); Fischer, in *Repertitorium für Kunstwissenschaft*, vol. xxxv (Berlin, 1912). Mention should also be made of such earlier works as Paléologue, *L'Art chinois* (Paris, 1888), and Hirth, *Fremde Einflüsse in der chinesischen Kunst* (Munich, 1896). For Chinese painting, consult, besides the above works, Hirth, *Scraps from a Collector's Notebook: Notes on some Chinese Painters* (New York, 1906); Sei-ichi Taki, *Three Essays on Oriental Painting* (London, 1911); Binyon, *Painting in the Far East* (London, 1913). The Japanese periodical, *The Kokka*, with Japanese and English text, contains admirable colored reproductions of Chinese paintings (Nos. 191 (1906) et seq.). For a summary of Chinese architecture, see Cram, in *Dictionary of Architecture and Building* (New York, 1901–02); Chûta Itô, in *The Kokka*, Nos. 197, 198; Boerschman, *Die Baukunst der Chinesen*, vol. i (Berlin, 1911), others to follow. For the influence of Græco-Buddhist art, consult Stein, *Ruins of Desert Cathay* (London, 1912). For sculpture, see Chavannes, *La sculpture sur pierre en Chine au temps des deux dynasties Han* (Paris, 1893). For the extensive literature on Chinese porcelain, see the bibliography of PORCELAIN.

CHINESE IMMIGRATION. This subject first assumed importance in the United States about the year 1870, although legislation hostile to the Chinese began in California in 1855. The California Legislature investigated the subject in 1862, and the United States Congress sent a joint special committee to the Pacific coast in 1876, the voluminous report of which gives the most authentic information on the subject yet published (*Rep. 44th Cong., 2d Sess., Sen. R. 689*, p. 1281, Washington, 1877).

Up to 1868 the United States was trying to compel China to admit Americans into that country for the pursuit of trade and commerce. The first treaty (1844) with China gave Americans the right of residence in five ports and gave them the rights of extraterritorial consular jurisdiction. The Americans, though not participating in the Chinese War of 1858, secured all of the privileges obtained by other nations which were stipulated in the Reed Treaty of 1858. Nothing was said in these treaties about Chinese in America, who came here under the same conditions as the citizens of other nations. The Burlingame Treaty of 1868 deprecated involuntary immigration—aimed at coolie labor—but declared the right of migration to be an inherent one, and a special resolution of Congress (July 27, 1868) declared the right of expatriation to be a natural and inherent right of all people, the obstruction or restriction of which is inconsistent with the fundamental principles of the republic. This declaration became subsequently an object of embarrassment in dealing with the Chinese when anti-Chinese feeling on the Pacific coast made it necessary for both political parties in 1876 to insert anti-Chinese planks in their platforms. The question of abrogating the Treaty of 1868 was discussed in Congress. A bill to restrict Chinese immigration passed both Houses of Congress in 1879, but was vetoed by President Hayes because it violated the Treaty of 1868. A commission was sent to China in 1880 to negotiate a new treaty to permit the absolute prohibition of Chinese immigration. The Treaty of 1880 declared that "the government of the United States may regulate, limit, or suspend such coming or residence, but may not absolutely prohibit it." The treaty further stated that the limitation must be reasonable and apply only to Chinese laborers. The Act of 1882 suspended the immigration of Chinese laborers for 10 years and gave those in the United States or those who should arrive within 90 days after the passage of the act the right to remain, but forbade the naturalization of Chinese, and the act applied to both skilled and unskilled laborers. The act was amended in 1888, while a treaty, in which the Chinese government undertook to prohibit Chinese laborers from coming to the United States, and our government agreed to protect those here from the violence and outrages to which they were constantly subjected without redress, was still pending. The amendment prohibited the return on certificate of Chinamen once here who went back to China, declared all such certificates void, and practically made Chinese exclusion permanent. This act angered the Chinese government, which did not ratify the treaty. The Act of 1882 expired in 1892, and the Geary law continuing the exclusion for a further period of 10 years was passed May 5, 1892. The Act of 1902 continued existing legislation until further enactment should be made. It extended the exclusion laws to the island possessions and forbade the migration to the mainland or to other island groups of Chinese domiciled in one island group.

The methods by which Chinese exclusion has been accomplished have not been above reproach, but public opinion forced radical action on the part of the government. It is asserted by those who advocate Chinese exclusion that the Chinese come here not in families, but chiefly as male laborers for a temporary stay, to secure about $1500 in savings and then return to China with a competency. The difference between the American and Chinese civilization makes it almost impossible to assimilate them. They work for low wages and live very cheaply. Whether or not they would ever come to this country in sufficient numbers to constitute a menace to the economic interests of American labor, which the American workingman supposes, is doubtful.

The number of Chinese who came to the United States from 1848 to 1852, when they began to come as a result of the gold discoveries, is estimated at 10,000. From 1852 to 1854 the excess of arrivals over departures amounted to 31,861. During the next 15 years the annual departures were about as great as the arrivals; 1868 showed a net gain of 6876, and from that year down to 1876 the net gain was about 11,000 per annum. The census of 1880 showed 105,465, exclusive of Hawaii; 1890, 107,488; 1900, 89,863; 1910, 71,531. Consult Mayo Smith, *Emigration and Immigration;* Hall, *Immigration* (New York, 1906); United States Bureau of Immigration and Naturalization, *Treaty, Laws, and Regulations Governing the Admission of Chinese* (Washington, 1912); Library of Congress, *Select List of References on Chinese Immigration* (Washington, 1904). See IMMIGRATION.

CHINESE LANGUAGE, WRITING, AND LITERATURE. The language of China is ancient and important because of the vast number of human beings speaking it; but it ranks among the most rudimentary forms of speech that have maintained a long existence anywhere in the world. It is monosyllabic, each word being uttered by a single movement of the organs of speech and expressing a complete idea or thing. It is characterized by the unchangeability of the root. Hence it is without inflections or distinct parts of speech. The relation of a word is recognized by its position in the sentence and the addition of other words. The same word may often serve as noun, adjective, verb, or adverb. Gender, number, person, and case are signified, not by the form of the word itself, but by related additional words. In the absence of inflection, position and the use of auxiliary words are much more important in Chinese than in other languages. Chinese is one of the simplest languages in the world and at the same time one of the most difficult; for while there is no grammar except syntax, to be a scholar one must learn the book language in its two or three different forms, the colloquial or spoken languages in their various vernaculars, and the tones (as many, it may be, as seven to a single sound), which increase the number of simple words or roots from nearly 500 to 1200 or more. It is very difficult for a Western man to be a master of the Chinese tones. The variety of dialects and their difficulties are overcome by

what is commonly called the "mandarin," or court, dialect, the medium of official communication, which, though phonetically the poorest of the dialects, has received considerable literary cultivation. There is a vast difference between the literary and colloquial idioms. Yet, though poor in form—indeed, one of the poorest—the Chinese language has been made, through ages of cultivation and solely by the genius of those who use it, superior as an instrument of thought to many, perhaps to most, inflected languages. "The contrast between the means and production in Chinese," says Steinthal, "is a perfectly unique phenomenon in language history."

The symbols, or ideographs, of the written language, at first few in number and derived from natural or artificial objects, became stereotyped by use and so modified by contractions as presently to lose all resemblance to the original hieroglyphs. Native philologists seem to recognize some such process as this in arranging their language in "six writings" (*liu shu*), 608 imitative symbols, 107 signs of thought, 740 combined ideas (e.g., "woman" and "broom" denoting a 'wife'), 372 inverted significations (the character for "hand" turned one way meaning 'right,' the other 'left'), 21,810 phonograms—the bulk of the language—combining an imitative with a sound symbol, and 598 metaphonic symbols and combinations, for the most part accepted conventions difficult to explain. This constitutes a vocabulary of 24,235 separate words, which is approximately the total of words in good usage; though this is increased by obsolete and compound characters in Kang-hi's dictionary to 44,449. Here, as elsewhere, however, the vocabulary of ordinary life is much more limited, not far exceeding 3000; that of the nine canonical books is only 4601. Doubtless the aspect of the written character underwent a change upon the invention of the hair pencil or brush, ascribed to a general in the third century B.C., when the hard stylus ceased to be used; and other changes in the mechanics of writing must account for the obliteration of almost every semblance of its hieroglyphic origin in the modern script. There being no alphabet in Chinese, the difficulties in arranging this assemblage of arbitrary signs are very great. After various phonetic plans had been tried, the characters were classified in the sixth century by selecting the most significant part of each as its key or radical and by grouping together those in which the same element occurred. These groups were subsequently reduced from 542 to 214 in the sixteenth century, the characters under the same radical being listed consecutively according to the number of strokes required to write the extra-radical portion. This latter part—usually called the primitive—may be written above, below, on either side, or inclosed within the radical; it is necessary, therefore, to become familiar with these 214 signs before the first step can be taken in acquiring a knowledge of the written language. The number of characters listed under each of these in the dictionary varies from 5 to 1354. A remarkable limitation in Chinese is the paucity of its sounds, hardly more than 400 in the modern mandarin dialect, though possibly twice that number in the ancient language. The difficulty arising from this is relieved by the employment of tones, mentioned above, and by breathings or aspirates (e.g., *t'ang* and *tang* are two different words); but in spite of these the number of homophones is excessive and embarrassing, and the spoken tongue, with its varying dialectic pronunciations of the same written character, may be considered the most difficult in the world for an alien to acquire. Great attention is paid to its calligraphy; no educated man allows himself to write carelessly, and the appearance of a written or printed page of Chinese characters in vertical columns is more ornamental than that of a page in any other language. Six different styles of script are recognized, of which only two—the "pattern" and "running" hands—are in common use. Finally, in addition to the difficulties already enumerated, it may be said that a language which cannot express by single words such abstract ideas as space, relation, etc., must have severely restricted the intellectual development of the race compelled to employ it during 40 centuries of comparatively high civilization.

Literature. Owing to the lack of durable monuments, there are no credible texts of very ancient inscriptions in China, as there are in Babylonia and Egypt. By the sixth century B.C., when Confucius edited the famous sacred canons known as the *king*, there evidently existed a considerable literature in verse and prose already considered old. To the *king*, the model of literary form, the acme of philosophic wisdom, is largely due that extraordinary stability of Chinese thought and institutions which is the wonder of their history. They consist of the "Five Canons"—*I-king*, the 'Book of Changes'; *Shu-king*, the 'Book of History'; *Shï-king*, or 'Book of Odes'; *Li-ki*, or 'Book of Rites'; and the *Ch'un-ts'iu*, or 'Spring and Autumn,' the last being the only one claiming Confucius as the actual author—and to these are added the "Four Books": The *Lun-yü*, or 'Analects,' of Confucius, his views and maxims retailed by disciples; the "Book of Mencius"; the *Ta-hio*, or 'Great Learning,' and the *Chung-yung*, or 'Doctrine of the Mean,' a short treatise enlarging upon Confucius' teaching as to conduct. These classics of the Far East constitute as interesting a body of literature as can be found in any ancient civilization. No written product of the human mind has for so long a period or so completely molded the culture, morals, and government of a large fraction of civilized mankind. Its profound and continuous study has not only left abiding traces upon Chinese thought and institutions, but has, through veneration for the letter as well as the spirit, preserved the language almost unchanged during 3000 years, set a permanent standard of literary style, and stimulated the critical faculties of an acute people to the production of thousands of volumes of commentary and discussion. The 'Book of Changes,' probably the oldest of the "Five Canons," is ascribed to Wen-wang, the father of Wu-wang, the founder of the Chou (or Chow) dynasty in the twelfth century B.C. It consists of a series of apparently random deductions based upon the groupings of divided and undivided lines said originally to have been copied and arranged from the back of a tortoise by the Emperor Fu-hi, 28 centuries B.C. These 'eight diagrams' (*pa-kua*) consisted of a combination of continuous and broken lines, each corresponding to certain elements of nature besides representing the male principle in that old natural philosophy in continuous lines, the female in the broken lines. The male principle (*yang*) is the positive element, the female (*yin*) the negative. All good things are male, their opposites female.

These eight diagrams of triplet lines (☰, ☱ ☲ ☳, ☴, etc.) were enlarged to 64 by doubling into sextets, each representing some natural force or element and followed by a short essay ascribing to every line its highly fanciful and allegorical import. The text is followed by the so-called "Ten Wings," or commentaries, long ascribed to Confucius, but unquestionably of later origin. It is impossible to do more than guess as to the real purpose of this antique puzzle, foreign speculators calling it a philosophy, a vocabulary of pre-Chinese tribes, a calendar of the lunar year, etc., while the natives persist in venerating it as divinely inspired, though they cannot interpret its true meaning. The 'Book of History,' or *Shu-king*, embodies, like the Hebrew Scripture, fragments of very ancient documents; but its present form is the work of Confucius, who infused into its brief and rather monotonous records his ideas of virtue, statecraft, and philosophy. Though its text is not always beyond dispute, this record places China indisputably in the first rank of Asiatic nations for its authentic data on ancient times. Scarcely less important in this respect, and as a sociological document, is the 'Book of Odes,' or *Shï-king*, while its human and literary interest far surpasses all the other *king*. This poetical relic consists of 305 odes, chants, and ballads, said to have been garnered by the Sage from 3000 songs current in China at his time. They date from the eighteenth to the sixth century B.C., and many if not most of them seem to have a religious use and meaning; but it is hardly possible to exaggerate their interest to the scholar as true pictures of the life and thought of antiquity, or their value in illustrating the language, cults, and customs of old China. They have inspired 80 generations of Chinamen since Confucius expressed approval of them by declaring that "He who knows not the *Shï* stands with his face towards a wall." The fourth classic, the 'Book of Rites,' or *Li-ki*, does not properly belong to the Confucian period, being the compilation of two cousins named *Tai*, in the first century B.C. It got its present form after remodeling in the second century A.D., and until the fourteenth century was always joined with two older works—the *Chou-li* and *I-li*—both devoted, as it was, to ceremonial forms and usages. The 'Spring and Autumn Annals,' or *Ch'un-ts'iu*, is the title of a brief record of Confucius' native state between the years 722–484 B.C., written by the Sage himself, a book upon which he considered his reputation would stand for all time. It is hardly more than a simple statement of events, devoid of comment or interest, but its dry annals were expanded by the *Tso-chuan*, the illuminating commentary of his disciple, Tso-kiu Ming, who made it altogether one of the most readable accounts we have of the remote past, earning for its author the title of the Froissart of ancient China. In style and as a historical text it is so much superior to the *Ch'un-ts'iu* itself that some scholars have suggested that Confucius himself must have had a hand in it.

The "Four Books" are the works of three disciples of the Sage and of Mencius, his great expositor, in the century following his death. The 'Analects' gives some accounts of the habits and records the teachings of the great moralist as nearly as possible in his own words, thus forming an invaluable repository of information about Confucius and his moral system. In this is formulated the famous text of altruism, the Golden Rule, in its Chinese form, "What you would not others should do unto you, do not unto them"; and here are expressed his ideas as to the nature of man, the necessity of education, of etiquette, of self-repression, of filial surrender, and here his agnosticism stands out in bold relief. The "Book of Mêng-tsz'," or Mencius, supplies at rather greater length the teachings of Confucius' greatest follower, a man who subordinated his whole doctrine to the system of his master, but who in breadth and strength of character seems to have been superior to the Sage himself. Like Socrates, he devoted himself to crushing the sophists of his time, and through his learning and influence in combating heterodox philosophers he may be said to have established the supremacy of the Confucian system in the mind of China. As third among the "Four Books" comes the *Ta-hio*, the 'Great Learning,' once constituting a chapter of the 'Book of Rites.' It enlarges upon the regulation of the individual, the family, the state, and the Empire, and has conduced, theoretically at least, to the maintenance during successive ages of China's political solidarity under a system allowing considerable liberty of home rule. Lastly, the *Chung-yung*, also originally a section of the 'Book of Rites,' develops the idea of the princely man who, basing his actions upon the principle of *cheng*, or 'uprightness,' and submitting to the all-pervading *ho*, or 'harmony of the universe,' never departs from the just mean. From this source come in great part the attitude of calm and the assumption of impartiality studiously cultivated by Chinese gentlemen.

In a sense these classical works may be considered the sum and substance of Chinese literature, for not only have the example and ethical system of Confucius become supreme over the minds of his countrymen, but forms of thought and style have ever been kept subservient to these early products of the national genius. Confucius did much for his people, but he has much to answer for in repressing original speculation, freedom of research, and imagination by a colorless formalism. Such was the idea of Ts'in Shï-huang-ti the 'First Emperor' of Ts'in, who in 220 B.C. consolidated feudal China into a real empire and greatly extended its domain. In order to combat the conservative *literati* who resisted his violent and rapid reforms by preaching the doctrines of the dead past, the Ts'in Emperor decreed in 213 B.C. the destruction of all books excepting those on science, agriculture, and divination (the last saving the *I-king* alone of the classics), and forbidding their reproduction or study. The edict, which was carried out with extraordinary thoroughness, brought death upon 460 recalcitrant scholars and forms an epoch in the history of Chinese literature. The tyrant's dynasty did not endure long, and within a half century of his death the ancient learning was revived with double zest under the Han dynasty (206 B.C.–221 A.D.). The new zeal also brought with it a harvest of forgeries of old works alleged to have been discovered in hiding places, but in reality efforts of clever writers to imitate the resuscitated ancients, whose prestige in eastern Asia always far exceeds the most brilliant successes of authors among their own contemporaries. Before touching upon this revival of learning in China, however, it is proper to refer briefly to the non-Confucian literature of Taoism and the mystics.

The philosopher Lau-tzĭ, an earlier contemporary of Confucius, gave birth to a philosophy of quietism, the esoteric meaning of which is hard to determine. The pursuits of *tau*, as set forth in the *Tau-te king*, a work ascribed (improperly) to the teacher, suggests Hindu transcendentalism and may be derived from India. In its purity it never took much hold on the practical and worldly minded Chinese, but idealists exist even there, and to these such speculations have invariably appealed. In the fourth century B.C. there arose an author, Chuang-tzĭ, who illuminated for his followers the dark places of *tau* and by the charm and erudition of his style elevated his exposition to a high place in the literature of a country where style atones for all heresy. The history of the sect of *tau*, which passed from pure mysticism to the utmost pretensions of alchemy and divination, does not belong here, nor is there much more than this to be said of the numerous writings of the Buddhists, which begin here in the first century A.D., but which have never greatly affected the literary life of educated China.

While elucidations of the Confucian canons constitute an important part of the literary output of China during its mediæval period, the chief distinction of the Han era comes from the development of poetry and of historical writing. To Mei Sheng (second century B.C.) belongs the honor of first exhibiting the beauties of the five-word metre, in which form have been produced the finest specimens of the poetic art in the language. Rhymes are, of course, easily found in a monosyllabic language of few sounds, but Chinese verse calls for similar tones to perfect the rhyme and demands also the disposal of rising and falling tones in the line in accordance with a scheme which recalls the niceties of metrical arrangement among the Greeks. The identification of the human mood with nature, which was almost unknown in Europe until modern times, appears strong and fresh as a poetic *motif* in China, as elsewhere in the East, from very early ages. In our comprehension of their art, however, the need of translation is a portentous obstacle; whatever the care of the translator, there must always remain differences in standpoint, in mode of life, and intellectual environment to thwart and prejudice the resulting effect upon readers in an alien land. Where every chance allusion to history and familiar custom, where nature herself, as exhibited in an exotic clime, require explanation before the sense is secure, it is hard to keep the flowers of Chinese verse from withering when transferred to another speech. In history the language, of course, fares better, and scholars have reason to look for larger results from translations of the standard Chinese historians than from those of any other Asiatic peoples. First of these authors in time and reputation—next to Confucius, who preached but could not write history—is Ssĭ-ma Ts'ien (born about 145 B.C.), whose "Historical Record" relates the history of China from the Emperor Huang-ti down to nearly his own period. Its 526,500 words, all originally scratched on bamboo tablets with a stylus, have been conned and counted with such affectionate care in subsequent ages as to have become the unvarying type of historical presentation in China ever since. Each dynasty has made it a serious business to compile the nation's annals during the preceding dynasty as well as to collect records for its own reigns, and the 24 dynastic histories produced in a uniform set of 219 volumes in 1747 are an exhibit of intellectual activity creditable in the extreme to the Chinese mind, even if their pages do not glow with marks of genius or lofty imagination. These official histories are supplemented by private memoirs, local annals, travels, and topographies, and at long intervals authors have appeared to continue the work of Confucius and Ssĭ-ma Ts'ien by revising and condensing the national history into acceptable literary form. Such have been Ssĭ-ma Kuang, whose history in 360 books appeared in the eleventh century, and Chu Hi, who issued an "abridgment" in 55 books in the twelfth century. On the whole, the mass of historical literature of all kinds in China may be called enormous, a mine as yet almost unworked by European students. In the rather scant literature of foreign travel should be mentioned the accounts of the journeys of the Buddhist pilgrims Fa-hien in the fourth century and of Hüan-tsang in the seventh century to India in search of holy books and images. They seem to have inspired in China no lasting interest in foreign lands or desire to travel abroad, but by the efforts of these and other priests in translating Buddhist books much of the literature of that creed which would otherwise have perished in its extinction in India has been preserved for the researches of modern scholars.

After a long period of political disturbance and comparative intellectual sterility following the fall of the house of Han, there arose the T'ang dynasty (618–907 A.D.), during which China may be said to have reached the zenith of its intellectual life. "Poetry," declares a Chinese critic, "began with the *Shĭ*, developed with the *Li Sau*, burst forth and became perfect under the T'ang. Much excellent work was achieved under the Han and Wei dynasties; their writers appear to have selected good subjects, but their language was unequal to its expression." It was notably the age of lyric verse, expressed in a language which had by this time become refined and adapted to the highest literary purposes. Long flights are almost never attempted, the epic being a product altogether alien to the Chinese mind; but as tests of skill under great technical difficulties the eight-line poem and the still harder four-line epigram or "stop-short" have remained favorite forms. Professor Giles describes the invariable arrangement of the two conventional tones in the latter stanza as follows:

Sharp sharp flat flat sharp
Flat flat sharp sharp flat
Flat flat flat sharp sharp
Sharp sharp sharp flat flat

"The effect produced by these tones," he says, "is very marked and pleasing to the ear, and often makes up for the faultiness of the rhymes, which are simply the rhymes of the odes as heard 2500 years ago, many of them of course being no longer rhymes at all. Thus there is as much artificiality about a stanza of Chinese verse as there is about an Alcaic stanza in Latin. But in the hands of the most gifted this artificiality is altogether concealed by art, and the very trammels of tone and rhyme appear to be necessary aids and adjuncts to success." The names of famous poets in this era are legion, and it would be difficult as well as useless to enumerate them. Anthologies of the period are numerous and always studied for their famous poems, as they are set as standards for imitation. The

"Complete Collection," published in 1707, contains nearly 50,000 poems of all sorts arranged in 900 books. Chief among their poets must, however, be mentioned Li Po, or Li T'ai-po (705–762), and Tu Fu (712–770). The former, a sort of Chinese Anacreon, enjoyed immense popularity, became a spoiled child of the Imperial palace, where he performed prodigies of impromptu verse making when too drunk to stand, fell a victim to court intrigue, and was drowned at last, very appropriately, in a maudlin attempt to kiss the moon's reflection in a river. Rather curiously, the Chinese, though a temperate people, are passionately fond of songs in praise of wine and rejoice in a long array of poets who were more or less drunkards. On the other hand, their literature as a whole is singularly pure, standing in this respect high among those of Orientals, though social life among them is far from clean, and obscenity in familiar intercourse is often if not always condoned. Li Po's contemporary, Tu Fu, was also a court officer and favorite and likewise compelled to retire. His career resembled that of Villon and ended in the mire, but his name has been for 1000 years a household word in Asia. One of his verses will serve as a sample of the *summum bonum* of Chinese poetic art and as an illustration of what is admired in the four-line lyric epigram:

> "White gleam the gulls across the darkling tide,
> On the green hills the scarlet flowers burn;
> Alas! I see another spring has died . . .
> When will it come, the day of my return?"

It is perhaps creditable to Chinese institutions that many of their great writers have been men of official rank. In a land where the road to office has long lain through the study of letters this has resulted in efforts more or less serious on the part of every mandarin to "write," and produced in the aggregate a long list of respectable works. Among these the poet, philosopher, and statesman Han Yü (768–824), of the dynasty of T'ang, stands preëminent as a model of nobility of character, ability in high office, and remarkable elevation of literary style. His career is familiar to every well-read Chinaman, one of his compositions being customarily read by the bier as a part of the funeral service, while another, his protest to the Emperor on the subject of receiving a bone of Buddha with Imperial honors, an ode which caused him a long banishment, is one of the favorite "pieces" for reading in the language. Several women emerge from the obscurity of female life in this time and take their places among the famous men of letters in China—a galaxy which knows neither creed nor sex, which stands or falls only by the great test of an approved style.

The literary life of China decreases in originality and power after the great T'ang period, but some phases of its later periods are notable for various reasons. The Sung and some minor dynasties cover the tenth and twelfth centuries, during which renewed attention was paid to history, and Ssï-ma Kuang (1019–86) and Chu Hi (1130–1200) flourished. The latter, one of the most remarkable minds China ever produced, is famous not only as a historian, but as a philosopher, and it is his original interpretations of the classics that constitute the system or code commonly called Confucianism by foreigners. The rise of metaphysical speculation may be said to be the distinguishing mark of this era, within which, however, no phase of literature or learning was neglected and during which the invention of block printing (tenth century) gave great impetus to book making and the formation of libraries. The Mongols themselves added nothing to China's intellectual life, but their dynasty is marked by the introduction of the drama and of novels. Both of these forms of literature are as important now in China as elsewhere, and it is remarkable, in view of the passion common to all Asiatics alike for the story, that the art of fiction in its two highest forms should have been so tardy in developing here. Chinese plays, contrary to the notion accepted in the West, are usually very short, their plots being often ingenious and highly melodramatic, but seldom complicated. No scenery is used, and some of the accepted conventions are naïvely frank. The plays follow each other without change of scene or intermission, the sessions, like school hours in China, lasting all day long. Novels under the Ming (1368–1644) and Manchu dynasties (1644–1912) absorb increasing attention and show great ability, though the plots are often too long and intricate and the characters too numerous to suit the taste of Europeans. Their short stories are, at their best, altogether admirable, if their almost invariable introduction of the supernatural be allowed, some of them, like the *Strange Stories* (1679), ranking among the world's best *contes*. China, like modern Europe, has during recent centuries passed through the encyclopædic age, when scholars have devoted themselves to amassing great repertories of the literature, knowledge, and wit of past generations. No country, in fact, surpasses China in the wealth and variety of her dictionaries and encyclopædias of all kinds, but these can hardly be called literature. Nor does the often scurrilous wit of their proverbs and gross wall literature—anonymous placards frequently found on street corners—call for mention in an account of Chinese letters. The intellectual record of the race is, on the whole, one to be proud of and deserves more attention than it has yet received from Western scholars.

Bibliography. On the language, consult Marshman, *Clavis Sinica* (Serampore, 1814); Premare, *Notitia linguæ Sinicæ* (Malacca, 1831; in English by Bridgman, Canton, 1847); the grammatical works of Williams (Canton, 1842), Schott (Berlin, 1857), Martin (Shanghai, 1863), Julien (Paris, 1870); Hirth, *Notes on the Chinese Documentary Style* (2d ed., 1909); Watters, *Essays on the Chinese Language* (Shanghai, 1889); and the dictionaries of Morrison (ib., 1865), Medhurst (ib., 1847–48), Williams (ib., 1874), Giles (ib., 1892, 2d ed., 1912), Eitel-Genähr (Hongkong, 1910).

Chief among translations of important works stand: Legge, *Chinese Classics* (new ed., 8 vols., Oxford, 1893–95); also in vols. iii, xvi, xxvii, and xxviii of Müller's *Sacred Books of the East;* Beal, *Texts of Taoism*, ib., vols., xxxix and xl (Oxford, 1892); Giles, *Strange Stories from a Chinese Studio* (London, 1879) and *Chinese Poetry in English Verse* (ib., 1898); also his *Chuang Tzŭ* (ib., 1889); Loomis, *Confucius and the Chinese Classics* (San Francisco, 1867); Marquis d'Hervey de Saint-Denys, *Poésie de l'époque de T'ang* (Paris, 1876); C. de Harlez, *La poésie chinoise* (ib., 1893); Carus, *Lao-Tze's Tao-Teh-King* (Chicago, 1898); Chavannes, *Mémoires historiques de Sse-ma Ts'ien* (Paris, 1895–1905); Bazin, *Théâtre chinois* (ib., 1838);

CHINESE MUSIC. The music of no other nation presents such a vast difference between the theoretical writings and the practical execution as does that of China. The theory of music had reached a high state of development at the earliest times of which we have record; but the practical execution of music was then, and is still to-day, nothing else than a barbarous, cacophonous combination of noises worthy of the rudest savages. The oldest Chinese scale consists of but five tones: F, G, A, C, D. The names of these tones were, *kung, chang, kio, che, yu.* For centuries this incomplete scale remained in use until Tsay-Yu introduced, against violent opposition, the two remaining tones B, E, known as *pien-chung* ('the mediator') and *pien-ho* ('the leader'). Strange to say, from the very beginning the Chinese theory was acquainted with the full octave and its division into 12 semitones. Each semitone was called *Lü.* The idea was conceived of arranging a series of 12 bamboo pipes so that each pipe would produce one Lü. As the older hymns, moving within the compass of the old five-tone scale, could not be adapted to this new device, the pipes were divided into two series, in each of which the progression should be by whole tones—one called perfect, the other imperfect:

1. Series F, G, A, B, C♯, D♯—perfect.
2. Series F♯, G♯, A♯, C, D, E—imperfect.

This progression of whole tones was soon found unsatisfactory. As the result of various experiments, a new scale, consisting of 14 tones, was adopted. This began with the tetrachord B, C, D, E, to which was added the octave F, G, A, B, C, D, E, and three tones above, F, G, A. Within this compass our C major scale is comprised, and the fact that the tones have the same names in different octaves proves that the Chinese understood the principle of the octave. But F was still regarded as the fundamental tone. The fifth tones above and below F are regarded as its helpers, for by means of progression in fifths it was possible to arrive again at the starting tone: F—C—G—D—A—E—B—F♯—C♯—G♯—D♯—A♯—E♯(F). The first seven of these tones, in the progression, are called "principles," the other five "complements." The fifth above is called *Ta-Kinen-Keu* ('great interval'), the fifth below *Tchao-Kinen-Keu* ('small interval'). Every Lü, or semitone, may be taken as the fundamental tone (*kung*) of a scale, and thus the same scale can appear in 12 transpositions. As, moreover, every Lü can change its place seven times within the same scale (i.e., it may be on the first, second, third, etc., step), there arises the total number of 84 scales.

The musical instruments of the Chinese are strictly divided into eight classes, according to the material employed to produce a tone. One of the chief instruments is the *king*, consisting of a frame on which are hung stone plates, which are struck by a mallet. There are in all 16 plates, hanging in two rows. They are tuned in the 12 Lüs of the octave and four additional tones. The *nio-king* is a *king* made of especially fine plates, this instrument to be played only by the Emperor himself. The *cheng* is a peculiar instrument somewhat resembling a small organ. It consists of a gourd over which are arranged 12 or 24 bamboo pipes closed at the lower end with metal plates, with which are connected reeds. Each pipe has a hole which is stopped with the finger to produce the tone. The necessary wind is produced by a bellows. The cheng is the diapason of the Chinese. By it all other instruments are tuned. The *kin* is a stringed instrument with 25 strings made of twisted silk. *Yo* and *che* are flutes made of bamboo. The *ov* is seriously regarded as a musical instrument. It consists of a wooden image of a tiger. The end of a concert is indicated by striking three blows upon the head of this tiger and running a small stick (*chen*) over the back of the figure. The drums are built in all sizes and occupy a position of importance, for the chief purpose of Chinese music is to make as much noise as possible. As everything else, the number of instruments, of singers, etc., is strictly regulated by laws. According to the importance of the occasion, the number of performers may vary from 2 mandarins, 2 singers, and 12 instrumentalists to as many as 13 mandarins, 4 singers, and 52 instrumentalists. The actual Chinese melodies are devoid of all artistic sense; there is no rhythm, no symmetry, no melody. Most of the airs illustrate the conservatism of China by the fact that the tones B and E, which were wanting in the oldest scale, are almost always avoided. For full information the reader is referred to Ambros, *Geschichte der Musik*, vol. i (Leipzig, 1880); Roussier, *Notes et observations sur le mémoire du P. Amiot concernant la musique des Chinois* (Paris, 1779); E. Fischer, *Beiträge zur Erforschung der chinesischen Musik* (Berlin, 1910); J. A. Aalst, *Chinese Music* (Shanghai, 1884); F. Kühnert, *Zur Kenntniss der chinesischen Musik* (Vienna, 1900).

CHINESE WALL. A wall over 1500 miles long, and which has never yet been surveyed, extending between Mongolia and China proper from Suchau, in Kiang-su, eastward to Shanhaik Wan, on the Gulf of Pe-chi-li, with an extension northeastward to the Sungari River. It is called in Mongolian the White Wall, in Chinese the wall of 10,000 Li, and is the most gigantic defensive work in the world. In the third century B.C. an earthwork against the incursions of the Tatars was thrown up which in parts corresponds with the present wall. The latter, however, as recent researches indicate, dates only from the latter part of the fourteenth century. Since the accession of the Manchu dynasty in 1644, the wall has been allowed to fall into decay, except at a few points where it is maintained for customs purposes. The wall is generally about 22 feet high, 20 feet thick, with towers 40 feet high at intervals of some hundred yards. It is built of a brick or dressed granite shell filled with earth, and covered with a very hard coating of bricks in lime. Its course

is irregular, but chosen without regard to natural obstacles, following a serpentine course over mountains and through valleys. At present the wall is still intact for hundreds of miles, but here and there the granite and brick facing and some of the towers have fallen away, causing an appearance of ruin, while at a point near Kalzan it has been cut through to admit the railway line from Peking. Consult Geil, *The Great Wall of China* (London, 1909), and Von Moellendorf, "Die grosse Mauer von China," in *Zeitschr. d. Deutsch. Morgenl. Gesellsch.* (1881).

CHINESE WHITE. The white oxide of zinc now used as a pigment in place of the preparations of white lead. It changes very little, either by atmospheric action or by mixing with other pigments, but it has not the body of white lead. It is prepared also for use in water-color painting, and when so employed is known as body color (q.v.). It renders water colors less transparent when mixed freely with them, but is very useful when sketching on tinted paper, as by its means quick results and sharp effects may be obtained.

CHIN FLY. A bot (*Gastrophilus nasalis*), smaller than the horse bot (*Gastrophilus equi*), densely hairy and with the thorax rust-colored, troublesome to equine animals in the southern United States. "The eggs are laid on the lips or nostrils within easy reach of the tongue. . . . Measures of prevention must consist in preventing as far as possible the deposition of the eggs, for which purpose the application of a little tar and fish oil to the hairs of the under lip may be of service, and where eggs are suspected the use of a wash of carbolic acid to the lips and the margin of nostrils." See BOT.

CHINGACH'GOOK. An Indian chief, who plays a prominent part in Cooper's *Last of the Mohicans, Pathfinder, Deerslayer,* and *Pioneer.*

CHING-HAI, chĭng-hī'. A fortified seaport in the Chinese Province of Che-Kiang, situated at the mouth of the river Yung, about 18 miles from Ning-po (q.v.), of which it is the seaport. It has a citadel and an estimated population of over 140,000. It was taken by the British in 1841.

CHING-TU, chĭng-to͞o'. See CHENG-TU.

CHINIQUY, shē'nē'kē', CHARLES PASCAL TELESPHORE (1809–99). A Canadian preacher. He was born at Kamouraska, Quebec, ordained in 1833 as a Roman Catholic priest, and after having had charge of several parishes, started his successful temperance crusade (1846). In 1851 he established at Kankakee, Ill., an extensive Roman Catholic colony. He became a Presbyterian minister in 1858 and thenceforth spent much time in public addresses against the Roman Catholic church and published a number of works, largely controversial, of which the principal one, *Fifty Years in the Church of Rome,* first published in 1886, reached its forty-third edition in 1913. His other publications include: *The Priest, the Woman, and the Confessional* (1874; 43d ed., 1913); *Papal Idolatry: Exposition of the Doctrine of Transubstantiation* (1887); *The Murder of Abraham Lincoln Planned and Executed by Jesuit Priests* (1893); *Forty Years in the Church of Christ* (1899).

CHINKARA, chĭn-kä'rȧ (from Skt. *chikkāra,* sort of antelope). The Indian gazelle (*Gazella bennetti*), sometimes improperly called "ravine deer." See GAZELLE.

CHINKIANG, or CHEN-KIANG-FU, chĕn'-kyäng'fo͞o'. A city and port in China, named Rule-the-River City, because of its former military importance. It is situated at the junction of the Grand Canal, on the right bank of the Yang-tze-kiang, about 150 miles from its mouth (Map: China, E 5). It was opened to commerce by the Treaty of Tientsin (1858). Waterways connect it with Shanghai and the several Yang-tze ports, and by the Grand Canal with the country north and south of the great river, but with the construction of railroads the Grand Canal is about to lose its former importance. It has a bund or river-fronting esplanade, clubhouse, and churches. In 1889 a native mob destroyed half the foreign houses. Nearly destroyed by the Tai-ping rebels, who occupied it from 1853 to 1857, it has fully regained its commercial importance. Goatskins, silk, rice, hides, wool, and fancy products are exported, and opium, cotton goods, and sugar are imported. In 1912 the foreign trade amounted to $15,952,000, the traffic in goods having gradually declined within the last few years, partly owing to railway freights having entered into competition with river steamers. The population is about 160,000.

CHIN'NERY-HAL'DANE, JAMES ROBERT ALEXANDER, Lord Bishop of Argyll and the Isles. See ARGYLL AND THE ISLES.

CHINON, shē'nôN' (anciently called *Caino,* probably connected with OIr. *cáin;* OWelsh *cein,* beautiful; Gk. *καίσθαι, kaisthai,* to surpass; Alban. *si,* eye). A town of France in the Department of Indre-et-Loire, situated on the left bank of the Vienne, 25 miles southwest of Tours (Map: France, N., F 5). It has the remains of the huge old Château de Saint-Georges, the occasional residence of the Plantagenet kings of England and also of some of the French sovereigns. Chinon is celebrated as the birthplace of Rabelais, and in the Château de Milieu Jeanne d'Arc first met Charles VII of France, in 1429, both events being commemorated by monuments. Chinon has manufactures of druggets, serges, earthenware, baskets, wines, rope, etc. Pop. (commune), 1901, 6033; 1911, 5943. Consult De Cougny, *Chinon et ses monuments* (Chinon, 1874).

CHINOOK, chĭ-no͞ok'. Formerly an important tribe occupying the country at the mouth of the Columbia River in Washington. They were venturesome fishermen and enterprising traders, traveling long distances up the river and along the coast in great canoes hewn from immense cedar trunks. They lived in houses made from cedar boards, flattened the head, owned slaves, and practiced the potlatch (q.v.). Together with the Clackamas, Clastop, Wasco, and Wishram, they constitute the Chinookan linguistic stock. Though once numerous and occupying both banks of the Columbia as far up as the Dalles, they have dwindled to 897 individuals. Consult Chittenden and Richardson, *Life, Letters, and Travels of Pierre Jean de Smet* (New York, 1905).

CHINOOK. A term applied by the early settlers of the Northwest Territory and in meteorological literature to a strong, warm, and dry south or west wind descending the eastern slopes of the Rocky Mountains into Montana and Wyoming, evaporating or melting the snow and bringing great relief in cold weather. The name was probably given to it because the wind occurred in, or blew from, the territory occupied by the Chinook Indians. It was at first supposed by the settlers to be a branch of the

warm southwest wind of the Pacific Ocean that had crossed over the Rocky Mountain Range; indeed, the moist southwest winds on the coasts of Oregon and Washington have also been called "chinook winds." It is a mistake to think that the Montana chinook originates over the warm waters of the Pacific; it is essentially a descending wind and owes its temperature and dryness to this fact; it belongs to the same class as the föhn winds of Switzerland. Several very different combinations of conditions may cause descending winds, but in any case descending air by coming under greater pressure must be compressed and therefore warmed up at the rate of about 1° F. for each 183 feet of descent, or 1° C. per 100 meters. Therefore a fall of 5500 feet, such as is very common in flowing over the Rockies, will raise the temperature of the air by 30°, and as this warmth is very slowly lost, the warm air spreads over a wide extent of ground. The hot winds of Kansas and Iowa undoubtedly also owe their high temperatures to the fact that the air is descending rapidly. As no moisture is added to the mass of descending air, the föhn winds of Switzerland, the chinooks of Montana, and especially the hot winds of Kansas are extremely dry and evaporate and absorb any snow or moisture at the surface of the ground. The proper explanation of chinooks was first given by G. M. Dawson, 1879–80, but the most important early paper on the subject was by Prof. Mark W. Harrington of the University of Michigan, in the *American Meteorological Journal*, vol. iii (Ann Arbor, 1887).

CHINOOK JARGON. An important trade jargon, formerly constituting the chief medium of intercommunication among all the tribes of the Pacific coast from northern California far up into Alaska and throughout the Columbia region. Owing to its great usefulness over a wide area, considerable attention was given to it by traders and missionaries, despite its mongrel and skeleton character. According to an analysis of 500 words, two-fifths are of Chinook origin, two-fifths from other Indian languages and Canadian French, and one-fifth from the English, all, however, being softened and modified to suit the phonetic deficiencies of those using the jargon. Consult: Hale, *Manual of Oregon Trade Language* (London, 1890); Gill, *Dictionary of Chinook Jargon* (Portland, Oreg., 1891); Boas, "Chinook Texts," in *Smithsonian Bureau of Ethnology* (Washington, 1894); Pilling, "Bibliography of Chinook Languages," in *Smithsonian Bureau of Ethnology* (Washington, 1893).

CHINOOK SALMON. The common and most valuable salmon of the Pacific coast. See QUINNAT SALMON; SALMON.

CHINQUAPIN. See CHESTNUT.

CHINS. A general name applied to certain peoples of a more or less primitive type inhabiting the mountains of Assam, Arakan, the Burmo-Chinese frontier, etc., known variously as Chins, Kakhyens, Khyens, Katchins, or Singhpos. Physically they are now somewhat mixed with the other peoples of this area, Karens, Burmese, and Shans, with perhaps a later Hindu and an earlier Dravidian strain, the whole resting upon a Mongoloid (Sinitic) basis. Some of the Chins are very warlike and great hunters. By language they seem to belong in the Tibeto-Chinese stock, being nearest related to the Burmese. Besides the general works on Assam, Burma, etc., the literature relating to the Chins includes Anderson, *Mandalay and Momien* (London, 1876), and Reid, *Chin-Lushai Land* (ib., 1893); and, particularly, for data on mythology and religion, material culture, ethnology, etc., the articles of Father Gilhodes in *Anthropos* for 1908–10, and the monograph of Wehrli, *Beitrag zur Ethnographie der Chingpaw* (Leiden, 1904). The Chins of Dardistan belong to another race altogether and speak an Aryan tongue.

CHINSURA, chĭn-sōō'rȧ. A former town in Bengal, British India, on the right bank of the Hugli, 20 miles above Calcutta, now incorporated with Hugli (q.v.), Hugli-Chinsura (Map: India, E 4). Chinsura was originally the chief Dutch settlement in Bengal and was established in 1656. It was ceded in 1824 to the British, together with other places on the mainland, in exchange for the English possessions in the island of Sumatra. It is noted for its educational institutions, including Hugli College and many missionary schools, but is now slowly declining. Its industry is unimportant.

CHINTREUIL, shăN'trē'y', ANTOINE (1814–73). A French landscape painter, born at Pont-de-Vaux (Ain). He was the most important of Corot's pupils and succeeded better than any other in expressing in his work the poetic sentiment of his master, yet without losing his own individuality. His subjects are chiefly misty melancholy plains, sunlit thickets, and grassy clearings. They are found in most of the French provincial museums; the Louvre possesses three of the best: a "Thicket with Deer," "Space," and "Rain and Sunshine" (1873), his masterpiece.

CHINTZ (Hind. *cīnt, cīt*, Beng. *cīt*, chintz, from Skt. *chitra*, spotted, variegated). A highly glazed printed cotton fabric, with a pattern in many colors on a white or light-colored ground. It was used for bed hangings and other purposes where gay colors were desired and where there was much exposure to dust, which does not readily adhere to its highly calendered surface. See CRETONNE.

CHIO, kē'ō. See CHIOS.

CHIOGGIA, kyŏ'jȧ, or **CHIOZZA,** -dzȧ (mediæval *Clugia*, from Lat. *Fossa Claudia*). An episcopal city and fortified seaport of Italy, in the Province of Venice, 18 miles south of Venice (to which there are frequent daily steamboats) and 63 miles by rail southeast of Padua (Map: Italy, G 2). It is built on piles and is surrounded by the Lombardo Ship Canal. The Vena Canal, which is crossed by nine bridges, cuts it in two, and it is connected with the mainland by a stone bridge, 800 feet long, with 43 arches. The cathedral dates from 1633, the Board of Trade building from 1322. The inhabitants have always been distinguished by quaint customs, costumes, and dialect, and the fisheries have long been important. The other principal industries are flax spinning, shipbuilding, and the manufacture of sails, bricks, candles, and lace. The rivalry of Genoa and Venice was decided here, Dec. 23, 1379, by the victory of the Venetian fleet. Pop. (commune), 1881, 28,000; 1901, 30,563; 1911, 35,052. See VENICE, *History*.

CHION, kī'ŏn (Lat., from Gk. Χίων). A native of Heraclea, on the Euxine Sea, son of Matris and pupil of Plato. In conjunction with Leonides and others, he tried, in 352 B.C., to liberate his native city from the tyranny of

Clearchus. Clearchus was killed, but his brother, Satyrus, brought about the death of chion and reasserted the tyranny. Seventeen extant letters are wrongly ascribed to Chion.

CHIONIDES, kī-ŏn'ĭ-dēz (from Gk. Χιονίδης). A Greek comic poet, whose representations date from 487 B.C. He is called the earliest writer of the Old Attic Comedy in that he was the first to impart to it its characteristic spirit of censorious criticism, whether of morals, politics, or literary taste. The extant fragments of his works have been edited in Meineke, *Fragmenta Comicorum Græcorum* (Paris, 1839–57), and Kock, *Comicorum Atticorum Fragmenta*, vol. i, pp. 4–7 (Leipzig, 1880–84).

CHIOS, kī'ŏs (Gk. Χίος, *Chíos;* Turk. *Sagis adásch;* Scio in the Genoese form). A Turkish island 7 miles off the west coast of Asia Minor, about 50 miles in a direct line west of Smyrna (Map: Turkey in Asia, A 3). Its length from north to south is 32 miles; its greatest breadth, 18; area, about 318 square miles. Chios is one of the largest islands in the Ægean Sea and is, or was, until the terrible earthquake of 1881, one of the most productive and beautiful, the name having furnished in ancient times a synonym for wealth and profligacy. The surface is largely occupied by chalky limestone mountains, which in the north reach an altitude of 4080 feet in Mount Oros. Along the centre of the east coast lies an extensive plain around the capital, Chios. It is a rich and picturesque district, abounding in vines and orange, lemon, and almond trees, and embellished with villas. The climate is dry, especially in summer, and delightful. The wine of Chios, famous in antiquity, is still of some repute. Oil, cotton, and the usual fruits of that latitude are produced, and in the southwestern part a well-known variety of mastic. Cheese, silk, wool, and silk and woolen stuffs, as well as grain, cattle, salt, and preserved fruits, figure prominently among the products. The leading export articles are leather, mastic, fruits, and distilled spirits. The leading imports are hides and grain. Chios, with the islands, forms a sanjak of the archipelago (Jezairi-Bahri-Sefid) vilayet and has a population of 59,600, mostly Greeks. The population of the capital (Chios or Kastro) is about 14,250. The city has an aga, a bishop of the Greek church, and is, with its new haven, protected by a fortress.

In early times the island was colonized by the Ionians and remained an independent and powerful state till 546 B.C., when it was subdued by the Persians. It took part in the Ionian revolt and contributed 100 vessels to the Greek naval force which was defeated at the battle of Lade (494). From that time until 479 it was again subject to the Persians, but in the latter year it was freed from the Persian yoke, and became in 477 an independent member of the Delian Confederacy. In 415 it took part in the Sicilian expedition with 50 ships. The island remained on its original footing of autonomous ally of Athens, retaining its armed force, its ships, and its fortifications, until 412 B.C., when it attempted to revolt—an attempt which led in the end to its conquest and devastation. It supported the Romans in their wars in the East, and was made by them a free and allied state. In more recent times the island has changed hands repeatedly and has experienced many vicissitudes of fortune. In 1089 it was devastated by the Turks under Tzachas. In 1172 it was in the possession of the Doge of Venice, Vital Michieli. In 1346 it fell into the hands of the Genoese, and in 1566 it was taken by the Turks, in whose hands it has since, except for a short interval (1694–95), remained. It was conferred as private property upon the Sultana, enjoyed her protection, and consequently prospered. In 1822, a number of the Sciotes having joined the Samians in a revolt against Turkey, the island was attacked by a Turkish fleet and army, and the inhabitants were mercilessly slaughtered or sold as slaves. The town and island were laid waste. The island has since recovered, however, and is now in a prosperous condition. In recent years the island has suffered from earthquakes, notably in March, 1881, when much property was destroyed and over 5000 persons lost their lives.

On Nov. 24, 1912, in the course of the Balkan War (q.v.), a Greek expedition effected a landing on the island and after a stubborn campaign obliged the last Turkish garrison to surrender, Jan. 3, 1913. By the Treaty of London (May 30, 1913) the final political disposition of Chios was left to the arbitrament of the Powers, and this arrangement was confirmed by the Treaty of Athens between Greece and Turkey (Nov. 13, 1913).

CHIOS, Hippocrates of. See Hippocrates of Chios.

CHIOZZA. See Chioggia.

CHIP'MAN, Nathaniel (1752–1843). An American jurist and politician. He was born in Salisbury, Conn., graduated at Yale in 1777, served as a lieutenant in the Revolutionary army, and was at the battles of White Plains and Monmouth. He was admitted to the bar in 1779 and began practice in Vermont, where he served in the Legislature in 1784–85 and became a judge of the State Supreme Court in 1786 and Chief Justice in 1789. In 1791 he was a member of the convention called to decide whether Vermont should join the Union, and was one of the commissioners to arrange for the State's admission. He was judge of the United States Court for the district of Vermont in 1791–93. He served as United States Senator in 1798–1804, in the State Legislature in 1806–09 and 1811, and was again Chief Justice of the Supreme Court in 1813–15. In 1826 he revised the laws of the State. He was professor of law in Middlebury College from 1816 to the time of his death. He published *Principles of Government: A Treatise on Free Institutions* (1833) and other works of a similar character. Consult the memoir (Boston, 1846) by his brother Daniel (1765–1850), also a prominent Vermont jurist.

CHIP'MAN, Ward (1787–1851). A Canadian jurist, born in St. John, New Brunswick, son of a Massachusetts Loyalist (1754–1824) of the same name. He graduated at Harvard College in 1805, and was crown agent for determining the northwest "angle" of Nova Scotia in 1824–29. He was Advocate-General, clerk of the circuits, and Solicitor-General, puisne judge of the Supreme Court (1825), and Chief Justice (1834). He was also President of the Legislative Council and Speaker of the Assembly.

CHIP'MUNK (N. Amer. Indian, probably originally imitative). An American ground squirrel of the genus *Tamias*, which forms a connecting link between the arboreal squirrels proper and the spermophiles. It is a small animal, about 6 inches long, with a slender 4-inch tail. The color is reddish brown or gray, with

black and white stripes on the back. The chipmunk (*Tamias striatus*) is one of the commonest and most pleasantly familiar animals in eastern North America, living in stone walls and stumps. Four geographical races are recognized. It is almost always to be found along old fences and hedgerows, especially near woods, and lives in a burrow, wherein it stores for winter use large quantities of small nuts, acorns, etc., and where it remains in a snug nest until spring, frequently appearing, however, on the warmer days. Other species occur in the central and western United States, of which the "four-lined" is extremely numerous and active throughout the whole Rocky Mountain region. (See Plate of SQUIRRELS.) For life history, consult Thompson Seton, *Life Histories of Northern Animals* (New York, 1909). For systematic review of the genus, consult J. A. Allen, *American Museum of Natural History Bulletin*, vol. iii (New York, 1890).

CHIPPAWA, chĭp'ȧ-wä. A village and port of entry in Welland Co., Ontario, Canada, at the junction of the Chippawa with the Niagara River, 2 miles above the great falls, and on the Michigan Central Railroad. An electric railway running from Queenston terminates at Chippawa. Here Maj. Gen. Joseph Brown, July 5, 1814, with 1900 Americans defeated the English under Major General Rial, who had 2100 men. The Americans had 68 killed and 267 wounded and the English 138 killed and 365 wounded. Pop., 1910, 707.

CHIPPENDALE, THOMAS (?–1779). A famous English cabinetmaker of the eighteenth century, who, with his father of the same name, a carver and maker of picture frames, moved from Worcester to London before 1727. He took a shop in Conduit Street, Long Acre, at Christmas, 1749, and four years later moved to larger premises at 60 St. Martin's Lane. In April, 1754, he published the first edition (two following) of his *The Gentleman and Cabinet Maker's Director*, and by 1760 he had become so prominent as to be elected a member of the Society for the Encouragement of Arts, Manufactures, and Commerce, an organization that still flourishes. Chippendale's name in this connection appears in an autograph book with those of Sir Joshua Reynolds, Edward Gibbon, Samuel Richardson, Dr. Johnson, David Garrick, Horace Walpole, the Earl of Bute, and John Wilkes. From 1766, when his partner, Ranney, died, until his own death, Nov. 13, 1779, Thomas Chippendale carried on his business alone; he was succeeded by his eldest son, Thomas, in partnership with Thomas Haig. For facsimile reproductions of two of the firm's bills, consult MacQuoid, *History of English Furniture*, vol. iii (New York, 1904–08). Much of the furniture enumerated in these bills is still in existence and illustrated by MacQuoid. Consult, for detail, Simon, *English Furniture Designers of the Eighteenth Century* (London, 1905).

CHIPPENDALE CHAIRS. The great name in chair making is Chippendale. For many years before and after the middle of the eighteenth century he flourished in London, and his famous book, *The Gentleman and Cabinet Maker's Director*, published in 1754 and sold mainly to the trade, brought him posthumous reputation as well as immediate business. Ever since then the strongest and handsomest chairs used in England and America, and to some extent in Germany, have been Chippendale chairs made in the master's own shop or reproduced from them and his book. Thomas Chippendale was a genius in the workroom. Chinese and rococo, Dutch and Gothic, were all alike to him. From bad designs as well as from good designs, made by architects as well as by professional furniture designers, he produced models that are marvelous for beauty of proportion, comfort in use, strength, and durability. Characteristic of Chippendale chairs is the carved and pierced openwork of the splat in the back. Chairs of the Hogarth and Queen Anne type that preceded Chippendale have a solid splat. Also characteristic is the starting of the splat in the rail of the seat. The backs of Hepplewhite and Sheraton chairs, that followed Chippendale, are supported entirely by the side posts and consequently look fragile even when they are not. The only chairs built by Chippendale for the great architect Robert Adam came through absolutely Chippendale in construction and feeling, though completely classic in line, made in light mahogany and after designs by Adam. Chippendale's favorite wood was dark mahogany, and his favorite ornament carving. Inlay and the fancy woods in light colors affected by Hepplewhite and Sheraton, he avoided. While Chippendale's book in its different editions shows many kinds of furniture besides chairs—some of it atrocious, particularly the rococo mirrors—and he undoubtedly made all kinds in his shop, his fame rests upon his chairs.

Consult: Chippendale's own book named above; MacQuoid, "The Age of Mahogany," vol. iii of his *History of English Furniture* (London, 1904–08); Foley, *The Book of Decorative Furniture*, 2 vols. (New York, 1911); Lockwood, *Colonial Furniture in America* (ib., 1903); Singleton, *The Furniture of our Forefathers* (ib., 1901); Strange, *English Furniture* (London, 1901).

CHIPPENHAM, chĭp'en-ȧm. A market town in Wiltshire, England, on the Avon, 22 miles east of Bristol (Map: England, D 5). Chippenham is famed for its markets of cheese and corn, its cheese market being one of the largest in Britain. Pop., 1901, 5000; 1911, 5332. Near the town is Lacock Abbey. It was the scene of the signing of the famous Treaty of Chippenham, or Wedmore, in 878, between King Alfred the Great and the Danish leader Guthrum.

CHIPPEWA, chĭp'pê-wä. See OJIBWA.

CHIPPEWA FALLS. A city and the county seat of Chippewa Co., Wis., 105 miles east of St. Paul, Minn., on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Minneapolis, St. Paul, and Sault Ste. Marie railroads, and on the Chippewa River (Map: Wisconsin, B 4). It contains a public library and a fine county courthouse, and is the seat of the State Home for the Feeble-minded and the County Insane Asylum. Tone Rock battleground, near the city, is of interest as the scene of a Sioux-Ojibwa conflict. The city has fine water power, carries on a considerable trade in lumber, and manufactures beet sugar, chairs, sashes and doors, flour, shoes, gloves, beer, woolen goods, foundry products, etc. It is especially noted, however, for the pure spring water which is obtained from the Chippewa Springs and which is shipped to all parts of the United States and to the Orient. Settled in 1838, Chippewa Falls was chartered as a city in 1870. The government is administered under a general State law, by a mayor and a council. Pop., 1900, 8094; 1910, 8893.

CHIPPEWA RIVER. A river of Wisconsin, rising in the northern part of the State, about 30 miles southeast of Ashland, on Lake Superior (Map: Wisconsin, B 3). It flows southwest, meeting its west branch in Sawyer County, and, receiving the Flambeau from the east and the Red Cedar from the west, empties into the Mississippi River at the lower end of Lake Pepin. It flows through the great lumber region of the State. At Chippewa Falls there is good water power.

CHIP'PEWY'AN. A nomadic hunting tribe of Athabascan stock, roaming over the country along Great Slave River from Lake Athabasca to Great Slave Lake. The name, which must not be confounded with Chippewa or Ojibwa (q.v.), is of Cree origin and signifies 'pointed coat,' referring to a characteristic fur garment worn by the men. They are also frequently known as Athabasca, from the lake near which they reside. They number about 1000, all now Christianized by Catholic missionaries. Consult Goddard, *Texts and Analysis of the Cold Lake Dialect* (New York, 1912).

CHIP'PING WYCOMBE, wĭk'am. See WYCOMBE.

CHIP'PY, or **CHIPPING SPARROW** (so called from its note). One of the smallest and most numerous of the migratory American sparrows (*Spizella passerina*, or *socialis*), distinguished by its small size, unspotted, ashy blue breast, and chestnut cap. It is a general favorite because of its gentle manners and familiarity. It builds its nest in shrubs, of grass and fine roots, and always lines it with horsehairs, whence it is sometimes called "hairbird." The eggs are four or five in number, blue, speckled at the larger end with blackish brown. Two or three broods are reared in a season. (For illustration, see SPARROW.) Like other sparrows, the chippy feeds chiefly on seeds, but it often eats insects too. It is by no means a songster, but the usual *chippy-chippy-chippy* forms a trill that is musical and sweet. Consult Weed, "Feeding Habits of the Chipping Sparrow," *New Hampshire College Agricultural Experiment Station Bulletin 55* (Durham, 1898), from which it appears that the bird does good service for the gardener as a destroyer of insects and should be protected and encouraged. See SPARROW.

CHIQUICHIQUI (chē'kē-chē'kē) **PALM** (So. Amer. Indian). A palm (*Leopoldinia piassaba*) called "piassaba" in northern Brazil. It is one of the species yielding piassaba fibre, which is employed in the manufacture of brushes. The piassaba fibre exported from Pará is partly obtained from it. It grows in swampy or occasionally flooded lands, on the banks of the Río Negro and other rivers of Venezuela and the north of Brazil, and has a crown of very large, regularly pinnate leaves, with smooth, slender stalks. The leaves, like those of many other palms, are much used for thatching.

CHIQUINQUIRÁ, chē-kēn'kē-rä'. A city in the Department of Boyacá, Colombia, situated 44 miles west of Tunja and 8600 feet above sea level (Map: Colombia, C 2). The town is famed for its Dominican Conventual Chapel having a miraculous picture of the Virgin. The chapel is visited annually by some 30,000 pilgrims, which number swells to 50,000 every seventh year, the time of public celebration. The permanent population is about 13,000. Its educational facilities are good, there being one State college, one private College of Philosophy and Letters, three colleges for women, and one higher school for men.

CHIQUITO, chē-kē'tō (Sp., very small). A group of tribes constituting a distinct linguistic stock, between the headwaters of the Mamoré and the Paraguay, eastern Bolivia. Their territory included the region between 16° and 18° S. lat. and 59° and 64° W. long. They are of rather small stature, whence, according to some, the name, which has also been explained as referring to the small entrance to their houses, and were originally agricultural, but warlike, living in palisaded villages with houses regularly ranged in streets. They resisted the Spaniards for nearly two centuries, but in 1691 accepted the Jesuit missionaries, who established flourishing mission communities among them. In 1831 they were found at Buenvista de Santa Cruz, San Francisco Xavier de Chiquitos, Concepción, San Ignacio, San Miguel, Santa Ana, San Rafael, San José, San Juan, and Santo Corazón; some also at Casalavasco, whither they had been transported by the Brazilians. They selected the Chiquito language proper as the general medium of communication among the converts, who numbered over 50,000, representing nearly 50 tribes, including the Curuminaca, Corabeca, Covareca, Curaveca, Curucaneca, etc. On the expulsion of the Jesuits in 1767 the communities rapidly decayed, and within a generation nearly two-thirds of the Chiquito race had disappeared. A considerable body still survives, living in straw-thatched adobe houses, cultivating cotton and sugar cane, and weaving ponchos and hammocks. Some of the old tribal differences still exist in the Chiquitan villages. Consult Cardûs, *Las Misiones Franciscanas entre los infieles de Bolivia* (Barcelona, 1886), and Adam and Henry, *Arte y vocabulario de la lengua Chiquita* (Paris, 1880).

CHIR. See CHEER PHEASANT.

CHIRIGUÁNOS, chē'rē-gwä'nōz. An important Indian tribe, of Tripian stock, occupying a considerable area in southern Bolivia, massed about the region of 63° W. long. and 19°–22° S. lat. They resisted alike the Incas and the Spaniards and were very adverse to accepting Christianity. At one time the Chiriguânos seem to have been in confederacy with the Calchaquís, and some authorities would trace Calchaquí culture among them. Consult: Del Campana, "Notizie intorno ai Ciriguani," in the *Archivio per l'Artopologia*, vol. xxxii, pp. 17–144 (Firenze, 1902); Nordenskiöld, *Indianerleben El Gran Chaco*, pp. 173–303 (Leipzig, 1912); Church, *Aborigines of South America*, pp. 206–227 (London, 1912).

CHIR'IMOY'A. See CHERIMOYER.

CHIRIQUI, chē-rē-kē'. A lagoon in the Mosquito Gulf and at the west extremity of Panama (Map: Central America, F 6). The name is also given to a river and mountain range of Panama. The lagoon, which is about 35 miles long and extends inland from 12 to 15 miles, has three entrances and is navigable to the largest vessels.

CHIROGALE, kī'rō-gāl (from Gk. χείρ, *cheir*, hand + γαλῆ, *galē*, weasel). A genus (*Chirogaleus*) of small arboreal lemurs of Madagascar, which curl up in holes of trees and pass the dry season in torpidity. "Before this takes place an immense deposit of fat accumulates upon certain parts of the body, especially upon the basal portion of the tail, . . . which by the time they emerge from their torpor has acquired its normal proportions. The smallest

species . . . live in nests among the small branches on the tops of the highest trees, feeding on fruit and insects." Lydekker, *Mammals* (London, 1891). See Plate of LEMURS.

CHIROL, chĭr'ol, SIR VALENTINE (1852–). An English journalist and writer on the Orient. He was educated in France and Germany, receiving the degree of bachelier-ès-lettres from the University of Paris; was a clerk in the British Foreign Office in 1872–76, traveled in the East and in the United States, was Berlin correspondent for the London *Times*, and was director of the foreign department of the *Times* from 1899 to 1912. In the latter year he was knighted, and was appointed to a commission to inquire into the Indian public services. He wrote: *'Twixt Greek and Turk* (1881); *The Far Eastern Question* (1896); *The Middle Eastern Question* (1903); *Indian Unrest* (1910).

CHIROLEPIS, kī-rŏl'ê-pĭs. See CHEIROLEPIS.

CHIROMANCY, kī'rō-măn'sĭ (from Gk. χείρ, *cheir*, hand + μαντεία, *manteia*, divination), or PALMISTRY. The art of divination through the study of the palm of the hand. The interpretative science of the hand in general is termed "chirosophy." It is divided into two branches—chirognomy, which is concerned with studying man's tendencies through the form of the hand and the fingers, and chiromancy, which pretends to foretell by inspecting the lines of the palm. Chiromancy is an ancient art which was known among the Chaldæans, Assyrians, Egyptians, and Hebrews, and was cultivated by the philosophers Plato, Aristotle, Antiochus, Ptolemy, and others. Aristotle found on an altar dedicated to Apollo a treatise on chiromancy, written in letters of gold, and presented it to Alexander the Great as a gift worthy of his lofty mind. The subject is referred to in Aristotle's *Hist. Animalium* (i, 15) and in the *Problemata* and *Physiognomica*, doubtfully assigned to him. A reference in Juvenal (Sat., vi, 581) indicates that the art was practiced among the Romans. That chiromancy was practiced and accepted seriously in the Middle Ages we know from frequent references to it in the writings of that period. Albertus Magnus, Paracelsus, and Cardanus seem to have been greatly interested in the subject. Later it became involved in jugglery, until in the nineteenth century it again received a certain amount of serious consideration, owing largely to the work of two Frenchmen—Adrien Adolphe Desbarrolles (1801–76) and Casimir Stanislas d'Arpentigny (born 1798), an officer in the French army.

Palmistry treats mainly of the mounts of the hand, with the lines on them and the lines interlacing the palm. The left hand is usually the one studied, since it is less affected by use. There are seven mounts—that at the base of the first finger is the mount of Jupiter; the middle finger, the mount of Saturn; the ring finger, the mount of Apollo; the little finger, the mount of Mercury; beneath Mercury, the mount of Mars; at the wrist, the mount of the Moon; and at the thumb, the mount of Venus. More important even than the mounts are the four great lines—the lines of life, of the head, of the heart, and of fortune. The three first named suggest the letter M and represent the trinity of human existence—sensation, intelligence, and action. The line of life, which follows the mount of Venus and meets the line of the head, determines the length of life, possibility of illness, etc. The line of the head, which crosses the palm obliquely from Jupiter to Mars, indicates the intellectual quality. The line of the heart, which crosses the hand horizontally from Jupiter to Mercury, indicates worth of character; the nearer the line approaches Jupiter the better the character. The line of fortune, which cuts the hand vertically, if clear and straight foretells a prosperous life. Other lines of special interest are the Venus line, the line of the liver, and the line of Apollo. In general, the lines indicate the strength or weakness of tendencies, according to their length and clearness.

Each mount indicates a certain quality; conversely, every missing mount denotes the lack of a corresponding quality. Jupiter normally developed indicates love of honor and a happy disposition; Saturn, prudence and wisdom and therefore success; Apollo, a love of the beautiful and noble aspirations; Mercury, a love of science, industry, and commerce; Mars, courage and resolution; the Moon, a dreamy disposition and moral character; Venus, a taste for beauty and an amorous temperament. Besides the mounts and the lines are squares, stars, circles, points, triangles, crosses, rings, branches, chains, forks, islands, etc., which corroborate or modify, according to their situation, the indications deduced from the inspection of the mounts, the lines, the form of the hand, and the nails.

Bibliography. D'Arpentigny, *La chirognomie* (Paris, 1843); Desbarrolles, *Les mystères de la main* (ib., 1879), and his *Révélations complètes* (ib., 1879); Lenormand, *Souvenirs prophétiques d'une sibylle* (ib., 1814); Firth and Heron Allen, *Chiromancy, or the Science of Palmistry* (London, 1883); L. Cotton, *Palmistry and its Practical Uses* (ib., 1890); Wood, *Scientific Palmistry* (ib., 1900); Oxenford, *Modern Palmistry* (ib., 1900); Benham, *The Laws of Scientific Hand Reading* (New York, 1903); Cheiro, *Cheiro's Memoirs: The Reminiscences of a Society Palmist* (London, 1912). See SUPERSTITION.

CHIRON, kī'rŏn (Lat., from Gk. Χείρων, *Cheirōn*). The most famous of the Centaurs (q.v.), the son of Cronus and Philyra, distinguished from the other Centaurs by his mildness and wisdom and the general benevolence of his character. In works of art he has a nobler and more human bearing. Many Greek heroes—Achilles, Actæon, Alcon, and even Apollo—were educated by Chiron. He was skilled in medicine and was considered the inventor of the lyre. Consult Mannhardt, *Wald- und Feldkulte* (Danzig, 1875–77).

CHI'ROPRAC'TIC. A system of manipulations which aims to cure disease by the mechanical restoration of displaced or subluxated bones, especially the vertebræ, to their normal relation. It is claimed that slight displacements of the spinal segments are frequent, that they constrict important nerves and arteries, and that chiropractic adjustment corrects the displacement and relieves the pressure. In 1913 there were said to be over 5000 practitioners of the art in the United States and about 1000 students attending seven schools.

CHIROPTERA, kī-rŏp'tê-rȧ (Neo-Lat. nom. pl., from Gk. χείρ, *cheir*, hand + πτερόν, *pteron*, wing). An order of mammals, the bats, characterized by the possession of membranous wings (*patagia*) supported upon the highly modified bones of all limbs and extended by the greatly prolonged metacarpals and phalanges of the *manus*. (For details, see BAT.) This order is regarded as an ancient offshoot of the Insec-

tivora, to which it is allied in dentition and many features of internal structure; it is also allied to the Primates in dental characters and especially in the structure and external characteristics of the generative organs. Hence it is usually classified in a linear arrangement next to the Insectivora. It is divided into two suborders—*Frugivorous megachiroptera*, or fruit eaters, and *Animalivorous microchiroptera*, or insect eaters. Geologically the history of the order begins in the Eocene age.

CHIROSOPHY. See CHIROMANCY.

CHI'ROTHE'RIUM. See CHEIROTHERIUM.

CHIRU, chē'rū (Hind., from Tibetan). An antelope (*Pantholops hodgsoni*) inhabiting the pine forests and elevated plains of Tibet. It is about 32 inches in height, pale fawn in color, with a black face in the bucks, and these alone have long, gazelle-like horns. They sometimes gather in autumn into great herds and always tax the stalker's patience by their watchfulness.

CHIS'ELMOUTH'. A large, blackish chub (*Acrocheilus alutaceus*) of the Columbia River, also called "hardmouth" and "squaremouth," in reference to the blunt, fleshy mouth, the lower lip of which is covered with a firm, sharp-edged cartilaginous plate. It is occasionally eaten.

CHISHOLM, chīz'om. A village in St. Louis Co., Minn., 98 miles by rail northwest of Duluth, on the Great Northern and the Duluth, Missabe, and Northern railroads (Map: Minnesota, E 3). It is in a productive agricultural and lumber region and has large deposits of iron ore, which is the chief product. The village contains a library. Pop., 1910, 7684.

CHISHOLM, HUGH (1866–). An English publicist and editor. He was born in London, was educated at Felsted School and at Corpus Christi College, Oxford, of which he was scholar, and became a barrister of the Middle Temple in 1892. As a journalist he advocated imperialism, tariff reform, and colonial preference, and was assistant editor (to Sidney Low) in 1892–97 and editor in 1897–1900 of the *St. James's Gazette*. With Sir Donald Mackenzie Wallace and President Arthur Twining Hadley of Yale, he edited the supplement to the ninth edition of the *Encyclopædia Britannica* published under the auspices of the London *Times* in 1902. A year later he became editor of the eleventh edition of the same Encyclopædia, and he edited the *Britannica Year Book, 1911–12* (1913). In 1913 he became day editor of the London *Times*.

CHISLEHURST, chīz''l-hĕrst, or **CHISELHURST.** An urban district in Kent, England, 11 miles southeast of London. It was here, at Camden House, that the exiled Napoleon III fixed his residence in 1871 and died, Jan. 9, 1873. Chislehurst remained the residence of the Empress Eugénie until 1880. Pop., 1901, 7400; 1911, 8666.

CHISOLM, WILLIAM WALLACE (1830–77). An American official, born in Morgan Co., Ga. In 1847 the family removed to Kemper Co., Miss. As a Union sympathizer he was elected sheriff by the negroes after the war and reëlected in 1873. He was an able party leader and succeeded in making the county the chief rallying point of the Republican party in the State. He was arrested in the spring of 1877, charged with murdering John W. Gully, a Democratic leader, who had been shot near Chisolm's dwelling. Chisolm's family, consisting of his wife, three sons, and a daughter, voluntarily accompanied him to jail. On the morning following his arrest the doors of the jail were demolished by the mob, which probably consisted largely of members of the Ku-Klux Klan. Chisolm's son, a boy of 13, was shot; his daughter of 18 mortally wounded; and Chisolm himself was fatally injured. A negro in December, 1877, confessed to murdering Gully, but did not implicate Chisolm. His death at the hands of the mob was due in part to race and partisan prejudice, in part to the abuses of power by the radicals and negroes. The episode of Chisolm's death suggested a chapter in Tourgée's *A Fool's Errand*. An equally exaggerated account is Wells's *Chisolm Massacre* (1877). The other side is told in Lynch, *Kemper County Vindicated* (1879).

CHISOLM v. GEORGIA. A noteworthy case decided by the Supreme Court of the United States in 1793 and reported in 2 Dallas Reports, 419. In 1792 Alexander Chisolm, a citizen of South Carolina, sued the State of Georgia in the Federal courts, but the State refused to make an appearance in the suit. The Supreme Court, when the case came before it, took occasion to review the origin and nature of the Union, and decided that a State could properly be made a party defendant to such a suit under the grant to the Federal courts, in the Constitution, of judicial power over cases "between a State and citizens of another State." The agitation incident to such a decision, apparently invading the "sovereignty" of each State, led shortly thereafter to the adoption of the eleventh amendment to the Constitution, providing that the Federal judicial power should not extend to any suit brought against a State by a citizen of another State or of a foreign State. Later, efforts were made to circumvent this prohibition by a citizen assigning his claim to the State of his domicile, and by then having the suit brought in the name of the assignee State; but it was held that this could not be done, in New York *v.* Louisiana, 108 United States Reports, 76.

CHISTOPOL, chē'stô-pôl'. See TSCHISTOPOL.

CHISWICK, chīz'ĭk (sandy bay). A suburb of London, 7 miles west-southwest of St. Paul's, on the left bank of the Thames (Map: London, E 5). Around Chiswick are many fine villas, extensive market gardens for supplying London, and the gardens of the London Horticultural Society. The churchyard contains the grave of Hogarth, and both Fox and Canning died here. The Duke of Devonshire's beautiful villa, Chiswick House, is situated here. Pop., 1901, 29,901; 1911, 38,772.

CHITAL, chē'tŭl, or **CHITRA,** chē'trâ. The axis deer. See AXIS.

CHITARRONE, kē'târ-rō'nâ. A bass guitar over 5 feet long, used in the orchestras of the seventeenth and eighteenth centuries. It had two sets of wire strings which were plucked with a plectrum. Its general construction is that of the theorbo (q.v.).

CHITIN, kī'tĭn (from Gk. *χιτών, chitōn*, tunic). The chief chemical constituent of the skeleton of insects and crustaceans. It differs from the horn substance by being insoluble in alkalies. It may be prepared from the body of articulata by extracting with dilute hydrochloric acid and alkali, then boiling with water, alcohol, and ether. Chitin is insoluble in dilute

acids and alkalies, but dissolves in strong hydrochloric, nitric, and sulphuric acids. When pure, it is a white, amorphous substance usually retaining the skeleton form. It is composed of carbon, hydrogen, nitrogen, and oxygen, as indicated by its "empirical" formula: $(C_{12}H_{20}N_2O_{10})_n$. But its molecular formula is unknown, nor is, consequently, anything known of its chemical constitution. (See CHEMISTRY.) Boiling concentrated acids transform it chiefly into glucosamine, $C_6H_{13}NO_5$.

CHITON, kī'tŏn (Lat., from Gk. χιτών, *chitōn*). In ancient Greece, a sort of shirt or undergarment, worn next the skin by both men and women. In Homeric times it was worn by men alone, the *peplos* being the women's underdress of this period. The Homeric chiton was a close-fitting garment of linen, which, being closed at the sides, was drawn on over the head, while the peplos was a long, loose woolen garment, open at one side and fastened with a brooch at the shoulder. In later times the chiton came into use for both sexes and was of two general forms. That of the men resembled the earlier Homeric chiton, being a short, close-fitting garment, sewed at the sides and provided with short sleeves or mere armholes; while that of the women, the so-called Ionic chiton, was long and loose, and was sewed at the sides and provided with sleeves. The earlier peplos, however, was still used, being especially favored by the Spartan women, whence it received the name of *Dorian*. Later still there came into use a sleeveless chiton for women. The chiton was sometimes worn girded and sometimes not, and it was of various colors and cuts. When one side of the chiton was unsewed, the girdle was regularly worn, so that the body was not left exposed. The length of the chiton could be adjusted at will, by the wearer pulling the skirt of the chiton up and letting part of it hang in a fold outside the girdle. Consult Amelung, in Pauly-Wissowa, *Realencyclopädie*, and Gulick, *The Life of the Ancient Greeks*, pp. 154–158 (New York, 1902). See COSTUME (Greek Section).

CHITON. A group of mollusks, the mail-shells, constituting an order (Placophora) in the class Amphineura. The shell is composed of eight narrow, transverse, calcareous pieces, overlapping each other in a row along the back,

CHITON, OR MAIL-SHELL.
1, attitude in life; 2, detail of shell and integument, dorsal view.

and strongly attached to the mantle, which is remarkably fleshy and fibrous. Chitons have the power of rolling themselves up into a ball like the armadillo (q.v.), thus exposing nothing but the hard shell. The organ of locomotion is an oval foot, extending the whole length of the animal, by means of which chitons cling to rocks so tenaciously that the heaviest surf does not disturb them. More than 200 species are known; they dwell in all climates, but are most abundant in the warmer seas. They occur at all depths, but prefer the rocks along the shore, where they sometimes are found in surprising numbers. All North Atlantic species are small, seldom an inch in length, but some of those found in the tropics and on the coast of California may be 8 or 10 inches long. Most of the chitons are gray or brown in color, but some species are very handsomely marked with red, orange, yellow, green, and other colors. The upper surface may be comparatively rough, with papillæ and spines. In most cases it is nearly covered by the shell plates, but in one or two genera the plates are very narrow and cover only the mid-dorsal part of the animal, while in still others the plates are completely concealed within the thickened integument. "West Indian negroes" are said to "eat the large chitons, which are abundant on their rocky coasts, cutting off and swallowing raw the fleshy foot, which they call beef."

Fossil Forms. The modern chitons are the survivors of a long line of ancestors that made their first appearance in the Ordovician or Lower Silurian rocks, attained some prominence during Carboniferous time, and, with a slight decline during the Tertiary period, have continued with only slight changes of scarcely more than generic rank down to the present era. The group thus affords an excellent example of the persistence of a generalized primitive type. The fossil genera are classified according to the form of the articulating facets of the valves and the proportions of the shell and its segments. See also PLACOPHORA.

CHITOR. See CHITTUR.

CHITRA. See AXIS.

CHITRALI, chē-trä'lē. The natives of Chitral, a region on the borders of British India, northeast of Kafiristan, on the southeastern slope of the Hindu-Kush. They belong, with the Kafirs (Siahposh), physically to the white race and linguistically to the Aryan stock. Their number is estimated at between 150,000 and 200,000. In the last years of the nineteenth century they came into conflict with the English authorities, and their ruler, with Mehtar, is now a British vassal. They are now adherents of Islam, but traces of their former Buddhism still exist. The chief language is known as Khowar. An interesting account of this people and their neighbors is given in Sir George Robertson, *Chitral* (London, 1898). Consult also Holdich, *The Indian Borderland* (London, 1901), and Anderson, *Peoples of India* (London, 1913).

CHIT'TAGONG' (corrupted from *Chatgoan*), or ISLAMABAD (city of Islam). A city in the Presidency of Bengal, India, capital and port of the district of the same name, situated on several small but steep hills on the Karnaphuli, 12 miles from its mouth, in lat. 22° 21′ N. and long. 91° 50′ E. (Map: Burma, B 2). An important commercial centre under the Portuguese, it came into possession of the British East India Company, with Bengal proper, in 1760–65. Originally a part of Arakan, it was claimed 60 years later by the Burmese Emperor, as a dependency of that territory—a claim which constituted one of the grounds of

the War of 1824. It is the seat of Chittagong College, churches, a general hospital; has shipbuilding industries and a considerable export trade in rice, jute, gunny, hides, and tea. Pop., 1901, 22,140; of district, 1901, 1,353,250; 1911, 1,508,433.

CHITTAGONG WOOD. The wood of *Chickrassia tabularis*, a tree of the family Cedrelaceæ, a native of the mountainous countries to the east of Bengal. In some parts of India it is called *cedar* or *bastard cedar;* names, however, which are also given to other kinds of wood. Chittagong wood is much valued in India and is used for all purposes for which mahogany is used in Great Britain. It makes beautiful and light furniture, but is apt to warp in very dry weather. Beautifully veined and mottled pieces are occasionally met with and are highly valued.

CHITTEM BARK. See CASCARA SAGRADA.

CHIT'TENDEN, FRANK HURLBUT (1858–). An American entomologist, born in Cleveland, Ohio. He was educated at Cornell University, edited *Entomologica Americana* in 1890, and became assistant entomologist in the United States Department of Agriculture in 1891. His publications, consisting of a large number of bulletins of the Department of Agriculture describing insect pests, include: *The Colorado Potato Beetle* (1907); *The Harlequin Squash Bug* (1908); *The Common Red Spider* (1909); *The Asparagus Miner* (1911); *The Broad-Bean Weevil* (1912); *The Potato-Tuber Moth* (1912); *The Spotted Beet Webworm* (1913).

CHITTENDEN, HIRAM MARTIN (1858–1917). An American soldier, born in western New York. After graduating from the United States Military Academy (1884), he rose through various grades to be lieutenant colonel of volunteers and chief engineer of the Fourth Army Corps in the Spanish-American War in 1898–99. He retired as brigadier general in 1910. He had charge of government works in Yellowstone National Park and on the Missouri, Ohio, and other western rivers. In 1911 he was appointed commissioner of the port of Seattle. He is author of *Yellowstone National Park, Historical and Descriptive* (1895; 6th ed., 1913); *Reservoirs in the Arid Regions* (1897); *Forests and Reservoirs in their Relation to Stream Flow* (1908); *War or Peace* (1911); *Report on the Water-Supply System of the Spring Valley Water Company* (1912).

CHITTENDEN, RUSSEL HENRY (1856–). An American physiological chemist. He was born in New Haven, Conn., Feb. 18, 1856, graduated at the Sheffield Scientific School of Yale University in 1875, became instructor in chemistry at Yale in 1876, studied in Heidelberg in 1878–79, and received his doctor's degree at Yale in 1880. He became professor of physiological chemistry at Yale in 1882 and director of the Sheffield Scientific School in 1898. From 1898 to 1903 he was lecturer on physiological chemistry at Columbia University, New York. From 1895 to 1904 he was president of the American Physiological Society and in 1907 president of the Society of Biological Chemistry. Dr. Chittenden has carried out several important researches in physiological chemistry, principally on questions pertaining to the chemistry of proteids and their primary cleavage products, and has made very valuable contributions to the knowledge of the process of nutrition. He is the author of an important work on *Digestive Proteolysis* and *Physiological Economy in Nutrition* (New York, 1905).

CHITTENDEN, THOMAS (1730–97). The first Governor of Vermont. He was born in East Guilford, Conn., but emigrated to the so-called New Hampshire Grants (now Vermont) in 1774. Here he took an active part in the controversy with New York and was a member of the convention which declared Vermont a State (1777) and of the State Constitutional Convention of 1778. He was Governor from 1778 to 1789 and again from 1790 to his death. His son Martin (1769–1841) was Governor in 1813–14. A Vermont county bears the family name, and the State erected a monument to the first Governor at Williston in 1896. Consult Chipman, *A Memoir* (Middlebury, 1849).

CHITTIM. See KITTIM.

CHITTUR, chĭt-tōōr', or **CHITOR.** A town in the State of Madras, India, 100 miles west of Madras (Map: India, B 4). Until 1908 it was the headquarters of the North Arcot district, but due to the prevalence of virulent fever they were removed to Vellose. A Roman Catholic chapel, an English church, a high school, and literary institutes are numbered among its institutions. Pop., 1901, 10,893; 1911, 15,108.

CHIT'TY, JOSEPH (1776–1841). An English lawyer and writer on law. He was a successful practitioner at the bar and enjoyed a great reputation for legal learning. His writings became the textbooks of the generation succeeding his own, their accuracy and systematic character rendering them peculiarly suitable for the purposes of law students. Among his principal works are: *Treatise on Parties to Actions and to Pleadings* (1808); *Treatise on the Law of Nations Relative to the Legal Effects of War on the Commerce of Belligerents and Neutrals and on Orders in Council in Licenses* (1812); *Treatise on Criminal Law* (1816); *Synopsis of Practice in the King's Bench and Common Pleas* (1831–32); *Treatise on Bills of Exchange and Promissory Notes* (1799); and an edition of *Blackstone's Commentaries* (1832).

CHIUN, kī'ŭn. A deity mentioned by the prophet Amos (v. 26), who reproaches the Israelites for having carried "the tabernacle of your Moloch [marg. better; Siccuth, your king], and Chiun, your images, the star of your God." The latter idol, Chiun, is now generally recognized to have the Babylonian name of the planet Saturn—*Kaiwan*, as the Syrians, Mandeans, and Persians called him. The assertion that there is an Egyptian god *Ken*, who may be identified with Chiun, is quite unfounded.

CHIUSI, kyōō'sē. A town of central Italy, in the Province of Siena, 37 miles southeast of Siena, with a population of 6000 (Map: Italy, F 4). It stands on an eminence in the Val di Chiana, near the lake of the same name. In ancient times, under the name of Clusium, it was one of the 12 cities of Etruria and the residence of Porsena (q.v.). When Italy was overrun by the barbarians, Chiusi fell into decay, the whole valley was depopulated, and became the pestilential pool described by Dante. Since the improvement of the course of the Chiana (q.v.), Chiusi has begun to flourish again. Necropolises round Chiusi have yielded a long series of objects, representing Etruscan products and imports from Greece. The earliest graves show no Greek wares and must reach well back into the eighth century B.C. Succeeding graves contain Greek

vases of the seventh century and from the beginning of the sixth century are found the chamber tombs, often richly decorated. Three thousand Etruscan inscriptions and 500 Latin inscriptions have been found in Clusium and its neighborhood; some are bilingual, and Latin inscriptions have been found beside Etruscan in the same cemeteries. The objects found in the graves are partly in the local museum and partly in Florence. Beneath the town is a series of underground passages which seems to belong to the old Etruscan system of drainage. Consult Dennis, *Cities and Cemeteries of Etruria*, vol. ii (rev. ed., London, 1907); L. Giometti, *Guida di Chiusi* (Poggibonsi, 1904).

CHIVALRY, shĭv'al-rĭ (Fr. *chevalerie*, horsemanship, knighthood, from *chevalier*, horseman, knight, from *cheval*, horse, from Lat. *caballus*, horse). In the Middle Ages the body of customs and ideals relating to the duties and privileges of knighthood. It owed its development partly to feudal usages, with which it had many relations, and partly to the Church, which adopted and altered the customs of chivalry to further its own control of society. Chivalry probably had its origin in the ancient Germanic custom of arming the youth solemnly in the presence of the warriors. Tacitus refers to this usage, and it seems to have prevailed throughout the early Middle Ages. The chronicles record that Louis the Pious, at the age of 13, received his arms from Charles the Great, and that Charles the Bald, at the age of 16, received his arms from Louis. The cavalry, after the middle of the eighth century, grew to be the most important part of the army, and as feudalism developed there was a tendency to fix the customs for the assumption of the arms and to define the duties of the knight. The last were to a great extent the regular duties of a vassal, which included bravery, fidelity, and loyalty. The conception of knightly honor, which grew up slowly, was comparatively late. The Crusades and the intense interest in religious matters in the twelfth century tended to make chivalry more Christian. It was held to be the knight's duty to defend Christianity, to protect the Church, and to battle against the infidel. Lanfranc Cigala, a little later, wrote: "I do not hold him to be a knight who does not go with a willing heart and all his might to the aid of the Lord, who has so great need of him."

According to the mediæval conception of chivalry, no one was born a knight. The candidate for the honor was sent, at the age of about seven, to act as page or valet in the household of some knight. There he obtained his education, and when old enough might become a squire. The duty of the squire was to attend the knight in battle or in tournament, to care for his horse and weapons, and to act as his aid. In time the squire might be made a knight. The distinction could be conferred in the earlier period by any knight; at a subsequent period the monarchs claimed the sole right to confer knighthood. The age when the squire became a knight varied; there are cases where the honor was conferred on boys of 10 or 11, but later it was usual to defer it until the age of 21 or later. In fact, some squires never became knights, in order to avoid the expense of the ceremony. In France, in the thirteenth century, a royal order punished with a fine noble squires who had not become knights by the time they were 24 years old.

The ceremony of admission into knighthood, known as "dubbing," usually took place on a festival, although squires were often made knights on the battlefield, in recognition of deeds of bravery. Occasionally before a battle took place the dignity was conferred upon a considerable number. The essential parts of the dubbing in the early twelfth century were the *collée*, or accolade, a blow upon the neck or shoulder, and the running *la quintaine*—i.e., tilting on horseback against a figure stuffed with straw. Later there was a symbolical and mystical development, which made the process of initiation mainly a religious ceremony. According to one ritual of the fifteenth century, the following were the details of the ceremony: after bathing, as a symbol of purity, the candidate "watched" his arms for a whole night before the altar of some church or the grave of some saint, and in the morning he confessed, often aloud, attended communion and mass, and listened to a sermon on the duties of purity, fidelity, honesty, the protection of the Church, widows, orphans, ladies, and all who were oppressed. A priest then blessed his sword and other pieces of armor; a knight made him take oath to fulfill all his duties; then the accolade, which consisted of three strokes with the sword, was given solemnly, and the following sentence uttered: "In the name of the Father, Son, and Holy Ghost, I make you knight." The knight who had given the accolade embraced the new knight, and girded him with his sword; the godfathers put on him the golden spurs, the symbol of knighthood; and the lords and ladies present assisted in clothing him with the other pieces of armor. Lastly, he mounted on horseback and ran *la quintaine*.

At the end of the twelfth century and later, chivalry was profoundly influenced by the popular romances of Arthur, Charlemagne, and other famous heroes. Manners became less brutal, and a spirit of knight-errantry grew up. It became the fashion to be rash, imprudent, and extravagant in conduct. The *Orlando* of Ariosto and *Don Quixote* have made the follies of declining chivalry familiar to all. Chivalry was at its best in the twelfth century, in the fourteenth was declining rapidly, and in the fifteenth was thoroughly decadent. Knight and squire gradually became mere titles of honor which might be hereditary. Consult: Gautier, *La chevalerie* (Paris, 1884); id., Eng. trans. by Firth (London, 1890); Sir Walter Scott, *Essay on Chivalry* (ib., 1868); and Stebbing, *History of Chivalry and the Crusades* (ib., 1830). See Feudalism; Knight; Orders; Bushido.

CHIVALRY, Court of, or Marshal's Court. An ancient military court of great dignity, which was formerly held by the Lord High Constable of England and the Earl Marshal. It had jurisdiction over civil matters affecting the naval establishments abroad and of all military matters and infractions of the martial law both within and without the kingdom. The extension of the jurisdiction of the common-law courts and the transfer of the jurisdiction over purely military offenses to modern courts-martial, instituted by parliamentary authority, has reduced the court of chivalry to a purely honorary position at the English court. During the seventeenth and eighteenth centuries it played the rôle of a court of honor (see Herald's College), but at the present time it has no legitimate function but that of "redressing en-

croachments and usurpations in matters of heraldry and coat armor." If in fact it should exercise this authority, the Earl Marshal alone would act as judge of the court, the office of Lord High Constable having fallen into abeyance. Consult the commentaries of Blackstone and Stephen.

Chivalry, Tenure in. The characteristic form of land tenure under the feudal system, the vassal, as tenant in chivalry, holding his land of his feudal lord on condition of military service. See FEUDALISM; KNIGHT'S SERVICE; TENURE.

CHIVASSO, kē-vȧs'sō. A city in the Province of Turin, north Italy, on the left bank of the Po, 18 miles northeast of Turin (Map: Italy, B 2). It markets grain and cattle. It was the residence of the dukes of Montferrat, and a stronghold until the fortifications were destroyed by the French in 1804. There are sulphur baths at San Genesio, 2 miles south. Pop., 1901, 9913; 1911, 10,084.

CHIVE, chīv, or **CIVE,** sīv (from Lat. *cepa*, onion) (*Allium schœnoprasum*). A plant of the same genus with the leek and onion (see ALLIUM), a perennial, ½ to 1 foot in height, with very small, flat, clustered bulbs, increasing by its bulbs so as to form a sort of tuft. The leaves are tubular, cylindrical tapering, radical, nearly as long as the most leafless flowering stem, which is terminated by a hemispherical, many-flowered umbel of bluish-red or flesh-colored flowers. The plant grows wild on the banks of rivers, and in marshy or occasionally flooded places in the middle latitudes of Europe and Asia, and on the northern borders of the United States. Chives are commonly cultivated in kitchen gardens, often as an edging for lots, and are used for flavoring soups and stews. Their properties are very similar to those of the onion. The part used is the young leaves, which bear repeated cutting during the season.

CHIVILCOY, chē'vēl-kō'ē. A town in the Province of Buenos Aires, Argentina, situated in a populous district 90 miles west by south of Buenos Aires (Map: Argentina, F 11). The inhabitants, among whom are many Italians and Basques, are engaged chiefly in agriculture and in the manufacture of brandy, ironware, and machinery. Pop., 15,000.

CHIVOT, shē'vō', HENRI (1830–97). A French writer of vaudevilles. He was born in Paris, where he brought out a large number of very successful vaudevilles, light comedies, and operettas, most of which were written with Alfred Duru (1829–89). Among these may be mentioned: *Le soldat malgré lui*, operetta in two acts, music by M. F. Barbier (1868); *Les cent vierges*, operetta in three acts, music by M. Lecocq (1872), libretto written in collaboration with Clairville; *Le pompon*, music by M. Lecocq (1876); *Madame Favart*, operetta in three acts, music by Offenbach (1879), of which 200 performances were given in Paris; *La mascotte*, comic opera, in three acts, music by Audran (1881); *La cigale et la fourmi*, music by Audran (1886); *La souris blanche* (1897).

CHLADNI, klȧd'nē, ERNST FLORENS FRIEDRICH (1756–1827). A German physicist. He was born in Wittenberg and studied law there and in Leipzig. He ultimately abandoned the legal profession in order to devote himself to physical science and, being acquainted with music, was led to observe that the laws of sound were by no means so well established as those of other branches of physics. He therefore began to apply his knowledge of mathematics and physics to acoustics and traveled for 10 years (after 1802) through Germany, Holland, France, Italy, Russia, and Denmark, giving a series of successful lectures on the subject. He discovered the longitudinal vibration of strings and rods and also produced the experiments since known by his name (see CHLADNI FIGURES), where the vibration of a plate is studied by means of sand figures. Using organ pipes, he was able to determine the velocity of sound in gases other than air and, in addition, was the inventor of many pieces of acoustic apparatus. Chladni's writings include *Entdeckungen über die Theorie des Klanges* (1787); *Akustik* (1802); *Neue Beiträge zur Akustik* (1817); *Beiträge zur praktischen Akustik und zur Lehre vom Instrumentenbau* (1822). Chladni also wrote several essays on meteoric stones. Consult: Bernhardt, *Dr. Ernst Chladni der Akustiker* (Wittenberg, 1856); Melde, *Chladnis Leben und Wirken* (Marburg, 1888); Kohlschütter, *Ernst Florens Friedrich Chladni* (Hamburg, 1897).

CHLADNI FIGURES. Figures produced by sand on a vibrating plate, forming designs more or less complex and depending upon the vibrations of the plate. This important experiment is due to Chladni (q.v.) and illustrates the formation of nodes and segments in a vibrating plate. The plate used in the experiment may be either metal or glass, and in shape may be a disk, a square, or any other form whose

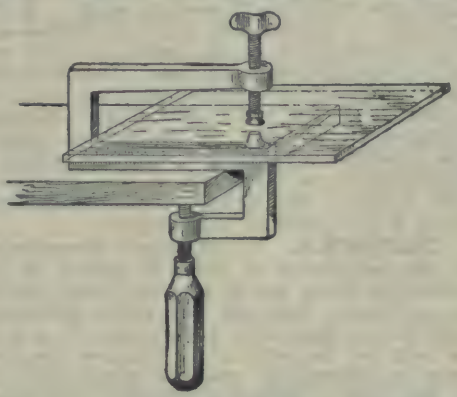

FIG. 1. CLAMP AND PLATE FOR CHLADNI EXPERIMENT.

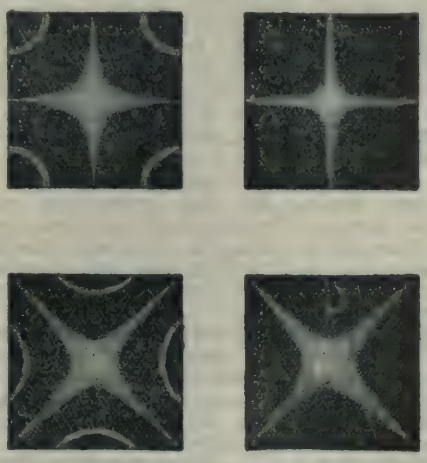

FIG. 2. CHLADNI FIGURES.

vibrations it is desired to study. The plate is clamped to a stand at its centre, and its edge is rubbed with a violin bow and set into vibration. The point where the plate is clamped will of course be a point of rest or node, while the part of the plate in contact with the bow executes the maximum vibration and will be a ventral segment. When sand is strewn on the plate, it will take a position along the nodes, being forced away from the points of vibrations to positions of rest. The figures formed by the sand take various forms, and indicate the vibration of the plate. A few of these figures, together with a plate clamped in position, are shown in the illustrations. The Chladni figures will be found described in most of the larger treatises on physics.

CHLAM'YDOPH'ORUS. See ARMADILLO.

CHLAMYDOSAURUS, klăm'ĭ-dō-są'rŭs. See FRILLED LIZARD.

CHLA'MYS (Lat., from Gk. χλαμύς). A form of cloak worn among the Greeks by huntsmen and horsemen, and the special garment of the Athenian ephebi. (See EPHEBUS.) It was straight on one edge, but circular on the other, with two long sidepieces, from which it was sometimes called the "Thessalian wings." It was gathered round the neck and was clasped over the right shoulder or the breast, in such way as to leave the right arm free. The loose ends were weighted with bits of lead or clay. At Athens it reached to the rider's waist, in colder climates to his feet. As the regular garb of the cavalry it appears in a manifold variety by the adjustments on the frieze of the Parthenon. The material was usually wool, and it seems often to have been of bright colors.

CHLOAS'MA. A skin disease characterized by the appearance of spots or patches of discoloration which may be brownish, fawn colored, or yellowish. They are irregularly distributed and vary in size from a mere spot to a patch as large as the palm of the hand, or the color may be diffused all over the body. Chloasma is due both to local and systematic influences; chronic local irritation, pressure, blistering, or sunburn (producing freckles) being local causes. Examples of systemic affections producing discoloration of the skin are Addison's disease (q.v.), cancer, pregnancy, malaria, and liver disease. Chloasma appears on the face or any part of the body. The term is frequently but erroneously applied to patches of pigmentation on the chest (popularly called "liver spots"), due to *Tinea versicolor*, a parasite.

CHLOË, klō'ē (Lat., from Gk. χλόη, blooming, verdant). A pretty, sportive shepherdess in the Greek romance *Daphnis and Chloë*, by Longus (q.v.). She has become the stock idyllic heroine. The name and character appear in Sidney's *Arcadia*, in Fletcher's *Faithful Shepherdess*, in Prior's poems, and elsewhere. The Chloë in Jonson's *Poetaster* can hardly be described as bucolic.

CHLOPICKI, klô-pĭts'kĭ, JÓZEF (1771–1854). A Polish general and dictator of Poland during the revolution of 1830–31. He was born in Galicia, entered the army in 1787, and fought gallantly in the war for independence under Kosciuszko. After the surrender of Warsaw to the Russians, Nov. 8, 1794, Chlopicki went to France and joined the Army of the Cisalpine Republic, under General Dombrowski. In 1806, when Dombrowski and Wybicki called the Poles to arms, under the protection of Napoleon, Chlopicki returned to his country and fought gallantly at Eylau and Friedland (1807). From 1808 to 1811 he took part in the Spanish campaign. In 1812 he followed Napoleon to Russia, taking part in the bloody engagements at Smolensk and on the Moskva. After the remnants of the invading force had returned Chlopicki left the Imperial service on account of certain slights. After the taking of Paris by the allies in 1814, Emperor Alexander made him a general of division in the new Polish army, but he soon resigned, owing to the violent temper of the commander in chief, the Grand Duke Constantine. When the insurrection of the Poles broke out in 1830, Chlopicki, who foresaw the hopeless nature of the attempt, reluctantly obeyed the voice of the nation, which had conferred upon him the dignity of dictator (December 5). His moderate views and hesitating policy involved him in disputes with the patriot party, and on Jan. 23, 1831, he resigned his office; but to prove his sincerity, he entered the Polish army as a private soldier and took part as such in the battles of Waver and Grochow. After the suppression of the insurrection Chlopicki went to Cracow and withdrew altogether from public life. Consult Maczynski, *Life and Death of Joseph Chlopicki* (Cracow, 1858).

CHLO'RAL (from Gk. χλωρός, *chlōros*, greenish yellow), CCl_3CHO. A colorless oily liquid extensively used in medicine, in the form of its hydrate. It has a peculiar irritating smell and an acrid taste. Its specific gravity at 20° C. is 1.512. It is made on a large scale by the prolonged action of chlorine on ethyl alcohol; this yields first chloral alcoholate, which is then transformed into chloral by distilling with strong sulphuric acid at temperatures slightly below 100° C. When mixed with an equivalent quantity of water, chloral forms the hydrate $CCl_3CH(OH)_2$, which no longer contains the aldehyde group, CHO, contained in chloral.

Chloral hydrate is a colorless crystalline substance freely soluble in water and melting at 57° C. When distilled with sulphuric acid, it is retransformed into chloral. Alkalies transform chloral or its hydrate into chloroform. If taken internally, chloral acts as a powerful depressant, especially of the heart, causing a slow, feeble, irregular pulse. It acts directly on the brain and, if administered in medicinal doses, produces a refreshing and natural sleep. Frequent administration of chloral is, however, liable to cause chronic poisoning and may permanently affect the mind. In cases of poisoning from an overdose of chloral, the stomach should be washed out, sleep should be prevented by all means, and a strong coffee solution should be injected into the rectum. Chloral is often administered in tetanus, whooping cough, acute mania, delirium tremens, infantile convulsions, chorea, and other spasmodic affections; but it must always be given with caution on account of its depressant action on the heart. Locally chloral is an antiseptic and analgesic, being used for toothache, earache, and various neuralgic pains. It is also a useful sedative in itching skin diseases. Chloral was discovered by Liebig in 1832, and Liebreich in 1869 was the first to use it as an anæsthetic and hypnotic. *Chloralamide* and *chloralimide* are chemically allied to chloral, and have been used as substitutes for it.

CHLO'RALAM'IDE, and **CHLO'RALIM'IDE.** Substances used in medicine as substitutes for chloral (q.v.).

CHLORAL HY'DRATE. See CHLORAL.

CHLORAS'TROLITE (from Gk. *χλωρός, chlōros*, greenish yellow + *ἄστρον, astron*, star + *λίθος, lithos*, stone). A green, opaque, usually mottled and stellated variety of *prehnite* or *thomsonite*, that is found in amygdaloid trap rock on the Île Royale, Lake Superior. The mineral generally occurs in the form of rolled pebbles on the beach and takes a high polish, in consequence of which specimens are cut as gems and sold to tourists.

CHLOREN'CHYMA (Neo-Lat., from Gk. *χλωρός, chlōros*, greenish yellow + *ἔγχυμα, enchyma*, injection, from *ἐγχεῖν, enchein*, to pour in, from *ἐν, en*, in + *χεῖν, chein*, to pour). A collective name for the tissues which bear chlorophyll (q.v.), the characteristic green pigment of plants. See LEAF.

CHLO'RIC ACID (from Gk. *χλωρός, chlōros*, greenish yellow), $HClO_3$. A colorless liquid with a pungent odor, first obtained by Gay-Lussac in 1814. It is prepared by decomposing barium chlorate with dilute sulphuric acid. It rapidly bleaches vegetable colors and gives up its oxygen to organic bodies so rapidly that they take fire. With the metals chloric acid forms a series of salts called "chlorates." The most important of these is potassium chlorate, a white crystalline compound made on a large scale by passing chlorine gas into a hot solution of lime and adding potassium chloride. Potassium chlorate then separates out in the form of a mass of crystals and may be purified by recrystallization from water. Potassium chlorate is largely used as a source of oxygen gas. It also finds application in calico printing, in the manufacture of safety matches, in the production of fireworks, and as a detonator. Finally, it is employed medicinally in throat troubles, and it is especially valuable in the treatment of ulcerative stomatitis. Potassium chlorate was discovered by Berthollet in 1786 and is sometimes called "Berthollet's salt."

CHLO'RIC ETHER. A name formerly given to chloride of ethylene, or *Dutch liquid*, $C_2H_4Cl_2$. The name is now applied to spirits of chloroform, a mixture containing 6 per cent of chloroform and 94 per cent of alcohol; spirit of chloroform is often used in medicine as a flavoring agent.

CHLO'RIDES. See HYDROCHLORIC ACID.

CHLO'RIDIZING. A metallurgical term referring to the roasting of sulphide or complex silver ores with salt to convert the silver into a chloride which is soluble in hyposulphite solution or recoverable by amalgamation. This method of extraction is known as the Russell process and has been replaced by the cyanide process. See SILVER, *Metallurgy*. Consult Hoffman, *The Hydro-Metallurgy of Silver*.

CHLORIM'ETRY, or CHLOROM'ETRY (from Gk. *χλωρός, chlōros*, greenish yellow + *μέτρον, metron*, measure). The process of estimating the amount of chlorine in hypochlorites, as bleaching powder. The process depends upon the oxidizing power of chlorine. The laboratory methods usually employed consist in determining the amount of bleaching powder required in order to convert a known amount of arsenious acid into arsenic acid, or a known amount of ferrous salt into ferric salt; or else in determining the quantity of iodine which will be liberated by a given amount of bleaching powder from a standard solution of potassium iodide.

CHLO'RINA'TION. The conversion of gold contained in an ore into a soluble chloride by the addition of chlorine gas. In 1848 C. F. Plattner suggested that this method could be adopted on a large scale for the recovery of gold from ores. The method as developed is known as the chlorination process and was successfully used for many years in various parts of the world, though later it was replaced by the cyanide process. The chlorination process may be subdivided into two heads: the Plattner process, in which free chlorine gas is added to the ore, and the barrel process, in which chlorine is liberated in the ore from chemicals previously added. With the Plattner process the concentrates or residues are first subjected to a "dead" roast. The roasted ore is dampened and placed in tanks containing false bottoms through which chlorine, generated in another vessel, is introduced. After the ore becomes saturated with chlorine the tank is closed for about 24 hours, during which time the gold is converted into a soluble chloride. The soluble gold chloride is then leached from the ore with water and precipitated from the solution by the use of ferrous sulphate, sulphuretted hydrogen, or some other suitable reagent. The precipitated gold is then collected, melted, and cast into bars. The barrel process is also known as the Thies process, from improvements introduced by Adolph Thies about 1877. This process consists in charging the pulverized ore, together with a small percentage of bleaching powder, into a lead-lined barrel and adding from 40 to 60 per cent of water and the proper amount of sulphuric acid. The barrel is then closed and revolved until all of the gold is converted into a chloride. The recovery of the gold from the chloride is similar to the Plattner process. Many advantages were claimed for the barrel process, and it was used successfully in many gold mills throughout the world. This process has also been replaced by the cyanide process. Consult Rose, *The Metallurgy of Gold* (London, 1902).

CHLO'RINE (from Gk. *χλωρός, chlōros*, greenish yellow). A gaseous element discovered by Scheele in 1774. It was supposed by its discoverer to be hydrochloric acid deprived of phlogiston and was called by him "dephlogisticated marine acid gas." In 1785 Berthollet advanced the view that this gas should be regarded as a compound of hydrochloric acid with oxygen, and this view was universally maintained for nearly a quarter of a century. The error was first pointed out by Gay-Lussac and Thénard in 1809, and in the following year Davy demonstrated clearly the elementary nature of the gas, which he named "chlorine." It is never found free, but occurs extensively in the form of chlorides, as in the mineral halite, or rock salt, and in sea water; in sylvite (potassium chloride); in cerargyrite (silver chloride); also as alkaline chlorides in plants and animals. It may be readily prepared by the action of hydrochloric acid on manganese dioxide and purified by passing through water. Chlorine is employed as such in the manufacture of dyestuffs. It is largely transformed commercially into metallic chlorates and especially into bleaching powder (q.v.). It was formerly obtained by the wasteful Weldon process, i.e., by the action of manganese dioxide on the hydrochloric acid formed as a by-product in the manufacture of salt cake. (See SODA.) At present it is obtained partly by the electrolysis of common salt (see SODA) or of potassium chloride, partly

by the Deacon-Hasenclever process. The latter consists in first passing the hydrochloric-acid gas of the salt-cake manufacture into water, then expelling it by means of sulphuric acid, mixing it with air, heating the mixture to from 450° to 460° C. (842° to 860° F.), passing it at that temperature over brick fragments coated with cupric chloride, and freeing the resulting chlorine from unchanged hydrochloric acid by passing it through water. The cupric chloride itself unchanged (see CATALYSIS) acts as a "catalytic agent," causing the hydrochloric acid to give up its hydrogen to the oxygen of the air, the result being free chlorine and water.

Chlorine (symbol Cl; atomic weight 35.46) is a greenish-yellow gas with an irritating odor. It is readily liquefiable. Under normal atmospheric pressure the liquid boils at 33.6° below 0° C. Hence no compression beyond normal atmospheric pressure is needed to liquefy chlorine at −33.6° C. At 0° C. (freezing point of water) a pressure of 3.66 atmospheres is required. At 80° C., 28.4 atmospheres are required. The highest temperature point at which it is still possible to liquefy chlorine (i.e., its "critical point") is 146°, and at that point the necessary and sufficient pressure is 93.5 atmospheres (the critical pressure). Liquid chlorine is heavier than, and not miscible with water. Chlorine is a nonconductor of electricity and is exceedingly poisonous; it attacks the mucous membranes, causing much irritation, and if inhaled is capable of causing death. It dissolves in cold water, yielding a solution that resembles the gas in color, odor, and other properties. The solubility, curiously enough, increases up to 9° C., but diminishes again as the temperature rises. Chlorine finds important application in the arts as bleaching powder (q.v.), which is very extensively used in the cotton and paper industries. Its bleaching action is due to the readiness with which it combines, in the presence of water, with the hydrogen of the coloring matter. This avidity for the hydrogen of organic matter may be demonstrated by introducing a lighted taper into an atmosphere of chlorine—the taper will continue to burn, its hydrogen combining with the chlorine while its carbon is liberated in the form of soot. Chlorine is also a powerful disinfectant and deodorant and is much used for the destruction of the germs of infectious diseases. In chemical processes chlorine is frequently used as an oxidizer. Chlorine combines readily with basic radicles to form chlorides. Its most important compounds are described under SALT; BLEACHING POWDER; HYDROCHLORIC ACID; ETC. Consult Lunge, *Handbuch der Soda-Industrie und ihrer Nebenzweige*, vol. iii (Brunswick, 1896); also the authorities referred to under BLEACHING.

CHLO'RIS (Lat., from Gk. Χλωρίς). 1. The Greek goddess of flowers, identified with the Roman goddess Flora. 2. One of the daughters of the Theban Amphion and Niobe. She and her brother Amyclas, alone of the children of Niobe, escaped being slain by Apollo and Artemis. 3. The daughter of Amphion of Orchomenos and the mother of Nestor.

CHLO'RITES (from χλωρός, *chlōros*, greenish yellow). A group of minerals crystallizing in the monoclinic system and related to the micas. They are silicates of aluminum, magnesium, and ferrous iron—the latter constituent causing the characteristic green color—and also contain chemically combined water in varying proportions. The aluminum may be replaced partially by ferric iron. They occur as distinct crystals, or in the form of fibres and scales, which possess a well-marked cleavage. The chlorites are usually secondary minerals—i.e., they have been formed by the alteration of other magnesium silicates, such as garnet, amphibole, pyroxene, biotite, etc. This process of alteration, commonly called "chloritization," may be frequently observed among the older rock formations. (See CHLORITE SCHIST; METAMORPHISM.) In chemistry the name "chlorites" is applied to the salts of chlorous acid.

CHLORITE SCHIST, klō'rīt shīst. A foliated rock containing more or less chlorite in parallel plates. Associated with the chlorite may be quartz and feldspar in considerable quantity, hornblende, talc, mica, iron ores, and a great variety of the rarer minerals. Chlorite varies in quantity from an exceedingly small amount to predominance. Chlorite schists are metamorphic rocks resulting from the alteration of igneous or sedimentary rocks of appropriate composition. The chlorite may result from such original minerals as biotite, amphibole, pyroxene, and garnet, and its presence is usually denoted by a green color as well as by a soft, somewhat greasy feel. See CHLORITES; METAMORPHISM.

CHLO'ROFORM (from *chlorine* + *formyl*), or TRICHLOROMETHANE, $CHCl_3$. A colorless, heavy liquid having a sweetish, ethereal odor and burning taste. It does not mix with water, but dissolves freely in alcohol and ether. Its specific gravity at 15° C. is 1.498, and it boils at 61.20° C. It is an excellent solvent for a variety of substances, such as camphor, iodine, sulphur, phosphorus, resins, fats, alkaloids, etc. It is chiefly used, however, as an anæsthetic. It is formed by the direct action of chlorine on methane, or marsh gas, in sunlight; further, by the action of sodium or potassium hydroxide on chloral (q.v.). The method usually employed in making chloroform on a large scale consists in distilling from iron retorts a mixture of bleaching powder, water, and ethyl alcohol, or preferably acetone; the crude product of distillation is purified by shaking with strong sulphuric acid and redistilling. For anæsthetic purposes chloroform must be perfectly pure; and as by the action of light it is readily decomposed if kept in contact with moist air, bottles containing chloroform should be well stoppered and kept in the dark. Pure chloroform is not darkened by shaking with sulphuric acid; it should also contain no phosgene gas, which forms by the action of moist air on chloroform, and may cause bad aftereffects when the latter is employed as an anæsthetic. To prevent the formation of phosgene gas a small amount (0.6–1.0 per cent) of alcohol is added to chloroform. Attempts have been made to find a more efficient preservative of chloroform, but as yet without success: solid caustic potash, e.g., does more harm than good, its contact with chloroform resulting in decomposition, with steady evolution of carbon-monoxide (carbonic oxide) gas. The presence of chloroform in substances submitted for examination may be readily detected by the so-called carbylamine reaction; a small quantity of the substance is gently warmed with a mixture of aniline and an alcoholic solution of caustic potash, when, if chloroform is present, an intensely nauseous smell is observed, due to the formation of carbylamine (phenyl isocyanide). Preparations of chloroform are often used to mask the taste of nauseous medicines. Exter-

nally chloroform is irritant and if confined produces vesication. It is used as a liniment in chronic rheumatism, neuralgia, and chronic inflammations. The chances of danger from using chloroform as an anæsthetic are very small when it is skillfully given in properly selected cases: statistics show that no more than one death occurs in 3000 cases of administration of the substance. Ether, however, is even safer, and is in this country preferred to chloroform. If inhaled in small quantities, chloroform has the effect of abolishing the sensation of pain; for this purpose it is successfully employed in labor. It may also be inhaled to relax spasms in cases of tetanus, gallstone colic, or renal colic. As an anæsthetic, chloroform should be administered with the greatest caution, and ether is substituted for it if the patient suffers from heart disease. If anæsthesia be prolonged several hours, three stages may be distinguished: at first the highest functions of the organism are affected; confusion of the mind is accompanied in the patient by a pleasurable feeling throughout the body; general sensation is blunted, while the lower motor functions are powerfully excited, and the arms and legs are tossed about in a disorderly manner. This is followed (second stage) by general depression, and soon general anæsthesia sets in. The administration of chloroform is, however, carried on until the patient is partially narcotized and reflex excitability is completely abolished (third stage). During the administration of chloroform vomiting is very liable to occur. If dangerous symptoms appear, artificial respiration should at once be resorted to. Chloroform was discovered in 1831, independently by Samuel Guthrie at Sackett's Harbor, N. Y., by Liebig in Germany, and by Soubeiran in France. It was introduced as a general anæsthetic by Simpson, of Edinburgh, in 1848. Consult Baskerville and Hamor in *Journal of Industrial and Engineering Chemistry* for 1912.

CHLOROM'ETRY. See CHLORIMETRY.

CHLO'ROPHANE (from Gk. *χλωρός, chlōros*, greenish yellow + *φαίνειν, phainein*, to appear). A variety of fluorite or fluor spar which emits a bright emerald-green light on a comparatively low rise of temperature, in consequence of which it has some value as a gem stone. Excellent specimens of this mineral are found in Trumbull, Conn., and also Amelia Courthouse, Va.

CHLO'ROPHY'CEÆ (Neo-Lat. nom. pl., from Gk. *χλωρός, chlōros*, greenish yellow + *φῦκος, phykos*, seaweed). One of four great groups of algæ, and commonly called the "green algæ." They usually contain no pigment in addition to the chlorophyll, so that the appearance of the group justifies the name. Chlorophyceæ are usually made to include six orders, but two of them at least are included for convenience rather than because they are closely related to the other groups. These six orders have been described partly in the article on ALGÆ. The group includes the simplest algæ, and these are generally supposed to be the forms from which the higher groups of plants have been derived. On this account green algæ may be regarded as the beginning of the present vegetation. The most primitive of the green algæ are the aquatic Volvocales, which are distinguished from all other green algæ by the fact that the vegetative cells have cilia and are therefore motile. By many they are regarded as animals. The forms of Volvocales range from isolated cells to complex spherical colonies. The Protococcales include a very heterogeneous assemblage of forms and are evidently closely related to the Volvocales. They occur mainly in fresh water and range from an extreme aquatic

habitat to occurrence in moist places, such as tree trunks, shaded earth, etc. They differ from the Volvocales in the fact that the vegetative cells have no cilia and are therefore quiescent. Their range of form is also from a solitary cell to a complex colony, the water net being an extreme expression of colony formation. The most important assemblage of Chlorophyceæ is that called Confervales, which is also a very artificial assemblage, including aquatic and

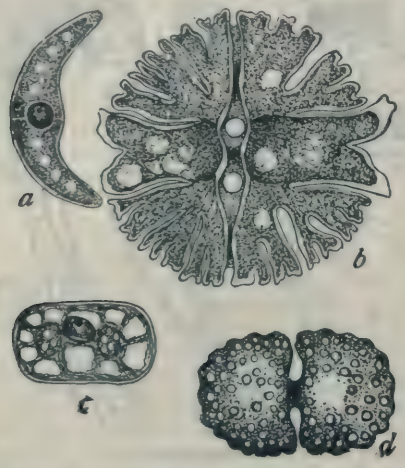
usually filamentous forms. All of them produce swimming spores and have worked out some form of sexual reproduction. The Confervales are supposed to represent the particular group of Chlorophyceæ from which the higher plants have been derived. The Siphonales represent a very

well-defined group, mostly marine, and characterized by having no cross-walls, the whole body, often quite complex, being one continuous cavity. The Conjugales are very distinct forms, and perhaps are not related, at least closely, to the other green algæ. They are characterized by the



CHLOROPHYCEÆ.

Desmids: *a*, Closterium; *b*, Micrasterias; *c*, *d*, Cosmarium.

absence of spores and by the peculiar method of sexual reproduction. It is in this group that the desmids occur, one-celled plants which are often extremely beautiful in form. In the same group is the well-known *Spirogyra*, with its very characteristic chloroplasts, which are spiral bands. The final group which is included under green algæ, simply on account of its pigment and not at all on account of its structure, is called Charales (q.v.).

There are many special monographs covering various orders in this large group. For general treatment, consult Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Berlin, 1899 et seq.). See ALGÆ.

CHLOR'OPHYLL (Neo-Lat. *chlorophyllum*, from Gk. χλωρός, *chlōros*, greenish yellow + φύλλον, *phyllon*, leaf). The green coloring matter of ordinary foliage. This is not a single pigment, but a mixture of at least two—one a green pigment to which the name is sometimes restricted, and a yellow pigment, carotin (q.v.), or xanthophyll. Chlorophyll is also often associated with blue (phycocyanin), brown (phycophæin), or red (phycoërythrin) pigments, especially in the algæ showing these tints. Chlorophyll is only found associated with protoplasm, by which, indeed, it is produced. In some of the small plants it may color the whole protoplasm of the cell, but usually it is restricted to certain definite portions of the protoplasm called chloroplasts (q.v.). It is restricted to plants, though it is not found in all, being wanting in the whole class of fungi, and in some of the seed plants, especially those which live as parasites or saprophytes (q.v.). Chloroplasts have been said to occur in animals, but they turn out on examination to be minute green algæ, which live associated with the animal (e.g., hydra, sponges, certain radiolaria, etc.). The amount of chlorophyll in leaves, according to Tschirch, varies from 0.2 to 1 gram per square meter of surface. From the chloroplasts it may be extracted by various solvents, alcohol, ether, fatty and volatile oils, etc., but probably at once undergoes an alteration in its composition. In alcoholic solution it exhibits the property of fluorescence, being emerald green by transmitted light and deep blood red by reflected light. Molisch's test for chlorophyll is as follows: If a bit of dry tissue to be tested be wetted with a saturated watery solution of potassium hydrate, it instantly turns brown and after 15–30 minutes becomes again green. This change appears immediately on heating or adding water.

The chemical nature of chlorophyll has been discovered during the last five years. It is found to be a complex consisting of at least two green pigments, which are different oxidation stages of the same substance. These two pigments have been called α and β chlorophyllin. They have been crystallized, the form and structure of the crystals varying with the alcohol used. Chlorophyll is chemically related to hæmoglobin, the red coloring matter of the blood. It is found that, if the iron of the hæmatin molecule be replaced by magnesium, the result is chlorophyllin. The best account of the constitution of chlorophyll as shown by recent investigations will be found in Haas and Hill, *An Introduction to the Chemistry of Plant Products* (London, 1913).

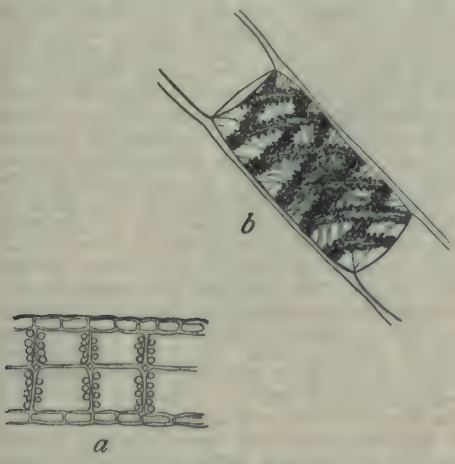
The coloring matters in a live leaf absorb certain wave lengths of light, notably λ 680–660 (between the B and C lines of the spectrum). There are also weaker absorption bands about λ 615–600, λ 560–540, λ 530–527 (nearly E line), and extensive absorption beyond λ 490. (See LIGHT, *Rectilinear Propagation*.) These absorbed portions are utilized in part for the making of food (see PHOTOSYNTHESIS); though the greater portion of the energy is dissipated in evaporating water. In the absence of chlorophyll, however, no formation of carbohydrate foods can occur. To this there are only unimportant exceptions.

Chlorophyll is formed usually only in the plastids which lie near the surface of a plant exposed to light of certain intensity. It is produced in darkness in certain exceptional plants, e.g., embryos of pines. It is only produced within certain limits of temperature and in the presence of oxygen. Probably under the normal conditions of life it is being continually formed and as continually destroyed. Intense light promotes its destruction, so that plants may become blanched thereby. Ordinary blanching (e.g., of celery) is accomplished by darkening, whereby the formation of chlorophyll is checked. See XANTHOPHYLL and CAROTIN.

CHLO'ROPLAST (from Gk. χλωρός, *chlōros*, greenish yellow + πλαστός, *plastos*, formed from πλάσσειν, *plassein*, to shape). In botany, the protoplasmic body found in green plants and distinguished by the green pigment chlorophyll. Chloroplasts are developed only in the cells to which a sufficient amount of light penetrates; therefore in the larger plants they are found only in the cells near the surface. The absorption of light by 6 to 10 cell layers is so complete that neither chlorophyll nor chloroplast is developed. Chloroplasts originate from preëxistent structures of the same kind. Unspecialized protoplasmic organs known as plastids (q.v.) multiply by direct division as the cells divide. Later those plastids in the superficial cells may differentiate into chloroplasts, which also may increase by direct division; those in storage organs may become leucoplasts (q.v.); or in

appropriate regions they may form chromoplasts (q.v.); or the chloroplasts may later be transformed into chromoplasts.

The form of chloroplasts is quite various in some of the algæ. In *Spirogyra* there are one to several chloroplasts in each cell. Each is ribbon-like, with an irregularly toothed edge, somewhat depressed and thicker along the median



CHLOROPLASTS.

a, *Lemna*, with chloroplasts against the vertical walls; *b*, *Spirogyra*, the two chloroplasts consisting of spiral bands.

line (thus troughlike) and spirally coiled in the protoplasm near to the cell wall. In *Mougeottia* the chloroplast is single and platelike, occupying the axis of the cell. In *Zygnema* there are two chloroplasts, each an irregular mass, with radiating arms reaching to the periphery. All these chloroplasts are peculiar in having one or more pyrenoids (q.v.) imbedded in them. In species of *Anthoceros* and *Selaginella* each cell contains a single irregular chloroplast. But in most algæ and mosses and in all the higher plants the chloroplasts are several or many in each cell and have a somewhat flattened globoid or ovoid form.

The structure of the chloroplast, like that of other protoplasmic organs, is not definitely known; but it appears to be vacuolate, i.e., to consist of a firmer colorless portion inclosing many minute spaces filled with chlorophyll; but just how the latter is related to the colorless portion, and whether dissolved or not, is not satisfactorily determined.

The chloroplasts are capable of moving about the cell. When the protoplasm is rotating, the chloroplasts are swept along with it; but they are capable of independent creeping. When a leaf of sorrel, e.g., is exposed to diffuse light, the chloroplasts arrange themselves on the best illuminated sides (top and bottom) with their broad sides turned to the light. This position is known as epistrophe. In direct sunlight they pass to the side walls, standing edgewise to the light—a position known as light apostrophe. A somewhat similar position is assumed in prolonged darkness (dark apostrophe), the chloroplasts accumulating also on the bottom of the cell.

Photosynthesis depends wholly upon the chloroplast and its associated chlorophyll. The decolorized chloroplast is unable to form carbohydrates, and chlorophyll separated from the chloroplast is equally functionless. See ETIOLIN; PHOTOSYNTHESIS; MOVEMENT; PROTOPLASM.

CHLORO'SIS (Neo-Lat., from Gk. χλωρός, *chlōros*, greenish yellow). A peculiar form of anæmia, common in young women, and often associated with menstrual disorders. Constipation, tight lacing, mental anxiety, overwork, and faulty hygiene are factors in its production. In chlorosis the red blood corpuscles are not markedly reduced in number, but are pale, and their hæmoglobin content greatly lowered. It has been called the *green sickness*, from the greenish-yellow hue of the complexion in some patients. The disease is attended with great debility, with breathlessness, palpitation, and occasionally a perverted appetite. Chlorosis is curable in a large proportion of cases. The principal means to be employed are rest, fresh air, moderate exercise, a selected diet, proper clothing, iron, and arsenic. See ANÆMIA.

CHLOROSIS. A diseased state of plants, in which a sickly green or greenish-yellow color takes the place of the natural color. Sometimes only a particular shoot is affected by it, but very generally the whole plant; and it seems to depend upon causes which render the plant altogether unhealthy, the pallid appearance being merely symptomatic, and not only the formation of chlorophyll, but all the functions of vegetable life being languidly and imperfectly carried on. There seems to be considerable evidence that chlorosis is largely the result of malnutrition of the plant. Plants affected by this disease are often to be seen among crops generally healthy; but whole crops of grain, potatoes, etc., sometimes perish from it, or are much diminished in value. Fruit trees also suffer from it. Most investigators claim that chlorosis in plants is due to a superabundance of carbonate of lime in soils, although a lack of magnesia is also considered a contributing cause. Pineapples in Porto Rico became chlorotic when grown in soils containing more than 2 per cent calcium carbonate. The green color was restored by the use of iron sulphate as a fertilizer or sprayed on the leaves. A mixture of nitrate of potash, superphosphate, and iron sulphate may be used as a fertilizer with excellent results. In France grapes are subject to chlorosis to a great extent, and good results are reported to have followed washing the vines and fertilizing them in winter or early spring with an iron sulphate solution.

CHMEL, KMĚL, JOSEPH (1798–1858). An Austrian historian, born at Olmütz. He was appointed in 1846 vice director of state archives in Vienna. His works include *Die Handschriften der kaiserlich-königlichen Hofbibliothek zu Wien* (1840–41); *Geschichte Kaiser Friedrichs IV* (1840–43); and *Urkunden, Briefe und Aktenstücke zur Geschichte Maximilians I* (1845).

CHMIELNICKI, KMYĚL-NĪTS'KÊ, BOGDAN (1593–1657). The leader of the Cossacks in the great revolt against Poland in the middle of the seventeenth century. He belonged to a noble Polish family and was born in the Ukraine. By his courage and daring he won a high position among the Cossack tribesmen about the Dnieper. Oppressed by the Poles, the Cossacks rose in insurrection in 1648 under the leadership of Chmielnicki, who had been wrought up against the Poles by wrongs inflicted upon him. For a time Chmielnicki waged war victoriously, his followers committing the bloodiest excesses. At last, however, fortune forsook his standard,

and in 1654 he placed himself under the protection of the Czar of Russia, who, in return for the suzerainty thus obtained, guaranteed to the Cossacks their ancient rights and privileges. In 1873 an equestrian statue of Chmielnicki was unveiled at Kiev. For his life, consult Kostomarov (St. Petersburg, 1859).

CHMIELOWSKI, KMĔ-LŌF'SKÊ, PIOTR (1848–1904). A famous Polish writer. He was born in Podolia and was educated at Warsaw University and in Leipzig, where he subsequently received his Ph.D. In 1880 he began to lecture on the history of Polish literature at Warsaw University. These lectures were delivered in Polish, and when he was asked to substitute Russian for his native tongue, he preferred to abandon the course rather than comply with the request. Then he devoted himself to literary work with great zeal and success, showing in all he did a scholarly insight and a breadth of view but little known in Polish writers before his day. His many-sidedness is evidenced in the diversity of his interests, for he wrote on literature, pedagogy, art, and the lives of great men. Polish literature of the earlier nineteenth century claimed his particular attention, while he tirelessly combated the maxim of "art for art's sake" expounded by his contemporaries at home and abroad. From 1881 to 1897 he was editor of the *Ateneum*, a monthly literary review published at Warsaw. As author, editor, and translator, Chmielowski did very much to promote the culture of Poland.

Among his numerous works are: *Rousseau* (1878); *Goethe* (1878); *Liberalizm i obskurantyzm* (1882); *Autorkipolskie* (1885); *Adam Mickiewicz* (2 vols., 1886); *Jozef Ignacy Kraszewski* (1886); *Studja i szkice* (1886); *Nasza literatura dramatyczna* (1897); and *Estetyka Mickiewicza* (1898).

CHOATE, JOSEPH HODGES (1832–1917). A distinguished American lawyer and diplomat. He was born in Salem, Mass., and graduated at Harvard College in 1852 and at the Harvard Law School in 1854. He then practiced law for a year in Boston and afterward went to New York City, where he soon became remarkably successful as a lawyer. In 1884 he became a member of the legal firm of Evarts, Choate, and Beaman. As a trial lawyer he became widely known and after 1865 conducted many noteworthy cases before State, Federal, and international tribunals. Among them may be mentioned his successful defense of Gen. Fitz-John Porter, the Tweed Ring prosecution, the Tilden will contest, the Chinese exclusion cases, the cases in which he successfully contested the constitutionality of the Income Tax Law of 1894, and the Bering Sea dispute, in which he represented the Canadian government. Mr. Choate became a Republican in 1856, when he supported John C. Frémont, and in 1894 he was president of the New York State Constitutional Convention. He became an active opponent of machine government and in 1896 was defeated for the United States Senatorship by Thomas C. Platt. He was president of the American Bar Association in 1898–99. From 1899 to 1905 he was the Ambassador of the United States to Great Britain, serving in that capacity with distinction and notable personal popularity. He received the degree of D.C.L. from Oxford, and that of LL.D. from many foreign and American universities, and was made an honorary bencher of the Middle Temple. In 1907 he was first delegate of this country to the International Peace Conference at The Hague. Throughout his active life, and even after retirement from professional and official duties, he was much in demand as a speaker on public occasions; as an after-dinner speaker his fame was international.

CHOATE, RUFUS (1799–1859). One of the most famous of American lawyers. He was born in Ipswich, Mass., on Oct. 1, 1799. As a child he was remarkable for precocity, beginning to read while still almost an infant, and being able before his sixth year to repeat large portions of the Bible and of *Pilgrim's Progress*. In 1815 he entered Dartmouth College, where he soon attracted attention by his scholarly habits and unusual abilities and evinced an aptitude for classical and historical studies which characterized him through life. He graduated in 1819 as valedictorian of his class, was a tutor at Dartmouth during the following year, and then, under the inspiration of Webster's great speech in the Dartmouth College case, which he had heard in 1818, he took up the study of law, entering the Cambridge Law School in 1821 and subsequently removing to the office (in Washington) of William Wirt (q.v.), then Attorney-General of the United States. He returned to Massachusetts in 1822, continued his studies in Ipswich and Salem, was admitted to the bar in the following year, and began practice in Danvers. He married, in 1825, Miss Helen Olcott. He remained in Danvers until 1828, when he removed to Salem. In 1830 he entered Congress as a Whig, and immediately attracted general attention by a brilliant speech in favor of a protective tariff. He was reëlected in 1832, but resigned in 1834 before the expiration of his term, and opened an office in Boston, where he soon became the acknowledged leader, first of the local, then of the State, and finally of the New England bar. In 1841, Daniel Webster having become Secretary of State, Choate was elected to serve out his term in the United States Senate and represented Massachusetts until 1845, taking a conspicuous part in the debates on the Oregon boundary, the tariff, and the annexation of Texas. Weakened by overwork, he spent the summer of 1850 in Europe. In 1852, as a member of the Whig Convention in Baltimore, he led the faction which advocated the nomination of Webster, delivering on this occasion one of his most eloquent addresses; and in 1856, along with a section of the conservative Whigs, he supported Buchanan in opposition to Frémont. In 1859 his health failed him, and under the advice of his physician he sailed for Europe, but, feeling unable to complete the voyage, landed at Halifax, where in a few days—on July 13—he died. Throughout his life he was a thorough student, not only of law, but also of the classics, English literature, and history, reading with avidity and remembering everything that he read. His eloquence and remarkable facility in the use of the English language, his intuitive knowledge of human nature, and the acuteness and vigor of his intellect combined to make him preëminently successful as a lawyer, especially as a jury lawyer, and in the course of a long career he seldom lost a case. Consult: Brown, *Life of Rufus Choate* (Boston, 1870); *The Works of Rufus Choate, with a Memoir* (2 vols., Boston, 1862); *Addresses and Orations of Rufus Choate* (6th ed., Boston, 1891); Neilson, *Memories of Rufus Choate* (Boston, 1884); and Whipple, *Recollections of Eminent Men* (Boston, 1886).

CHOBI, chō'bē. A Bantu people in southeastern Africa, extending from the lower Limpopo to the sea. They are called Chobi on the river and Mindonga on the coast. They disfigure their faces with lumps raised by scarification.

CHOC'OLATE (Mex. *chocolatl*, from *choco*, coca, *latl*, water). A preparation made from the seeds of *Theobroma cacao*, a plant whose culture is restricted to an area bounded by 20° on either side of the equator. (See CACAO.) These seeds, after being removed from the pods, which are shelled and broken, are allowed to ferment and cure. The beans are then washed, dried, "finished," and polished for export. In the process of manufacture the beans are first graded, then roasted, cracked, nibbed, husked, and winnowed. They are then ground in a mill, and, if the fat or oil which constitutes not far from 50 per cent of good cacao beans must be removed for cocoa, the mass is then treated in a press, and the cocoa left after the fat is expressed is removed, allowed to cool, and crushed and powdered. Chocolate, which contains more of the fat, is taken direct from the grinding mill and is mixed with sugar or other materials as desired and then placed in molds, where it cools and hardens. Chocolate is used as a beverage and for this purpose is dissolved in hot water or milk. It is also much used as a confection and for this purpose is mixed with sugar, flavoring matters, and various other substances. The cacao tree, from which chocolate is made, flourishes in tropical regions, and the increase in the annual production and consumption of cacao beans practically doubled in the period 1903–13, amounting in 1911 to 550,000,000 pounds. The leading producers of that year were Ecuador, 88,660,000 pounds; Brazil, 86,000,000 pounds; Gold Coast, 77,000,000 pounds; St. Thomas, 73,000,000 pounds; Trinidad, 53,000,000 pounds; Dominican Republic, 214,000,000 pounds; and Venezuela, 40,000,000 pounds. The world's consumption in 1911 was stated as about 512,000,000 pounds, of which the approximate amounts taken by the leading countries were as follows: United States, 135,000,000 pounds; Germany, 110,000,000 pounds; France, 63,000,000 pounds; England, 56,200,000 pounds; Holland, 52,000,000 pounds; Switzerland, 22,700,000 pounds. In 1913 crude cacao, or cocoa, to the amount of 140,039,172 pounds, valued at $17,389,042, and 3,469,680 pounds of prepared cocoa and chocolate, exclusive of confectionery valued at $787,678, were imported into the United States. Chocolate was brought to Europe by the Spaniards, who learned its use from the Mexicans at the time of the invasion of Cortés in 1519. It was introduced into England about 1657. In the time of Charles II it was still a great luxury, costing 6s. 8d. per pound. In the United States chocolate was first manufactured at Milton Lower Mills, near Dorchester, Mass., in 1765.

Good chocolate is externally smooth, firm, and shining—not gritty in the fracture—easily soluble, and aromatic; not viscid after having been liquefied and cooled, but oily on the surface, and leaves no sediment of foreign substances. Chocolate is adulterated in many ways, by mixing it with rice meal, oatmeal, flour, potato starch, roasted hazelnuts, or almonds, and with benzoin, storax, etc., in place of vanilla.

Bibliography. Whymper, *Cocoa and Chocolate: Their Chemistry and Manufacture*, with bibliography (London, 1910); *Bulletins, United States Department of Agriculture*, Ewill, No. 13; No. 107 (1907); No. 32 (1910); Duval, *Confiserie moderne* (1908); Zipperer, *The Manufacturer of Chocolate* (New York, 1902). Also various volumes by manufacturers, such as Baker, *Cocoa and Chocolate* (Dorchester, 1904), and Historicus, *Cocoa and All about It* (London, 1880).

CHOCÓS, chō-kōz'. An Indian tribe, whose language constitutes a distinct stock, occupying the valley of the Río Atrato and the Pacific coast of Colombia between 4° and 8° N. lat. Consult Brinton, in *Proc. Amer. Philos. Soc.* for 1896 and 1897, and Rivet in *L'Année linguistique* (1908–10), vol. iv, pp. 123–126 (1912).

CHOC'TAW. An important Muskhogean confederacy, formerly occupying southern Mississippi and the adjacent parts of Alabama. They were sedentary and agricultural, slow and unwarlike in disposition, contrasting strongly with their cousins, the restless Chickasaw. Throughout the Colonial period they generally sided with the French, but were always doubtful allies. They flattened the head and had peculiar burial rites, the body being disinterred after a few days, when the bones were picked clean, by old men appointed for the purpose, and afterward preserved in their houses. About the close of the Revolution they began to drift westward into Louisiana. In 1830 they ceded all their remaining lands east of the Mississippi and removed to Oklahoma, where, under the style of the "Choctaw Nation," they maintained an autonomous form of government similar to that of the Cherokee (q.v.) until admitted to citizenship. There are now about 15,000 "citizens" in the nation, of whom perhaps two-thirds may be of pure or mixed Choctaw blood. There are also 1366 still remaining in Mississippi, Louisiana, and Alabama.

CHODAT, shō'dä', ROBERT (1865–). A Swiss botanist, born at Moutier-Grandval, Jura-Bernois, Switzerland. He was educated largely at Geneva University, where he became assistant professor (1889) and professor (1890) of systematic botany and (1900) professor of botany, and where he was dean of the faculty of sciences from 1898 to 1906 and rector of the university from 1908 to 1910. Besides some 200 articles in various journals of botany, his publications include: *Principes de botanique* (1907; 2d ed., 1911); *Sur le polymorphisme des Algues* (1908); *Aperçu de la géographie botanique du Paraguay* (1910).

CHODKIEWICZ, kōd'kē-ā'vĭch, JAN KAROL (1560–1621). A Polish general. He learned the science of war in the Spanish army, serving under Alva and Maurice of Nassau. On returning home he was made a lieutenant to Zolkiewski, and in this capacity he aided in crushing the Cossack uprising of Naleujko. He took part in the campaigns against Wallachia, in 1602 received command of the Polish army in Livonia, and in 1605 severely defeated Charles IX of Sweden near Kirchholm. For lack of adequate funds he was unable properly to follow up this victory, and in 1611 he concluded a truce with the Swedes. He was sent by Sigismund III to Russia to prosecute the war there in behalf of the Pseudo-Demetrius; but, hampered by the disorganization of his army, was compelled to relinquish Moscow and ultimately returned to Poland. He commanded in 1620–21 an army against the Turks, beating back an army of 160,000 trained veterans under Sultan Osman.

A few days after this victory (Sept. 24, 1621) he died of exhaustion in his camp. Consult the biography by Naruszewicz (new ed., Cracow, 1857–58).

CHODOWIECKI, kō'dō-vyĕts'kē, Daniel Nikolaus (1726–1801). A German painter and engraver, born in Danzig, West Prussia. At first a merchant in Danzig and Berlin, he afterward studied painting in the latter city; was for a time a miniature painter, but was chiefly successful as an engraver. He was appointed director of the Academy of Arts in Berlin in 1797. He executed over 2000 engravings, of which the best are genre studies of everyday life. Admirable plates were prepared by him for Lessing's *Minna von Barnhelm*, Gellert's *Fabeln*, Schiller's *Räuber*, and German versions of *Don Quixote* and Goldsmith's *Vicar of Wakefield*. Most of his paintings are rather weak imitations of Watteau, but he is best in family groups, such as "The Departure of Jean Calas." The Berlin Museum contains two unimportant pictures in oil, and the Berlin Academy a number of wash and pen-and-ink drawings. Consult: Engelmann, *Chodowieckis sämtliche Kupferstiche* (Leipzig, 1857; supplement, 1860); Hirsch, *Nachträge zu Chodowieckis sämtliche Kupferstiche* (Leipzig, 1906); Meyer, *Chodowiecki, der Peintre-Graveur* (Berlin, 1887).

CHODZKO, kōdz'kō, Leonard Jakob (1800–71). A Polish historian, born at Oborek (Government of Vilna). After study at the University of Vilna he traveled with Prince Michael Cleophas Oginski, who had commanded a regiment in the insurrection of 1794. Having taken up residence in Paris, he received the appointment of adjutant to the Marquis de Lafayette for his activity in connection with the July Revolution (1830). During the insurrection of 1863–64 in Russian Poland he was agent at Paris of the revolutionary government. He wrote many historical works, most of them in French. These include *Observations sur la Pologne et les Polonais* (1827), designed as an introduction to Ozinski's *Mémoires sur la Pologne et les Polonais depuis 1788 à 1815* (2 vols., Paris, 1826); *Histoire populaire de la Pologne* (1835); *La Pologne historique, littéraire, monumentale, et pittoresque* (2 vols., 1835–37; 8th ed., 3 vols., 1854–57).

CHŒNIX, kē'nĭks (Lat., from Gk. χοῖνιξ, *choinix*). A Greek dry measure, varying in size under different standards. In Athens, according to the system introduced by Solon, it was equivalent to 4 cotylæ, 1.08 liters, 1.14 quarts. In the later Athenian system, established about 100 B.C., the cotyle was equivalent to 0.2047 liter, the chœnix to 6 cotylæ, 1.228 liters, 1.297 quarts. Consult Hultsch, *Metrologie der Gricchen und Römer* (1882).

CHOËPHORI, kō-ĕf'ō-rī, The. The second tragedy of the Orestean trilogy by Æschylus (q.v.).

CHŒRILUS, kĕr'ĭ-lŭs (Lat., from Gk. Χοιρίλος, *Choirilos*). An Athenian dramatist of the late sixth and early fifth centuries B.C., the rival of Pratinas, Phrynichus, and Æschylus. Tradition says that he was preëminent in satyric dramas. The lexicographers attribute to him 150 plays in all and report that he won 13 victories.

CHŒRILUS OF SAMOS (c.470 B.C.–). The author of an epic poem called the Περσηΐς, *Persēïs*, or Περσικά, *Persika*, descriptive of the Persian wars. He was, according to tradition, a friend of Herodotus and of Lysander the Spartan; he lived also at the court of Archelaüs (q.v.) of Macedonia. He was the first epic poet to choose his subject from contemporary history. His work received the honor of public recitation together with the poems of Homer, and was admitted to the Epic Canon, later to be ejected by the grammarians of Alexandria, in favor of that of Antimachus (q.v.). The fragments are included in Kinkel, *Epicorum Græcorum Fragmenta* (Leipzig, 1877). Consult also Müder, in *Klio* for 1907.

CHOG'SET. See Cunner.

CHOIR, kwīr (older forms *quire, quier, queer;* modern spelling affected by Fr. *chœur*, Lat. *chorus*, from Gk. χορός, *choros*, whence the word is derived). Strictly speaking, the choir is the part of the church occupied by the singers, wherever that may be; but at different periods in church architecture it came to designate two distinct sections: (1) in early churches, the part midway between the upper end, or sanctuary, occupied by the higher clergy, and the lower end, or nave and aisles, occupied by the laity; (2) in mediæval and later churches, the entire upper or eastern end of the church, including high altar and apse, to which the singing had been transferred. The ritualistic sense, however, does not always agree with the architectural; for we speak of the choir of a cathedral, meaning the entire upper end beyond the transepts with its aisles or chapels, whether the singing is done there or not. In early basilican churches the upper end is called *apse*, and not choir, and the choir, as in San Clemente in Rome, is the space below the high altar, extending part way down the nave and slightly raised above its level, surrounded by a decorative parapet within which are marble benches for the singers, with a pulpit on each side and a paschal candlestick attached to the gospel pulpit (on the left side as one faces the high altar). This arrangement still persists in many Spanish cathedrals. This kind of choir is less a part of the architecture than of the ritualistic furniture and ornament. But, when monasticism gained complete control of church architecture in the eighth century, the old distinctions between higher and lower secular clergy no longer obtained, the division between choir and sanctuary lapsed, and the entire upper end became the choir. As the monks were numerous, and on the mediæval theory the worship of God was the primary consideration, the edification of the laity being secondary, the size of the choir increased, and the choir screen, shutting off the monks and the services from the laity in the lower part of the choir, was made lofty and heavy. Only when episcopal power returned and with it cathedral architecture and numerous lay congregations, in the eleventh and twelfth centuries, was this segregation of the choir partly broken down and some return made to early Christian custom. But the monastic custom of high choir screens was retained in many cathedrals, especially in England, where nave and choir are completely separated, attendants upon the services being usually seated within the latter. In England the term "chancel" (q.v.) is used to designate the upper end of churches without canons, e.g., parish churches. Ordinarily architects distinguish an apse from a choir in the sense of using the latter only when there is a considerable projection beyond the transept or nave. This projection often includes a cer-

CHOIR OF THE CATHEDRAL OF SAINT JOHN THE DIVINE, NEW YORK CITY

tain straight portion, as a continuation of the nave and aisles; then a semicircle with projecting choir chapels and choir aisles. An important feature of the architectural effect of the mediæval choirs was provided by the choir stalls, or sedilia. These are ranges of individual seats, sometimes in two or even three rows on either side of the choir, each higher than the one in front of it, those of the rearmost or highest row having an elaborate pinnacled canopy over each seat. The seats were pivoted to fold back while the choristers stood for the singing, with a carved projection (*miserere*) on the underside to relieve somewhat the strain of long standing. These choir stalls are superb examples of wood carving and inlay. For the æsthetic significance of the development of the choir in mediæval churches, the varieties of its form in different schools, see ARCHITECTURE. Choir is also the name given to the singers of the choral service.

CHOIR SCREEN, or **CHOIR WALL.** The screen or wall which divides the choir and presbytery from the nave and side aisles. When it bears a cross over the central entrance, it is sometimes called the rood screen. In the great monastic churches it was a solid wall with a single archway in the centre; but in many English cathedrals this has been replaced by a screen of open ironwork in modern times. Wooden screens are not uncommon in the smaller churches. The choir screens of the fourteenth and early fifteenth centuries in France are especially rich, as at Albi and Brou.

The term "choir wall," or "choir inclosure," is commonly applied to the screen wall separating the choir from the side aisles. Celebrated examples of this are those of the French cathedrals of Chartres and Amiens.

CHOISEUL-AMBOISE, shwä'zēl' äN'bwäz', ETIENNE FRANÇOIS, DUC DE (1719–85). A French statesman. He fought bravely in the War of the Austrian Succession, but did not attain any prominence until later, when his attractive bearing and disposition won for him the favor of Madame de Pompadour, and as long as she lived his advancement was continuous and regular. He was made lieutenant general in 1748. In 1756 he was sent as Ambassador to Rome, where he adjusted with Pope Benedict XIV the dispute over the sacraments. In the same year he went to Vienna, intrusted with the mission of uniting Austria with France against Prussia. After accomplishing this he was made Minister of Foreign Affairs (1758) and created Duc de Choiseul (he had formerly been Count Stainville). He was the author of the *Pacte de famille*, which in 1761 brought about the alliance of all the Bourbon crowns against foreign aggression. His popularity with the court and the nation was increased when in 1763 he secured terms of peace for France, which, though humiliating, were far better than the French dared to hope for. His reputation was enhanced by his success in suppressing the Jesuits, whom Madame de Pompadour had come to hate no less than did the nation. His patroness died in 1764, but Choiseul continued to direct both the internal and external affairs of France. He was a skillful courtier and shrewd diplomatist and so controlled the intrigues of European courts that Catharine II of Russia gave him the name *le cocher de l'Europe* ('the coachman of Europe'). In 1768 he brought Corsica under French dominion. In 1770 Madame du Barry caused his dismissal. He lived magnificently in Chanteloup and (under Louis XVI) in Paris. He died May 7, 1785. Consult: *Mémoires de Choiseul* (2 vols., Paris, 1790); Boutry, *Choiseul à Rome* (ib., 1895); Broglie, *L'Alliance autrichienne* (ib., 1895).

CHOISEUL-GOUFFIER, gōō'fyā', MARIE GABRIEL AUGUSTE FLORENT, COMTE DE (1752–1817). A French diplomatist and archæologist. In 1776–82 he visited Greece and made a careful study of the whole country. His investigations resulted in the magnificent work *Voyage pittoresque de la Grèce* (2 vols., 1782–1822). He became a member of the French Academy in 1784 and two years later was sent as Ambassador to Constantinople, where he remained eight years. During the Revolution he adhered to the royal cause and afterward went to Russia, where he was made director of the Imperial libraries and of the Academy of Fine Arts. He returned to France in 1802 and under the Restoration was Minister of State. He was a lifelong friend of Talleyrand.

CHOISEUL-PRASLIN, -prä'lăN', EUGÈNE ANTOINE HORACE, COMTE DE (1837–). A French politician. He served in the navy from 1853 to 1865, held some minor offices, and in 1869 was elected to the Corps Législatif. In 1871 he was chosen to represent Seine-et-Marne in the National Assembly. He was elected to the Chamber in 1876, 1877, 1881, and 1889. From March to November, 1871, he was Minister Plenipotentiary of France to Italy and in 1880 was appointed Undersecretary of State in the Ministry for Foreign Affairs. In 1887 he was dispatched on a botanical mission to Ceylon and the United States. He was regarded as very influential in the Republican majority.

CHOISEUL (shwä'zēl') -STAINVILLE, CLAUDE ANTOINE GABRIEL, DUC DE (1760–1838). A French soldier and politician. He was a colonel of dragoons during the French Revolution and warmly supported the royal cause. He was one of those who arranged the flight of Louis XVI in 1791, but, after the royal party was captured, a price was set upon his head, and he was finally taken prisoner and confined at Dunkirk. He escaped, but was recaptured and condemned to death. He escaped, however, and at the Restoration received a seat in the House of Peers from Louis XVIII. In the Revolution of 1830 he was a member of the provisional government and afterward was appointed by Louis Philippe to the offices of governor of the Louvre and royal aid-de-camp. He wrote an account of the flight of the King (1822).

CHOISY-LE-ROI, shwä'zē'le-rwä', or **CHOISY-SUR-SEINE,** sŭr-sān'. A town in the Department of Seine, France, on the river Seine, 6 miles southeast of Paris (Map: Paris). It owes its importance to the pleasure château built here by Mlle. de Montpensier in 1682, which was acquired later by Louis XV as a residence. It was destroyed during the French Revolution. The church and the town hall were built in the reign of Louis XV. Among its monuments is a bronze statue of Rouget de l'Isle, author of the *Marseillaise*, who died here in 1836. The industries comprise textile, porcelain, glass, hat, and chemical factories. Pop. (commune), 1901, 11,281; 1911, 15,908.

CHOKEBORE. A shotgun (q.v.) whose bore is slightly narrowed towards the muzzle in order to concentrate the shot.

CHOKECHERRY (so called on account of its astringent fruit). A name given to those

species of the genus *Prunus* of which the fruit is astringent. They are comprised in the section *Padus* of the genus *Prunus;* they are natives of North America and have small fruit that hangs in racemes. The true chokecherry is *Prunus virginiana,* which is a shrub or small tree. Closely allied to it is the wild black cherry, *Prunus serotina.* This is an important forest tree, 60 feet high, and ranging over the United States from Maine to Florida and west to the Dakotas and Texas. It is a handsome tree, and its wood is one of the most valuable of American woods for cabinetwork. It has a considerable resemblance to the Portugal laurel, although the leaves are deciduous. The bark is used as a febrifuge, pectoral, and tonic, under the name of wild-cherry bark; and by distilling it with water, a volatile oil is obtained from it associated with hydrocyanic acid, called oil of wild cherry. This bark allays nervous irritation and is particularly suitable as a tonic. See WILD CHERRY.

CHOKE DAMP. See CARBONIC-ACID GAS.

CHOKED DISK. See OPTIC NEURITIS.

CHOKING. See LARYNGOTOMY; TRACHEOTOMY.

CHOLAGOGUE, kŏl'ȧ-gŏg (Gk. χολαγωγός, *cholagōgos,* from χολή, *cholē,* bile + ἀγωγός, *agōgos,* bringing, from ἄγειν, *agein,* to carry). An old term for a cathartic medicine which increases the flow of bile. The most reliable are calomel, phosphate of soda, and podophyllum. Cholagogues act either by promoting the secretion of bile or by facilitating the flow of bile from the gall bladder into the duodenum. See PURGATIVES.

CHOL'ELITHI'ASIS. See CALCULUS, or STONE.

CHOLERA, kŏl'ĕ-rȧ (Lat., from Gk. χολέρα, *cholera,* the cholera, from χολή, *cholē,* gall bile). A term applied to four different diseases known respectively as *cholera morbus, cholera nostras, cholera Asiatica,* and *cholera infantum.* An account of the last-named disease is given in a special article. The others may be briefly described in the present sketch.

Cholera Morbus. This is a rarely serious attack of gastroenteritis, characterized by vomiting, diarrhœa, cold surface, cramps in the abdomen, and some prostration. It is caused by eating indigestibles or overloading the stomach, by excessive drinking of ice water, exertion or exposure immediately after eating, etc., and usually occurs in the summer. In adults the treatment consists in emptying the digestive tract, then giving opium and carminatives, and resting the alimentary canal for several hours.

Cholera Nostras. This is an intense form of acute enteritis, which has appeared in various parts of Europe, sometimes in epidemic form, since the days of Hippocrates. The name was adopted after Asiatic cholera appeared and invaded Europe, to distinguish it from the latter disease. Cholera nostras is brought on by similar causes, and resembles cholera morbus except that the invasion is less sudden, the pains are more severe, and the prostration is more pronounced. Cramps occur in the legs, fingers, and arms, the skin becomes blue, and delirium or convulsions occur. Death is rare except among the aged, children, and invalids. No one cause can be named for it. The ordinary and normal intestinal bacteria (*Bacillus coli communis*) have been found in the fæces, but not the spirilla. The disease is not frequent in the United States, unless it be considered identical with the severer forms of cholera morbus. The term is but rarely used by American physicians. During an epidemic of true cholera it is difficult to differentiate cases of cholera nostras, except by the absence of the spirilla in the dejections. In treating cholera nostras the digestive tract should be emptied by washing out the stomach and by using purgatives; the rectum should be irrigated with large quantities of hot tannin solution; the patient should take a hot bath and be warmly covered; the heart should be supported by proper medication. The attack may last several days and is usually followed by considerable weakness and digestive disturbances.

Asiatic Cholera. This is an infectious disease caused by drinking water or food contaminated by the fæces of other cholera patients and containing a flagellated vibrio, the *Spirillum choleræ.* It is probably never communicated by contagion, i.e., through the breath, perspiration, or other emanation from the patient. The disease originated in India, where it is endemic. The earliest-known account of the disease is probably that of Sueruta, a Hindu physician. Its permanent home is Calcutta and the southern part of Bengal. It has existed since 1817 in endemic form, and epidemics of it antedate the Christian era. Cholera first appeared in China in 1820; in Arabia, Persia, and Mesopotamia in 1821; in Syria, Palestine, and on the shores of the Caspian in 1823. The second epidemic, starting from the Ganges in 1826, passed through Persia and Astrakhan to Russia in 1830 and to Poland in 1831. Meanwhile it extended through Mesopotamia, Arabia, Palestine, and Egypt, and from Russia it passed into Germany. After invading Austria, Hungary, Wallachia, and Turkey, it reached England in 1831. Brought by Irish immigrants to Quebec in 1832, it entered the United States by way of Detroit, Mich., and thence it spread through the West to the Pacific coast and south to New Orleans. Subsequent epidemics occurred in 1841, 1863, 1871, 1883, 1891, and 1893. The disease prevailed in America in 1848 and 1852 and from 1865 to 1868. It appeared in New Orleans and the valley of the Mississippi River in 1873, and in 1892 a few cases came to the port of New York from Hamburg, Germany. In 1899 it was found by the United States troops in the Philippine Islands, where it has probably been often prevalent.

Most cases of cholera begin with nausea, restlessness, and chilly sensations, followed by violent and frequently recurring diarrhœa, with vomiting and vertigo. In from one to six hours buzzing in the ears, palpitation of the heart, pressure over the stomach, an anxious gray face, and blueness of the whole surface supervene. The bowels are emptied, painlessly, of discharges resembling rice water. Pain in the stomach and in the region of the heart is often severe, and cramps occur in the calves and arms. The patient suffers continually from thirst. The external temperature is subnormal, being about 95° F., or lower, while the rectal temperature may be 103° or 104° F. The pulse rarely exceeds 100, while the respiration is usually increased to 30 or 40. Urine may be suppressed. The patient may sink into a somnolent and then a comatose condition and die, or else he may suddenly improve, and then either go on to convalescence or sink into fatal coma in a

few days. Of the mild cases, about 50 per cent die; while of those with subnormal temperature, cyanosis, and coma, 90 per cent die. A mild form of true Asiatic cholera, known as *cholerine*, is rarely fatal, but is dangerously infectious. Lobar or lobular pneumonia, enteritis, nephritis, and neurasthenia may follow cholera.

Asiatic cholera is due to a slightly curved bacillus which, from its shape, is called the comma bacillus (*Spirillum choleræ Asiaticæ*). The bacillus, discovered by Koch in 1883, is a short motile rod from 1 to 2 micromillimeters long. A number of such bacilli are often found clinging to one another at their ends and thus forming spirals of various lengths. The bacillus grows in the presence of oxygen and does not produce spores, the temperature best adapted to its growth being about that of the human body. It is, however, quite resistant to cold, though it is readily destroyed by drying or boiling. Its definite biological characteristics usually enable an expert to determine its pressure or absence in intestinal evacuation early in the disease. The bacilli are usually confined to the intestines, and during the active stages of the disease may be present in enormous numbers. The systemic effects seem to be due to absorption of toxins produced by the bacilli and are of the nature of a toxæmia. The pathological changes are not characteristic, and an autopsy shows those degenerative changes which usually accompany acute infection. In the small intestines, where the bacteria are present in greatest abundance, there are apt to be hemorrhages into the mucous membrane and intense congestion. The lymph follicles of the intestines are swollen and congested. The contents of the intestines may either consist of the typical rice-water fluid or else may be dark colored and bloody.

Patients suffering from cholera should be thoroughly isolated. Suspicious cases, also, should be isolated as soon as possible, and their dejections subjected to bacteriological examination. The vessels receiving the dejecta should contain a 5 per cent solution of carbolic acid and should be cleansed with boiling water after being used. The bedding and clothing of the patient should be disinfected by steam or soaked for one hour in a 5 per cent solution of carbolic acid. The room used should be scrubbed with a similar solution, and all loose articles either burned or sterilized by steam or by formaldehyde vapor. Bodies of the dead should be promptly wrapped in a close sheet saturated with bichloride of mercury or carbolic-acid solution and buried at once. Nurses, physicians, and undertakers should disinfect their hands, faces, and clothes with the greatest care. According to a rule adopted in the United States and in Germany, all persons arriving from infected districts are quarantined five days; if cases of cholera have broken out among them, the quarantine must be extended a week longer. As further preventive measures in time of danger, all water used for drinking or for washing tableware should be boiled, and all fruit, ice, and milk should be carefully inspected.

The treatment of cholera consists in supporting the patient by opium, astringents, stimulants, heat, etc. Some success has followed flushing the rectum with salt solution, and subcutaneous injections of the same. The immense losses of fluid from the body engender an intense thirst and concentrate the toxins; therefore the patient should be given a liberal supply of water by mouth. Anticholera inoculation has been used with considerable success, according to Haffkine's method. Artificial immunization is secured by subcutaneous injection of cultures of diminished virulence followed by injections of cultures of increased virulence. Forsyth reports on the use of Haffkine's serum in 1903 that no ill effect followed 30,609 inoculations. Of these 329 were attacked by cholera, of whom 15.1 per cent died. The uninoculated suffered a mortality of 45.2 per cent. Others report 40 per cent mortality among the inoculated who subsequently contracted cholera, and 75 per cent among uninoculated cholera patients. See SERUM THERAPY. Consult Wendt, *Treatise on Cholera* (New York, 1898).

CHOLERA INFANTUM (Lat., the cholera of children). A fatal form of diarrhœa, of infectious origin, occurring in infants and young children, especially in the summer months. The *Bacillus dysenteriæ* of Shiga is believed to be the specific infectious agent, but it is not always found in the stools. Attacks are caused by the ingestion of impure milk or other foods and are generally precipitated by chilling of the abdomen, the child lying uncovered during a cool night following a hot day. The onset of the disease is sudden, with great prostration, a rise of temperature to 103°–105° F., almost constant vomiting of food, mucus, and bilious material; 12 to 15 passages from the bowels each day, first of green, yellow, or brownish color, later of colorless serum, in most cases odorless, in some few instances overpoweringly offensive; rapid emaciation and loss of weight; depressed anterior fontanelle, sunken eyes, sharp features, a peculiar pallor, and an anxious expression; nervous irritation and moaning or crying; dullness, rarely delirium. The disease is fatal in two-thirds of the cases, and almost all cases occur in bottle-fed children of the poor during the first or second summer of their lives. In institutions the mortality is sometimes as high as 90 per cent. In such a fatal disease preventive treatment is most important. Strict attention to the preparation and keeping of milk is the chief consideration. During the summer months the milk should be pasteurized, or certified milk should be used; the enforcement of municipal milk inspection in many large cities has reduced the death rate from summer diarrhœa to a minimum. The child should be protected by suitable clothing from chilling of the abdomen at night. Treatment, when the attack is established, varies in individual cases, but the general indications are in the beginning to empty the bowels of infectious material by purgatives, such as calomel or castor oil, or by enemas; to withhold all food for 24 hours, meanwhile giving plenty of water to combat emaciation and relieve thirst, and following that by rice, barley, or albumen water, and a gradual return to the normal food. Small doses of brandy constitute the best stimulant. If the diarrhœa persists, opium, bismuth, or chalk mixture is useful. The term "cholera infantum" is also sometimes used, inaptly, as a synonym for gastroenteritis (q.v.). Consult Holt, *Diseases of Infancy and Childhood* (New York, 1904).

CHOL'ERINE. See CHOLERA, *Asiatic*.

CHOLESTERIN, kō-lĕs'tĕr-ĭn (from Gk. χολή, *cholē*, bile + στερεός, *stereos*, solid), $C_{26}H_{43}OH$. H_2O. A white crystalline substance occurring as a normal constituent in cell protoplasm. It

is therefore widely disseminated in both the animal and vegetable kingdoms. It is found in considerable quantities in the nerves and the white matter of the cerebro-spinal axis, and also occurs in milk, in the blood, and the bile, and is the main constituent of gallstones, from which it may be readily prepared by extracting with boiling water and dissolving in hot alcohol. On cooling, the alcoholic solution thus obtained deposits cholesterin in somewhat impure form; the substance is then purified by recrystallization from alcohol. Cholesterin crystallizes in glittering nacreous scales, melting at 148.5° C.; it may be distilled in vacuo, without decomposition, at temperatures above 360° C. Chemically it is a monatomic alcohol. When its solution in chloroform is shaken with strong sulphuric acid, the solution assumes a blood-red coloration, which gradually changes to blue, green, and finally yellow. Cholesterin is insoluble in water. An alcohol of the same molecular formula as cholesterin, called "phytosterin," or "plant cholesterin," is widely distributed in the vegetable kingdom and may be readily obtained by extracting peas with ligzoin, filtering, evaporating the filtrate to dryness, and recrystallizing the residue from alcohol. With chloroform and sulphuric acid phytosterin shows the same reaction as cholesterin. Phytosterin melts at 133° C. Both cholesterin and phytosterin are optically active, both turning the plane of polarized light to the left, though not to the same extent.

CHOLET, shō'lā'. A town of France, in the Department of Maine-et-Loire, on the right bank of the Maine, 37 miles southwest of Angers (Map: France, N., E 5). It has manufactures of linen, cotton, and woolen goods, including batiste and flannel, which industries in this and the surrounding territory employ between 50,000 and 60,000 operatives. There is a brisk trade in lumber, grain, and cattle. Granite is quarried near by. The first considerable growth of the town was when a colony of weavers settled here under Edouard Colbert, Count of Malévrier. Pop. of commune, 1901, 15,335; 1911, 21,058. Here, during the Vendean War, two actions were fought in 1793, in both of which the Royalists were decisively defeated.

CHOLIAMB, kō'lī-ăm̆b. See VERSIFICATION.

CHOLMONDELEY, chŭm'lĭ, MARY (?–). An English novelist, born at Hodnet, near Condover in Shropshire, daughter of the rector there. In 1896 her father's health broke down, and the family removed to London. Her novels comprise, notably: *The Danvers Jewels*, under the pen name of "Pax" (1887); its sequel, *Sir Charles Danvers* (1889); *Diana Tempest*, the first novel to appear under her name (1893); *The Devotee* (1897); *Red Pottage* (1899); *Moth and Rust* (1902); *Notwithstanding* (1913). Beginning with a detective story, Miss Cholmondeley has worked her way into the novel of contemporary life. She possesses humor and pathos and usually keeps a firm hold on her characters; but a tendency to melodrama prevents her work, in spite of its popularity, from being wholly admirable.

CHOLÓNES, chō-lō'nāz. An Indian tribe, whose language constitutes an independent stock, occupying a limited area on the left bank of the Huallaga, between 8° and 9° 30′ S. lat., in central Peru. The language of the Hibitos is said to belong to the Cholonan stock. Consult Brinton, "The Cholona Language," in his *Studies in South American Native Languages*, pp. 30–36 (Philadelphia, 1892), and Chamberlain, in *Journ. de la Soc. des Amér. de Paris*, N. S., vol. vii, pp. 185–186 (1910).

CHOLULA, chō-lōō'lȧ. An old town of Mexico, in the State of Puebla, situated at an altitude of nearly 7000 feet, about 8 miles west by north of Puebla, with which it is connected by rail (Map: Mexico, K 8). It is well built and contains a pyramid of clay and brick supposed to have been built by the aborigines in honor of one of their deities and surmounted by a half-ruined chapel, probably erected by Cortés. Cholula, at the time of Cortés, was a flourishing city of 20,000 houses and a large number of temples. It was the chief city of a semi-independent state settled by a tribe of the Nahuatl race. The inhabitants carried on a considerable trade and had a more or less democratic form of government. It was visited by Cortés in 1519, and in spite of his friendly reception by the inhabitants, he massacred a number of them, suspecting them of plotting against the Spaniards. The population of Cholula is about 9000.

CHONCHO. See CHUNCHO.

CHON'DRODITE. See HUMITE GROUP.

CHONDROPTERYGII, kŏn-drŏp'tĕr-ĭj'ĭ-ī (Neo-Lat. nom. pl., from Gk. *χόνδρος, chondros*, cartilage + *πτερύγιον, pterygion*, fin), or ELASMOBRANCHII. A group of cartilaginous fishes, including the sharks, rays, and chimæra. See FISH.

CHONDROSTEI, kŏn-drŏs'tê-ī (Neo-Lat., from Gk. *χόνδρος, chondros*, cartilage + *ὀστέον, osteon*, bone). An order of fishes within the group Teleostomi, which includes the sturgeons and closely allied forms. See STURGEON.

CHONDROSTEUS, kŏn-drŏs'tê-ŭs. A Jurassic fossil fish, the direct ancestor of the modern sturgeon, found in the Liassic beds of England. The form of the body is very similar to that of the sturgeon, and the skeleton differs only in the form and arrangements of the cranial bones and in the presence of a series of branchiostegal rays, which latter character is reminiscent of the Palæoniscidæ. The body was free from scales, except on the upper edge of the caudal fin, where thick rhombic scales like those of the sturgeon were present. The type species, *Chondrosteus acipenseroides*, was only 3 feet in length. Another species was about 6 feet long; and an associated genus, *Gyrosteus*, is known only by fragments that indicate for it a length of 20 to 25 feet. See STURGEON.

CHONEK, or TSONEKA, TZONEKA. See TSONEKAN (TEHUELCHEAN).

CHONETES, kō-nē'tēz (Neo-Lat. nom. pl., from Gk. *χώνη, chōnē, χοάνη, choanē*, funnel, from *χεῖν, chein*, to pour). A genus of fossil Brachiopoda, of the order Protremata, which may be recognized by the semicircular outline of the much-compressed concavo-convex shell, and by the row of hollow spines on the upper margin of the hinge area of the ventral valve. The outer surface of the shell is ornamented by radiating striations in most of the species, while in some Carboniferous species there is also a mesial fold and sinus. The species are mostly small, seldom exceeding an inch in transverse diameter. In America the genus appears first in the Silurian rocks, it attains its maximum evolution in the Devonian and Carboniferous, and it became extinct with the close of the Permian; thus it is a valuable index fossil for the Upper Paleozoic rocks. About 60 American species are known, and there is probably an equal number known

from Europe and Asia. See BRACHIOPODA; DEVONIAN SYSTEM; CARBONIFEROUS SYSTEM.

CHONODENDRON, kō'nō-dĕn'drŏn. See CISSAMPELOS.

CHONOS, chō'nŏs. A tribe of Indians, now extinct, who formerly occupied the Archipelago of Chonos and the adjacent regions of the Chilean coast, from about 45° to 52° S. lat. Their language, apparently, formed a distinct stock. Consult Chamberlain, on the Chonoan stock, in *American Anthropologist*, N. S., vol. xiii, pp. 467–468 (1911).

CHONOS ARCHIPELAGO, chō'nŏs ärˈkĭ-pĕl'ä-gō. A group of 45 larger and many small islands, aggregating 4700 square miles, off the coast of Chile, extending from about lat. 44° to 46° S. and from about long. 74° to 75° W. (Map: Chile, B 12). Many of the islands are barren, and the total population is small, being chiefly Araucanians. Administratively the group belongs to the Province of Chiloé.

CHONS, kŏnz, or **KHONSU**, kŏn'sû. An Egyptian deity worshiped at Thebes, where he had a special temple, built by Rameses III at Karnak (q.v.). Of his original character little is known. The sparrow hawk was his sacred animal. Later he was associated with the two principal gods of Thebes, Ammon and Mût. He was called their son and is usually represented as a child or youth, wearing the side lock, the badge of princely rank. As Ammon and Mût were solar deities, Chons, their child, had to take a lunar part, and he is therefore depicted bearing the moon on his head. This led to his identification with other moon gods, e.g., Thout. The Greeks identified him with Heracles, as son of Ammon-Zeus.

CHOPIN, shô'păN', FRÉDÉRIC FRANÇOIS (1810–49). The greatest master of pianoforte composition. He was born at Zelazowa Wola, near Warsaw, Poland, Feb. 22, 1810. The son of refined parents, his musical education began as soon as his predilection for music manifested itself. Adalbert Zwyny was his piano teacher, and later he had lessons in composition from Joseph Elsner. When not quite nine years old, he played in public a concerto by Gyrowetz. The father was a professor in the Warsaw gymnasium, and the family in comfortable circumstances. From the aristocratic social surroundings of his younger years Chopin inherited the liking for fashionable society which was one of his characteristics. A delicate boy, he seems nevertheless to have enjoyed a jest, and he had a talent for mimicry which convinced his friends of later years (Liszt, George Sand, and Balzac among them) that he could have succeeded as an actor.

In August, 1829, he gave two concerts in Vienna, which were attended by all the musical celebrities, who were unanimous in praising both his compositions and performance. His first concert in Warsaw was given in March, 1830, and was followed by a second, the net receipts from both being $600, by no means an inconsiderable sum for a young pianist in those days. He had a love romance with Constantia Gladowska, a vocal pupil at the Warsaw Conservatory, who, however, married a merchant. While giving concerts in Munich, in September, 1831, he heard of the Russian occupation of Warsaw. As a result, he settled, in October of the same year, in Paris, which was his home for the remaining 18 years of his life.

He had composed, but not published, several of his études, among them the great C minor, op. 10, no. 12, sometimes called the "Revolutionary," because inspired by his wrath at the fall of Warsaw before the Russians, his first sonata, and his F minor concerto. The adagio and the rondo had been publicly played by him. (It may be said, in passing, that the dates of publication of Chopin's works are misleading as to the years of composition. Most of them were composed much earlier.) During his life in Paris he was surrounded by men of genius and women at least of talent, among them Liszt, Heine, Berlioz, Mérimée, Meyerbeer, Bellini, Nourrit, Delacroix, Balzac, Dumas, De Musset, Ary Scheffer (who painted his portrait, destroyed in Warsaw by Russian soldiers, in September, 1863), and George Sand. During the first four years of his residence at Paris he made frequent public appearances as a pianist. His E minor concerto he played in February, 1832. Mendelssohn was among those who applauded him. Kalkbrenner was eager to have Chopin study with him—on the mechanical side. Chopin by letter consulted his former teacher, Elsner, who wisely counseled against it, for fear it might impair his originality. Great delicacy and a singing quality of tone seem to have been the characteristics of his playing. His own more colossal pieces, as some of the polonaises, ballads, scherzi, and études, were beyond his physical powers. "Young man," he is reported to have said to a budding virtuoso who apologized to Chopin for having broken a string while playing the famous polonaise militaire, "if I could play that polonaise as it should be interpreted, there would not be a string left in the piano." During the winter of 1835 he gave a concert in the *Opéra des Italiens*. The tone volume was not sufficient to fill the large hall, and the exquisite shading and details were lost, so that the audience was less responsive and enthusiastic than usual at Chopin's concerts. After that the sensitive master, to whom playing before a large audience had always been an ordeal, withdrew entirely from the concert platform, and thereafter played only to a small, select circle in the salons of the aristocracy and of his own friends.

During the summer and early autumn of 1835 Chopin was in Germany. He met his father at Karlsbad, and in Dresden fell in love with Marie Wodzinski, whose brothers had been his schoolmates. On his return trip to Paris he stopped at Leipzig, where he played at the homes of Wieck and Mendelssohn, and also made the acquaintance of Schumann, who had written most enthusiastically about Chopin's works. The following summer Chopin again visited Germany and became engaged to Marie. But scarcely had he returned to Paris, when he learned that the young lady had broken her troth and married a Count Skarbek. In July of that year he made a trip to England of only 11 days, but this sufficed to develop the germs of consumption latent in his constitution. (This disease was in the family. A sister died of it, and his father succumbed to combined chest and heart trouble.)

To Chopin's sensitive nature Marie's faithlessness proved a severe shock. He sought distraction in incessant work and the whirl of society. In this state of mind he met George Sand (q.v.) in the winter of 1837. She was then living separated from her husband, absorbed in her work and her children. With a woman's intuition she divined Chopin's sorrow, with an artist's

intuition Chopin's genius. The inevitable result was a passionate love, which Chopin soon reciprocated. How much they were in need of each other's company became evident when in the fall of 1838 the physician ordered Sand to spend the winter in a southern climate because of an illness of one of her children. The very thought of a possible separation threw the master into a feverish excitement. The problem was solved by going together to Majorca. Unfortunately the winter proved cold and rainy, so that Chopin suffered severely from bronchitis. George Sand proved a tender and constant nurse and inspired his genius to some of its most beautiful utterances, among them those immortal préludes. In the spring they returned, and passed the summer of 1839 at Sand's estate at Nohant.

The next few years passed uneventfully. The winters were spent in Paris, where Chopin was the lion of the salons, the summers at Nohant, where almost all the works of the last years were written. From the very beginning of his residence at Paris, Chopin had been in great demand as a teacher by the foremost families. Unlike some other great masters, Chopin loved teaching, and the money thus earned was his principal source of revenue. Before long publishers also sought his works, for which they paid handsome sums, so that the master was able to indulge his inborn taste for refined and even luxurious surroundings, which were as much a necessity for him as constant association with refined and brilliant people. Chopin was by no means the melancholy dreamer which he has been frequently, but unjustly, represented. Wherever he appeared he was the centre of attraction, not only because of his exquisite art, but also because of the wit and brilliancy of his conversation. His sensitive nature and delicate health, however, rendered him subject to sudden changes of mood and fits of depression. In his intercourse with strangers he was naturally reserved, for in his life, as in his art, he instinctively shrank from anything that was in the least commonplace.

The year 1844 was a momentous one, for in short succession Chopin lost his father and one of the dearest friends of his youth, Matuszynski. A deep gloom settled over his spirit, so that even George Sand lost her influence over him. As his strength failed, his nervous irritability increased, and the relation between the lovers became more and more strained. The complete break came in 1847. The exact cause of their final quarrel will probably never be known. Chopin himself never gave an explanation; Sand said and wrote so much that it is impossible to distinguish truth from fiction. For her it was the end of one of the episodes of her life; for him it was the end of life itself.

In order to forget the master threw himself madly into his work, often teaching seven hours in one day. He even prepared for a public concert, which he actually gave on Feb. 16, 1848. It was his last concert, and the enormous enthusiasm with which his works were received fired his ambition once more, so that he planned a trip to England in spite of the fact that his health was constantly growing poorer. In April he left Paris for London, where he played frequently in select circles. In the hope of enjoying a much-needed rest he accepted an invitation from Jane Stirling, a former pupil, to spend the summer at the castle of her family in Scotland. Late in the fall he returned to London without any improvement of his health. When in January, 1849, Chopin arrived in Paris, his friends were shocked at his appearance. A persistent cough racked his frame. In spite of his completely exhausted condition he resumed his lessons, but soon was compelled to abandon them. He now realized that the end was near. In the morning of Oct. 17, 1849, he died. With imposing splendor the body was conducted to the cemetery Père Lachaise and interred near the graves of Cherubini and Bellini. But his heart was sent back to Poland, where it is preserved in the church of the Holy Cross at Warsaw.

That Chopin was the creator of a new style of writing for the pianoforte has long been admitted. That at the same time he was one of those masters who have enormously increased the means of emotional expression and enriched the art by the creation of absolutely new forms was generally realized only within the present century. Still later came the knowledge that the sum total of Chopin's achievements entitles the composer to a foremost place among the supreme masters of music.

The increase in the range and power of the piano, together with the perfection of the damper pedals, about the year 1830 suggested new possibilities undreamed of before. Foremost among these were the wide distribution of the tones of a chord, the attainment of a real "singing" tone, practically an endless variety of tonal color and the utmost refinement of dynamic shading. Intuitively Chopin recognized all this and adopted a new style of writing, which he also carried to the point of perfection, so that neither Schumann nor Liszt, who both adopted this style, was able to develop it further. Had he accomplished nothing else, Chopin's fame would rest on a firm foundation. But he did infinitely more. He overthrew the whole system of harmony as taught at that time, and by means of enharmonic modulation brought the most remote tonalities into close relation. In his later works Beethoven had shown how ornamentation could become a means of real expression. This idea Chopin developed to the last degree, making embellishments a potent factor of musical expressiveness, a real heightening and intensifying of the melodic line, almost an integral part of the melodic and harmonic scheme. All this means a lasting contribution to the means of emotional expression. When speaking of Chopin's melodic gift, it is not possible to employ anything but superlatives. His wealth of melody, in the best sense of the word, is inexhaustible, like Schubert's. Almost invariably his themes are broad, flowing melodies, of noblest beauty and irresistible power. They captivate and grip the listener at the first hearing and never lose their charm. In this respect Chopin stands alone among the masters of the first rank. The music of Bach, Beethoven, Wagner, Brahms, and, to some extent, even of Schubert, discloses its real greatness and surpassing beauty only after repeated hearing. It grows with familiarity. Chopin's music discloses itself more readily; its appeal is almost instantaneous, but deep and lasting. In this last respect it is separated by a vast gulf from the music of lesser masters. Their melodies soon pall, in direct ratio to the frequency of repetition, whereas Chopin's never lose their perennial freshness.

Unsurpassed among the master's works stand the four great ballads, op. 23 (G m., 1836), op. 38 (F, 1838), op. 47 (A flat, 1841), and op. 52 (F m., 1843). According to the composer's own statement they were inspired by poems of Mickiewicz. Instead of choosing some existing form Chopin crystallizes his inspiration in a new, compact, and symmetrical form and calls it "ballad," thus indicating in a very general way the epic character of the works. The listener's imagination may supply any programme that he pleases, if a programme is needed.

On the same high level as the ballads stand the four scherzi, op. 20 (B m., 1835), op. 31 (B flat m., 1837), op. 39 (C sharp m., 1840), op. 54 (E, 1843). The name is absolutely misleading, for the form is entirely Chopin's own, and the contents have nothing of either the lightness or the robust humor that characterize the scherzo of Beethoven. Instead, the Polish master portrays poignant sorrow, fierce revolt, bold defiance, passionate regret. Occasionally, indeed, are heard calmer strains of transcendent beauty and infinite longing, but soon the seething sea of passion bursts upon them.

In some of his 13 polonaises the master soars to lofty heights, and frequently compasses the region of the sublime. The inequality among these works is due to the fact that six are early works, several of these having been published without the composer's sanction after his death. The great ones are the two constituting op. 40 in A and C m. (1840), op. 44 in F sharp m. (1841), op. 53 in A flat (1843), and the polonaise-fantaisie, op. 61 in A flat (1845). In some of these Chopin gives intense subjective expression to the melancholy, gloomy side of his own character; in others, from a more objective standpoint, he portrays with irresistible brilliancy and elemental power the chivalrous and warlike spirit of the Polish nation.

Throughout his life Chopin cultivated the form of the mazourka. In 13 opus numbers he published 55 of these national dances. It is in them that the national element appears most strongly. Frequently the composer employs genuine folk melodies, which generally are conceived in the old church modes. (See Modes.) The distinctive character of these modes is faithfully preserved in the harmonic treatment, while the melody and rhythm are idealized. The proper performance of these idealized dances depends largely on a judicious use of the *rubato* (q.v.).

Likewise, in the waltzes, 17 in number, the form and content are idealized to such an extent that they are dances rather of the spirit than of the body. There is about them an aristocratic air, the refinement of the elegant salons, the atmosphere of which was so congenial and essential to the composer.

The four impromptus, op. 29 in A flat (1838), op. 36 in F sharp (1840), op. 51 in G flat (1843), and op. 66 in C sharp m. (published 1855), are free fantasies, real improvisations, but withal in well-defined form, with which Chopin never could dispense. The effect of abandon is due to the unexpected juxtaposition of varying moods rather than to looseness of formal structures. Closely allied in spirit to the impromptus is the fantaisie, op. 49 in F m. (1843), a work of intense power and concentration, beyond the capabilities of all but the greatest pianists.

In his 19 nocturnes the master has poured out a profusion of noble melody, infinitely tender. As through a silvery veil we behold mystic shapes moving in the fairyland of dreams. No other works of the master disclose to a similar extent his marvelous skill in the use of ornamentation. But one of these nocturnes, the greatest of all, op. 48 in C minor (1842), towers far above the others, both in formal dimensions and grandeur of content. Those passionate, mournful strains with their incisive rhythm, the sublime middle section with its sonorous chord progressions, the agitation and stress of the closing section, tell of heroic struggles doomed to a tragic ending.

During his stay at Majorca in the winter of 1838 Chopin wrote the greater part of those small pieces which he published under the title of "Préludes, op. 28." Each and every one of these, some only a dozen bars in length, is an immortal masterpiece, showing some distinctive trait of the composer's genius. Here we find the power of the scherzos, the fire of the ballads, the brilliancy of the polonaises, the elegance of the waltzes, the grace of the mazourkas, the dreaminess of the nocturnes. Short as these sketches are, each is a well-rounded artistic unit, marvelously expressive and suggestive.

The berceuse, op. 57 (1845), and barcarolle, op. 60 (1846), are works of such intimate and delicate sentiment, of such supreme refinement of figuration, that a public performance in a large auditorium seems to despoil them of their ethereal charm.

In his treatment of classical forms Chopin was not successful. This frank admission does not in the least detract from the master's greatness, nor does it cast the slightest reflection on the artistic value of the form. It only means that Chopin's individuality required some other form for its fullest expression, and that, like Wagner's, it was powerful enough to create its own form. Chopin, the ardent admirer and student of Bach and Mozart, began by expressing himself in the classical forms of the rondo, variation, and sonata. These works are the rondos, op. 1, 5, 16; the variations, op. 2 and 12; a trio for piano, violin, and 'cello, op. 8; a sonata in C minor, op. 4; the two piano concertos in E minor and F minor, op. 11 and 21; and the Allegro de Concert in A, op. 46. In spite of its advanced opus number and its publication in 1841, this last work bears all evidence of being an early composition. Niecks believes it to be a movement of a concerto for two pianos mentioned by Chopin in a letter dated Dec. 21, 1830. In all these works there is pretty close adherence to the traditional forms and much beautiful, occasionally even quite characteristic, music. Yet it is not the true Chopin, the bold innovator of the later period. The two sonatas in B flat minor, op. 35 (1840), and in B minor, op. 58 (1845), two of the master's great works, cannot be classed with the early compositions, which are distinctly cast in the classical forms. These two sonatas are as different from the classical sonata as are Chopin's scherzi from the classical scherzo. In the exposition and development sections Chopin follows the classical tradition quite faithfully, but breaks away entirely in the repetition after the development. In both sonatas he intentionally discards in this place the principal subject entirely and follows his own form as determined by the musical ideas, giving great prominence to

the second subject. In every bar of these works we feel a conscious purpose and the guiding hand of the master. Among the most remarkable works are the 24 études in two sets, op. 10 (1833) and op. 25 (1837). Primarily they were written to furnish much-needed material for the mere mechanical study of the new piano technic employed by Chopin. Each étude deals in masterly fashion with some particular problem of finger technic or tone production. With almost prophetic foresight provision is made for every possible contingency. But, above all this, these studies are musical masterpieces of the highest order, of the widest emotional range, of transcendent beauty.

For the sake of completeness brief mention must be made of Chopin's 17 Polish songs, published as op. 74 in 1855. Between 1824 and 1844 the master wrote a considerable number of songs, most of which have been lost, because the composer himself did not deem them worthy of publication. After his death his friend Julius Fontana collected all manuscripts and published them in 1855. These posthumous works bear the opus numbers 66–74. With the exception of the beautiful fantaisie-impromptu, op. 66 (1834), all are early works written before 1830, scarcely worthy of the name of their author.

And yet they are of great value in another respect. Considered together with the other early works, op. 1–20 (approximately), they prove conclusively that Chopin, just as every other great master, passed through a stage of development; that he did not appear as the real Chopin, the supreme master, in his first works. The fact is that his development was very rapid, that he soon found himself, that the early compositions indeed foreshadow the individuality of the later ones. But in the concessions which they make to the display of virtuosity on the part of the performer they are quite the product of their time. They also show that the composer is still groping about in search of a proper vehicle of expression. Yet one thing arrests the attention: all are marked by a striking characteristic, the conscious employment of the new piano technic. With the ballad in G minor, op. 23, in 1836, Chopin strikes out in his own peculiar path, on which until now none has followed him. As he had found no form that would adapt itself to his new and strikingly original utterance, his genius intuitively created those forms which permitted him his fullest and freest artistic expression. In his earlier attempts Chopin had also gained the conviction that it was not for him to dominate the orchestra, and after that time he devoted all his energy to the piano. This fact has been held against him by no less a man than Schumann, and it certainly has retarded the appreciation of Chopin's towering greatness. It is not the means of expression nor any particular form that determines greatness, but the content, the essential quality of the musical ideas themselves, the power of thematic invention. When this test is applied, there must be assigned to Chopin a prominent place among the few supreme masters of the first rank.

CHOPINE, chô-pēn′ (from Sp. *chapin*, clog). A high clog or slipper, deriving its name possibly from the sound *chap, chop*, made by the wearers in walking. Chopines probably originated in Turkey and were worn in Spain and Italy about 1600. It was from Venice that these exaggerated shoes found their way into England. There is scant evidence, however, that they became fashionable among English ladies, although they are repeatedly mentioned in English literature as parts of seventeenth-century costume. Thus they were worn by ladies under the shoes and were usually made of wood covered with leather, often of various colors and frequently painted and gilded. Some of them were as much as half a yard high; and in Venice, where they were usually worn, their height distinguished the quality of the lady. Evelyn, in his *Diary* (1645), defines them as "high-heel'd shoes particularly affected by these proude dames, or, as some say, invented to keepe them at home, it being very difficult to walke with them." Frequent references to them are found in Scott and other writers, even as late as Charles Reade, whose *Cloister and the Hearth* (1861) has the line: "Your wooden-heeled chopines to raise your little stunted limbs up."

CHOP′TANK RIVER. A river rising in Kent Co., Del. (Map: Maryland, O 5). It flows southwest through that State and Maryland and becomes a wide estuary 20 miles long as it nears Chesapeake Bay, into which it empties. It is navigable for small vessels for about 40 miles.

CHORAGIC (kô-răj′ĭk) **MONUMENT** (from Gk. *χορᾱγικός, choragikos*, choragic, from *χορᾱγός, choragos*, leader of the chorus, from *χορός, choros*, dance + *ἄγειν, agein*, to lead). The choragus, or person at Athens who, on behalf of his tribe, had borne the expense of furnishing and instructing the chorus (q.v.), and who, in competition with the other tribes, had exhibited the best musical performance, received a tripod for a prize; but he had the expense of consecrating it and of building the monument on which it was placed. There was in Athens a whole street formed by these monuments, called the "Street of the Tripods." A fine specimen still remaining is "the choragic monument of Lysicrates," erected in 334 B.C., in honor of a victory with a chorus of boys. Consult E. A. Gardner, *Ancient Athens* (New York, 1902), and Weller, *Athens and its Monuments* (ib., 1913).

CHORAGUS. See CHORAGIC MONUMENT; CHORUS.

CHORALE, kô-rā′lē (ML. *choralis*, from Lat. *chorus*, Gk. *χορός, choros*, dance, chorus). A melody to which hymns or psalms are sung in church by the congregation in unison. The Catholic church service has from early times contained chorales, but the name is generally applied to those in the style introduced by Luther into the German Protestant church in the sixteenth century. Realizing the great power of music to awaken religious emotion, he deter-

mined to carry his reforms into the music of the church service and to invigorate it with new life. He selected simple tunes from many sources, sacred and secular, and arranged them to fit the hymns and psalms used in the service. Some of the most attractive of the ancient Latin hymns were chosen; the chorale "Herr Gott, dich loben wir," is adapted from a song of praise by St. Ambrose. German songs furnished material for many others.

The inspiration proved a great success; congregations everywhere joined heartily in singing the familiar melodies, and their religious interest took a new growth. The chorale became a popular form of composition, and many fine examples of this style were written during the sixteenth and seventeenth centuries. The most important of the early collections of chorales was the one published by Luther and his friend Johann Walther, in 1524, called the *Enchiridion*. Chorales were intended always to have an organ accompaniment, which was usually contrapuntal, and as time went on these accompaniments were made more and more elaborate by the organists, who found this a tempting field for display. Originally chorales were strongly rhythmical in character, with frequent alternations of duple and triple rhythm; and this, being in direct contrast to the droning, unrhythmical nature of the Gregorian chant, formed one of their greatest attractions. By a gradual process of change, however, this rhythmic element has disappeared, and chorales are now sung in notes of almost uniform length. German writers complain of this "flattening-out" process and regret the loss of character which has resulted. But even without its original rhythm the fine simplicity and stately solemnity of the chorale render it an ideal form for the expression of religious fervor. Probably the most famous of all chorales is the one popularly accredited to Luther himself, "Ein' feste Burg ist unser Gott." This stirring tune has been incorporated into many compositions. It appears in one of Bach's cantatas and in Mendelssohn's *Reformation Symphony*, is heard in Wagner's *Kaiser Marsch*, and forms an important theme in Meyerbeer's opera *Les Huguenots*.

Bach's works abound in beautiful chorales, and when these are sung by a large chorus the effect is wonderfully impressive and inspiring. Consult F. Spitta, *Das deutsche Kirchenlied* (Leipzig, 1912), and P. Griesbacher, *Kirchenmusikalische Stilistik und Formenlehre*, vol. i (Ratisbon, 1912).

CHORAL (kō'ral) **MUSIC.** Music written in parts, usually for four different voices, and performed by a chorus or choir. See ANTHEM; HYMNOLOGY.

CHORAL SOCIETIES. Associations of amateur singers formed for the purpose of performing large choral works are of comparatively recent date. During the Middle Ages and down to the end of the eighteenth century vocal works were performed exclusively by professional musicians, who composed the regular church choirs or were attached to some royal or aristocratic chapel. Public concerts were of rare occurrence. The chief musical interest after the beginning of the seventeenth century was the opera. As operatic performances were prohibited during Lent, performances of oratorios and other works of a sacred character were instituted. With the growth of musical culture music lovers were no longer satisfied with the few public performances, but met together for the purpose of studying concerted works. For the instrumental parts the services of professional musicians were enlisted. Although the absence of any high standards or lofty aims did not allow these early attempts of amateurs to reach a high degree of perfection, these meetings, nevertheless, did prepare the way for the establishment of the choral societies with artistic aims. The sudden and rapid growth of instrumental music, beginning with Haydn and Mozart, and resulting in the perfection of the modern orchestra, also created a desire for a higher standard in the performance of vocal music.

The merest accident led to the establishment of the first permanent choral society, which is still in existence to-day and world-famous as the Berliner Singakademie. Karl Christian Fasch (1730–1800) had settled in Berlin as a singing master. In 1783 Reichardt, at that time royal chapelmaster, submitted to Fasch the score of a 16-part mass by Benevoli. In a spirit of rivalry Fasch at once set to work to compose a similar mass, which he attempted to perform with a chorus of 20 singers selected from the royal chapel in Potsdam. This attempt proved a failure, and the work was laid aside. Meanwhile the number of Fasch's pupils had increased considerably. Among these were the daughter and stepdaughter of the Privy Councilor von Milow, who were so much interested in their teacher that they persuaded a number of fellow students to form a little chorus for the purpose of performing Fasch's mass. This was in the autumn of 1790. During the winter the meetings were discontinued; but when in the following spring a meeting was called, 27 members were present. A record of the meetings was then kept, and from the date of the first of these (May 27, 1791) the foundation of the Singakademie is reckoned. These singers entered heart and soul into the task they had undertaken, and when the mass had been successfully performed they did not disband, but decided to remain together under the able leadership of Fasch. In 1793 the society numbered 43 members, and permission was obtained to hold their meetings in the Royal Academy of Science and Art. Fasch then formally organized the society. He retained absolute control over all musical affairs, while the administrative duties were vested in a board consisting of three men and three women. Each member paid 12 groschen a month, while the professional instrumentalists were exempt from dues in consideration of their services. At first the meetings of the society were strictly private. On April 8, 1794, a limited number of persons were invited, who were so much impressed with the excellence of the work done that a demand for public concerts was created. Accordingly several concerts were given every season. Admission was only by invitation. When in 1800 Zelter succeeded Fasch, a regular scale of admission prices was adopted. By that time the chorus of the society had increased to 115 voices. In 1802 the membership was 200; in 1813, 300; in 1827, 400; in 1833, 500. At present the membership is about 600. Among the proudest achievements of the Singakademie is the performance of Bach's *Passion according to St. Matthew*, under the direction of Mendelssohn, in 1829.

In spite of the great success of the Berlin Singakademie, the other cities of Germany were slow to follow in the establishment of choral

societies. Thirty years after the foundation of the Berlin institution only 10 such societies were in existence. But after that one city followed another, so that to-day there is scarcely a single town which does not boast its choral society. In England choral culture was widely diffused through the growth of music festivals. Although originally the chorus at such festivals was recruited from the regular choruses of the churches, it was not long before the number of singers was considerably increased by the addition of amateur voices. To-day England surpasses all other countries in the excellence and efficiency of its choral societies. The history of English choral societies is practically that of the English Music Festival, to which article the reader is referred.

In the United States choral societies enjoy the popular favor as much, and are cultivated almost as extensively, as in England. When the Pilgrim Fathers first landed, they opposed the use of any kind of music in church; but gradually a more liberal spirit gained ground, so that not only was music introduced into the services, but schools of singing also were established. The aim of these was merely to teach the singing of simple hymns, but in 1724 a "sacred singing school" was founded at Stoughton, Mass., and this, on Nov. 7, 1786, became the Stoughton Musical Society. Now that a beginning had been made, other choral societies came into existence. Up to 1820 the choral societies in the United States exceeded in number those of Germany, but could not compare with them in the quality of the work done. With increased facilities of communication with the Old World musical culture in America advanced step by step, so that in 1815 the Handel and Haydn Society was established in Boston. This institution became to the development of music in America what the Singakademie was in Germany—a model for all similar organizations. At its first concert, on Christmas Day, 1815, the chorus of the Handel and Haydn Society consisted of 100 members. Until 1847 the president of the society acted as conductor, and consequently the performances were rather crude, although marked by a spirit of earnestness. In that year a professional musician was elected as regular conductor. When, in 1852, Carl Bergmann assumed the leadership, the performances rose to a high level. But the present excellence of the society is largely due to the untiring and efficient labors of Carl Zerrahn, who directed the destinies of the organization from 1854 to 1898, with the exception of the seasons 1895–97, when B. J. Lang was the conductor. Since 1899 Emil Mollenhauer has been the conductor.

Shortly after the establishment of the Boston Handel and Haydn Society, a choral society bearing the same name was organized in New York. This, however, was short-lived and in 1823 branched out into two rival societies—the New York Choral Society and the New York Sacred Music Society. The former of these began its career on a very ambitious scale and soon was disbanded; whereas the latter rose to great importance, though it came to an end in 1849. But as soon as one society disbanded another sprang up so that New York was never without performances of choral works. This continued until 1873, when Dr. Leopold Damrosch founded the Oratorio Society. The first concert took place Dec. 3, 1873, at which occasion the chorus numbered about 60 members. When Dr. Damrosch died, in 1885, his son Walter succeeded him as conductor. Under his direction the chorus increased to 600 members. In 1898 he was succeeded by his brother Frank Damrosch, after whom Louis Koemmenich assumed control in 1912. Another choral society of importance is the Musical Art Society, founded by Frank Damrosch in 1896. This organization is unique, inasmuch as it consists exclusively of professional trained singers. The purpose of this society is the performance of older church music of the Palestrina style. The People's Choral Union is a society founded by Frank Damrosch in 1892. It consists of over 3000 members, recruiting themselves from among the laboring classes. The organization has three classes of members—those constituting the elementary class, the advanced class, and the choral union proper. Any self-supporting man or woman may join the elementary class, where thorough instruction as to the proper use of the voice and the rudiments of music is given. From this class the pupils are promoted to the advanced class, whence upon graduation they pass to the choral union. The attendance at the various classes numbers about 2500, 450, and 1200 respectively. Meetings are held every Sunday, and once, in May, a public concert is given. Another important New York society, the Arion, was founded in 1854. By 1902 its membership had increased to 1200.

In the West, Cincinnati, Chicago, and Milwaukee are famous for their choral societies. Here chiefly the German element of the population forms male choruses. But there is no lack of mixed choruses, which meet yearly for a great singing festival. In making these festivals a means for the spreading of musical culture and intelligence, Theodore Thomas (q.v.) and Frank van der Stucken (q.v.) were indefatigable. See Musical Festival.

CHORASSAN, kō′rā-sän′. See Khorasan.

CHORAZIN, kō-rā′zĭn (Gk. Χοραζείν, *Chorazein*). A town in Galilee mentioned in Matt. xi. 21 and Luke x. 13 (Map: Palestine, D 2). Along with Bethsaida, it is referred to as one of the cities in which Jesus had performed "mighty works" and which was condemned by Him because of its unreceptivity to them. As there is no record in the Gospels of any ministry of Jesus in these cities, the latter of which was the native place of three of His disciples (John i. 44; xii. 21), it has been surmised that Jesus carried on in this region an individual work before He called the disciples to His following (Mark i. 16–20). The site is uncertain, but the most probable identification is with the modern *Kerāseh*, located in a small valley a short distance from the north end of the Sea of Galilee and west of the Jordan, 2½ miles north of *Tell Ḥum*. Extensive ruins are to be seen here, showing the former importance of the town, which, however, is not mentioned in ancient writings outside the New Testament.

CHORD. See Harmony, *Chords*.

CHORDATA, kôr-dā′tȧ (Neo-Lat. nom. pl., from Lat. *chorda*, chord). The phylum of the animal kingdom that embraces all the vertebrated animals — fishes, amphibians, reptiles, birds, and mammals, together with the Urochorda, or ascidians, and the Adelochorda, or Hemichorda (see Balanoglossus)—based upon the fact that all these have as a common feature a structure termed the notochord, although in some of the lowest it is present only in the very

young condition. The notochord represents, and in the higher forms is replaced by, the spinal column. "Another nearly universal feature is the perforation of the wall of the pharynx, either in the embryonic or larval condition only, or throughout life, by a system of clefts—the bronchial clefts; and a third is the almost universal presence at all stages, or only in the larva, of a cavity or system of cavities, the *neurocœle*, in the interior of the body, lying above the central nervous system."

CHOREA, kō-rē'ȧ (Lat., from Gk. *χορεία, choreia*, dance), or SAINT VITUS'S DANCE. A disease due to an infectious agent or a toxin, of undecided origin, but probably rheumatic, acting on the central nervous system, and characterized by involuntary and irregular jerky movements of the muscles of the face, neck, chest, arms, hands, legs, feet, back, or abdomen. The infectious type of chorea was first recognized by Sydenham and is still known as Sydenham's chorea, but the term *Chorea Sancti Viti* was first used by Paracelsus and applied to a form of dancing mania, of an hysterical nature, prevalent in central Europe in the sixteenth century, called in Italy "tarantism" (q.v.). Those afflicted sought a cure at the shrines of various saints, notably those of St. Vitus, St. John, and St. Anthony. Most cases occur in neurotic children 5 to 13 years old, and attacks are superinduced by fright, shock, injury, or worry, overstudy, errors of refraction, and to some extent by imitation. Girls are attacked more than twice as often as boys. Women during pregnancy are occasionally attacked. The movements occur either when the person is performing voluntary motions or when at rest; but they generally cease during sleep. Often the attack begins by dropping articles, grimacing, stumbling, or winking. It may last from six weeks to six months, and relapses are frequent. The appetite is variable, and nutrition is impaired, with resulting anæmia. In many cases fibrinous deposits are found on the walls of the heart. The seat of the trouble is in the brain and spinal cord, but there is no mental change in the patient, except slight emotional excitability. Chorea is rarely fatal in the United States. In England the mortality reaches 2 per cent. The treatment consists in rest from violent exercise and all mental exertion, cold sponging, nourishing food, iron, and arsenic, and a few other drugs, electricity, and change of air and environment. One variety of chorea (Huntington's) is hereditary; this is attended with progressive mental deterioration and terminates in dementia. (See INSANITY.) Consult Church and Peterson, *Nervous and Mental Diseases* (Philadelphia, 1901).

CHORE'A SCRIPTO'RUM, or WRITER'S CRAMP. See NEUROSIS.

CHOREE, kō-rē'. The same as trochee (q.v.).

CHOREPISCOPUS, kō'rē-pĭs'kō-pŭs (Lat., from Gk. *χωρεπίσκοπος, chōrepiskopos*, from *χώρα, chōra*, place + *ἐπίσκοπος, episkopos*, overseer, bishop). An order of ministers of ancient origin, whose functions were to assist city bishops in rural districts or remote places. They acted in a subordinate capacity and possessed limited powers, acting as colleagues or vicars of the bishops. They possessed the privilege of attending councils in their own right and not merely as substitutes for bishops. At first they were confined to the Eastern church, but began to multiply in the Western church in the fifth century. They were succeeded after the tenth century by archdeacons, vicars-general, and rural deans. In the East, the order continued to exist until the ninth century, when it was superseded by the exarchs.

CHORIAMBUS, kō'rĭ-ăm'bŭs. See VERSIFICATION.

CHORLEY, chôr'lĭ. A market and manufacturing town of Lancashire, England, on the Leeds-Liverpool Canal, 22 miles northwest of Liverpool (Map: England, D 3). It is a thoroughly progressive municipality. Since the incorporation, in 1881, it has obtained control of its gas supply, and it maintains markets, slaughterhouses, and cemeteries. Its water is supplied by the Liverpool municipality. The ancient Norman parish church is worthy of notice. The manufacture of cottons, muslins, and calicoes constitutes the principal industry. Railway cars are also made. In the neighborhood are stone quarries and collieries. Pop., 1901, 26,900; 1911, 30,315.

CHORLEY, HENRY FOTHERGILL (1808–72). An English author and musical critic. He was on the staff of the London *Athenæum* from 1830 to 1868. He was also for a while musical critic for the *Times*. During most of that time his literary reviews, especially in belles-lettres, were numerous and important, and the entire direction of the musical department was in his hands. He wrote many librettos, and several novels, dramas, and poems, but was more successful as a critic and biographer. Among works separately published were: *Memorials of Mrs. Hemans* (1836); *Music and Manners in France and Germany* (3 vols., 1841); *Modern German Music* (1854); *Handel Studies* (1859); *Thirty Years' Musical Recollections* (1862). His unfinished autobiography formed the basis of the *Autobiography, Memoir, and Letters*, ed. by Hewlett (London, 1873).

CHOROGI, kō'rō-gī. See STACHYS.

CHOROID (kō'roid) **COAT.** See EYE.

CHORON, shô'rôN', ALEXANDRE ETIENNE (1772–1834). A French writer on music. He was born at Caen, studied with Roze and Bonesi, and is said to have accumulated more information on the theory and practice of music than any French musician before him. As corresponding member of the Academy (1811), he undertook the reorganization of the *maîtrises*, or training schools for church choirs, and was successively appointed conductor of religious festivals and director of the Grand Opéra (1816). In 1816 he reopened the Conservatoire, which had been closed in the previous year, under the name of the Ecole Royale de Chant et de Déclamation. In 1817 his appointment to the directorship of the Opéra was suddenly revoked, and he established the famous Conservatoire de Musique Classique et Réligieuse, which existed until 1830 and greatly promoted the musical instruction of the masses. Choron was a pedagogue of pronounced genius, who opened a new field to French musicians. His numerous works include: *Principes d'accompagnement des écoles d'Italie* (1804); *Introduction à l'étude générale et raisonnée de la musique*, a capital work, though unfortunately unfinished; *Méthode de plainchant* (1818); *Manuel complet de musique vocale et instrumentale*, etc. (1836–38). His compositions, which include a requiem and an opera, were never published. Consult H. Reity, *Notice historique sur Choron et son école* (Paris, 1873), and G. Vauthier, *Choron sous l'empire* (Poitiers, 1909).

CHORRILLOS, chô-rē'lyôs. A bathing resort of Peru, situated on the bay of Chorrillos, 7 miles south of Lima (Map: Peru, B 6). The town is a favorite summer resort for the inhabitants of Lima. Pop., 5000. It was the scene of a Peruvian defeat at the hands of the Chileans, Jan. 13, 1881.

CHORUS, kō'rŭs (Lat., from Gk. *χορός, choros,* dance, chorus; connected with *χόρτος, chortos,* inclosure, Lat. *hortus,* garden, OIr. *gort,* crop, Ger. *Garten,* garden, Eng. *yard*). Among the early Greeks, a festal dance, accompanied by music. Through its development in the Attic theatre the word came to mean particularly the group of dancing singers who took part in the rendering of a play, and was also applied to the parts of the composition itself which they performed. The primitive dithyrambic chorus of 50 voices in honor of Dionysus, supplemented by the addition of actors (see ARION; THESPIS), was, in fact, the source of the Greek drama.

In the time of the Attic tragedy the chorus consisted of 12 or 15 persons, in character befitting the scene and nature of the plot, who usually made their entrance to the orchestra from the sides early in the play and remained there before the stage throughout the performance. At pauses in the acting the chorus, with an accompaniment of dancing movements, sang lyrical passages having reference suggestively to the subject and progress of the drama and serving to heighten and solemnize the impression produced by the actors. Occasionally the chorus, in the person of its leader, called the "coryphеus," participated briefly in the dialogue itself. The chorus has been thought to represent the attitude of the ideal spectator of the action, taking part with or against the persons on the stage by advice, comfort, exhortation, or dissuasion. At times the chorus was divided and spoke or sang antiphonally. These divisions passed from side to side in movements from which originated the naming of the single songs or stanzas, such as strophe, antistrophe, and epode. Of the musical element in the composition of the ancient choruses little is known with any certainty. Possibly it was only a kind of rhythmic declamation and very simple, though the metres of its verse are often complicated. It was accompanied by flutes in unison.

The charge of organizing the chorus was considered a great distinction among the people of Athens, being one of the public services (*λειτουργίαι, leitourgiai*) offered by rich citizens to the state. The person appointed for the purpose was called the *choragus,* and the one most successful in each competition was awarded a prize. The honor was expensive, as the choragus had to pay all the cost of training the chorus, besides feeding and lodging them and providing their masques and dresses.

In comedy the chorus was somewhat more numerous than in tragedy, and was often fantastically adapted to the humor of the story, as, e.g., that in the *Clouds* and that in the *Frogs,* comedies of Aristophanes. Later comedy, however, gradually discarded the chorus, and with the decline of ancient tragedy the chorus fell into disuse. In recent times there has been some attempt, as in Schiller's *Bride of Messina,* to produce the chorus on the stage in the manner of the ancients; but the music that has been occasionally set to some of the Greek tragedies can give but slight idea of that which originally accompanied them. Consult: Haigh, *The Attic Theatre* (Oxford, 1889); id., *The Tragic Drama of the Greeks* (ib., 1896); Donaldson, *The Theatre of the Greeks* (8th ed., London, 1875).

In music, a vocal composition in which each part is sung by a number of singers, as distinguished from a duet, trio, quartet, etc., in which each part is sung by a solo singer. The term also denotes the entire body of vocalists performing a choral composition. Choruses may be written for one part (unison), two, three, four, five, or six parts. Eight-part choruses are almost invariably double choruses, consisting of four parts each. Works written for 12, 16, 20 and more parts are really four-part works written for a number of choruses. The greater the number of parts, the more the individuality of each part is destroyed. Hence modern composers rarely write for more than double chorus. The foundation of all choral writing is the four-part chorus. According to the quality of voices employed choruses are distinguished as mixed choruses (sopranos, altos, tenors, basses), male choruses (first and second tenors, first and second basses), female choruses, also sung by boys' voices (first and second sopranos, first and second altos). Choruses without instrumental accompaniment are called *a capella* (q.v.). The effect produced by a body of singers depends far more on the quality and training of the individual voice than on mere numbers. It is reported that at the coronation of Napoleon I in Notre Dame at Paris the chorus of 35 highly trained singers from the Papal Chapel singing a capella *Tu es Petrus* produced a far greater effect than the special chorus of hundreds of voices accompanied by 80 harps.

In the earliest operas the chorus took no part in the action. To it was assigned the rôle of the chorus in the Greek drama, that of narrator or commentator. One of Gluck's most important reforms was the employment of the chorus as an essential factor of the dramatic action. In the operas of Spontini, Auber, Halévy, Bizet, and Verdi the chorus is of prime importance. Wagner, who in his earlier works had obtained some of the greatest climaxes from his masterly treatment of the choruses, banished this form on purely theoretical grounds from his *Tristan* and *Ring,* but later modified his extreme view and reinstated the chorus in his *Meistersinger* and *Parsifal.* Consult A. Mees, *Choirs and Choral Music* (New York, 1901); H. Coward, *Choral Technique and Interpretation* (London, 1911).

CHOSE (shōz) **IN ACTION** (Fr. *chose,* thing, from ML. *cosa, causa,* thing, Lat. *causa,* cause). In the law of England, that kind of property which is founded not in possession, but in the legal right to possess. As this right can, in general, be vindicated and made available only by means of an action, the property to which it relates, whether real or personal, is called a thing (Fr. *chose*) in action, to distinguish it from a thing already in possession. The right to recover money due on bonds and bills, and that to recover on goods bought and not yet delivered, are examples of choses in action, as is also the right to compensation for damages occasioned by breach of contract or by tort.

By the strict rule of the ancient common law, no *chose in action* could be assigned or granted over, because it was thought to be a great encouragement to litigiousness if a man were allowed to make over to a stranger his right of going to law. (See CHAMPERTY.) But this

nicety is not now so far regarded as to render such a transaction really ineffectual. It is, on the contrary, in substance a valid and constant practice; though, in compliance with the ancient principle, the effect of assigning a chose in action is to confer on the assignee a power of attorney to prosecute the action in the assignor's name for the assignee's own benefit. The assignment has this effect in law, and not in equity alone, as is commonly stated. If, however, the assignor interfered with his assignment by collecting the chose in action, or otherwise, equity would protect the assignee's rights, provided the assignment was made for value. The King is an exception to this general rule, for he may always either grant or receive a chose in action by assignment. By the law merchant an indorsee of negotiable paper could sue upon the paper in his own name. The law relating to *choses in action* was formerly the same in the United States as in England. But in many States, as in New York, the assignee of a chose in action is now allowed to sue in his own name, provided the chose in action does not belong to one of the excepted classes (such as the right to recover for personal injuries, for breach of promise to marry, for seduction, etc.). The assignee of a chose in action, however, takes it subject to all defenses which might have been interposed to it had the action been brought upon it by the original owner. Choses in possession are commonly called "chattels" (q.v.). The branches of the law relating to choses in action are specifically treated under such titles as ASSIGNMENT; SPECIFIC PERFORMANCE; NEGOTIABLE INSTRUMENTS; ETC. Consult the authorities referred to under CONTRACT; and for a discussion of the early English law upon the ownership of choses in action, consult Pollock and Maitland, *History of English Law* (Boston, 1899).

CHO'SEN'. See KOREA.

CHOSHI, chō'shê. A prefectural town of Japan, situated on the east coast of Nippon, 72 miles by rail from Tokio (Map: Japan, G 6). It extends for about 2½ miles along the river of Tonegawa and has a temple situated on an eminence in the centre of the city. The chief occupation is the manufacture of fish oil. Pop., 1903, 16,154; 1906, 18,721.

CHOSROES. See KHOSRU.

CHOTA NAGPUR, chō'tà nāg-pōōr', or CHUTIA NAGPUR. A southwest division of Bengal, Bihar, and Orissa, British India (q.v.). The division formerly comprising the five districts of Hazáribágh, Ranchi, Palamau, Mánbhum, and Singhbum. It is sparsely inhabited, with a density of 181 per square mile compared to 438 for the whole of Bengal, the largest towns not exceeding a population of 5000. Area, 27,679 miles. Pop., 1891, 4,628,792; 1901, 4,900,429; 1911, 5,754,008. The political agency comprises nine tributary states, whose area is 16,054 square miles. Pop., 1891, 883,500; 1901, 982,400. The region is mountainous, being largely contained in three plateaus, and lies between the basins of the Ganges and its tributaries, the Sov and the Manahadi. It is largely inhabited by aboriginal tribes. Coal in considerable quantities is found, some gold and mica. Tea, rice, corn, potatoes, and oil seeds are cultivated. The climate is dry and healthful.

CHOTIN. See KHOTIN.

CHOUANS, shōō'ăn' (corruption of Fr. *chathuant,* screech owl). The bands of insurgent peasants in Brittany and Maine who during the French Revolution, following the Vendéans, fought for the King. They were so called from Chouan, the nickname of their first leader, Jean Cottereau, smuggler and soldier. The species of mingled brigandage and warfare known as the *chouannerie* first broke out in 1793, after having been fomented assiduously by the priests and the agents of the royal family. After several exploits of the guerrilla sort Cottereau was killed, July 29, 1794, near Laval. Other leaders, however, appeared: Cadoudal, Désoteux, Charette, Puisaye. The pacification of La Vendée in 1795 gave Hoche an opportunity to crush the Chouans: but they sprang up again in 1799 and forced Napoleon to send against them Brune, with 30,000 men, who suppressed the rising and put an end to organized chouannerie. Eruptions of chouannerie continued till 1803, and it made its appearance once more in 1814–15. Consult: Beauchamp, *Histoire des Chouans* (Paris, 1806); Kérigant, *Les Chouans* (Paris, 1882); Moulin, *Mémoires sur la chouannerie* (Paris, 1893).

CHOUGH, chŭf (AS. *cēo,* originally imitative of the bird's note). A small crow of the genus *Pyrrhocorax,* specifically the Cornish chough, or red-legged crow (*Pyrrhocorax pyrrhocorax*), a widely distributed but very local and diminishing bird, inhabiting the high mountains of Europe, Persia, India, the north of Africa, and some parts of the British seacoasts, but almost exclusively confined to high cliffs. In these it generally makes its nests; sometimes, however, in ruined towers. Its long hooked claws enable it to cling easily to a rough rock, but it seems unwilling even to set its feet on turf. It lives in societies, like the rook. It feeds on insects, berries, grubs, and grain. It is easily tamed, becomes very familiar and forward, and exhibits in the highest degree the curiosity, pilfering disposition, and delight in brilliant or glittering objects which also characterize others of the crow family. Other species of chough are known, one, the chocard or Alpine chough (*Pyrrhocorax graculus*), being confined to the European Alps, and the others natives of Australia, Java, etc.

CHOUICHA, chou'ī-chà (Alaska). The quinnat (q.v.).

CHOULANT, shōō'läN', JOHANN LUDWIG (1791–1861). A German physician, born in Dresden. He studied in Dresden and Leipzig and became connected with the clinics in Dresden, in which he was appointed professor of therapeutics in 1823 and director in 1828. Beginning in 1842, he acted for a number of years as head of the Academy. His published works include the following: *Lehrbuch der speciellen Pathologie und Therapie des Menschen* (1831 and several later eds.); *Handbuch der Bücherkunde für ältere Medizin* (2d ed., 1841); *Bibliotheca Medico-historica* (1842); *Die Anfänge wissenschaftlicher Naturgeschichte* (1857); *Graphische Inkunabeln für Naturgeschichte und Medizin* (1858).

CHOUQUET, shōō'kâ', ADOLPHE GUSTAVE (1819–86). A French writer on music, born in Havre and educated at the Institution Massin in Paris. He lived in the United States from 1840 to 1860 and then returned to Paris, where he twice won the Prix Bordin (1864 and 1868) for works on the history of music. He was appointed custodian of the collection of instruments in the Conservatory in 1871 and in 1875 published a catalogue of them. He also wrote the

text of several cantatas, among them the *Hymne de la Paix*, the prize cantata of the Exposition of 1867. Of his literary productions the *Histoire de la musique dramatique en France depuis ses origines jusqu'à nos jours* (1873) is the most important.

CHOUSINGHA, chou'sĭng-hâ (East Indian). The four-horned antelope (*Tetraceros quadricornis*) of India. It is a small brown species resembling the duikerboks and distinguished by the buck having four short smooth horns upon the forehead. These animals are not gregarious, and conceal themselves in bushy places. See Plate of GAZELLES.

CHOUTEAU, shōō'tō', AUGUSTE (1739–1829). An American pioneer of French descent, born in New Orleans. Under the direction of Pierre Laclède Liguest he made the first settlement on the site of St. Louis, Mo., on Feb. 15, 1764. (See SAINT LOUIS.) He and his brother, Pierre (1749–1849), were well known as traders for many years in the West.

CHOUVACHES, chōō-väsh'ez. See TCHUVASHES.

CHOWCHOW (strictly an adjective, meaning 'mixed,' 'miscellaneous,' 'broken'; of unknown origin, usually considered pidgin English). A name most commonly used to denote a kind of mixed pickles, made originally in the East Indies and now imitated elsewhere. Among its principal ingredients may be mentioned cucumbers, onions, cauliflower, and beans all steeped in mustard. A kind of Chinese sweetmeats, consisting of odds and ends of orange peel, ginger, bamboo sirup, pumelo rind, etc., is also called chowchow. The word is also used to denote a mixture or medley of any kind or constituency.

CHOWCHOW. A Chinese domestic dog which resembles a modern Pomeranian, although much lighter in weight, with so thick, plain, and even a coat that when it is pressed down by the hand it rises again, just as a close-wooled sheep's coat will do. It has one characteristic which differentiates it from all other dogs, a black tongue. Many dogs have black roofs to their mouths, but no chowchow is of the true breed that has not a black tongue. The dog is frequently eaten by the Chinese. Two varieties have been exhibited at bench shows, one all red and the other all black, though yellow, blue, white, or other colors (not in patches) may be shown by full-blooded specimens. In all cases the tail should be curled well over the back. Consult Leighton, *The New Book of the Dog* (London, 1907). The chowchow made its first appearance in America at the Westminster Kennel Club's show in New York in 1900.

CHOW'DER (Fr. *chaudière*, pot, caldron; Lat. *caldaria*, boiling pot, from *caldus*, *calidus*, warm, hot). A savory stew of fish or shellfish cooked with pork and vegetables and thickened with crushed hard bread. The term seems to have originated in the Breton fishing villages, where *faire la chaudière* is to provide a kettle in which is cooked a stew from ingredients furnished by the fishermen, each of whom receives a share of the prepared dish. The practice seems to have been carried by the French fishers to Newfoundland, from whence it spread to Nova Scotia, New Brunswick, and New England.

CHOY'A. See CHAY ROOT.

CHRESTIEN DE TROYES, krâ'tyăn' de trwä (c.1140–c.1195). A French poet, the founder of the mediæval courtly romance and one of the most important writers in French literature, both for his influence and the qualities of his new style. He was probably born in Troyes and was attached to the court not only of the Count of Champagne, his native district, but also to those of the neighboring principalities of Flanders and Hainaut. He traveled in England and died, according to Gaston Paris, in 1180, when only about 40 years of age, though Förster places his death at a much later date. Chrestien is the most famous of the authors who developed the Arthurian romances in France and expressed the spirit of the later chivalry, much more refined and approaching more nearly modern ideas than the fierce and warlike epics of the Charlemagne cycle. Arthur's court, in his hands, becomes a civilized and brilliant gathering, modeled after those with which the poet was familiar. In fact, though finding his subjects in the fantastic and ideal legends of an earlier age, he treats them most successfully when he deals with details of everyday life, which he renders with the fidelity of a modern novelist, delighting in the reproduction of scenes of pomp and ceremony to please the aristocratic society for whom he wrote. His main topic is love; and as his poems were intended for women, he is fond of describing beauty and the adornments of the toilet. He is distinctly a stylist, showing a desire to produce a definite effect through choice of expression, which, however, often causes him to fall into affectation and trifling. It is probable that to the novelist's instinct of Chrestien is due the rounding out and completion of what we may call the plot of the Arthurian story, in which case a very high place must be assigned to him among the romancers of the world. From his working in of the Grail legend (see GRAIL, THE HOLY) in his huge romance of *Perceval le Gallois* (ed. Potvin, 6 vols., Mons, 1866–71), which with its continuations by other hands extends to 63,000 lines, sprang the great epic of Wolfram von Eschenbach which furnished Wagner with the material for the libretto of *Parsifal*. His other main works, in the best editions, are *Erec et Enide* (Förster, Halle, 1896); *Yvain* or *Le Chevalier au Lyon* (id., ib., 1887; 3d ed., 1906); *Le Chevalier à la Charrette* (Jonckbloët, The Hague, 1850; Förster, Halle, 1899); and *Cligès* (id., ib., 1884). They are written in octosyllabic couplets, light, flowing, and full of charm. Consult Potvin, *Bibliographie de Chrestien de Troyes* (Brussels, 1863); Förster, *Sämtliche Werke von Chrestien de Troyes* (4 vols., Halle, 1884–99); *Contes del Graal: Percevaus li galois* (Freiburg, 1909); Borodine, *La femme et l'amour au XIIe siècle* (Paris, 1909; Thüre, *Die formalen Satzarten bei Crestien von Troyes* (Marburg, 1909); Wilmotte, *L'Evolution du roman français aux environs de 1150* (Paris, 1903); Zenker, *Zur Mabinogionfrage* (Halle, 1912); and see FRENCH LITERATURE; ARTHUR; PERCEVAL.

CHRIEMHILD, or KRIEMHILD, krēm'hĭlt. See NIBELUNGENLIED.

CHRISM, krĭz'm (from AS. *chrisma*, OHG. *chrismo*, Ger. *Chrisam*, from OF. *chresme*, Fr. *crême*, It. *crisma*, Lat. *chrisma*, oil, from Gk. *χρῖσμα*, ointment, from *χρίειν*, *chriein*, to anoint). The name given to the oil consecrated on Maundy Thursday in the Roman Catholic and Greek churches by the Bishop and used in baptism, confirmation, orders, and extreme unction. There are two kinds of chrism used in the Roman Catholic church—the one, a mixture of oil and

balsam, is used in baptism, confirmation, and orders; the other, which is merely plain oil, is used in extreme unction. That in the Greek church contains many ingredients.

CHRISOM, krĭz'om (variant spelling of *chrism*). The name of the white vesture laid by the priest on the child in former times at baptism, to signify its innocence. It was generally presented by the mother as an offering to the church when she came to be "churched"; but if the child died before the mother was "churched," it was used as a shroud. By a common abuse of words, chrisom came to be applied to the child itself if it died before it was baptized. A chrisom child is a child in a chrisom cloth.

CHRIST (Lat. *Christus*, Gk. Χριστός, *Christos*, anointed, from χρίειν, *chriein*, to anoint). The Greek term is found in the Septuagint, where it translates varied forms of the Hebrew verb *māshakh* (to anoint), most frequently the nominal form *māshiakh* (an anointed one), whence the English term *Messiah* is derived. The Hebrew conception of anointing was derived from the ancient magical idea that the application of oil endowed the person or object with certain superior and even supernatural qualities. In early Israel the custom of anointing was thus in recognition of the endowment of the person with the qualification for exalted office. It was applied, not only to the priests (Lev. iv. 3) as intermediaries between God and man, but also to the kings (1 Sam. ii. 10) as representatives of God in the theocracy and as thus assuming in their person priestly functions. Later, it was applied to the prophets (1 Kings xix. 16) and was referred to even in connection with the patriarchs (Ps. cv. 15) and with Cyrus (Isa. xlv. 1), though in these cases without any thought of its being literally understood. In the development of the Messianic thought it came to be narrowed down to the redeemer and restorer of the Jewish nation (Ps. ii. 2). The first application of this idea, in its full technical sense, to this expected King is found in the apocryphal Book of Enoch (xlviii. 10).

In the New Testament Christ is used both as an appellative and as a proper name. In both cases it occurs either with or without the article, either alone or in combination with other terms and names (e.g., Matt. xvi. 20; Mark viii. 29; Luke ii. 11, 26; ix. 20; xxiii. 2; Acts ii. 36; xviii. 5; Rom. iii. 24; xv. 3; 1 Cor. iii. 11; 2 Cor. i. 2; iv. 5; 2 Tim. i. 2). Always when used as a proper name, and frequently when otherwise used, it is a designation of Jesus of Nazareth, as the expected Messiah of the Jews. It is from this application of the term that its English meaning is derived. See Christology; Christianity; Jesus Christ; Messiah.

CHRIST, Descent of, into Hades. See Apocrypha, *New Testament*.

CHRIST in Art. See Jesus Christ in Art.

CHRIST, Order of the Knights of, in Portugal. An order instituted in 1317 by King Diniz, of Portugal (1279–1325), and endowed with property confiscated from the Order of the Templars, which was suppressed in 1312. It was founded in imitation of the Spanish orders of Alcántara (q.v.) and Calatrava (q.v.) and the regulations of the Cistercians. The new order was established "for the defense of the faith, the discomfiture of the Moors, and the extension of the Portuguese monarchy." With some difficulty Pope John XXII was induced, in 1319, to sanction the new order, but only on condition that the knights swore fealty to the Pope and that their Grand Master made a special vow of such obedience before the abbot of the Cistercian monastery of Alcobaça, one of the largest and richest then extant, who was the Pope's special representative. The knights joined in all Portuguese crusades against the infidels and also in their African and Indian expeditions, receiving in compensation continual additions to their own possessions. The Grand Prior of the order was invested by Pope Calixtus III (1455–58) with power equal to that of a bishop; and, as an encouragement to adventure, the knights were promised all the countries which they might discover, to be held under the protection of Portugal. Under such favorable conditions it is no wonder that the order became immensely rich. Its headquarters was the splendid castle of Thomar, 70 miles northeast of Lisbon, whence it had been in 1357 transferred from Castro Marino, at the mouth of the Guadiana. At length their wealth and power excited the jealousy of the kings of Portugal; their future acquisitions, and subsequently even their actual possessions, were declared to be crown possessions, and the offices of Administrator and Grand Master were transferred to the crown. Noble descent and three years' military service against the infidel were required for admission. The members took the three monastic vows of celibacy, poverty, and obedience, till Pope Alexander VI (1492–1503) released them from the first two on condition of their applying the third part of their revenues to the support of the Thomar cloister, the priests of which were bound by the three vows. In 1523 King John III turned the order into a monastic one. In 1797 it was secularized and it is now merely an honorary order. Its membership, which is restricted to Catholics of noble descent, is very large. The order was nationalized in Brazil in 1823, but was dissolved in 1890.

CHRIST, Papal Order of. A branch of the Portuguese order created by Pope John XXII (1316–34) for Italians. It has only one class and is now merely honorary.

CHRIST, Person of. See Christology.

CHRIST, Second Advent of. See Second Advent of Christ.

CHRIST, krīst, Wilhelm von (1831–1906). A German classical philologist, born at Geisenheim. He was professor in the University of Munich from 1861, and was the author and editor of numerous works, of which the most important are: *Die metrische Ueberlieferung der Pindarischen Oden* (1868); *Metrik der Griechen und Römer* (Leipzig, 1879); *Attikusausgabe des Demosthenes* (1882); *Griechische Litteraturgeschichte* (4 editions, 1888, 1890, 1898, 1904); and editions of Homer's *Iliad* (1884), Pindar (1887), Aristotle's *Poetica* and *Metaphysica* (1878, 1895).

CHRISTABEL, krīs'tȧ-bĕl. 1. An old ballad which deals with the love of a princess, the title character, for the valiant Sir Cauline. The latter is killed in rescuing her from an Eastern potentate, and she thereupon dies of grief. 2. A poetical fragment by Coleridge (1816), a bit of haunting melody and genuine inspiration. Before its publication Scott heard lines of it recited and adopted the metre for his "Lay

of the Last Minstrel" (1805). Saintsbury finds in it a metrical resemblance to Gottfried von Strassburg's *Tristan* and Spenser's "The Oak and the Brere." Admirably adapted as is the vehicle, the story is itself of engrossing interest and is narrated with the poet's best art. A parody appeared in *Blackwood's*, June, 1819.

CHRIS'TADEL'PHIANS (from Gk. Χριστάδελφος, *Christadelphos*, having brotherhood with Christ, from Χριστός, *Christos*, Christ + ἀδελφός, *adelphos*, brother), or BROTHERS OF CHRIST. A religious sect in the United States, Canada, and Great Britain, organized by John Thomas, M.D., an Englishman, who came hither in 1844 and at first belonged to the Disciples. But being "convinced by a study of the Bible that the cardinal doctrines of the existing churches correspond with those of the apostate Church predicted in Scripture," he spread his views. Making converts, he formed them into societies, which, till the outbreak of the Civil War, had no distinctive name, but the one now held was selected when their members claimed exemption from military duty on the ground of conscientious opposition to war. The principles of the sect are thus stated: The Old and New Testaments are equally important; God will restore to immortal life all who love Him in this life, but those who have not accepted this immortal principle cease to exist at death; there is no personal devil; Christ is the son of God, deriving from the Deity moral perfection, but from His mother a human nature; He has the threefold character of prophet, priest, and king; the first office He fulfilled by His life and death on earth, and now as priest He mediates before the Deity; as king He will return to earth and reign over all the world from the throne of David in the Holy Land. In 1913 the Christadelphians had in the United States 70 organizations and some 1400 members. They reject the doctrine of the Trinity, practice immersion, and have no ordained ministry. Consult H. K. Carroll, *The Religious Forces of the United States*, pp. 89–90, 454 (New York, 1896), and *Religious Census of the United States* (1910).

CHRIST AMONG THE DOCTORS. A painting by Ingres. It hangs in the Musée Municipal, Montauban, France.

CHRIST'CHURCH'. A parliamentary and municipal borough and seaport on the English Channel, in Hampshire, England, at the head of the estuary formed by the Avon and Stour, 24 miles southwest of Southampton (Map: England, E 6). The priory church, partly of Norman and partly of early English architecture, one of the most interesting and beautiful of English ecclesiastical structures, dates from the reign of William Rufus and was restored in 1861. It contains a very interesting monument to the poet Shelley. The parliamentary borough comprises two favorite watering places, Muddiford and Bournemouth, and returns one member to Parliament. Christchurch Bay has a double tide every 12 hours. Christchurch was known in Saxon times as Tweonæteam, but took its present name from the Augustinian abbey of Christchurch, founded here before the Conquest. Pop., 1891, 4000; 1901, 4200; 1911, 5104. The church contains a monument to Shelley.

CHRIST'CHURCH'. The capital of the Province of Canterbury, South Island, New Zealand, situated on the river Avon, about 8 miles from the sea (Map: New Zealand, South I., D 4). Its port is Lyttelton, with which it is connected by a railway. It is the centre of a great grazing district and also has flourishing manufactures—boots, clothing, furniture, and agricultural implements being perhaps the chief. There is a large export trade, mainly in timber, frozen mutton, and wool. The city possesses numerous fine public buildings, churches, including a fine reproduction of Caen Cathedral, France, a museum, a theatre, an opera house, Christ College, high schools, parks, and pleasure grounds. The city has electric tramways and owns an abundant artesian-well water supply. The United States is represented by a consular agent. Christchurch is the see of the New Zealand bishopric of Canterbury. The city owes its foundation to the Canterbury Association, a society of influential men which included the Archbishop of Canterbury, Lord Lyttelton, and other prelates and peers. Each of its streets bears the name of an Anglican diocese. In 1903 several suburbs were annexed to the city. Pop., with suburbs, 1901, 17,537; 1911, 80,193.

CHRIST CHURCH. A college at Oxford, England, the magnificent project of Cardinal Wolsey when, as the minister of Henry VIII, he was the most powerful man in England next to the King. The foundation was to be known as Cardinal College and was to have in connection with it a school in Ipswich, Wolsey's native town. The plans for the college were drawn, and the building begun in 1525, but with the fall of the Cardinal in 1529 and his death in 1530 the whole project fell to the ground. In 1532, however, Henry VIII took up the work, refounded the college on a smaller scale under the name of King Henry the Eighth's College, and in 1545–46 he again reconstituted it under the name it now bears, and united it with his newly established see of Oxford by the removal of the episcopal establishment from Osney Abbey to Christ Church. He thus formed a unique union of cathedral and college, from which the foundation was called *Ædes Christi*, or the 'House of Christ.' It is spoken of generally as the "house," not the college, and the incumbents are referred to as the dean and chapter, not of Oxford, but of Christ Church. The original foundation was for a dean, 8 canons, 8 clerks, a schoolmaster, 100 students, choristers, and an organist. In accordance with the few changes of 1882 there were a dean, 6 canons, 31 senior students (i.e., fellows), 2 lecturers, a number of honorary students, 60 scholars, and 29 exhibitioners, besides 6 chaplains, the whole forming the largest collegiate establishment in Oxford. The modern spirit of reform was introduced by one of the most famous deans of the college, Dean Liddell (1855–91), who was also responsible for the restoration of and additions to the college buildings. In 1913 it had 326 undergraduates. The buildings about the great quadrangle (Tom Quad) include the cathedral, which occupies the site and contains some of the work of the Saxon nunnery of St. Frideswide, and the Hall, with the exception of the Hall of William Rufus at Westminster, the most splendid example of its kind in England. Christ Church is one of the foremost colleges in Oxford and has always been famous for its distinguished members. Among these may be mentioned five prime ministers of England in the nineteenth century—Canning, Peel, Gladstone, Salisbury, and Rosebery. Of the other political worthies may be noted Arlington, Nottingham, Godolphin, Bolingbroke, Carteret, Wyndham, Grenville, Sir

G. C. Lewis, Lord Elgin, and Lord Dalhousie. Christ Church has had on its books, besides these, such names as Lyttleton, Mansfield, John Locke, William Penn, Ben Jonson, Camden, Sir Philip Sidney, John and Charles Wesley, Dr. Pusey, and Ruskin. Consult H. L. Thompson, *Christ Church* (London, 1900).

CHRISTEN, krĕ'sten, ADA. See BREDEN, CHRISTIANE.

CHRISTENING, krĭs'en-ĭng (from AS. *cristenian*, to Christianize, baptize, from *cristena*, Christian, from Lat. *Christianus*, Gk. Χριστιανός, *Christianos*, Christian, from Χριστός, *Christos*, Christ). A term often used as equivalent to baptism (q.v.).

CHRISTENING A SHIP. The present custom of christening ships doubtless grew out of the ancient libations practiced when ships were launched. The action of blessing ships is alluded to by the monks of St. Denys. In July, 1418, the Bishop of Bangor was sent to South Hampton to bless the King's ship, the *Grâce à Dieu*, and received £5 for his expenses. The christening is ordinarily performed by a lady, who breaks a bottle of wine against the stem as the ship starts down the ways in launching and at the same time utters the christening words. In the Russian navy the christening ceremony is performed by a priest and takes place at some convenient time subsequent to the laying of the keel. At the conclusion of it a silver plate bearing the name of the ship, date of christening, etc., is affixed to the keel.

CHRIS'TIAN. The name of the hero of Bunyan's *Pilgrim's Progress*.

CHRISTIAN II (1481–1559). King of Denmark and Norway from 1513 to 1523 and of Sweden from 1520 to 1523. He was born at Nyborg, on the island of Fünen, July 2, 1481. As Crown Prince he distinguished himself in 1502 by the implacable cruelty with which he suppressed a Norwegian insurrection. As King he favored merchants, artisans, and peasantry and deprived the nobility of many of their exclusive privileges. In 1520 he succeeded by force of arms in recovering Sweden for the Danish crown, marked his success by the execution in Stockholm of 94 men of high rank, and followed this up with sweeping executions throughout the country. His severity hastened the approach of the successful revolt of Sweden under Gustavus Vasa, which seated the latter on the Swedish throne in 1523. On his return to Copenhagen Christian found the clergy and nobles of Jutland also in open rebellion, and in April, 1523, he fled to the Netherlands with his wife and children, calling upon the Emperor Charles V, his wife's brother, for assistance. Frederick of Holstein, uncle of Christian, took possession of the kingdom, supported by the clergy and nobles, but stoutly resisted by the burghers and peasantry. Aided by the Dutch, Christian made a final attempt to recover his throne, landing in Norway in 1531, but was defeated and made a prisoner in 1532, and remained until his death, Jan. 25, 1559, a captive in the castle of Sonderborg, on the island of Alsen. See DENMARK; NORWAY; SWEDEN.

CHRISTIAN IV (1577–1648). King of Denmark and Norway from 1588 to 1648. He was born, April 12, 1577, in Frederiksborg, Zealand. In 1611–13 he carried on a war against the young Gustavus Adolphus of Sweden and gained some territory. In the second period of the Thirty Years' War (1625–29) an exaggerated military reputation and England's support made him the leader of the Protestants, but only disaster resulted. His forces were overwhelmed by Tilly at Lutter in 1626. He was driven back into Jutland, which was overrun by the enemy, and in 1629 made peace with the Emperor Ferdinand II at Lübeck. Soon after his Swedish rival became the Protestant leader. He waged war with Sweden unsuccessfully from 1643 to 1645. In civil affairs, however, he proved himself a capable sovereign, introducing financial and legislative reforms, encouraging industry and science, and giving a powerful impetus to both the external and the internal trade of his kingdoms. The present capital of Norway was founded by him and bears his name. See DENMARK.

CHRISTIAN VII (1749–1808). King of Denmark and Norway from 1766 to 1808. He succeeded his father, Frederick V, in 1766. He was miserably feeble and incapable and scarcely exercised any influence in the government. During his reign the reforms carried out by his ministers, Struensee in particular, were profuse, though hasty. The actual power was wielded successively by his ministers, Bernstorff and Struensee, and his son Frederick, who became joint regent with his mother, Caroline Matilda, sister of George III of England, in 1784, and upon the death of Christian assumed the title of King Frederick VI (q.v.). Christian died March 13, 1808. Consult Reverdil, *Danmarks Riges Histoire*, vol. v (Copenhagen, 1897–1905).

CHRISTIAN VIII (1786–1848). King of Denmark from 1839 to 1848. He was a nephew of Christian VII and was born Sept. 18, 1786. When Norway was ceded to Sweden by the Treaty of Kiel, the people of the former country repudiated the act of alienation, and Prince Christian was made Governor. He raised an army and convened a diet, at which a constitution was framed, and he was elected, May 29, 1814, King of Norway under the title of Christian I; but the Norwegians were unable to withstand the invading Swedish army under Bernadotte, and the Allied Powers compelled Christian formally to relinquish the throne on October 10. He succeeded Frederick VI as King of Denmark in 1839. His reign was characterized by industrial progress and by increased political liberty. He made many significant administrative reforms, though in unifying his dominions into a firm whole he was less successful. Consult Thiele, *Christian den Ottende* (Copenhagen, 1848).

CHRISTIAN IX (1818–1906). King of Denmark from 1863 to 1906. He was born April 8, 1818, the fourth son of Duke William of Schleswig-Holstein-Sonderburg-Glücksburg. As the male line of the house of Oldenburg, which had occupied the Danish throne since 1448, was approaching extinction in the person of Frederick VII, the Powers, by the Treaty of London, May 8, 1852, to maintain the integrity of the Danish monarchy, "as connected with the general interests of the balance of power in Europe," guaranteed the succession to Prince Christian, by right of his wife, who was a niece of King Christian VIII. The London agreement was ratified by the Danish Diet by the Act of Succession of July 31, 1853. Accordingly Christian became King on the death of Frederick, Nov. 15, 1863. Soon after his accession the trouble over the duchies (see SCHLESWIG-HOLSTEIN) reached an acute stage, and Denmark

was compelled to relinquish them in 1864, after a brief war with Austria and Prussia. From 1873 to 1894 the King was engaged in a constitutional conflict with the democratic parties over the question of the responsibility of the ministry. The Conservatives finally triumphed. Victory lasted but a brief space of time. In 1901 the Liberals won out at the general elections, and a Liberal government was established in Denmark, much to the joy of the radical wing. Its success was not so great as expected, though the policy of reform was stimulated anew. By his wife Louise, a princess of Hesse-Cassel (1817–98), he had six children. Of these the eldest, Frederick, succeeded him on the throne as Frederick VIII; Alexandra married the Prince of Wales, later Edward VII; Dagmar married the Grand Duke Alexander of Russia, later Alexander III; and George became King of Greece as George I. His grandson, Charles, became King of Norway in 1905, as Haakon VII. The popularity of Christian IX was ever growing, due to his honorable and unassuming nature. Sound of judgment and loyal to the constitution, he won the love of his subjects and the respect of the other European nations. Consult Barford, *Kong Kristian IX's Regerings-Dagbog* (Copenhagen, 1876), and Majestet, *Kong Kristian IX* (ib., 1888).

CHRISTIAN X, Carl Frederik Albert Alexander Vilhelm (1870–). King of Denmark. He was born at Charlottenlund, Sept. 26, 1870, the son of King Frederik VIII. He married Alexandrine, Duchess of Mecklenburg, in 1898. He has two sons—Frederik, the Crown Prince, born in 1899, and Knud, born in 1900. Christian X succeeded his father to the throne of Denmark, May 14, 1912.

CHRISTIAN, of Brunswick (Braunschweig-Wolfenbüttel) (1599–1626). A German prelate and soldier, Lutheran Bishop of Halberstadt, and general in the Thirty Years' War, styled "the Madman of Halberstadt." He was born in Gröningen (Saxony) and became Bishop of Halberstadt in 1616. His military training he obtained in service in the Netherlands, under Maurice, Prince of Orange, against the Spanish. After Frederick V, Elector Palatine (q.v.), had lost Bohemia and the Palatinate through the disastrous battle of White Hill, Christian offered his sword in defense of the electoral cause, and in 1621, with an army of 15,000, plundered Roman Catholic churches and religious establishments along the river Main and through Westphalia. He was defeated by General Tilly at Höchst in June, 1862, and was dismissed from Frederick's service by the Elector. Immediately he joined the forces of the United Provinces, and as a commander under Prince Maurice defeated the Spaniards at Fleurus (in the modern Province of Hainaut, Belgium). Afterward he returned to Lower Saxony and was signally defeated by Tilly at Stadtlohn (Aug. 6, 1623). With English and French assistance he and Count Mansfield took the field in 1625, in command of an army of 14,000, under the general direction of King Christian IV of Denmark, the Protestant leader. He died, however, before anything was accomplished. See Thirty Years' War.

CHRIS'TIAN'A. The wife of Christian in Bunyan's *Pilgrim's Progress.* She is left in the City of Destruction by her husband. In the second part of the allegory she also leaves that place, and her subsequent adventures form the chief interest of the plot.

CHRISTIAN ART (Early). All art in the service of the Christian Church and religion is Christian art. By general usage the term "early Christian" is restricted to those phases of that art which belong to the period before the year 800, when Charles the Great was crowned Emperor of the West. It is therefore Christian art before its mediæval form was developed, while it still retains much of antique tradition. It falls into three divisions: (1) pre-Constantinian (c.100–313); (2) from Constantine to Justinian (c.312–550); (3) Justinian to Charlemagne. The first period is mainly illustrated by the Roman catacombs and shows Christian art in embryo; the second can be studied principally in the great basilicas and other churches of Italy, though the few examples at all well preserved in the East show that art was there quite as advanced; the third is illustrated in both East and West, but its Eastern phases are commonly classed under the term "Byzantine" (q.v.).

Architecture. There was very little opportunity for anything characteristic in the architecture of the earliest Christians. Constantine in 313 gave Christians freedom to erect places of worship. All that remains of early Christian art before this date is described in the article on Catacombs. The style formed in the fourth century is called basilical, because this name was given to the large churches that were by far the most important monuments erected. Christian architects faced the problem of creating a large interior for worshiping multitudes, in contrast with ancient worship, which was in the open air, or carried on individually or by sacrifices in the temples. In pagan temples nearly all the artistic efforts had been concentrated on the exteriors. Christian art neglected the exterior, leaving it of bare brick, conditioned in its form entirely by the interior arrangement and proportions. The arrangements of these churches are elsewhere described. (See Basilica; Apse; Transept; Atrium; Nave; Aisle; Altar; Choir; Confession.) Structurally they were of little importance. No rivalry with the great domed and vaulted halls of the Roman Imperial baths was attempted. The interiors were roofed with wood, and the thin brick walls had simple doors and windows. The general composition was good—columnar vestibule to a high, encircling wall; square open court, or atrium; open porch with three doors leading into an oblong interior divided into three or five aisles by rows of columns, supporting either a straight architrave or a line of arches. The dominant note of the interiors was not form, light, and shade, but color, given by mosaic pictures (see Mosaic) or frescoes (see Fresco) on the upper part of the walls, marble veneer or wainscot on the lower part, elaborately patterned marble floors, and rich hangings between the columns. This is what might be termed the official style, prevalent throughout Italy and in Greek lands, but elsewhere other ideals prevailed. The following schools may be distinguished: 1. *Roman*—in Rome, Milan, and most Italian cities; in southern Gaul; and in Rhenish Germany. 2. *Græco-Roman*—with decided Hellenic and Oriental influences, in several cities of Italy, where this element was strong, as in Ravenna and Naples; in the Adriatic provinces of

Istria and Dalmatia; and in Greece proper and the Balkan Peninsula. 3. *Asia Minor*—with use of stone and of vaulting, with heavier proportions and differences in plan. 4. *Syria*—especially in the ruined cities of the Hauran, and regions of Antioch and Damascus, where stone styles of great originality were developed. 5. *Egypt*—where the Christian Copts drew both from ancient Egyptian and from Hellenic Christian models. 6. *Northern Africa*—especially the present Algeria and Tunis, where the French excavations have brought to light a large number of early churches, but all in ruins. In these schools the earliest works were nearly always the finest, because in the fourth century the Roman Empire was still comparatively flourishing, and Imperial funds were lavishly used in building and decorating churches. The Church itself was far richer than during the barbarian inroads. The early Christian style lasted much longer in the West than in the East or in Greece, because the decay in the West caused by the barbarian invasions prevented the developments and changes that were possible in the East, where civilization continued uninterruptedly at a high level. In Italy, Gaul, Spain, and Germany it ruled far into the Middle Ages, the basilical type of church prevailing in many parts until the twelfth century. But in the Orient, where it never had so uniform a type, it gradually gave way to what is termed the Byzantine style. In Salonica (Thessalonica), which came next to Constantinople as a Greek centre, the wooden-ceiled churches continued to be built side by side with the domical ones until the eighth and ninth centuries. But elsewhere, as early as the seventh century, the flimsier wooden-roofed style had been entirely superseded by the Byzantine vaulted structures. The following are some of the basilicas which remain wholly or in part: In Rome—Santa Maria Maggiore (fifth century), San Paolo fuore le Mura (fifth), Santa Sabina (fifth), San Pietro in Vincoli (fifth), San Lorenzo (sixth, old part), Sant' Agnese (seventh), Santa Maria in Cosmedin (eighth), Santa Prassede (ninth), San Martino ai Monti (ninth). In Ravenna—San Teodoro (fifth), San Francesco (fifth), San Apollinare Nuovo, San Apollinare in Classe (sixth). In Spoleto—San Agostino. In Perugia—San Pietro. Also on the Adriatic, basilicas in Parenzo, Pola, Grado, all of the sixth century. In Constantinople—St. John (fifth). In Bethlehem—church of the Nativity. In Salonica—St. Demetrius. In Syria, such a multitude of churches, from the basilica of Shakka, in the fourth century, to the church of St. Simeon, in Kalat Siman, in the sixth century, that enumeration would be impossible. In nearly all these buildings, and in many others of less importance or poorer preservation, the one official type (see BASILICA) is followed. The differences are mainly in the common use by Greek and Eastern churches of the gallery for women over the side aisles, of double capitals over the columns, of polygonal apses, and of a modification of the old Corinthian and Ionic orders that led up to Byzantine ornament. In fact, from the beginning, architecture in the East was tending towards the Byzantine. If one were to select a half dozen out of all the remaining early basilicas as the finest and best-preserved examples of the style, these would be: church of the Nativity, Bethlehem; Santa Maria Maggiore, Santa Sabina, and Santa Prassede, Rome; the two San Apollinares in Ravenna; and the cathedral in Parenzo. They have preserved a great part of their original decoration as well as their architecture. There was another important class of early Christian buildings—the baptisteries, chapels, sacristies, mausoleums, and other religious structures, that were built not on an oblong, but on a concentric plan, i.e., buildings that were circular, polygonal, or even equilaterally cruciform. These buildings are, of course, comparable to Roman structures like the Pantheon or the temple of Vesta or Minerva Medica, but they were never so bold nor on so large a scale. At first even churches were sometimes built in this form (Antioch; San Stefano Rotondo, Rome; St. George, Salonica); but this was found inconvenient for liturgical reasons, and it was thenceforth confined to other religious and funerary structures. Some were square externally and octagonal internally, by means of niches, like the two baptisteries in Ravenna and that in Kalat Siman; some purely circular, like St. George in Salonica. In these cases the dome rests upon the outer wall, but in the more developed and monumental examples it rests upon a row of columns and is surrounded by a concentric aisle imitated from the straight aisles of the basilica and covered by a lower roof. Sometimes both dome and aisles are of masonry, as in Santa Costanza in Rome and Santa Maria Maggiore in Nocera—both of them of circular plan; at other times, with lighter walls and higher proportions, the coverings are of wood, as in the Lateran baptistery in Rome, which is octagonal, and San Stefano Rotondo, which is circular and with two aisles. This type of masonry vaulted "concentric" building was adopted in the East for church use: by the use of pendentives (q.v.) and the addition of an apse the Eastern architects produced a fine church type that was the germ of the Byzantine style. This is the case with the cathedral of Bozra and St. George in Ezra in Syria, and with Saints Sergius and Bacchus in Constantinople. Some of these buildings have galleries over the aisles.

For civil buildings of this period we must go to the Syrian cities, where there remain thousands of houses, halls, colonnades, sepulchral monuments, all well built in stonework, and telling us as much of the life of that time as Pompeii does for the previous centuries.

In so far as *materials* of construction are concerned, bricks were the common material in the West, including the Greek provinces, and this precluded sculptured decoration, because no marble facing was used. But in parts of the Orient, especially in Syria, local stone replaced brick, and there is a great deal of good carved detail. Here also the normal types of the classic orders, slavishly followed farther west, are varied by many new forms, which are not only connected with Persian and Byzantine ornament, but seem to foreshadow Romanesque and Gothic foliage and ornament. It is in Syria also that the greatest variety and inventiveness of architectural plan, composition, and form are shown. The masterpiece of the school is the monastery of St. Simeon in Kalat Siman.

Sculpture. The earliest of the arts to fall, at the decline of the Roman Empire, was sculpture. The carvings on the Arch of Constantine, the Column of Theodosius at Constantinople, and the Imperial portraits of the fourth century show this to have been so, even in the case of the most pretentious monuments. A few works of Christian sculpture of pre-Constantinian date come before this complete decadence. Such are the statue of St. Hippolytus and that of the Good Shepherd in the Lateran Museum and a few of the sarcophagi (q.v.). The latter form the bulk of early Christian marble sculpture during the third, fourth, and fifth centuries, after which there was very little sculpture on a large scale of any sort. These sarcophagi, after the fashion of the earlier ones of the Etruscans and pagan Romans, had a line of reliefs covering face and sides. Sometimes, even, there were two superposed rows of figures. Many subjects were usually crowded together, though sometimes such scenes as the crossing of the Red Sea, or Jonah swallowed by the whale, occupy the entire front. The scenes are selected with evident relation to funerary ideas and belief in future life, and are thus very instructive. (See Iconography.) Most of them occur also in the catacomb frescoes. The technique begins to decline in the fourth century, as is shown by the liberal use of the trepan, the loss of finish, and of good proportions. The museum of the Lateran contains the largest collection, but there are many in Arles. In fact, throughout the Roman world a similar style prevailed. The sarcophagi in Ravenna show the stiffness and limitations of the latest sarcophagi—those of the fifth and sixth centuries. To this time probably belongs the last colossal statue of antiquity—the bronze emperor found at Barletta, hard in its style, showing the loss of ability since the time of the famous bronze statue of St. Peter in the Vatican (fifth century). After the sixth century no attempt was made at monumental sculpture, the religious scruples of the Iconoclasts hastening the total downfall, which was complete both for the East and the West. The eclipse was to last about six centuries.

Painting and Mosaics. The painted ornamentation of the earliest crypts in the Roman catacombs, such as those of Domitilla and Priscilla, show that not until the middle of the second century was there enough that was significantly Christian to be called Christian painting. The technique is exactly the same as in contemporary pagan monuments; but a system of symbolism to express Christian faith is in process of formation. (See Iconography; a more general description is given under Catacombs.) Everything that could be regarded as a symbol of the resurrection and of salvation was represented, whether in the form of animate and inanimate symbols, such as the phœnix, the fish, or the bread; or of symbolic scenes, such as Noah, Daniel, or the three children in the furnace. In its limitation and simplicity this art was very direct and appealed alike to learned and unlearned. After the time of Constantine the historic, descriptive, genre, and dogmatic elements were added to diversify the art, while the deterioration of technique detracted from its appeal. The catacombs continue throughout the fourth century to furnish practically the entire material for study, because the churches of this period still in existence have partly or entirely lost their paintings. The art of mosaic painting now entered the field of figured composition and rapidly displaced fresco painting in the larger and richer churches. The mausoleum of Constantia and the church of Santa Pudentiana in Rome preserve works of this century of very different character—the former, in its semipagan decoration, harking back to the early catacombs, while the latter, with its ordered scene of Christ enthroned teaching the Apostles and establishing the Church of the Jews and of the Gentiles, shows the new dogmatic and didactic tendency. While painting had been rather sentimental and free, it became now more systematically a religious handmaid. (See Iconography.) The desire to tell the people all the main facts of religious history led to the invention of a series of chronological illustrations of the events of the Old and New Testaments which, originating as early as the fifth century, were handed down, almost unchanged, for about 1000 years. The mosaics of Santa Maria Maggiore in Rome, with their scenes from Genesis (c.430), show the early phase of the style before its historic exuberance had been pruned to the selection of fewer types. The historic series soon became subordinate to the dogmatic, as in the later mosaics (c.500) in San Apollinare Nuovo, in Ravenna, portraying the life of Christ. This was due to the influence of the East and of Greece. Although nearly all the preserved works of painting and mosaic earlier than 800 A.D. are found in the West, there are abundant proofs that the change from the symbolic to the dogmatico-historic style was due to the Orient. One of these proofs is the series of Greek illuminated manuscripts of the fifth and sixth centuries, in which this style is fully developed, and which may have served as models to the Western painter—such were the Vienna and Colton Genesis, Rossano Gospels, etc. The Oriental love of color also dictated the replacing of the thinner, colder fresco by the richer, warmer mosaics. The two typical Italian schools are Rome and Ravenna—the former representing the Latin, the latter the Oriental-Hellenic current. In Rome the mosaics of Santa Sabina (fifth century) and Santi Cosmo e Damiano (c.530) are the finest of their class—genuinely Roman; but the invasion of Byzantine methods is shown a little later in San Teodoro and even more in San Venanzio. The Ravenna series is richer in the fifth and sixth centuries, with its two churches of San Apollinare, San Vitale, the two baptisteries, the archiepiscopal palace, and the tomb of Galla Placidia, filled with mosaics by the best artists of the Greek school. The use of the gold ground, which they made popular, revolutionized mosaic painting and made its figures as clean-cut as those of a Greek frieze. The period closes with the supremacy of the East in painting.

Minor Arts. The smaller branches of art appeared to feel the decadence the least. This was especially true of ivory carving (q.v.) and metal sculpture. Yet in the diptychs and triptychs of the sixth to the ninth century, and in the ivory throne of Bishop Maximian at Ravenna, there is fine decorative effect, though the carving of figures is inferior. One branch, that of illuminated manuscripts (q.v.), may even be said to have been created at this time. The subjects portrayed were the same as in the larger arts. Certain branches were especially popular in special localities. Figured woven stuffs were worn in the Orient, especially in Egypt, St. Asterius commenting on the personages who carried all the Old and New Testaments on their garments. Many such textiles have been found in the Fayum. Then there was the special industry of figures delicately outlined in gold on glass, as in so many cups found in the Roman catacombs. The earthenware and bronze lamps also were decorated with religious scenes. But the choicest remaining examples are the ivories and illuminations. The scenes carved on the diptychs were necessarily limited in character to the figures and functions of the consuls; but a greater variety appears in the boxes (pyxes), the book covers, and other objects of ecclesiastical use, carved with great skill throughout this period, but especially between the fourth and the close of the sixth century, which is also the golden age for illuminations.

Symbolism and Iconography. All early Christian figured art expressed or taught some religious truth and was not produced primarily for æsthetic reasons. Therefore the study of its subjects is even more interesting than that of its style. This is treated under the title ICONOGRAPHY, as well as under SYMBOLISM; ALLEGORY.

Bibliography. Besides the authorities referred to under CATACOMBS and ICONOGRAPHY, such as Garrucci, Peraté, De Rossi, etc., consult: Kraus, *Geschichte der christlichen Kunst* (Freiburg, 1895–97); Woltmann and Woermann, *Geschichte der Malerei* (Leipzig, 1879); Zimmermann, *Gioto und die Kunst Italiens* (ib., 1899).

CHRISTIAN BROTHERS COLLEGE. A Roman Catholic institution in St. Louis, Mo., conducted by the Brothers of the Christian Schools (q.v.). The college was chartered in 1855 and maintains collegiate, scientific (civil and mechanical engineering), commercial, and preparatory departments. The value of the college buildings and grounds is about $650,000, and the total annual income $40,000. The library contains about 22,400 volumes. The student enrollment in all departments in 1912 was about 400. President, Brother Lawrence Sixtus.

CHRISTIAN CATHOLIC CHURCH. A religious denomination organized in 1896 by the Rev. John Alexander Dowie, a former Congregational minister in Australia. He went to the Pacific coast of the United States and then to Chicago, preaching and practicing faith healing, and he soon attracted a large following. While the generally received principles of the Christian religion are taught and the sacraments are recognized in the Christian Catholic church, special prominence is given to the doctrine of the divine cure of disease in answer to prayer. Dowie claimed for himself extraordinary powers of healing, and these claims he based on the asserted fact that he was a reincarnation of the prophet Elijah. The chief centre of the denominational activities is at Zion City, near Chicago, where Dowie acquired large properties, and where many institutions and business enterprises are located. He established schools and a college. The business enterprises founded by him included a printing and publishing house, a general store, lace making, and other industries. To establish his lace-making enterprise he purchased the complete plant of several lace factories in Dublin and brought over the employees of these plants to operate the enterprise and to instruct others in the making of lace. Dowie was very successful in these enterprises and in his effort to gather believers until 1903, when he led a large number of his followers to New York City for the purpose of carrying on a missionary campaign. This was a failure. He was received with ridicule by the press of the city, and his meetings were attended chiefly as a matter of curiosity. He made few converts. This was followed by disastrous visits to England and Australia. Upon his return to the United States he found considerable opposition to his leadership, and on Feb. 8, 1906, he was deposed and W. G. Voliva became Overseer. Dowie died in 1907. Following his death the importance of the church as a religious movement continued to decrease, while Zion City continued to develop as an industrial community. Two factions developed —those who held strictly to the rules and regulations for spiritual and social government as set down by Dowie, and those, chiefly newcomers to Zion City, who wished more liberal laws for the government of the community and found little significance in the set rules for conduct hitherto in force. This division resulted in financial difficulties, and in 1910 certain of the enterprises of Zion City were put up at auction and were purchased by Marshall Field and Company. The most important of these were the lace factories.

A usual feature of the meetings of the members of the denomination is a united consecration service at its close. Baptism is administered to believers by trine immersion. The organization of the church comprises the General Overseer, the Overseers for the largest districts, and Seventies. Besides the United States and Canada, the church claims to be represented in England, Scotland, Ireland, Australia, New Zealand, China, and Japan. There are no figures for membership later than 1906. At that time the communicants numbered 5865, the churches 17, and the ministers 35. The chief organs are the *Leaves of Healing*, a weekly, and the *Little White Dove*, a weekly. Consult: J. A. Dowie, *A Voice from Zion* (Chicago); *Zion's Conflict with Methodist Apostasy* (Chicago, 1901); Carroll, *Religious Denominations of the United States* (rev. ed., 1912).

CHRISTIAN CHURCH, SOUTH. See CHRISTIANS.

CHRISTIAN CONVENTION. See CHRISTIANS.

CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETY OF. A society originated by the Rev. Francis E. Clark, pastor of the Williston Congregational Church in Portland, Me. Its first membership consisted of about 50 boys and girls, who met, Feb. 2, 1881, in the pastor's parlor and pledged themselves to attend and take some part in a weekly prayer meeting and

once a month to hold a consecration meeting. Other duties, social, religious, literary, and of various kinds, were assigned to different members. The idea met with instant acceptance. In 1913 there were 75,063 societies, of which 53,417 were in the United States and Canada and 21,646 in other lands. The total membership was about 3,753,000. More than 100,000 societies under different names, with over 5,000,000 members, are organized on the plan of the Christian Endeavor. These scattered organizations are bound together by a corporation, the United Society of Christian Endeavor, organized 1885, with headquarters in Boston, and managed by a board of trustees. The organ of the society is the *Christian Endeavor World*. In 1895 the World's Christian Endeavor Union was formed. For details, consult L. W. Bacon and C. A. Northrup, *Young People's Societies* (New York, 1900), and Clark, *Christian Endeavor in all Lands* (Boston, 1906).

CHRISTIAN ERA. See CHRONOLOGY.

CHRISTIANIA, krēs'tē-ä'nē-ȧ, or **KRISTIANIA.** The capital of Norway, situated at the north end of Christiania Fiord, in lat. 59° 55′ N. and long. 10° 43′ E. (Map: Norway, D 7). It occupies about 7 square miles. Christiania is composed of the well-built city proper and of a number of rapidly growing suburbs. There are broad streets and fine, large squares adorned with monuments. The promenade of St. John's Hill is one of the city's attractive features. The historic citadel of Akershus now serves as an arsenal and prison. The most noteworthy churches are the Gamle Akers Kirke, mentioned before 1150; the Trinity Church, erected in the Gothic style in 1853–58; the church of Our Saviour, consecrated in 1697 and recently restored; and the Johannes Kirke, completed in 1878. The more prominent secular buildings are the Parliament House, the Museum of Art, the exchange, the royal palace, constructed in 1825–48, the episcopal residence, and the university. (See CHRISTIANIA, UNIVERSITY OF.) The botanical garden and astronomical observatory are worthy of mention.

Christiania forms a separate official district and is administered by a magistracy composed of the burgomaster and two councilmen. It has good water works and several electric-car lines. The educational institutions include, besides the university, two higher military schools, a gymnasium, a technical school, and a number of Latin schools and *realschulen*. The Museum of Art contains many meritorious paintings by Scandinavian and foreign artists, but no great masterpieces. The Industrial Art Museum has fine ancient and modern specimens of Norwegian handicraft. There are three theatres and a municipal library of about 55,000 volumes.

Industrially Christiania is quite important. Among its leading manufactured products are paper, oil, cotton yarn, tobacco, furniture, ironwares, and liquors. It is the principal seaport of Norway, handling about half of the imports and nearly one-fifth of the exports. The harbor is very spacious and is kept open in winter by means of ice breakers. There is regular steamship communication with Great Britain, Germany, the Netherlands, and France, as well as with Denmark and Sweden. Christiania is the seat of a number of consular representatives, including one from the United States. The population, almost wholly Protestant, was 227,626 in 1900, 241,834 in 1910, and 247,588 in 1912. The environs are very attractive, offering magnificent views. The average annual temperature of Christiania is 42° F. The city was founded in 1624 by Christian IV, on the site of the town of Oslo, which dated from 1048 and was burned in 1624. Consult Annéus, *La ville de Kristiania, son commerce, sa navigation et son industrie: Résumé historique* (Christiania, 1900).

CHRISTIANIA, UNIVERSITY OF. The Norwegian State University. During the union of Norway and Denmark, the Norwegian students frequented the university at Copenhagen; but the awakening of the national spirit at the end of the eighteenth century finally compelled the foundation of the Christiania University, under Frederick VI in 1811–12, mainly through voluntary subscriptions. In the course of the nineteenth century many buildings have been erected, both by the state and by private contributions. The university is under the control of the Minister of Religion and Education. There were in 1912–13 about 1600 students. The library is large, containing 495,000 volumes. The university has a botanical garden and an observatory, besides various laboratories and museums.

CHRISTIAN'ITY (from OF. *Crestiente, Crestientet*, from Lat. *Christianitas*, Christianity, from *Christianus*, Christian). The religion which has grown out of the teaching of Jesus Christ and which looks to Him as the great revelation of the character of God and of the ideals of human life. It exhibits a peculiarly wide variety of forms, only Buddhism being able to compare with it in this respect. At first sight it would seem that there is little in common between, e.g., the elaborate ritualistic religion represented by the Greek church and the simple, bare individualism of the Quakers. Beneath the surface, however, it is easy to see that there is a broad common ground. This consists in the acceptance of Jesus as the revealer of God and of the way of life. The line between Christianity and other religions is clearly defined. As he who can say, "There is no God but Allah, and Mohammed is his prophet," is a Mohammedan, so he who regards Jesus as presenting the highest religious ideals of the world, and who tries to follow those ideals in his own life, is a Christian, whatever else he may or may not believe. Men have divided, however, upon a definition of Christianity from the point of view of its historical content. Four great groups of answers have been made to the question, What is the content of Christianity? 1. The teaching of Jesus only. Even the rest of the New Testament is not authoritative and may be in error in fundamental things. For example, the view of John or of Paul regarding the person of Jesus may be rejected. An example of this general position may be found in Harnack's *What is Christianity?* (Eng. trans.). 2. The teaching of the New Testament. Whatever a reasonable exegesis shows this book to teach becomes authoritative Christian doctrine. This does not mean that all beliefs held by any New Testament writer are necessarily true, but that what the New Testament as a whole combines to teach as fundamental truth is necessary for Christianity. This has been, in the main, the position of the Protestant churches and is expressed in the great Protestant creeds. 3. The New Testament and the decisions of the ecumenical councils of

the early Church. So long as the Church remained essentially undivided, its decisions were so guided by the Spirit of God as to make the decrees of its councils authoritative doctrine. Christianity, e.g., includes the interpretation of the person of Christ expressed in the Nicene Creed. This was the position of the Oxford High Church movement in the Church of England in the middle of the nineteenth century. 4. The New Testament and the formal dogmas of the orthodox church up to the present time. This makes the authoritative doctrines of Christianity a constantly growing body, whose essence, however, may be found in the germinal teaching of Christ. No church claims that this may be superseded or changed, but only interpreted in the growing light of truth, by a church guided by the Spirit of God. This is the position of the Roman Catholic church.

All these interpretations, however, would assign to Jesus a unique position in the religion. (For His Life, see JESUS CHRIST.) His relation to Christianity is different from that of any other religious leader to his system. He is more than a teacher like Buddha, or a prophet like Mohammed, or a lawgiver like Moses. In a sense, He is the religion. He lived its ideals. Orthodox Christianity has regarded the reconciliation between God and man as not only revealed, but actually made, by His life and death. His teaching was not independent of history. The germs of it were in the Hebrew prophets. In fact, He was the last and greatest of the prophets, and in Him the prophetic teaching finds its culmination. In the prophets individual religion was mingled with national religion. In the teaching of Christ the national element completely falls away, and the individual religion stands out as the only type of religion. Christ did not inveigh against the national ideals or the temple worship. He only put forth clearly His conception of religion as a relation of personal trust in the fatherhood of God, and shortly national ideas and ritual worship fell away from His followers of their own accord.

The elements common to Christianity and other religions are the sense of human need of superhuman help; the belief in the possible communion between man and God; the conception of the willingness of God to aid man; and a means of bringing about that communion and so of opening for man the possibility of divine help. Its unique element lies in its conception of the means by which man may come into communion with God. Man comes into that communion through Christ, but the interpretation of this phrase differs in different branches of Christianity. Some hold that the communion must be mediated by the church; some, that it is a matter for the individual alone; but all hold that Christ is, in one way or another, the door of communion with God.

Christianity teaches (1) man's ideal life. This ideal is a life in harmony with God. The conception of God, then, is crucial for Christianity. Christ's common term for Him shows His character. God is the Father in heaven. He is holy, but His holiness does not shut Him away from man. His love is the main characteristic of God which Christianity expresses. He is omnipotent and omniscient, but it is not only as abstract wisdom or power that Christianity presents Him. Rather it dwells upon His all-embracing loving-kindness. Man ought to be in loving accord with the loving Father. As Augustine expressed it, "O God, my heart is restless, and finds no rest until it rests in Thee." (2) Man's actual life. This is very far from rest in God. Man is a prodigal son, wandering far from the loving Father's home. He is a sinner, and Christianity calls him to turn and repent. Here lies what has sometimes been termed the pessimism of Christianity. Christianity does not view the world as inherently miserable, as some Oriental religions do, and recommend self-effacement as the remedy. The world is miserable because of its sin. The world is a lost world. Christianity does not reject evolution (q.v.), whereby the race is viewed as progressing upon the whole, and even the Church as developing in grace and knowledge, but it nevertheless regards man as sinful. The result is that the world is a kingdom of evil. Man was made to know God. Remove this knowledge from him by sin, and he tends to evil. But with this view of man and the world is combined another. The apparent pessimism is changed to an optimism. (3) How man may obtain his ideal life. Man is capable of salvation and has in the divine design great and noble possibilities. Christianity comes to bring into his history the saving power which shall rescue him from himself and make him a son of God. It presents to him in Jesus Christ an ideal of purity which, under the ministration of the divine Spirit, convinces him of his sin. The same Spirit produces a new allegiance in his soul, allegiance to God in Christ, creates a new purpose to do the right, animates him by a new affection, that of an all-embracing love, and produces a new obedience to the will of God. The change in him is not a mere change of purpose. It is accompanied with the gift of the Spirit as an abiding, renovating, inspiring, and enabling presence, so that the man finds a new power in himself to overcome the temptations of the world. Christianity puts him, also, in a new society, and it thus saves him. It brings him out from under the condemnation of the law of God, it puts him in the position of communion with his Father, and thus it both shows what he was intended to be and helps him increasingly to attain that ideal. He knows and trusts his Father, and so not only attains the ideal life, but finds with it perfect peace and rest. His mind responds to Christ's sayings, "Ye shall find rest unto your souls"; "Peace I leave with you."

This ideal is not one of selfish inactivity. Harmony with God implies being animated with the same spirit of love which gives God the title "Father." Such a spirit must necessarily issue in loving sympathy with all men, in the attempt to bring them, by every means in the power of man, into that same realization of the love of God which the Christian has found. Here lies the Christian warrant, and even demand, for works of charity and beneficence; for civic and social reform and for mission work. Such good works are a part of the effort to bring all men to that condition of harmony with God which Christ called the Kingdom of God. Christianity is essentially a missionary religion.

In the classifications of religion Christianity is a universal religion, because it is not limited to any race or stage of culture and may be followed as well in one place as another. It thus differs from national and local religions.

It is the absolute religion among the religions which affirm the independent individuality of man; i.e., it holds up as the ideal complete harmony of will between God and man. All religions seek harmony of some sort, but harmony of will is absolute harmony and represents the final stage, beyond which it is impossible to go without becoming pantheistic and accepting the absorption of personality in a monistic being.

Historic Christianity presents other elements than those given in the teaching of Jesus. He made no effort to separate His followers from the Jewish church. The new religion soon began to make converts among the Gentiles, and the question arose whether those who refused to become Jews could be followers of Jesus, whom His disciples regarded as the Jewish Messiah. The real point at issue was whether Christianity was a Jewish Messianic sect or an independent religion. Paul became the champion of the broader view, and his influence, together with the logic of events, soon launched Christianity upon an independent career. It took over, however, many Judaistic elements. Its idea of God, its first Bible, its emphasis on morality, its conceptions of the future life, were parts of its Jewish heritage. It also borrowed from Greek philosophy and institutions. The development of the Church was influenced by the forms of Greek societies, and its theology by Greek thought, especially by Neoplatonism. Later, national ideas and customs molded the different forms of the religion, so that we find sections of it differing as widely as the intellectual Calvinism of Scotland and the semipagan Christianity of Abyssinia.

Some external organization is, of course, necessary for the growth of any religion. Accordingly there has always been a church. The sacerdotal tendency, transplanted from Judaism into early Christianity, strengthened by Augustine (q.v.) and culminating in the papacy, identified the visible with the invisible Church, made membership in it essential to salvation, and viewed the hierarchy as essential to the being of the Church. This view is largely held in the Anglican communion at the present time. Other Protestant bodies have, however, laid the emphasis upon the invisible Church to such a degree that they have acknowledged the validity of any church organization which seemed to possess the Spirit of Christ.

For specific doctrine, see TRINITY; CHRISTOLOGY; ATONEMENT; HOLY GHOST; SACRAMENT; INSPIRATION; RESURRECTION; JUDGMENT, FINAL; ESCHATOLOGY; GREEK CHURCH; ROMAN CATHOLIC CHURCH; LUTHERANISM; CALVINISM.

The evidences of Christianity vary from age to age according to the needs of that age; they must, however, always consist in the display of the essential meaning of Christianity and its place in the plan of the world. The chief external arguments were formerly derived from the fulfillment of prophecy and from the testimony of miracles. The modern stress upon law in the world has caused a change at this point. Prophecy and miracle themselves have now become an object of attack and need defense. The argument for the truth of Christianity as a whole is derived from two principal sources: from history, particularly from Christianity's place in history as a force cooperating with other forces to make history what it is, and that upon its best side; and from the reasonableness of its doctrines and their agreement with the results of every other realm of human knowledge. The internal evidences of Christianity were formerly occupied largely with the character of Christ and the career of the Apostles as both exhibiting the presence of a supernatural power. While these arguments have not passed away and never can, there has been a tendency of late to lay a new stress upon Christian experience as a source of evidence. Not only does the gospel, when accepted and tried, do for the sinner what it professes itself able to do, and thus prove itself because "it works," but the Christian comes to possess an experiential and thus an independent knowledge of the chief truths of Christianity which is logically independent of the Scriptures and the Church, and is thus able to confirm their claims. Consult Stearns, *Evidence of Christian Experience* (New York, 1891).

CHRISTIAN KNOWLEDGE, SOCIETY FOR PROMOTING. The oldest religious association connected with the Church of England. Founded in 1698, it did not receive its present name till 1701. It had for object: "(1) To promote and encourage the erecting of charity schools in all parts of England and Wales; (2) to disperse, both at home and abroad, Bibles and tracts of religion; and, in general, to advance the honor of God, and the good of mankind, by promoting Christian knowledge, both at home and in other parts of the world, by the best methods that should offer." It has directed its efforts chiefly to the British dominions, partaking of the nature of an educational association, a missionary society, a Bible society, and a religious tract society; and notwithstanding the operations of other great societies in these several departments of Christian benevolence, it still does a great work. Consult Sewell, *The Society for Promoting Christian Knowledge* (London, 1885), and *An Important Chapter in English Church History* (London, 1905).

CHRISTIAN REFORMED CHURCH. A religious denomination in the United States, numbering, in 1913, 35,142 communicants. It had 209 congregations located chiefly in Michigan, Illinois, and Iowa. The ministers numbered 156, and the Sunday-school scholars about 25,000. The highest church court is the Synod, which meets biennially. This church is the result of secession movements from the Reformed

(Dutch) church (q.v.) in 1822, 1857, and 1882. The doctrinal standards are the same as those of other Reformed churches of Holland origin, viz., the Heidelberg Catechism, Belgic Confession, and Canons of Dordrecht. The Calvin College Theological Seminary, at Grand Rapids, Mich., had, in 1912, 24 students. Most of the churches use the Holland language in divine services; half a dozen are German-speaking; a constantly increasing proportion uses English. The English organ of the denomination is the *Banner of Truth*, published at Holland, Mich. Consult *Religious Census of the United States* (1910).

CHRISTIANS. The religious denomination known as the "Christians" or the "Christian Church" originated near the close of the eighteenth century in three unconnected movements. James O'Kelley and others in Virginia and North Carolina withdrew from the Methodist Episcopal church in 1793 and at first were known as "Republican Methodists." In 1794 they decided to be known only as "The Christian Church," but commonly spoke of themselves simply as Christians. Abner Jones, a Baptist, led a movement in 1800 under which a church was formed in Lyndon, Vt., in which the conditions of membership were simply a belief in Christ and the Holy Scriptures, and the only name for the members was Christian. In 1804, in Kentucky, Barton W. Stone and five other ministers of the Presbyterian church, forming what was known as the "Springfield Presbytery," voted to dissolve that body and henceforth were known to each other as Christian ministers only. At first neither of these groups had any knowledge of the others. But as churches multiplied, they became acquainted, and as early as 1819 general meetings were held. From these developed general organizations for the promotion of publishing, educational, and missionary interests. These are now represented by the American Christian Convention, an incorporated body, composed of representatives of local conferences in the United States and Canada, and of presidents of colleges and State and district organizations coöperating with the convention. It meets every four years. The Mission Board is an incorporated department of the convention, through which mission and church extension work are carried on in the United States, Canada, Japan, and Porto Rico. There were in Japan, in 1913, 9 missionaries, 15 native helpers, 4 mission stations with 15 outposts, 11 churches with 847 members and 2110 Sunday-school scholars. In Porto Rico there were, in 1913, 2 missionaries and 4 churches, with 14 stations and out-stations. In the United States and Canada 32 home-mission pastors and home missionaries were wholly or partly sustained. The educational interests of the convention include the following institutions: The Christian Biblical Institute, Defiance, Ohio; Starkey Seminary, Lakemont, N. Y.; Union Christian College, Merom, Ind.; Elon College, Elon College, N. C.; Weaubleau Christian College, Weaubleau, Mo.; Palmer College, Albany, Mo.; Defiance College, Defiance, Ohio; Jireh College, Jireh, Wyo.; and Franklinton Christian College (colored), Franklinton, N. C. The publishing department is under the control of the Christian Publishing Association. It issues the *Herald of Gospel Liberty*, a weekly religious newspaper, which was established by the Rev. Elias Smith at Portsmouth, N. H., Sept. 8, 1808. Other publications of the Christians are the *Christian Missionary*, *Christian Sun*, *Christian Vanguard*, besides local and conference publications. The Christians had, in 1913, about 110,000 communicants and 1318 ministers. There are 72 conferences, some of which are combined into State or district organizations, such as the New England Christian Convention and the Southern Christian Convention. The latter body was organized in 1856, when the Southern delegates to the American Christian Convention at Cincinnati, Ohio, withdrew on account of resolutions passed by that body condemning slavery. They were practically reunited in 1890. The pioneers of the Christians had little thought of organizing a new sect. In order to maintain public worship and properly care for the membership, they were compelled to organize more perfectly, but they strove to preserve the principles upon which the movement was based. These are: Christ the only head of the Church, excluding popes, bishops, and similar ecclesiastics; acceptance of the Bible as a sufficient rule of faith; avoidance of sectarian or divisible names; Christian character as the only requirement for fellowship or church membership; insistence upon the right of private judgment and liberty of conscience in all matters of theological opinion and ceremonial observance, and advocacy of the union of all the followers of Christ.

CHRISTIANS, or DISCIPLES OF SAINT JOHN, or MANDÆANS, or SABIANS (Lat. *Johannitæ*, from *Johannes*, John). A small religious body in south Babylonia. The name "Christians of St. John" is not used by them and is a misnomer. Their veneration of John the Baptist and the similarity of certain of their rites with those of the Christians led the early Carmelite missionaries to believe them to be the descendants of the early disciples of John. One of these missionaries, Ignatius a Jesu, who came in contact with them in Basra, introduced this name to Europe in a description of them (1652). In fact, the religion is Gnostic in origin, with some infusion of Persian and Indian philosophy. See MANDÆANS.

CHRISTIANSAND, krĭs'tyăn-sănd'. An episcopal city, the largest in south Norway, situated at the mouth of the Torrisdals Elv, in the Bay of Christiansand (Map: Norway, C 7). The town exports lumber, fish, lobsters, hides, copper, and iron. Its harbor is good. It has twice, once in 1880 and once in 1892, been devastated by fires. Its fortifications have become useless because of the fortress built at Flekkerö, 5 miles distant. Pop., 1891, 12,813; 1901, 14,566; 1911, 15,154. It was founded by Christian IV in 1641.

CHRISTIANSBURG, krĭs'chanz-bûrg. A town and the county seat of Montgomery Co., Va., 33 miles southwest of Roanoke, on the Norfolk and Western Railroad (Map: Virginia, D 4). It is known as a summer resort and contains the buildings of the Old Montgomery Female College. Stock raising is the chief industry. Pop., 1910, 1568.

CHRISTIAN SCIENCE. The name given by Mary Baker Eddy to the discovery which she made in 1866 and the religion which she afterward founded. As its name indicates, Christian Science is an interpretation of the religion taught and practised by Christ Jesus. It purports to be the science of God and His universe, including man,

and the science of salvation from all evil.

Christian Science defines God as "incorporeal, divine, supreme, infinite Mind, Spirit, Soul, Principle, Life, Truth, Love" (*Science and Health*, by Mrs. Eddy, page 465). It affirms the divine individuality or infinite personality of God, but denies that He is personal in a human or finite sense, and rejects all anthropomorphic conceptions of Deity. Christian Scientists vindicate the use of unusual synonyms for God by saying that they are intended, and are all required, "to express the nature, essence, and wholeness of Deity" (*Science and Health*, page 465). Christian Science declares that God is the divine Principle of all real being; that is, the cause, origin, source, and substance of all that has actual existence. It also declares that the will of God is the law of divine Love which invariably provides, and is always available, for the welfare and preservation of man. With reference to the relation between God and man as "the creator and the created," and the nature of real personality, Mrs. Eddy has said, "We are not transcendentalists to the extent of extinguishing anything that is real, good, or true; for God and man in divine Science, or the logic of Truth, are coexistent and eternal, and the nature of God must be seen in man, who is His eternal image and likeness. . . . Scholastic theology makes God manlike; Christian Science makes man Godlike." (*Message to The Mother Church* for 1901, pages 5 and 7.)

Christian Science denies the personality of evil, the devil, or Satan, and avers that evil has no real entity or existence. It does not deny that sin, disease, death, want, woe, suffering, and all the phenomena of evil have a relative existence in human experience; but this science does deny that evil, in any form, has the reality of absolute substance or being; it affirms that every phase of evil can be scientifically abated and abolished, and it gives to its students a spiritual understanding that lifts them more and more into the realm of the real.

Why does Christian Science attach so much importance to its healing? Christian Scientists reply that mankind is in great need of relief from disease, and this science is the most effectual means to that end; also, that Christian healing results from the power of good over evil, and is certain to turn thought towards God to-day or to-morrow, even as it did before: "When the multitudes saw it, they marvelled and glorified God, which had given such power unto men" (Matt. ix. 8).

In denying that Jesus is God, Christian Science relies chiefly on the authority of his own utterances, and maintains that this view alone gives full effect to all his sayings. While acknowledging the atoning sacrifice of Jesus, Christian Science finds the essential efficacy of his atonement in his life—in his teaching and demonstration of the truth of being; as he himself said, "Because I live, ye shall live also" (John xiv. 19). Christian Science holds that Jesus acted within the range of what is possible for men, exemplifying universal possibilities, even as he said, "He that believeth on me, the works that I do shall he do also" (John xiv. 12); also, that Jesus was rightly entitled to the name Messiah or Christ, though either of these terms is less a personal name than a designation of his office; that the office of the Christ is to liberate and deliver, to heal and to save; and that, to quote the words used by Mrs. Eddy on page 473 of *Science and Health*, "Christ is the ideal Truth, that comes to heal sickness and sin through Christian Science, and attributes all power to God . . . Jesus is the human man, and Christ is the divine idea; hence the duality of Jesus the Christ."

Christian Scientists, therefore, invite all men to reëxamine the Scriptures in the light thrown upon them by this teaching, to the end that all may begin anew the working out of the salvation which Jesus taught and exemplified. In support of this appeal, they point to the complete change of theory which ecclesiastical Christianity has more than once undergone regarding the way of Christian salvation, to the evident correspondence of Christian Science to all the teachings of Jesus, and to the increased benefits of Christianity which have come to pass since the advent of its science. This science, so they aver, has come to repeat what Jesus knew and taught; to be that "spirit of Truth" which he foretold and promised (John xiv. 15–26; xv. 20–26; xvi. 7–15); to revive his original gospel, without the limitations which have arisen in human belief; to restore the scope and complete the mission of primitive Christianity. In short, the aim of Christian Science is to introduce the practice of original Christianity, with its knowledge of the truth that makes free and its consequent power over error and erroneous conditions.

As an organization, the Christian Science church is remarkable for its simplicity. It consists of "The Mother Church," at Boston, "branch churches" to be found wherever there are a sufficient number of Christian Scientists, and "societies" where the number of Scientists is not yet large enough for a church. The affairs of The Mother Church are conducted by a board of directors in accordance with a definite order established by Mrs. Eddy and published in the *Church Manual*. The branch churches and societies are self-governing, subject only to certain provisions of the *Church Manual*. The functions of The Mother Church, outside its character as a local church with seats for 5000 people, are those related to the denomination as a whole. Included in these activities are the publication of a directory of representative practitioners, the certifying of authorized teachers, the maintenance of a board of lectureship, the issuance of authentic literature, and the employment of other means for guarding the purity and integrity of Christian Science.

As a religious movement, Christian Science is notable for the rapidity of its growth and the intelligent class of people which it has attracted. The First Church of Christ, Scientist, was organized in 1879 at Boston. In 1915 there are 1500 Christian Science churches and societies. A majority of these are in the United States, but they are numerous wherever the English language is spoken, and a considerable number are to be found in other countries. It was predicted that the passing of Mrs. Eddy (in 1910) would mark the highest point for the Christian Science movement, but its growth and vitality steadily increased after that event as before.

Consult: Eddy, *Science and Health with Key to the Scriptures* (Boston, 1906); id., *Miscella-*

neous Writings (ib., 1896); id., *The First Church of Christ, Scientist, and Miscellany* (ib., 1913); Wilbur, *The Life of Mary Baker Eddy* (ib., 1913). See also bibliography under EDDY, MARY BAKER.

CHRISTIANSEN, krĭs'tē-ăn-sĕn, ARNE EINAR (1861–). A Danish dramatist, unconventional, but noteworthy for his mastery of the playwright's art. His first play, *Lindows Börn* ('Lindow's Bairns,' 1881), was a prose comedy. It was followed by another, *En Egoist* (1882). He then passed several years in travel in various European countries and the Orient. On his return he turned to tragedy in *Nero* (1885) and afterward wrote, besides comedies and prose dramas, several romantic historical plays in verse; a philosophic drama in verse (*Cosmus*, 1897), remarkable for its skillful blending of romanticism and idealism; novels (*Joppe*, 1889; *Hjarl*, 1894); and the libretti of several original operas. In 1899 he was made director of the Royal Theatre in Copenhagen. Christiansen is at his best when he depicts the life of the higher Copenhagen bourgeoisie.

CHRISTIANSEN, CHRISTIAN (1843–). A Danish physicist, born in Loenborg. He studied in Copenhagen, subsequently taught at the school of technology there, and in 1886 became professor of physics in the university. He carried out several interesting investigations on subjects of natural philosophy, and wrote general scientific works in Danish, including an introduction to mathematical physics (1887–89). Among his original contributions to physics, his researches on radiant heat deserve mention.

CHRISTIANSFELD, krĭs'tĭ-ăns-fĕlt' (Ger., Christian's field). A settlement of Moravian Brethren, in the northern part of Schleswig, about 2 miles from the Danish frontier, founded in 1773. The houses, which are well built and cheerful in appearance, are arranged in two parallel streets, with the church upon a green plot in the middle. There is a coöperative farm, and there are manufactures of soap, candles, leather, tobacco, and wool. Pop., less than 1000.

CHRISTIAN SOCIAL UNION. An organization founded in England in 1889, by members of the Church of England, for the study and advocacy of Christian socialism and the application of the principles of Christianity to social problems. The first body was organized at Oxford, and a branch was founded in London in 1891. The Oxford branch has given its chief attention to the study of economic facts, while the London branch is active in holding meetings, issuing addresses, and in general carrying on active propaganda. There are branches in other important cities of England, and in Australia and New Zealand. It has two organs in England, *The Economic Review* and *The Commonwealth*. An affiliated organization of the same name and with the same general purpose was founded in the United States in 1891. Its first president was Bishop F. D. Huntington.

CHRISTIANS OF SAINT THOMAS. The name of a branch of the Christian Church still existing on the Malabar coast, southwestern India, hence called by themselves the Syrian Church of Malagala, formed originally by excommunicated Nestorians, although it claims the Apostle Thomas as its founder. In the eighth century it received a metropolitan from the Nestorian patriarch. The liturgy is in the Syriac language. They still celebrate the early agape, or love feast, use bread, salt, and oil in the communion service, and anoint infants on baptism. Their priests are allowed to marry. Consult: Hugh, *History of Christianity in India* (4 vols., London, 1839–45); the monograph by W. Germann, *Die Kirche des Thomaschristen* (Gütersloh, 1877); Richter, *A History of Missions in India* (New York, 1908).

CHRISTIANSTAD, krĭs'tē-ăn-städ', or **KRISTIANSTAD** (Swed., Christian's city). A town in south Sweden, capital of a län of the same name, situated on the Helge, about 14 miles from Ahus on the Baltic, and 265 miles southwest of Stockholm (Map: Sweden, E 8). It is regularly built, possesses an arsenal and a magnificent church of the seventeenth century, a museum, and is the seat of a court of justice. Its fortifications were destroyed in 1847. The chief manufactures are woolen stuffs, tobacco, leather, ironware, and gloves, while the trade in brandy and grain is considerable since the river has been made navigable to this point. Pop., 1901, 10,318; 1912, 11,680. The town, which was founded by Christian IV of Denmark in 1612, came into the hands of Sweden in 1658 and suffered many sieges during the wars between Denmark and Sweden.

CHRISTIANSTED, krĭs'tē-ăn-stĕd' (Dan., Christian's city). The capital of the Danish West Indies and the chief town of the island of Santa Cruz. It is situated on the northeast coast of the island and has an excellent harbor which is defended by a fort and a battery. The chief exports are sugar, molasses, and rum. The population numbers about 6000.

CHRISTIANSUND, krĭs'tē-ăn-sŏŏn' (Norweg., Christian's sound). A seaport on the west coast of Norway, 85 miles west-southwest of Trondhjem, situated on three small islands (Map: Norway, C 5). It is a very flourishing town, having an excellent harbor formed around the islands. But fresh water is scarce and must be brought to the islands in long aqueducts. It exports great quantities of fish. It has also a thriving coast trade, which is carried on in its own ships. Pop., 1891, 10,381; 1901, 12,043; 1911, 13,012. The town was called Christiansund in 1742 in honor of Christian VI, who gave it its privileges.

CHRISTIAN UNION, INDEPENDENT CHURCHES OF CHRIST IN. The Christian Union churches were formed in Ohio during the first years of the Civil War, when enthusiasm for the war in defense of the national Union against secession was strong in the Northern churches, and the duty of supporting the government was freely preached by their ministers. Under the leading, principally, of the Rev. J. Flack, previously of the Methodist Episcopal church, church members who were opposed to the war and those who disapproved of what was called political preaching were gathered into separate congregations. After the period of the war and reconstruction the aim of these churches gradually became to promote Christian unity and undenominationalism. At the General Council of 1878 a paper defining the position of the organization was adopted which was essentially the same in terms with the declaration of the Christian Connection, and the Christian Union churches became affiliated with that body in 1890. At that time they had, according to the census of 1890, 294 congregations, with 18,214 communicant members, in 17 States.

CHRISTIAN UNITY, WORLD CONFERENCE ON. A movement which originated at the general

convention of the Protestant Episcopal church in the United States in 1910, when the following resolution was adopted: "Whereas there is today among all Christian people a growing desire for the fulfillment of Our Lord's Prayer, that all His disciples may be one, that the world may believe that God has sent Him; *Resolved:* That a joint commission be appointed to bring about a conference for the consideration of questions touching faith and order, and that all Christian communions throughout the world which confess our Lord Jesus Christ as God and Saviour be asked to unite with us in arranging for and conducting such a conference. The commission shall consist of seven bishops appointed by the chairman of the House of Bishops, and seven presbyters and seven laymen appointed by the president of the House of Deputies." This commission was accordingly appointed, with Bishop Anderson of Chicago as president. Steps were immediately taken to secure the coöperation of Christians in the United States. The leading Protestant communions promptly responded, and the majority of them appointed similar commissions or committees. Conferences with a view to obtaining coöperation were held with officials of the Roman Catholic church, the Eastern Orthodox church, the Holy Orthodox church of Russia, and the Church of Armenia. The greatest interest and sympathy in the movement was shown by these officials. Up to Oct. 15, 1913, 30 commissions or committees had been appointed by denominations throughout the world. These included, in addition to the Protestant denominations in the United States, the Church of England, the Holy Catholic church of Japan, and the Old Catholic churches in Europe. On May 8, 1913, an informal conference was held in New York City, in which representatives of all commissions appointed in the United States were invited to take part. Preliminary arrangements were considered for the holding of a world conference on some future date.

CHRISTIAN YEAR, The. A religious work by John Keble (1827), containing reflections in verse appropriate for Sundays and holy days throughout the year. It is marked by deep religious sentiment, love of nature, and domestic affection.

CHRISTIE, krĭs'tĭ, Anne (1837–). A Canadian poet and novelist. She was born in London, England, but early went to Canada to live on Amherst Island, near Kingston, Ontario. Afterward she removed to North Gower and later to Ottawa. She contributed many short stories and poems to British, Canadian, and American magazines. Some of her poems appeared in *The Magazine of Poetry*, and those written on various phases of the half-breed rebellion in the Northwest received high praise from Sir Edwin Arnold. She also wrote four novels: *Alice Gray* (1873); *Edged Tools* (1880); *Requited* (1886); *Loved I not Honour More* (1887); and a poem, *A Canadian's Appeal to Canada* (1911).

CHRISTIE, krĭs'tĭ, Richard Copley (1830–1901). An English scholar and bibliophile, born at Lenton, Nottinghamshire. He matriculated in 1849 at Lincoln College, Oxford (where began his friendship with Mark Pattison), and afterward studied for the bar. In 1854 he received the appointment of professor of history at Owens College, Manchester, recently founded, and later he was given the chairs of political economy and commercial science and jurisprudence and law. The last of these appointments he resigned in 1869, but his connection with the college, as one of its governors and most interested advisers, lasted until his death. From 1872 to 1893 he was chancellor of the diocese of Manchester. Christie left to Owens College his rare library, containing one of the largest private collections of editions of Horace (800 vols.), as well as his collection of Renaissance literature. As an author his most important book is *Etienne Dolet, the Martyr of the Renaissance* (1880; rev. ed., 1899), which was translated into French by C. Stryienski (1886) and is worthy to be classed with his friend Pattison's *Casaubon*. Among other works by him are valuable studies of certain Renaissance characters. His bibliographical writings include: *The Marquis de Morante: His Library and its Catalogue* (1883); *Catalogues of the Library of the Duc de la Vallière* (1885); *Elzevir Bibliography* (1889); *Chronology of the Early Aldines* (1895). The most notable of his works are collected in the *Selected Essays and Papers of Richard Copley Christie*, ed., with a memoir, by W. A. Shaw (1902).

CHRISTIE, Robert (1788–1856). A Canadian journalist, legislator, and historian. He was born in Nova Scotia, but in early manhood removed to the city of Quebec, studied law, and was called to the bar. He showed little interest in his profession and never succeeded in it; but his keen interest in the issues which precipitated the union of Upper and Lower Canada in 1841 led him into journalism and politics. He took the popular side; but his views were often visionary and unpractical, while his restive temper made him difficult to coöperate with. For some time he was an editorial contributor to the Quebec *Gazette* and the Quebec *Mercury*, and his writing, informed by ample political knowledge, exerted a strong influence. He was elected to the Legislative Assembly of Lower Canada, but in 1829 he was expelled for having wrongfully advised the dismissal of a number of justices of the peace. He was reëlected, and expelled a second time. In 1841–56 he was a member of the Canadian Legislative Assembly. He wrote a *History of the Late Province of Lower Canada* (6 vols., 1866), a work containing a valuable mass of historical material, but ill arranged and marred by serious defects of style.

CHRISTIE, Sir William Henry Mahoney (1845–). An English astronomer, born at Woolwich. He received his education at King's College School, London, and at Trinity College, Cambridge. He was elected a fellow of his college in 1869; in 1870 he was made chief assistant at the Royal Observatory of Greenwich and in 1880 secretary of the Royal Astronomical Society. In 1881 he succeeded Airy as Astronomer Royal and held that position until 1910. His published works include a *Manual of Elementary Astronomy* (1875) and a number of valuable technical papers contributed to scientific periodicals.

CHRISTINA, krê-stē'nȧ. Queen of Spain. See María Christina.

CHRISTINA (1626–89). Queen of Sweden from 1632 to 1654. She was the daughter of the great Gustavus Adolphus, and was born Dec. 18, 1626. She became Queen after the death of her father in the battle of Lützen, in 1632. Till 1644 she reigned under a regency headed by the Chancellor Oxenstierna. Distinguished by the possession of a lively imagination, a good memory, uncommon intelligence, and remarkable

aptitude for serious study, she received the education of a man rather than that of a woman, and to this may in part be attributed the many eccentricities of her life. Her subjects and counselors earnestly desired her to marry, but the Queen's restless spirit would accept no such bond. In 1649 she had her cousin, Charles Gustavus (see CHARLES X), declared her successor by the Estates of the realm. Her reign was notable for the patronage of learning and science; but the Queen was too eccentric and cared too little for politics to give that force to the administration which the position of Sweden in Europe at that time, and its own lively internal politics, required. In 1654 Christina voluntarily abdicated in favor of her cousin, reserving to herself sufficient revenues, her entire independence, and supreme authority over her suite and household. She embraced Roman Catholicism and afterward resided chiefly in Rome and in France, gathering about her a court of brilliant and learned men and spending much time in literary and scientific pursuits. She covered herself with infamy by the murder in 1657 at Fontainebleau of her grand equerry and favorite, Monaldeschi. After the death of Charles Gustavus in 1660 Christina repaired to Sweden and began to intrigue for the recovery of her throne; but her subjects cut short her pretensions by forcing her to sign another formal act of abdication. She died April 19, 1689. Consult: Geyer, *Geschichte Schwedens*, vol. iii (Hamburg, 1836); Archenholtz, *Vie de Christine par ellemême* (Stockholm, 1751); Bain, *Christina, Queen of Sweden* (London, 1890).

CHRISTINE DE PISAN, krê'stên' de pê'zăN' (1363–1431). A French writer, daughter of an Italian astrologer. Left a widow with three children, she made letters a livelihood and wrote some controversial and historical prose and considerable didactic verse, such as *Le chemin de longue estude* and the *Poème de la pucelle*, which are valuable pictures of the state of society. She wrote in defense of women. Caxton translated some of her works and printed Earl Rivers's version of her *Moral Proverbs* (1478). There is an edition of her *Œuvres poétiques* by Roy (1887–92). For her biography, consult Koch (Goslar, 1885).

CHRIS'TISON, SIR ROBERT (1797–1882). A Scottish physician. He was born in Edinburgh, studied medicine there, and afterward went to Paris to study chemistry under Robiquet and toxicology under Orfila. In medical jurisprudence and toxicology he became especially eminent. He was twice president of the Edinburgh College of Physicians, was physician in ordinary to the Queen in Scotland, and was created a baronet on Mr. Gladstone's recommendation in 1871. His best-known works were: *Treatise on Poisons* (1829) and *Granular Degeneration of the Kidneys* (1839). Consult his *Life*, edited by his sons (Edinburgh and London, 1885–86).

CHRISTLIEB, krist'lēp, THEODOR (1833–89). A German theologian, born at Birkenfeld, Württemberg. He was educated in Tübingen, taught in France, and preached in London from 1858 to 1865; returned to Germany, and in 1868 was made professor of practical theology and university preacher in Bonn. In 1873 he was a delegate to the Evangelical Alliance in New York. His best-known works, translated into English, are: *Modern Doubt and Christian Belief* (1870; 4th ed., 1879) and *Protestant Foreign Missions: Their Present State* (1880). Among his other works are: *Leben und Lehre des Johannes Scotus Erigena* (1860); *Der Missionsberuf des evangelischen Deutschlands* (1876); *Der indobritische Opiumhandel* (1874); *Ärztliche Missionen* (1884).

CHRISTMAS, kris'mas (ME. *Cristmas, Cristesmesse*, Christ's mass). The day on which the nativity of the Saviour is observed. The institution of this festival is attributed by the spurious decretals to Telesphorus, who flourished in the reign of Antoninus Pius (138–161 A.D.); but this is unhistorical. It is unknown just when it originated, but surely December 25 was not generally observed as the day prior to Chrysostom's time (fourth century) in the Eastern church, although much earlier in the Western; for there was no uniformity in the period of observing the Nativity among the early churches; some held the festival in the month of May or April, others in January. January 6 was the usual date for the feast of the Nativity in the Eastern church, and still continues to be the date in the Armenian church. Some modern scholars hold that this was also the date in the early times in Rome, and that December 25 was adopted under Pope Liberius in 353 or 354. The celebration of December 25 spread to most parts of the East in the fourth and fifth centuries. It is impossible to establish any date as the exact time in the year of the birth of Christ. It is often objected that December 25 cannot be the true date, for it is then the rainy season in Palestine, when shepherds would hardly have been watching their flocks by night in the fields. The "spirit of Christmas," however, is of far greater importance than the historical exactness of its time. The reasons for the final choice of December 25 cannot now be determined. Calculations, on somewhat arbitrary grounds, of the time of Christ's birth may have influenced it. The desire to displace the orgies of the Roman saturnalia is now less often ascribed as a reason than formerly. A widespread feast of the Great Mother may have had influence. The wish to place a Christian feast in opposition to the feast of the sun (*sol invictus*) at the winter solstice may have had weight. The early Church was eager to replace pagan festivals by Christian. As Christianity spread, the feast of the winter solstice, the time when the day begins to increase, and light to triumph over darkness, was easily turned into the feast of Christ, the light of life. At the winter solstice the Germans held their great Yule feast, in commemoration of the return of the fiery sun wheel, and believed that during the 12 nights reaching from December 25 to January 6 they could trace the personal movements and interferences on earth of their great deities, Odin, Berchta, etc. Many of the beliefs and usages of the old Germans, and also of the Romans, relating to this matter, passed over from heathenism to Christianity and have partly survived to the present day. But the Church also sought to combat and banish—and in this it was to a large extent successful—the deep-rooted heathen feeling, by adding, for the purification of the heathen customs and feasts which it retained, its grandly devised liturgy, besides dramatic representations of the birth of Christ and the first events of His life. Hence sprang the so-called "manger" songs and a multitude of Christmas carols as well as Christmas dramas, which at certain times and places degenerated into farces or fools' feasts (q.v.). Hence, also, originated at a later period the

Christ trees, or Christmas trees, adorned with lights and gifts, the custom of reciprocal presents and of special Christmas meats and dishes, such as Christmas rolls, cakes, currant loaves, dumplings, etc. Thus Christmas became a universal social festival for young and old, high and low, as no other Christian festival could have become. At one time the festivities were continued until Candlemas and Twelfth Day.

Christmas not only became the parent of many later festivals, such as those of the Virgin, but especially from the fifth to the eighth century gathered round it, as it were, several other festivals, partly old and partly new, so that what may be termed a *Christmas cycle* sprang up, which surpassed all other groups of Christian holidays in the manifold richness of its festal usages, and furthered, more than any other, the completion of the orderly and systematic distribution of Church festivals over the whole year.

In the Roman Catholic church each priest celebrates three masses at Christmas, viz., at midnight, at daybreak, and in the morning. The day is also observed religiously by the Anglican and Lutheran churches. The Scotch Presbyterians and English Nonconformists generally rejected all religious observance of the day as a "human invention" and savoring too much of "papistry." It is said that the Puritan founders of New England established the Thanksgiving festival as in some measure a substitute for Christmas. At the present time the tendency is strong towards religious observance of the day in all Protestant bodies.

CHRISTMAS BOX. See BOXING DAY.

CHRISTMAS CARDS. Pictured souvenirs appropriate to Christmas, which modern fashion has introduced into the social world. The earliest example of this art is attributed to J. C. Horsley, R.A., who in 1846 made designs of this character. Subsequently the demand for these tokens has become enormous, and at present Christmas cards are often of much artistic merit in both design and coloring.

CHRISTMAS CAROL. See CAROL.

CHRISTMAS CAROL, THE. A Christmas story by Charles Dickens, published in 1843. It narrates the regeneration of the miser Scrooge by the kind offices of "Marley's Ghost." The story was published in London by Chapman and Hall, and 15,000 copies, bringing the author over £700, were soon sold.

CHRISTMAS ISLAND. A small island in the Indian Ocean, in lat. 10° 25′ S. and long. 105° 42′ E., and about 190 miles south of the west end of Java. It has not a very good anchorage, but was colonized in 1907 from the Cocos-Keeling Islands, chiefly for the purpose of working valuable beds of phosphate of lime. It is under British control and administratively belongs to the Straits Settlements.

CHRISTMAS ISLAND. A large, low atoll in the Pacific Ocean, in about lat. 2° N. and long. 157° 30′ W. It has a good anchorage and belongs to the British government. It was discovered by Cook in December, 1777.

CHRISTMAS PANTOMIMES. Harlequinades given at Drury Lane and Covent Garden theatres at Christmas time. The institution dates from the end of the seventeenth century and reached its highest point under Garrick. The performance usually opens with the representation of some fairy tale, the characters of which change to the harlequin, columbine, and clown of the pantomime which follows.

CHRISTMAS ROSE. See HELLEBORE.

CHRIS'TODO'RUS OF COPTUS (Gk. *Χριστόδωρος Κοπτεύς, Christodōros Kopteus*). A Greek poet resident in Egypt, at the close of the fifth and the beginning of the sixth century A.D. His three books of epigrams have perished, except two epigrams preserved in the *Palatine Anthology*. (See ANTHOLOGY.) He is best known for his description in 416 hexameter verses of 80 statues contained in the gymnasium of Zeuxippus in Constantinople. This poem, which forms book ii of the *Palatine Anthology*, has, in the opinion of some critics, considerable value for both literature and the history of art.

CHRISTOL'OGY (from Gk. *Χριστός, Christos*, Christ + *λογία, logia*, account, from *λέγειν, legein*, to say). A technical term in theology, signifying the doctrine of the person of Christ, or the answer to the question, What is the relation of the divine and human in Christ? The elements of the problem may be said to have been given by the original and unvarying conviction of the Church. That Christ was man was too plain to be denied by any. But no less plain did it seem from the beginning, to the Apostles (John i. 14) and to the humble men who bore the first testimony to Christ by the surrender of their lives (Ignatius, *Eph.* vii, etc.), that He was truly divine. On the subtleties of this problem they did not dwell; but it certainly never occurred to them to divide His personality. And so, when more careful reflection was forced upon the Church, the question was one of adjustment of accepted truths. How could divinity and humanity coexist in the unity of one person?

There were early answers to the question which were tentative and soon rejected as incorrect. The Gnostics (q.v.) generally made the humanity a mere appearance; but their whole system was recognized as anti-Christian.

The great classical period of the growth of Christology was from the second century to the Council of Chalcedon. The first answer to the problem of the person of Christ was Modalist, Patripassian, or Sabellian. (See SABELLUS.) Christ is divine, and His divinity is indistinguishable from God the Father. He is a mode or manifestation of the divine Father. This theory affirmed Christ's divinity and denied His humanity. The discussion closed with Origen, who affirmed the real divinity and humanity, both in one person. Then followed the Arian controversy, which for a time split the Church. Arius held that Christ was divine, of a "like substance" (*homoiousios*) with the Father. He is the first of created beings, and in Him the divine Logos takes the place of a rational soul. Athanasius held that Christ is of the same substance (*homoousios*) with the Father, uncreated, from eternity, yet the Son of God. This became in the end the orthodox belief regarding the divine side of Christ's nature and is expressed in the Nicene creed. Thought about the human side produced another group of controversies. If Christ is of the same substance with the Father, how is His human nature related to the divine? Apollinaris held that Christ had no proper human nature, the divine Logos taking its place. Eutyches held that after the incarnation there was but one nature, the human being absorbed in the divine. Nestorius held firmly to the two natures, but dissolved the personality, making Christ a twofold person, the natures subsisting in "conjunction." The Nestorian position resulted in a schism, the Nestorian church having

a long career in Persia and the East and persisting to the present time.

By the time of the Council of Chalcedon (451) these various efforts at explanation, resulting in the essential modification of some element of the theanthropic person, had all been thought through and all finally condemned. The Church was ready to adopt a creed which reaffirmed all the three elements of the problem in the following words: We confess "one and the same Son, our Lord Jesus Christ, the same perfect in Godhead and also perfect in manhood; truly God, and truly man, of a reasonable soul and body; consubstantial with the Father according to the Godhead, and consubstantial with us according to the manhood; in all things like unto us, without sin; begotten before all ages of the Father according to the Godhead; and in these latter days, for us and our salvation, born of the Virgin Mary, the mother of God, according to the manhood; one and the same Christ, Son, Lord, only begotten, to be acknowledged in two natures, inconfusedly, unchangeably, indivisibly, inseparably; the distinction of natures being by no means taken away by the union, but rather the property of each nature being preserved and concurring in one person and one substance, not parted or divided into two persons, but one and the same Son and only begotten, God the Word, the Lord Jesus Christ."

But the creed of Chalcedon was not acceptable to all. The Monophysite ('one nature') church broke off, holding that "two natures" could only mean two persons, not one. The present Coptic, Ethiopic, Armenian, and Jacobite churches are Monophysite, the survivors of this controversy. An attempt was made to bring the two parties together by the statement that Christ, though having two natures, had one will (Monothelite), but this only resulted in further schism, the survival of which is found in the present Maronite church in Syria. With these various objectors excluded, the orthodox church maintained the creed of Chalcedon.
